UNIVERSAL KNOWLEDGE.

A REPRINT
OF THE LAST (1880) EDINBURGH AND LONDON EDITION
OF CHAMBERS'S ENCYCLOPÆDIA,

With Copious Additions by American Editors.

FIFTEEN VOLUMES,
VOLUME XIII.

NEW YORK:
AMERICAN BOOK EXCHANGE,
764 BROADWAY,
1881.

V. 13

AMERICAN PUBLISHER'S NOTICE.

THIS work, although based upon Chambers's Encyclopædia, whose distinguished merit is widely known, differs from it in important respects. It could scarcely be expected that an Encyclopædia, edited and published for a foreign market, would give as much prominence to American topics as American readers might desire. To supply these and other deficiencies the American Editors have inserted about 15,000 titles, arranging the whole, including Chambers's Supplement, in a single alphabet. The total number of titles is now about 40,000. The additions give greater fullness in the departments of biography, geography, history, natural history, and general and applied science. Scrupulous care has been taken not to mutilate or modify the original text of the edition of 1880; no changes have been made except such verbal alterations as are required by the omission of the wood-cuts. The titles of articles from Chambers's Encyclopædia, either from the main work or from the Supplement, are printed in bold-faced type—**AMERICA**. The titles of the American additions, whether of new topics or of enlargements of the old, are printed in plain capitals—**AMERICA**. Should it appear that an article from the English work and its American continuation disagree in any points, the reader will readily refer the conflicting statements to their proper sources.

The labor of consultation will be much reduced by the catch-words in bold-faced type at the top of the page, being the first and last titles of the pages which face each other; and by the full title-words on the back of the volume, being the first and last titles contained therein.

The word *ante* refers to Chambers's Encyclopædia, as represented in this issue. Whenever the word (*ante*) follows a title in the American additions, it indicates that the article is an enlargement of one under the same title in Chambers's Encyclopædia—usually to be found immediately preceding.

LIBRARY OF UNIVERSAL KNOWLEDGE.

SAFETY-LAMP. It has been long known that when marsh-gas or light carbureted hydrogen, which is frequently disengaged in large quantities from coal-mines, is mixed with seven or eight times its volume of atmospheric air, it becomes highly explosive, taking fire at the approach of a light, and burning with a pale blue flame. Moreover, this gas in exploding renders ten times its bulk of atmospheric air unfit for respiration, and the *choke-damp* thus produced is often as fatal to miners as the primary explosion. With the view of discovering some means of preventing these dangerous results, Davy instituted those important observations on flame which led him to the invention of the safety-lamp. He found that when two vessels filled with a gaseous explosive mixture are connected by a narrow tube, and the contents of one fired, the flame is not communicated to the other, provided the diameter of the tube, its length, and the conducting power for heat of its material, bear certain proportions to each other; the flame being extinguished by cooling, and its transmission rendered impossible. In this experiment, high conducting power and diminished diameter compensate for diminution in length; and to such an extent may this shortening of length be carried, that metallic gauze, which may be looked upon as a series of very short square tubes arranged side by side, completely arrests the passage of flame in explosive mixtures. The following are Davy's directions regarding the structure of his lamp: "The apertures in the gauze should not be more than $\frac{1}{32}$ of an inch square. As the fire-damp is not influenced by ignited wire, the thickness of the wire is not of importance; but wire from $\frac{1}{16}$ th to $\frac{1}{8}$ th of an inch in diameter is the most convenient. Iron-wire and brass-wire gauze of the required degree of fineness, are made for sieves by all wire-workers, but iron-wire gauze is to be preferred; when of the proper degree of thickness, it can neither melt nor burn; and the coat of black rust which soon forms upon it superficially defends the interior from the action of the air. The cage or cylinder should be made of double joinings, the gauze being folded over so as to leave no apertures. When it is cylindrical it should not be more than two inches in diameter; for in larger cylinders the combustion of the fire-damp renders the top inconveniently hot, and a double top is always a proper precaution, fixed at the distance of half or three-quarters of an inch above the first top. The gauze cylinder should be fastened to the lamp by a screw of four or five turns, and fitted to the screw by a tight ring. All joinings should be made with hard solder; and the security depends upon the circumstance that no aperture exists in the apparatus larger than in the wire gauze." The cylinder is protected by three external, strong, upright wires, which meet at the top; and to their point of junction a ring is attached, by which the lamp is suspended. The oil is supplied to the interior by a pipe projecting from the cylinder, and the wick is trimmed by a wire bent at the upper end, and passed through the bottom of the lamp, so that the gauze need not be removed for this process. When a lighted lamp of this kind is introduced into an explosive mixture of air and fire-damp, the flame is seen gradually to enlarge as the proportion of light carbureted hydrogen increases, until at length it fills the entire gauze cylinder. Whenever this pale enlarged flame is seen, the miners should depart to a place of safety, for although no explosion can occur while the gauze is sound, yet at that high temperature the metal becomes rapidly oxidized, and might easily break; and a single aperture of sufficient size would then occasion a destructive explosion. In a strong current of air, the heated gas may be blown through the apertures of the gauze before its temperature is sufficiently reduced to prevent an explosion; but such a contingency may be guarded against by placing a screen between the draught and the lamp. It was in the year 1815 that Sir Humphry Davy presented his first communication to the royal society respecting his discovery of the safety-lamp; and at the meeting held on Jan. 11, 1816, the lamp was exhibited. Sir Humphry Davy's claim as an original discoverer was immediately challenged by various persons, among whom may be especially noticed the late Dr. Reid Clanny, of Newcastle, and the great engineer, George Stephenson. Clanny's safety-lamp (which is described in the *Philosophical Transactions* for 1813) was based on the principle of forcing in air through water by bellows; but the machine was ponderous and complicated, and required a boy to work it; moreover, he had been anticipated by

Humboldt in 1796 (Weld's *History of the Royal Society*, vol. ii. p. 288, note). Notwithstanding a report of the royal society, dated Nov. 20, 1817, and signed by Joseph Banks, R.N.S., William Thomas Brande, Charles Hatchett, and William Hyde Wollaston, which is totally adverse to Stephenson's claims, there is undoubted evidence that, during the very months Davy was at work on the experiments which led to his invention, Stephenson's (familiarily called the *Geordy*) lamp was actually in use at the Killingworth mines. In its general principle it was the same as Davy's, the main difference being that the Stephenson lamp had a glass cylinder inside the wire-gauze cylinder, and that inside the top of the glass cylinder was a perforated metallic chimney; the air being supplied through a triple circle of small holes in the bottom. On the subject of this controversy, the reader is referred to Smiles's *Life of George Stephenson*. It has been generally agreed that there is a decided advantage in having a glass cylinder besides the gauze one, to resist strong currents of air; and that glass without gauze is not safe from fracture. In the French and Belgian collieries, Mueseler's lamp is in almost universal use. It consists of a glass cylinder immediately around the flame, and of wire gauze above. An internal metal chimney opening a short distance above the flame creates a strong upward draught, which causes the feed air to pass briskly down from the wire gauze, and so keeps the glass cool and insures thorough combustion. Mueseler's lamp is also used in a few English collieries; but modifications of Davy's, Stephenson's, and in a less degree of Clanny's later lamp are still in general use in England, the best kinds of each having their wire-gauze covers secured by patent lever locks. In the catalogue of the collection of scientific apparatus shown at South Kensington in 1876, there is given an interesting table with remarks, of the different forms of safety-lamps which either are or have been in use. It was compiled by the north of England institute of mining engineers.

Closely connected in its objects with the safety-lamp is a most ingenious invention patented by Mr. Ansell of her majesty's mint. Its object is to determine, by a simple application of the law of osmotic force, the presence of light carbureted hydrogen in coal mines. Mr. Ansell gives two or three forms to his apparatus, of which the following is the most simple: A thin india-rubber ball is filled with atmospheric air, and is placed on a stand under a lever which slightly presses its upper surface. This lever is connected with a spring, which it liberates when, from any cause, the lever is raised; and the liberation of the spring sets a bell in vibration. If this trap for the discovery of fire-damp is set where that gas is present to any material extent, the noxious gas enters the ball by virtue of osmose, causes it to swell, and when the swelling has attained a certain point, the warning bell rings.

The time is probably not distant when the electric light (q.v.) will be used in most, but especially in dangerous, mines. The great difficulty in the way of so applying it is that it cannot, as yet, be economically divided into many comparatively small lights from one source of electricity. As it burns *in vacuo* it can be rendered perfectly safe in an explosive mixture of fire-damp and air. Some 20 years ago Mr. Holmes, the well-known electrician, invented a miner's electric lamp in which the light—equal to that of an ordinary candle—was produced by a small portable galvanic battery. Its cost was estimated at between £3 and £4. More lately MM. Dumas and Benoit have constructed a lamp the light of which is produced by a current of electricity from a Rhumkorff coil passing through a Geissler's vacuum tube. The tube, however, really contains a highly rarefied gas such as carbonic acid, and the light has only the character of a rich phosphorescent glow. Neither of these, nor any other form of an electric light, has as yet come into practical use in mining operations.

SAFETY-VALVE is a circular valve placed on an opening in the top of a steam-boiler, and kept in its place either by means of weights piled above it, by a lever of the second kind, with a weight capable of sliding along the arm, or by a lever and spring. In stationary engines, one valve is frequently found sufficient, and the pressure on the valve is produced in the first or second of the methods indicated above. In locomotive engines, on the contrary, there are always two loaded valves: one called the *lock-up valve*, from its being out of the engineman's reach and control, is placed well forward on the top of the boiler, and kept down by weights; the other, on the hinder part of the top of the boiler, is for safety subjected to a less pressure than the lock-up valve, and is acted on by a lever and spring. The term "safety-valve" is particularly appropriate to this invention; for whenever the tension of the steam rises above a certain amount (= the weight in pounds with which the valve is held down divided by the area in inches of the under-surface exposed to the steam), the valve is forced upward by the superior pressure beneath, steam escapes, and the pressure on the boiler being thus relieved, the valve sinks to its place. The only precaution necessary is to be sure that the valves are not too heavily loaded or fastened; and wilful indifference, or disregard of this caution, has, especially in the case of American river-steamers, been productive of serious casualties.

SAFFI, AZAFFI, or ASFI, a sea-port of n. Africa, in the kingdom of Morocco, and 107 m. w.n.w. of the city of that name. It is surrounded by waste and desert land; and its inhabitants, about 12,000 in number, of whom 3,000 are Jews, are said to be the wildest, greediest, and most fanatical of the kingdom. It was at one time the chief seat of the trade with Europe, and though it has declined with the rise of Mogadore, it still

exports silk, wool, leather, gum, and goat-skins. The value of the imports in 1873 was £113,718; of the exports, £277,628.

SAFFLOWER, *Carthamus tinctorius*, a plant of the natural order *compositæ*, allied to thistles (q.v.), but distinguished by its heads of flowers having only hermaphrodite florets, and the fruit having four ribs, and no pappus. It is an annual, 2 to 4 ft. high, branching toward the top; flowers dark orange, or vermilion. It is a native of the East Indies from which it was probably introduced in a remote age into Egypt and the Levant, where it is now naturalized. It is extensively cultivated in France, and the more southern parts of Europe, and even in some parts of South America, chiefly on account of the corollas of the florets, which are used in dyeing yellow and red. In France, it is drilled or sown broadcast in the beginning of May. The plants are thinned to five or six inches apart; and the flowers are picked by the hand in dry weather, and very carefully dried on a kiln, under pressure, and are thus formed into small round cakes, in which state safflower appears in the market. The safflower of Persia is generally esteemed the best; but India yields the chief part of that imported into Britain. From its resemblance to saffron, safflower is sometimes called *bastard saffron*, and it is used to adulterate saffron. The yellow coloring matter of safflower is a kind of extractive. The red coloring matter is earthamine (q.v.). The coloring matter of rouge (q.v.) is derived from safflower.

The seeds of safflower are bitter and very oily. They are greedily eaten by parrots and many other birds. They are sometimes used as a purgative. The oil which they contain is employed in the East Indies in cases of rheumatism and paralysis.

SAFFORD, TRUMAN HENRY, b. Vt., 1836; graduated at Harvard in 1854. He was remarkable when a boy for his astonishing power of mentally performing with wonderful rapidity mathematical problems, such as extracting cube roots of numbers having 8 or 10 places of figures. When less than 10 years old he made the calculations for an almanac; and in 1849 ascertained the elliptic elements of the comet of that year. In 1863 he was made assistant observer at the Cambridge observatory, and in 1865 became director of that at Chicago. He has made many astronomical observations and discoveries.

SAFFRON, a coloring material, consisting of the dried stigmas of the common yellow crocus, so abundant in our gardens in early spring. It was introduced into Europe from Asia Minor, and is largely cultivated in several countries, but chiefly in Spain. In England the crocus was unknown until 1339, when it was introduced from the east by a pilgrim; and in 1582 it was extensively cultivated for yielding saffron, especially in Essex, at the place now called in consequence Saffron-Walden. Its cultivation in Britain has almost entirely ceased, and the saffron used is imported. Saffron is not only valuable as a coloring material, but has from very early ages had a great medicinal reputation. Homer mentions it, and Solomon associates it with spikenard and other precious drugs and spices. A large portion of the supply in ancient times was yielded by Cashmere, where it is still extensively cultivated. In addition to its other properties, it is often used as a perfume, and in flavoring as well as coloring confectionery and other article of food. These latter are now its chief uses in Britain, where its medicinal value has long been declining. The color yielded by saffron is a bright golden yellow, and is due to a peculiar principle called *polychroite*. Its great solubility in water prevents its being used as a dye for fabrics; but its agreeable flavor, and the absence of all injurious qualities, render it of great service in coloring articles of food.

The *S. crocus* (*crocus sativus*; see **CROCUS**) differs from most of the species of that genus in flowering in autumn, not in spring. It has large deep purple or violet flowers, with the throat bearded, and the long drooping trifid stigma much protruded from the tube of the perianth. The stigmas are the only valuable part of the plant.

In its cultivation the corms are planted in the beginning of summer in rows 6 in. apart, and 3 in. from bulb to bulb; the most suitable soil being a sandy loam, very thoroughly tilled. The stigmas are gathered by women and children, and are spread out on cloth or paper, and dried in the sun, or in kilns or drying-houses. The produce of an acre of saffron is about 5 pounds the first year, and 24 pounds the second and third year, after which the plantation must be renewed. But an ounce of saffron sells for at least £2.

SAFFRON-WALDEN, a market t. and municipal borough of England, in the county of Essex, 24 m. n.n.w. of Chelmsford. The church is an elegant specimen of late perpendicular. The free grammar-school has an income of £60 a year. The chief trade is in barley, malt, and cattle. Pop. '71, 5,718.

SAFVET PASHA', b. Constantinople, 1815; entered the diplomatic service, and was for a time secretary to the sultan Abdul Medjid. He was ambassador to Paris 1865-66, was member of the council of state, minister of foreign affairs, minister of justice, and for a short time in 1878 grand vizier.

SA'GA, an old Norse word, used to denote a tale which, originally dependent on, and gradually elaborated by, oral tradition, had at last acquired a definite form in written literature. Such sagas (Norse *sögur*), along with poetical and legislative writings, constitute the chief part of the old Norwegian-Icelandic literature. They have been divided into historical and legendary. The latter embrace partly stories universally current

about heroes of the Teutonic race (e.g., the *Völsunga-Saga*), and partly stories peculiar to the Norse or Scandinavian peoples (e.g., the *Prithjof's-Saga*); while the former handle the events and personages of Norwegian and Icelandic history from the 9th to the 13th c., in numerous biographies and family records. To Danish history belong the *Knyttlinga-Saga* and *Jomsrikinga-Saga*; to Swedish, the *Ingvars-Saga*; to Russian, the *Rygnuds-Saga*. The Faröe islanders and the Orcadians have also their own sagas. After the middle of the 14th c., when the motley literature of the church began to exercise an influence, tales were translated from foreign languages into Norse, e.g., the story of *Barlaam and Josephat* (q.v.), which also received the name of sagas. Bishop P. E. Müller, in his *Sagabibliothek* (Copenh. 1817-20) was the first who subjected the whole subject of saga-literature to a critical treatment. Since his time collections both of the historical and legendary sagas, with critical apparatus more or less complete, have appeared in all the countries of the north. The German *sage* is the same word, and expresses fundamentally the same idea as the Norse *saga*. The difference is this, that the Germans do not restrict its application to the legendary or traditional literature of their own country but extend it to that of others.

SAGADAHOC, a co. in s. Maine, drained by the Androscoggin and the Kennebec rivers, traversed by the Knox and Lincoln, and the Maine Central railroads; about 250 sq. m.; pop. '80, 19,276. The surface is diversified. The soil is fertile. The principal productions are hay, corn, and dairy products. Much lumber is made, and ship-building is an important interest. Co. seat, Bath.

SAGAN, a t. of Prussian Silesia, 48 m. n.w. of Liegnitz, on the Bober, and on the Hainnsdorf and Glogau railway. Pop. '75, 10,541, who manufacture cotton and woolen cloths, and paper, and trade in yarn, cattle, and corn. In the manufacture of woolen cloths alone 1600 men are employed.

SAGE, *Salvia*, a genus of plants of the natural order *labiata*, and containing many species, herbaceous, and half-shrubby. There are only two perfect stamens, the filaments of which bear at their summit a cross thread—the much elongated *connective*—fastened by a joint, and having one cell of the anther at the upper end, and the other but imperfect cell at the other end. The seeds of many of the species, when steeped in water, become covered with a mucilaginous slime like quince seeds.—**COMMON SAGE**, or **GARDEN SAGE** (*S. officinalis*), grows on sunny mountain slopes and rocks in the s. of Europe, and has long been in general cultivation in gardens. It is a half-shrubby plant, seldom more than two ft. high, with ovate-oblong or lanceolate, finely notched, curiously wrinkled, whitish-gray leaves, and racemes of purplish-blue, rarely white or red flowers. The whole plant has a peculiar, strong, penetrating aromatic smell, somewhat resembling that of camphor, and a bitterish, aromatic, somewhat astringent taste. It contains much essential oil (*oil of sage*), which has been sometimes used in liniments for rheumatism. *Sage leaves* are much used in flavoring dishes, and in sauces, etc. The leaves and young shoots are used for astringent tonic gargles. *Sage tea*, made of the dried leaves and shoots, is a popular astringent and tonic. Sage grows best in a dry soil, and is easily propagated by slips or cuttings.—**CLARY** (q.v.) is a species of sage.—**MEADOW CLARY**, or **MEADOW SAGE** (*S. pratensis*), is a common ornament of meadows and borders of fields in most parts of the continent of Europe, and in the s. of England. It has bluish-purple flowers. It is sometimes fraudulently put into beer, to make it more intoxicating.—**THE APPLE-BEARING SAGE** (*S. pomifera*) is a native of the s. of Europe and of the east, remarkable for its very large reddish or purple bracts, and for the large gall-nuts which grow on its branches, as on the leaves of the oak, and which are known as *sage apples*, have an agreeable aromatic taste, and are brought to market and eaten.—Some of the species of *salvia* have very beautiful flowers, and are prized ornaments of gardens and green-houses.

SAGEBRUSH, a popular name for the *artemisia tridentata*, and other artemisias of the western table-lands and plains. One kind, called the white sage is much liked by cattle and affords good pasturage.

SAGE COCK. See **COCK OF THE PLAINS**, *ante*.

SAGHALI EN, spelled in all Russian accounts Sakhalin (q.v.).

SAG HARBOR, a village in s.e. New York, on the s. shore of Long Island, in the township of Southampton; pop. (of the township) '80, 6,352. It is in Suffolk co., on Gardiner's bay, 100 m. from New York, and 10 m. from Greenport. It is the terminus of a branch of the Long Island railroad, has an excellent harbor, 6 churches, a number of fine residences, 2 newspapers, a bank, and a hotel. The principal industries are connected with the fisheries and the coastwise trade. A line of steamboats connects it with New York. It has manufactures of cotton, morocco, cigars, and pottery.

SAGINAW, a co. in the center of the lower peninsula of Michigan; drained by the Saginaw, the Cass, the Flint, the Shiawassee, and the Tittabawassee rivers; on the Saginaw Valley and St. Louis, the Flint and Pere Marquette, and the Jackson; Lansing, and Saginaw railroads; about 850 sq. m.; pop. '80, 59,095—39,167 of American birth. The surface is mostly level, and heavily timbered. The soil is a rich loam. The principal productions are corn, oats, and dairy products. Pine lumber is the main export. Co. seat, Saginaw.

SAGINAW, or **SAGINAW CITY**, co. seat of Saginaw co., Michigan, on the w. bank of the Saginaw river, on the Flint and Pere Marquette, the Jackson, Lansing, and Saginaw, and the Saginaw Valley and St. Louis railroads; pop. '80, 10,525. It is on a plain 30 ft. above the river, which is spanned by 3 bridges, and is navigable for vessels drawing 10 ft. of water. The city has a court house, churches, schools, 2 banks, and 2 newspapers. Lumber and salt are largely exported. There are large manufactories of flour, ashes and blinds, etc. It was incorporated in 1859.

SAGINAW BAY, an arm of lake Huron, extends s.w., and forms an important indentation of the shore of Michigan state. It is 60 m. long by 30 wide, with several fine harbors and picturesque islands. The water, like that of the whole lake, is of wonderful clearness and purity. The bay is named from the river Saginaw, which falls into it.

SAGO is a nutritive substance obtained from several species of palms, especially the *metrorhylon sago*, which abounds in Ceram and the west coast of New Guinea. It grows also in Sumatra, Borneo, Celebes, Timor, Buro, and other islands, of the Indian archipelago. In many of the islands sago is the chief article of food, and by the Alfoers and Papuans is made either into a gruel or baked into cakes. The sago-tree is first a shrub with several upright green branches, which at their lower parts are covered with thorns. After three years these branches form one stem, and the thorns gradually disappear. The tree attains a height of from 40 to 60 ft., and within the ligneous bark it is filled with fibers and flour. It first blooms when 10 to 15 years old, according to the nature of the soil, flourishing best in a moist situation. After blooming, the flour transpires through the pores of the leaves, indicating that the tree is ripe. It must then be cut down within a year, or the flour will be lost. The stem is cut into lengths, split open, and the pit dug out and placed in a vessel with a sieve bottom. Water is applied to separate the flour and carry it into a second vessel, where it is soon deposited. The water is then run off, and the flour dried and put into little baskets made of sago-leaves. The produce of a tree averages 750 lbs. A large quantity of sago-flour is annually sent from the n.w. of Borneo, the n.e. of Sumatra, and Siak, to Singapore, the leading market, where it is purified and fitted for use as starch in the calico and other manufactures. In Borneo much of the sago is granulated; and the Chinese of Malacca prepare pearl-sago which is also sent to Singapore. Pearl-sago is in small pearly-white spherical grains, varying in size from that of a poppy-seed to a grain of millet. Granulated sago is also in round grains, but of a larger size. There are several varieties which differ much in color, some being white and others reddish-brown like radish-seed. One kind of granulated sago from India has been introduced under the name of tapioca. The method of pearling and granulating sago is not known to Europeans. Sago is not entirely soluble in hot water, like ordinary starch, and can therefore be employed in making puddings, etc., and in this way forms a valuable article of food, being cheap, light, nutritious, and easy of digestion. The amount annually imported into Britain is upwards of 8,000 tons, and is valued at about £127,000. See "Sago" in *Journal of the Ind. Archip.*, vol. iii.; *Tijdschrift van Ned. Indië*, 8th year, vol. i, see "De Sagoboom."

SAGOU IN, *Callithrix* or *Saguinus*, a genus of American monkeys, having a long but not prehensile tail, a small and rounded head, short muzzle, and large ears. They are of small size, and remarkably active and graceful in their movements. They are sometimes called *squirrel monkeys*. They are of very gentle disposition, and when tamed become strongly attached to their masters. Both body and tail are covered with beautiful fur. The **SIAMIRI** or **TEE-TEE** (*C. sciureus*), a native of Brazil and Guiana, is one of the best known species.

SAGUA'CHE, a co. in s. Colorado; drained by Saguache creek, Gunnison river, Los Pinos creek, and other small streams; 2,500 sq.m.; pop. '80, 1973—1707 of American birth, 5 colored. Its surface is mountainous; in the n.e. is Homan's park. It comprises a portion of San Luis park, 7,000 ft. above the level of the sea, which is exceptionally fertile; the Uncompahgre mountains in the s.w., covered with forests of pine and fir, and the peaks of the Saguache and Sangre de Cristo. It contains San Luis lake, a large extent of wet swampy land receiving 12 streams and with no outlet. The soil furnishes excellent pasturage, and is adapted to the production of grain and the raising of cattle. Gold is found in the mountains. Co. seat, Saguache.

SAGUA-LA GRANDE, a t. of Cuba, on the river Sagua, about 12 m. from its mouth, which is on the n. coast of the island. It is a town of considerable importance, and is connected by railway with Villa Clara and other places. Pop. about 10,000.

SAGUENAY, a large river of Canada, falling into the estuary of the St. Lawrence, on the n. side, about 115 m. below Quebec. It drains the lake of St. John, which is nearly circular, and almost 30 m. in diameter. Its course from that lake to the gulf of St. Lawrence is about 100 m., and is almost a straight line. It flows between precipitous cliffs, has numerous cataracts in its upper part, and is in many places two or three m. broad. In the lower part of its course it is less wide, but very deep, and large ships ascend it more than 60 m. to load with timber from the settlements on its banks. The name Saguenay is sometimes also given to the principal river which falls into lake St. John, and which is known to the Indians as the Chomouchouan and as the Assouap-

moussin. It rises about 200 m. to the w. of lake St. John. The average depth in mid channel is 145 fathoms.

SAGUENAY, a co. in n.e. Quebec, having the St. Lawrence river for its s. and s.e. boundary; drained by Murray and Black rivers, and the head waters of the Little Saguenay; 12,815 sq. m.; pop. '71, 5,487. It includes the island of Anticosti, a resort for seal and bear hunting and salmon fishing, also lakes St. John and St. Anne. The principal towns are on the coast; and fishing is the chief industry. It has saw and grist mills, and a large lumber trade. Co. seat, Tadoussac.

SAGUNTUM, a wealthy and warlike town of ancient Spain, in Hispania Tarraconensis, stood on an eminence near the mouth of the Pallantias (modern Palancia). Its site is now occupied by the town of Murviedro (q.v.). Founded (according to Strabo) by Greeks from Zacynthus, it became at an early period celebrated for its commerce, and attained to great wealth. But it owes its historical vitality to the circumstances of its siege and destruction by the Carthaginians, under Hannibal, in 218 B.C. Having withstood the siege for the greater part of a year, against an army amounting to about 150,000 men, led by a general of consummate ability and indomitable resolution, the Saguntines, now most severely pressed by famine, concluded, with an act of heroic defiance and self-sacrifice, a resistance that had been characterized by the most brilliant valor. Heaping their valuable effects into one vast pile, and placing their women and children around it, the men issued forth for the last time against the enemy; and the women setting fire to the pile they had prepared, cast themselves upon it, with their children, and found in flames the fate their husbands met in battle. The destruction of Saguntum directly led to the second Punic war.

SAHAP TINS, or **SAPTINS**, a family of Indians w. of the Rocky mountains, occupying the country on both sides of the Columbia river, and on the forks of the Lewis and Sahaptin or Snake rivers. They are mostly in Oregon, Idaho, and Washington territories. They comprise the Nez Percés, Palus Tairtlas, Wascos, Wallawallas, Yakimas, and Kliketats.

SAHARA. The immense tract of country to which this name is commonly given has already been described under the heading **AFRICA** (q.v.). But the term Sahara is more correctly applied to a region of much more limited extent. The natives divide Africa n. of the line into three portions—the Tell, the Sahara, and the Desert. The Tell extends from the Mediterranean to the Atlas mountains; the Sahara, from the Atlas to the southern region where all regular supply of water fails; and the Desert, from the southern and not very clearly-defined frontier of the Sahara, southward almost to the watershed of the Niger, comprising a district salt and arid, inhospitable to man and beast, although the camel may even here snatch a scanty subsistence. As to physical geography, the Sahara may be subdivided into the following districts—1. The Hauts Plateaux, or Steppes, a series of high levels skirting the base of the Atlas mountains. 2. The land of the Dayas or waterless oases, stretching s. to the high lands on the s. bank of the Wed Mzi or Djidi. 3. The region of the southern oases, to the s. of the former, and extending s. till it loses itself in the desert. The principal feature of the Sahara is the Wed Mzi, which rises in the Djebel Amour, and after an e., n.e., and finally s.e. course, falls into the Chott Melr'hir. Throughout almost the whole of its course, which is about 400 m. long, it flows under ground. Its waters seem to rest on a bed of hard limestone from 30 to 60 ft. below the surface.—See H. B. Tristram's *Great Sahara*, with maps and illustrations.

SAHARANPUR, or **SCHURUNPUR**, a t. of British India, North-West Provinces, the chief place of a district of the same name. It is situated in a plain in n. lat. 29° 58', and e. long. 77° 36', about one mile e. of the Doab canal. It has a large fort, a military cantonment, and a government depot. Saharanpur is about 1000 ft. above the sea, and the climate is temperate during great part of the year. Saharanpur was therefore chosen as a suitable situation for a botanic garden, for plants requiring a milder climate than that of Calcutta, and one was formed in 1817. Saharanpur is described as one of the most handsome British stations in India. Pop. '72, 43,844.

SAHIB (Arabic, companion, master, lord) is, in Hindustani, the usual designation and address of a respectable European, equivalent to Mister, Sir, etc. Hence *Sahibā* is the term for Lady, Madam. In Bengali and Mahrati, the word assumes the form *Saheb*.

SAIDA. See **SIDON**.

SAID PASHA. See **EGYPT**.

SAIGA. See **ANTELOPE**.

SAIGO, the family name of two brothers, both of whom have held the highest military office in Japan. S. TAKAMORI, b. in Satsuma about 1827, a man of commanding physical and intellectual superiority, was one of the early supporters of the literary and political revolution that broke up anarchy in Japan, and established the present monarchy, which is but the ancient system restored. He was three times arrested and banished by the Yedo government of the tycoon; and in 1868 commanded the mikado's

forces and put down the rebels on the main island and in Yezo after a war of nearly two years. Being made marshal of the imperial army in 1873, he resigned after a few months, in consequence of a disagreement with the cabinet on the question of going to war with Corea. He retired to Satsuma and began the establishment of "military schools." On Feb. 1, 1877, the great "Satsuma rebellion," led by him and into which circumstances forced him prematurely, began by the seizure of vessels at Kagoshima laden with powder belonging to the government. To suppress the rebel forces, who were led and animated by his high military genius, the imperial government sent over 60,000 men into the field for eight months. After many bloody battles, and the loss of nearly ten thousand in killed and wounded on each side, the rebellion was ended by the battle of Shiroyama, in which the little band of four hundred rebels, armed only with swords and led by Saigo, Kirino, and Murata, were surrounded by 15,000 imperial troops. All of the band were killed or committed *hara-kiri*. SAIGO the younger, or Saigo Tsukumichi, b. about 1836 in Satsuma, was also conspicuous in the restoration of 1868. In 1874 he led the Japanese expedition to Formosa, occupying the aboriginal portion of the island with 1300 troops for six months, and severely chastising the cannibals in several skirmishes. In 1876, as president of the Japanese commission at the centennial exposition at Philadelphia, he spent several months in the United States. In 1877, though not ordered to do so by the mikado, he took the field against the Satsuma rebels, and led the operations that closed the campaign. He is now, 1880, commander-in-chief of the Japanese army.

SAIGON, one of the finest river-ports in Asia, the capital of the French possessions in Lower Cochin China, stands on a small river of the same name, about 35 m. from the Chinese sea. The city is fortified, and its value as a strategical position is unquestionable. By land it is defended from attack by many miles of jungle and swamp, and the approach from the sea on the s., by the fine river Donnai, could easily be rendered impassable to the strongest fleet. The entrance to the Donnai is at cape St. Jacques, and its winding course to Saigon, through a rich level country, is from 50 to 60 m. in length, and might be defended by fortifications at every point. It is of easy navigation, and is of sufficient depth to allow vessels of the heaviest burden to sail close to its banks under the overhanging foliage. The breadth of the river from Saigon to the sea varies little, but it is never narrower than the Thames at London. It is joined on both sides by many large affluents, and it is the main channel of a river-system that covers the whole country to the s. of the capital with a network of water-courses. The city of Saigon is fortified, and is defended by a permanent force of several large ships of war and a garrison of 10,000 men. At the beginning of the year 1865 the law of conscription, by which one man in seven is chosen from among the natives for military service, was already in force. Saigon consists of two parts, the Chinese town, 4 m. inland, filled with an active population busily engaged in trade, and the European, or fortified town on the banks of the Saigon. The latter, with its fleet of vessels riding at anchor in mid-stream, is already of considerable size. Good roads have been constructed for many miles around, and there are barracks, hospitals, official residences, and other buildings for public purposes. The soil, only about one-fourth of which is under cultivation, is abundantly fertile, and is admirably suited to the production of cotton, sugar, indigo, and tobacco, besides rice, the principal export. Its forests contain magnificent timber, and abound in woods rich in dyes. Many handsome public buildings have been erected. There is a naval yard and arsenal, and ship-building is carried on. Pop. estimated at 70,000.

Saigon, together with part of the territory of which it is the capital, was taken by the French in 1860. Treaties of peace and commerce, concluded with the Annamite government, in 1834, provided that the protectorate of the six provinces of Lower Cochin China should remain in the hands of France; that three important ports on the coast of Anam should be opened; and that a space of 9 kilometres on the shore of each port should be conceded to the French for the establishment of factories; that French merchants and missionaries should be allowed to traverse the kingdom of Anam without hindrance, and that an indemnity of 100 millions of francs should be paid. In 1867, in consequence of fresh aggressions, encouraged by the government of Anam, the French took the town of Vinh-long, and, by a new treaty, added three other provinces to their dominions, which now extend from 9° 5' to 10° n. lat., and from 1° 5' to 107° e. long. Pop. '73, 1,327,000. The revenue of the colony in 1873 was 14,300,000 francs. The yearly french trade amounts to about 60,000,000 francs.

SAIL. A sail is an expanse of canvas, matting, or other strong material, on which the wind may exert its force and propel the vessel. A sail is extended by means of a mast or yard, or both. It may be of various shapes, and of any size, according to the carrying power of the vessel. A vessel of shallow draught or of narrow beam can bear comparatively little sail; while a vessel of proportionately deep draught and heavily ballasted—as a yacht—or a vessel of great breadth of beam, can carry sail of great area. A sail acts with the greatest power when the wind is directly astern; but it can be applied, though with less strength, when on either beam. The action of the wind on an oblique sail is a good example of the resolution of forces. See COMPOSITION AND RESOLUTION OF FORCES, etc. Let TD, fig. 1, be a ship, PAS its sail, WA the direction

of the wind, and let the length of WA represent the pressure of the wind on the sail.

FIG. 1.

WA can be resolved into AB perpendicular to the sail, and BW parallel to it, the latter of which has no effect in pressing on the sail; therefore AB is the effective pressure on the sail. Were the vessel round, it would move in the direction BA. Let BA be resolved into CA and BC, the former, CA, acting in the direction of the keel or length of the vessel, or in the direction CAD, and the latter perpendicular to it, or in the direction of the breadth. The former pressure, CA, is the only pressure that moves the vessel forward, the other, BC, makes it move sideways. From the form of the vessel, however, this latter force, BC, produces comparatively little lateral motion; any that it does occasion is called *leeway*. It results, therefore, that with the wind exerting an oblique pressure, the actual progress will be to the power of the wind only as CA to WA. In the east and the Mediterranean, sails are frequently made of strong matting; but among northern nations, and for ocean navigation, very strong cloth, or canvas, called *sail-cloth*, is usually resorted to. It is woven narrow; and the many breadths in the sail are joined by carefully made double seams.

Sails are nearly always either triangular or quadrilateral, but not necessarily equiangular. To give greater strength, a strong rope or cord is sewn into the outer edge all round the sail; this rope has eyes in it, to which the various ropes employed in connection with the sail are fastened. The top of a sail is its *head*; the bottom, its *foot*; and the sides are *leeches*; the upper corners are termed *ear-rings*; the lower corners of a square sail, and the after lower corner of other sails, *clews*; the front lower corner of a fore-and-aft sail is the *tack*. The ropes from the lower corners, used in tightening the sail against the wind, are the *sheets*.

The sails of a ship are either "square" or "fore-and-aft." The square-sails—beginning from below—are the *course*, the *topsail*, the *topgallant-sail*, the *royal*, and, though very rarely used, the *sky-scraper*. Each has the name of the mast on which it is set prefixed, as "fore-topsail," "main-royal," etc. The square-sails are made fast by their heads to yards, the foot being drawn to the extremity of the yard below. Fore-and-aft sails are the *spanker* or *driver*, extended by the gaff at its head, boom at its foot, and mast on its fore-leech; the *staysails*, which are suspended by rings to the stays, and the *jibs* (q.v.). In a three-masted vessel the sails of most importance are the main-course, the spanker, the topsails, the fore-staysail, and the jibs, which can usually be all distended to the full without taking wind from each other. In very light winds, when every breadth is of consequence, the area of the sails is increased by setting the *studding-sails*, which are oblong sails set on each side of the square-sails, on short booms run out beyond the yards of the latter.

In small craft and boats, the most common sail is a lugsail (see **LOGGER**), which is a small square-sail, occasionally supplemented by a shoulder-of-mutton (triangular) sail on a shorter mast at the stern. Cutters or sloops carry a large spanker, with a topsail of similar shape, and jibs; some having the power of setting a large course when the wind is astern; but it is obvious that the course and spanker cannot be used together. A schooner uses the same sails as a cutter, except that in one form she carries a square topsail and topgallant-sail on the foremast.

Sails are furnished with rows of short ropes for the purpose of *reefing* them, when their area is too large for the wind. The effect of a sail is increased by wetting it, as the pores of the canvas close more tightly through the swelling of the hemp.

SAIL-CLOTH, a very strong fabric, woven generally with linen yarn, but in America it has been made wholly of cotton; and in this country, under Armitage's patent, of cotton and linen mixed. Hair—such as of the ox, horse, and deer—has also been used, under Taylor's patent, in 1832, but without success. Linen and hempen cloths are those generally used in all parts of Europe.

SAILINGS, the technical name in navigation for the various modes of determining the amount or direction of a ship's motion, or her position after having sailed a given distance in a given direction. The direction of a ship's motion is her *course*, and is expressed in terms of the angle between the line of direction and the meridian; the length of her path is the *distance*; the distance in nautical miles, made good to the e. or w., is the *departure*, and is measured along a parallel; the *difference of latitude* is an arc of the meridian intercepted by the parallels, one of which passes through the place sailed from, the other through the place sailed to; and the *difference of longitude* is an arc of the equator intercepted by meridians through the same two places. It will at once be seen that if a ship sails along a meridian, the difference of latitude becomes the course, and there is no departure or difference of longitude; and that if it sails along a parallel the departure will be the same as the distance, and there will be no difference of latitude. The two general questions which present themselves to the navigator for solution are—1. Given the course and distance from one place in given latitude and longitude to another place, find the latitude and longitude of the other; and 2. Given the latitude and longitude of two places, find the course and distance from the one to the other. The simplest way in which such problems can be solved is by the method known as *plane sailing*, a

method, however, which is only roughly approximate, assuming, as it does, that the surface of the sea is a plane; it is consequently applicable only to short distances and low latitudes where the meridians are nearly parallel. According to "plane sailing," the elements of a ship's path are represented by a right-angled plane triangle, as ABC (fig.), where AB is the distance, the angle BAC the course, AC the difference of latitude (AC being a portion of a meridian, and BC of a parallel of latitude), and BC the departure. The two problems given above are in this method merely simple cases of the resolution of a right-angled plane triangle (see TRIGONOMETRY), for if the course and distance are given, the *dif. of lat.* = distance \times cos. of course, and *dep.* = dist. \times sin. of course; while the idea of *dif. of long.*, as distinct from *dep.*, is quite inadmissible, since the method presupposes that the ship is sailing on an absolutely flat plain. If the ship does not stand on one course, but changes from time to time, the calculation of her final position may be effected, either by the previous method, repeated for each change of course, or more conveniently, by the method of *traverse sailing*. This method consists in the resolution of a ship's course and distance into two courses and distances, the courses being in the direction of some of the four cardinal points of the compass; thus, a ship which has sailed s.w.-by-s. for 24 m., has made 20 m. of *southing*, and 13.3 m. of *westing*. The *traverse table* has consequently six columns, the first containing the courses; the second, the corresponding distances; while the third and fourth contain the difference of latitude for each course, which, if n., is put in one column, and if s. into the other; the fifth and sixth columns, marked respectively e. and w., contain in a similar manner the departure for each course. When the table has been made out for the various courses and distances, the columns of dif. of lat. and departure are summed up, and the difference between the third and fourth, and between the fifth and sixth columns, gives the dif. of lat. and departure between the place sailed from and the place arrived at, from which the course and distance made good can be calculated as before. When a current interferes in any way, either by accelerating or retarding the ship's motion, its effect is estimated as in *traverse sailing*, as if it were one course and distance, the *set* of the current being the course, and its *drift*, i.e., its rate per hour multiplied by the number of hours it has affected the ship, the distance.

Parallel sailing may be employed when a ship sails between two places, on the same parallel of latitude, in which case, if her head be kept accurately and constantly in an e. or w. direction, she will describe an arc of the parallel between the two places. As in this sailing the departure is the same arc of the parallel that the difference of longitude is of the equator, the *dep.* (which is now the *distance*) = *dif. of long.* \times cos. of *lat.* The other elements are found as in plane sailing.

Middle latitude sailing is the application of the principle of parallel sailing to the case in which the ship's course is not perpendicular but oblique to the meridian; it is merely an approximate method, coming very close to a true estimate in low latitudes for any course, and in all latitudes for a course nearly e. and w. (i.e., one in which the distance is large as compared with the difference of latitude), but erring widely under other circumstances, though errors may be diminished as much as we please by dividing the distance into portions, and calculating the dif. of long. for each. The object of this sailing is to deduce the dif. of long. from the *dep.*, and *vice versa*, on the supposition that the whole departure has been made good along the parallel of latitude which is equidistant from each extremity of the course, a method which, at first sight, would seem to give a correct result, and would do so if the parallels of latitude increased uniformly, which they do not. The *dep.*, when laid off along the parallel of middle latitude, always gives the dif. of long. too small, and hence the limitations above noticed. When the latitudes are of the same name, the middle latitude is half their sum; but when of contrary names, it is better to find the dif. of long. for the portion on each side of the equator separately, the two middle latitudes being respectively half the latitude of the place sailed from, and half that of the place sailed to. The formulas are the same as for parallel sailing and plane sailing.

Mercator's sailing is a perfect method of obtaining the same result as is found approximately by middle latitude sailing, but in the former case the dif. of long. is found from the departure, while in this method the difference of latitude is employed for the same purpose. A table of meridional parts, as it is called, is necessary; this table shows the number of minutes in Mercator's projection (see MAP) corresponding to each degree and minute of latitude up to 78°, and is employed as follows. The latitude sailed from, and that reached, being known or found, the meridional parts for each are obtained, and their difference, if the latitudes are of the same name, or sum if of opposite names, gives the dif. of lat. We have then a right-angled triangle, with the dif. of lat. and dif. of long. forming the two smaller sides, and the vertical angle representing the course, whence *dif. of long.* = *dif. of lat.* \times tan. of *course*. This sailing is the one most generally employed by navigators, but is inferior in practice to middle-latitude sailing, in the cases noticed under that head, for though it be a perfect, and the other merely an approximate method, yet a small error in the course (if large), or in the dif. of lat., becomes greatly magnified in the dif. of long.; while in the case of the latter, a considerable error in departure is hardly magnified, and a large error in the course (if nearly e. and w.) becomes imper-

ceptible in the dif. of long. It is, however, better to work the problem according to both methods, and then estimate the true result as nearly as possible.

Great circle sailing (q.v.), the most perfect of all methods for finding a ship's course, is separately noticed. See also SPHEROGRAPH.

The obstacles that interfere with the correctness of the mariner's calculations are chiefly those which affect his data, the course and distance, the more important being the magnetic deviation of the compass produced by the attraction of the ship, errors in the estimated leeway or in the set and drift of currents, etc.; all of which require to be taken into account. The necessity for frequently checking the *dead-reckoning* (q.v.), by means of astronomical observations, is sufficiently apparent.

SAIMIRI. See SAPAJO.

SAIN FOIN, or SAINTFOIN, *Onobrychis sativa*, a plant of the natural order *leguminosæ*, suborder *papilionaceæ*, of a genus nearly allied to *hedyarum* (see FRENCH HONEYSUCKLE), but having one-seeded pods, which are marked with wrinkles or pits, and are more or less prickly-toothed at the margin. It is a spreading perennial, about 2 or 3 ft. high, with leaves of 9 to 15 smooth acute leaflets, and spikes of beautiful flesh-colored flowers, striated with rose-red, on long stalks. It is a native of the continent of Europe and of the s. of England, and is much cultivated as a fodder-plant in dry, and particularly in calcareous soils, to which it is admirably adapted. Its cultivation was introduced into England in 1651; and before the introduction of turnip-husbandry, the sheep-farmers of the chalk districts depended almost entirely upon it, as they still do to such a degree that in many leases there is a stipulation for the tenant's leaving a certain extent of land in sainfoin. It is, however, a very local crop, being scarcely cultivated on any but the most calcareous soils, where nothing else is nearly equal to it, although it has been found to succeed well on any soil sufficiently dry. There is no more nutritious fodder than sainfoin, whether for sheep, oxen, or horses. Even the dry stems of a crop which has produced seed are readily consumed by cattle, if cut into small pieces. Sainfoin sometimes endures for 10, or even 15 years on the same land—more generally only for 4 to 7 years; and in the eastern counties of England it is often sown instead of clover on light and somewhat calcareous sands and sandy loams, and the ground is plowed again in two or three years.—The name sainfoin is perhaps rather *sang foin*, from the blood-color of the flowers, than *saint-foin* (holy hay).

SAINT AFFRIQUE. See AFFRIQUE, SAINT, *ante*.

SAINT ALBAN HALL, Oxford, takes its name from Robert de St. Alban, a citizen of Oxford, who conveyed the building to the nuns of Littlemore, near Oxford, in 1230. On the dissolution of the nunnery, it was given by king Henry VIII. to his physician, George Owen, D.M., who conveyed it to lord Williams of Thame, and sir John Gresham. By their assignees, it was finally transferred to the warden and fellows of Merton college, and was some time after established as an academical hall. The principal of this, as well as of the other four halls, is assisted in his duties by a vice-principal and other officers appointed by himself.

SAINT ALBANS. See ALBANS, SAINT. (Other names beginning with *Saint*, and not given under that word, will similarly be found under the other part of the name.)

SAINT ALBANS, a city in Franklin co., n. Vt., 14 m. s. of the Canada line, 3 m. e. of lake Champlain, 59 m. n.w. of Montpelier. It is the headquarters of the Central Vermont railroad and the s. terminus of the Missisquoi railroad; pop. '70, 6,000. It is pleasantly situated on elevated land in the midst of a fertile agricultural region, devoted largely to the products of the dairy; 350 000 lbs. of butter and 5,000 lbs. of cheese, valued at \$110,000, being shipped annually, principally to Boston. The scenery is diversified; it has several sulphur springs, and is frequented as an agreeable summer resort. In the center is a park of 4 acres; it has 2 public libraries, water-works, gas-works, a court-house, public schools, several churches, 6 hotels, 2 national banks, a savings bank, 4 newspapers, and a nunnery. In the vicinity are quarries of calico stone and variegated marble. It has large manufactories of locomotives, railroad cars, silicon steel capped rails, marble, and agricultural implements.

SAINT ALBANS, HARRIET MELLON, Duchess of, 1775–1837. She was a successful actress in comedy, who married Mr. Coutts, a London banker; at his death she inherited a great estate. In 1827 she married the duke of St. Albans, to whom, at her death, she bequeathed £10,000 yearly, with a life estate in a portion of her landed property; but most of her property was left to the granddaughter of her first husband, the present baroness Burdett-Coutts.

SAINT AMAND, a t. of France, in the dep. of Cher, stands on the right bank of the river of that name, 27 m. s.s.e. of Bourges. It has a trade in iron. Pop. '76, 7,719.

SAINT AMAND, a small t. of France, in the dep. of Nord, 8 m. n.w. of Valenciennes. The town contains hot sulphur-springs; and lace, clay-pipes, and porcelain are manufactured. Pop. '76, 7,243.

SAINT ANDREWS. See ANDREW, ST.

SAINT ANDREWS, a t. in s. New Brunswick, on Passamaquoddy bay; pop. '71, 1800. It is the terminus of the New Brunswick and Canada railroad; 60 m. s.w. of St.

Johns, 3 m. from the state line. It is substantially built on a narrow point of land; on the e. the bay, on the w. the St. Croix river. It has an excellent harbor, with two entrances. It contains a county court-house, 5 churches, public schools, 2 banks, the U. S. consulate, a custom-house, several hotels, a marine hospital, and a postal savings bank. It is an agreeable summer resort. Principal industries: lumber, ship-building, and the fisheries.

SAINT ANTHONY, MINN. See MINNEAPOLIS.

SAINT ANTHONY'S FIRE. See ANTONY, SAINT.

SAINT ARNAUD. See LEROY.

SAINT AUGUSTINE, an ancient Spanish t. on e. coast of Florida, is built on the western shore of an estuary 2 m. from the Atlantic, 160 m. s. of Savannah. It enjoys a mild and equable climate, and is a resort for consumptive invalids. It was founded in 1565, and is the oldest town in the United States. Pop. '70, 1717.

SAINT AUGUSTINE (*ante*), city, capital of St. Johns co., Fla., on Matanzas sound, 2 m. w. of the Atlantic ocean, from which it is separated by the n. end of Anastasia island. This is the oldest city in the United States—first settled in 1565 by Menendez de Aviles, a Spanish navigator, who with 1500 followers arrived off the coast Aug. 28, St. Augustine's day, and so named the new settlement after that saint. The Indian town of Seloy, or Selooe, is said to have occupied the same spot. The early history of the city was a bloody one, the original settlers having a hard struggle to maintain it against the Indians and against French and English adventurers. Twice—in 1586 by sir Francis Drake, and in 1665 by John Davis, a pirate—the city was captured and pillaged. Still, it grew slowly, and at the time of the cession of the Spanish provinces to Great Britain, in 1763, it numbered some 3,000 inhabitants, besides a garrison of 2,500 men; but it was then partly abandoned by the Spanish settlers; and the last census (1870) rates the population at only 1717—some two-thirds of whom are of Spanish descent. The population in 1880 was probably a little over 2,200. The principal objects of interest are the Roman Catholic cathedral, an imposing structure in the Moorish style, erected in 1793; fort Marion (originally fort San Marco), which was finished in 1756, after nearly a century of enforced labor by Indian slaves and Mexican convicts; and the U. S. barracks, one of the finest buildings of the kind in America, originally a Franciscan convent. Besides these there are two convents, a custom-house, formerly the residence of the Spanish governors, 2 newspaper offices, 2 public schools, a number of hotels, and 5 churches of the following denominations: Episcopal, Presbyterian, Roman Catholic, Baptist, and Methodist, the last two belonging to colored congregations. Along the e. front of the city is a sea-wall 4 ft. wide and about a mile long, erected at considerable expense by the U. S. government in 1837-42, which is used as a promenade. The private residences are mostly quaint and old-fashioned, constructed of a material called coquina rock, a conglomerate of shells and shell-lime, of which there are extensive quarries on Anastasia island. To many of them are attached high-walled gardens, enriched with an abundance of tropical fruits and flowers. The mildness of the climate and the historical interest of the place draw to it every winter many invalids and tourists, sometimes 10,000 in a single season. The harbor is good, although the bar at its mouth prevents the entrance of vessels drawing more than 10 feet. Two lines of sailing vessels run between this port and New York. There is railroad communication to Tocoi, a landing on the St. Johns about 15 m. distant. The manufacture of Palmetto straw goods is the principal industry.

SAINT AUSTELL, a small t. of Cornwall, 13 m. n.e. of Truro by railway. Woolen goods are manufactured, and at the bay of Saint Austell, from which the town is about a mile distant, there is a pilchard-fishery, and tin and copper are exported. Pop. '71, 3,803.

SAINT BARTHOLOMEW, island. See BARTHOLOMEW, ST., *ante*.

SAINT BEES, an ancient village of Cumberland, pleasantly situated on the bay formed by *St. Bees Head*. It is 4 m. s. of Whitehaven, and about 10 m. beyond the limits of the lake district. Saint Bees is a station on the Whitehaven and Furness Junction railway. The parish is very large, comprising town and port of Whitehaven, village of Saint Bees, and several chapelries and townships. The village of St. Bees contains about 1,100 inhabitants. According to tradition, preserved by the early chroniclers, Saint Bees originated in a nunnery founded here, 650 A.D., by an Irish saint named Bega, of whom Sandford's MS. (in the Dean and Chapter library, Carlisle) records a very pretty legend. It appears to have been destroyed before the reign of Henry I., in whose time we find that Ranulph, earl of Cumberland, reconstituted it as a priory; but after the dissolution of the monasteries, it went to ruin. The institution known as **SAINT BEES COLLEGE** was established in 1816 by Dr. Law, then bi-hop of Chester, to supply a systematic training in divinity to young men desirous of ordination, whose means were inadequate to defray the expenses of a university education. The bishops of the province of York had previously been compelled to ordain a number of such men as literates, the poverty of many of the northern benefices not securing a sufficient supply of graduates. A portion of the ruined priory of Saint Bees was fitted up by the earl of Lonsdale as lecture-rooms, library, etc. On the recommendation of the bishop,

an incumbent was selected for the perpetual curacy of Saint Bees (value, £100 per annum) by the patron, the earl of Lonsdale, with a view to his holding the position of principal of the college in connection with the living. The principal selects his own staff of lecturers. The expenses are defrayed from the fees paid by the students—£10 each term. The college course extends over two years, each divided into two terms, from about Jan. 28 to May 5, and Aug. 25 to Dec. 5. During this period, the standard English divinity works, with the Greek Testament, are chiefly studied, and the composition of sermons, etc., practiced. The students reside in lodgings in the village, under the control of the principal, and attend the service daily in the parish church, the transepts of which were restored in 1855 for their accommodation. A new lecture-room and library were built in 1863, adjoining the ancient structure. Students are admitted at the age of 21, on producing testimonials of character, etc., satisfactory to the principal. Graduates of a university where there is no divinity course are admitted to the second year's course on producing their diploma, along with the usual testimonials as to their fitness for the ministry. Students who have passed the course are not now confined to the northern province, as was the original design, but are admitted into most of the southern dioceses. The average number of students in the college is about 100. Near the church is an endowed grammar school. Saint Bees is in some repute as a sea-bathing place.

SAINT BERNARD, a parish in extreme s.e. Louisiana; bounded by the gulf of Mexico, the Mississippi, and lake Borgne, on the s.e., n., and n.w. respectively; about 650 sq.m.; pop. '80, 4,405—4,016 of American birth, 2,301 colored. The surface is low and level; sweet-potatoes, sugar-cane, and molasses are the staples. Chief town, Saint Bernard.

SAINT BERNARD, GREAT. See **BERNARD, GREAT, ST.**, *ante*.

SAINT BERNARD, LITTLE. See **BERNARD, LITTLE, ST.**, *ante*.

SAINT CATHERINE'S, an incorporated t. of the province of Ontario (formerly Canada West), Canada. It is on the Welland canal, and is a station on the Welland railway. The town is very flourishing, and has large manufactures of machinery and agricultural implements. The surrounding country is very picturesque. The well-known mineral well of Saint Catherine's, whose water is of great value as a remedial agent, supplies on an average 120,000 gallons a day. Of these waters, a large quantity, partially evaporated, is sent out through the country. A second well, similar to the first, is also in use. Saint Catherine's has been called the Saratoga of British America. Its hotels are equal to any in the province. Saint Catherine's is 23 m. to the s. of Toronto, and 12 m. from Niagara Falls. Pop. '71, 7,864.

SAINT CHARLES, a parish in s.e. Louisiana, s. of lake Pontchartrain; bounded on the s.e. by lake Washa, drained by the Mississippi river; on the Louisiana and Texas, and the Chicago, St. Louis and New Orleans railroads; about 550 sq.m.; pop. '80, 7,161—5,761 colored. The surface is level and the soil fertile. Principal productions are cotton, rice, and sugar-cane. Co. seat, St. Charles.

SAINT CHARLES, a co. in e. Missouri, adjoining Illinois, bounded on the n. by the Mississippi and Copper rivers, on the s.e. by the Missouri river; traversed by the St. Louis, Kansas City and Northern railroad; about 550 sq.m. pop. '80, 23,060—2,410 colored. The surface is moderately hilly, and well wooded. Bituminous coal is found. The soil is fertile. The principal productions are corn, wheat, oats, and live stock. Co. seat, Saint Charles.

SAINT CHARLES, a city, the co. seat of St. Charles co., Mo., on the n. bank of the Missouri, and on the St. Louis, Kansas City and Northern railroad; pop. '70, 5,570. The city has a fire and a police department, gas, etc. It has churches, schools, banks, an insurance company, 4 newspapers, St. Charles college, Lindenwood college for girls, and the Roman Catholic convent of the Sacred Heart. The manufacturing interests are extensive, including a bridge-building establishment, a foundry and machine-shop, a pork-packing establishment, a car-manufacture, flour-mills, woolen-mills, cooper-shops, manufactories of tobacco, furniture, plows, etc. A bridge of iron, 6,535 ft. long, with 7 spans, crosses the Missouri at this point; finished in 1871 at a cost of \$1,750,000.

SAINT CLAIR a co. in n.e. central Alabama; drained by the Cahawba and Coosa rivers, the latter its s.e. boundary; traversed by the Alabama and Chattanooga railroads; 650 sq.m.; pop. '80, 14,463—14,425 of American birth, 2,838 colored. Surface broken, and in great part woodland; cotton, corn, grass, and pork are the staples. Bituminous coal is found. Co. seat, Ashville.

SAINT CLAIR, a co. in s.w. Illinois; bounded on the w. by the Mississippi river, watered by Kaskaskia river, Silver and Richland creeks; traversed by the Ohio and Mississippi, the St. Louis, Alton and Terre Haute, the St. Louis and Southeastern, the Illinois and St. Louis, and the St. Louis, Belleville and Southern railroads; about 660 sq.m.; pop. '80, 61,850—45,870 of American birth. The surface is rolling. The soil is fertile. The principal productions are corn, wheat, and oats. Coal is found. Co. seat, Belleville.

SAINT CLAIR, a co. in e. Michigan, bounded on the e. by lake Huron and the St. Clair river, on the s. by lake St. Clair; watered by Black and Bell rivers and Mill

creek, crossed by the Grand Trunk and the Chicago and lake Huron railroads; about 800 sq.m.; pop. '80, 43,197—29,923 of American birth. The surface is rolling and heavily wooded. The soil in the s. is fertile. The principal productions are wheat, corn, oats, and wool. Co. seat, St. Clair.

SAINT CLAIR, a co. in s.w. Missouri, drained by the Sac and the Osage rivers, and Warbleau creek, traversed by the Missouri, Kansas and Texas railroad; about 670 sq.m.; pop. '80, 14,157—13,870 of American birth. The surface is prairie or woodland. The soil is fertile. The principal productions are corn, oats, and live stock. Co. seat, Osceola.

SAINT CLAIR, a city in s.e. Michigan, incorporated 1858; on the Michigan, Midland and Canada, and the Chicago, Saginaw and Canada railroads; pop. '80, 1923. It is 48 m. n.e. of Detroit, 13 m. s. of Port Huron, opposite Courtright on the St. Clair river. It has 5 churches, public schools, 2 banks, 6 steam brick-yards, 2 ship-yards, and manufactures of lumber, leather, woolen goods, machinery, carriages, ale, and beer. It contains 2 hotels and a newspaper office, and has a large interest in hay-shipping.

SAINT CLAIR, a borough in Schuylkill co., Penn., on Mill creek, and the Philadelphia and Reading railroad; pop. '70, 5,726. It stands on flat ground, inclosed by hills full of anthracite coal, near which are immense coal-works. There are churches, newspapers, schools, a blast-furnace, a manufactory of shovels, etc.

SAINT CLAIR, ARTHUR, 1734—1818; b. at Thurso, Caithness-shire, Scotland; educated at the university of Edinburgh. He joined the British army as an ensign, and, in 1758, came to America with admiral Boscawen; served with distinction under Amherst at Louisburg, and under Wolfe at Quebec; resigned his commission in 1762, and held various civil offices until the breaking out of the revolution, when he joined the colonial army with the rank of col. Promotion rapidly followed upon his gallant services at the battles of Three Rivers, Princeton, and Trenton, until in 1777 he was raised to the rank of maj.gen., and placed in command at Ticonderoga. That point he was forced to surrender to Burgoyne, and although acquitted of all blame by court-martial, his consequent unpopularity lost him his command. Remaining in the army as a volunteer he again rose to important positions, distinguishing himself under Washington in the campaign which ended with the surrender of Cornwallis, and afterward under Greene. He was a member of the continental congress 1783—87, becoming its president in the latter year. In 1788 he was made the first governor of the Northwest territory, which position he held until 1802. Meanwhile, becoming, in 1791, commander-in-chief of the U. S. army, he was sent on an expedition against the Miami Indians, which ended in the disastrous rout of his forces. A committee of investigation appointed by congress exonerated him, but he resigned his command in May, 1792. His last years were spent in poverty and obscurity.

SAINT CLOUD, a city in central Minnesota, on the St. Paul and Pacific railroad, by which it is connected with St. Paul; pop. '70, 2,080. It is the co. seat of Stearns co., 75 m. from St. Paul, on the w. bank of the Mississippi river, a few miles below the mouth of Sauk river, and 3 m. below Sauk rapids. It is built on a high bluff, commanding a fine view of the river, and is the seat of the state normal school. It has a public library, a fine brick court-house, 7 churches, 4 newspapers (1 German), and 2 banks. The rapids furnish valuable water-power, which is utilized by the manufacture of lumber, flour, wagons, iron, brass, and marble. It is in the center of a grain and stock-raising country, and in the vicinity of beds of granite, which is shipped to Chicago. In the season steamers run from this place to the falls of St. Anthony.

SAINT CROIX, an American river, called also the Passamaquoddy, which, flowing out of Grand lake, on the eastern border of Maine, runs e.s.e. 75 m. to Passamaquoddy bay, and forms a portion of the boundary between the United States and New Brunswick.

SAINT CROIX, a river of Wisconsin, rising near the the w. end of lake Superior in Douglas co., and emptying into the Mississippi about 38 m. below St. Paul. Its course is s.w. and s., and for a part of its length, it forms the boundary between Wisconsin and Minnesota. There are several waterfalls, and near its mouth the river expands to form St. Croix lake, 33 m. long and 4 wide. The length of the stream is about 200 miles.

SAINT CROIX, a co. in w. Wisconsin, adjoining Minnesota; bounded w. by the St. Croix river, and drained by its branches; traversed by the North Wisconsin and the West Wisconsin railroads; 729 sq.m.; pop. '80, 18,956—13,130 of American birth. The surface is hilly but fairly fertile; wheat, hay, oats, cattle, and lumber are the staples. Co. seat, Hudson.

SAINT DOMINGO. See HAYTI.

SAINT DOMINGO BARK. See CARIBBEE BARK.

SAINTE-BEUVE, CHARLES-AUGUSTIN, a French poet and critic of great eminence, was b. at Boulogne-sur-Mer, on Dec. 23, 1804. His father, who died two months before his birth, was *principal des droits réunis* at that port. His mother, a woman of superior character and intelligence, was by family originally English, and through her the boy early acquired a familiarity with the English language and literature. He was educated at an institution of his native place, and afterward at the collège Charlemagne in Paris.

On leaving college, though his bent toward literature was already pronounced, he was shy of committing himself to it as a profession, and betook himself to the study of medicine and anatomy. Shortly he obtained a situation at the hospital St. Louis. Here for some time he worked steadily; but his spare time was occupied with literature; and his articles contributed to the *Globe* on topics of history, philosophy, and criticism, attracted attention, and in particular procured him the acquaintance of the celebrated M. Jouffroy. While he was thus wavering between literature and the claims of a profession distasteful to him, Victor Hugo's *Odes et Ballades* were published, and the impression made upon him by this work, of which he wrote an enthusiastic *critique*, seems to have determined him finally to a life exclusively literary. He gave up his situation at the hospital, and attached himself to *Le Cénacle*, along with Alfred de Musset, the two Deschamps, and others of the so-called Romantic school. Shortly, he gave to the world his *Tableau Historique et Critique de la Poésie Française, au XVI.^e Siècle* (1828—afterward enlarged in ed. 1843), which at once established his reputation as one of the first critics of the time. His next work, *Les Poésies de Joseph Delorme*, though somewhat coolly received by the public, brought him what perhaps pleased him better than any applause of the multitude, the emphatic approval of Béranger and others of the literary guild. *Les Consolations*, published in 1830, was considerably more successful in hitting the taste of the public. On the cessation of *Le Cénacle*, after the revolution of 1830, Sainte-Beuve attached himself to the *Globe*; and subsequently he wrote much in the *Revue des Deux Mondes*, the *National*, and the *Constitutionnel*. In 1834 appeared his *Volupté*, a work curious as a study of moral pathology, but more curious than pleasing; and in 1840 he published the first volume of his *Histoire de Port Royal*, a work which, in 1860, he completed in five volumes. On Feb. 27, 1845, he received the most distinguished mark of honor which can fall to a Frenchman of letters, by his election to be a member of the academy. In 1850 he began to issue, in the pages of the *Constitutionnel*, the famous series entitled *Causeries de Lundi*, the most delightful of all his works, and that by which he is most widely known. After the *coup d'état* of Dec. 2, 1851, he became connected with the *Moniteur*, and was appointed professor of Latin poetry at the collège de France. Of this appointment some fruits are before the world in his *L'Etude sur Virgile*, published in 1857. In 1865 he was called to be a member of the senate. He died Nov., 1869.

As a poet Sainte-Beuve, despite the fine talent he displayed, never succeeded in becoming popular, nor can very high rank be accorded him. But as critic, he was "himself alone," and his place is by common consent in the very fore-front of French literature. His sympathies were wide and catholic; in delicacy of perception, and subtlety of refined analysis, he was almost without a rival; his style is piquant, lively, fascinating, instinct with individual expressiveness; and nothing can exceed the felicity with which the interest of criticism proper is combined in his sketches with that of anecdotic biography.

Of his works not already glanced at, the following only need be mentioned: *Poésies Complètes* (1840); *Critiques et Portraits Littéraires* (1832-39); *Portraits Littéraires* (1844); *Portraits Contemporains*; *Causeries de Lundi* (1851-57); *Nouveaux Lundis* (1863); *Souvenirs et Indiscrétions*. *Le Dîner du Vendredi-Saint* (1872). A selection from the *Causeries de Lundi* has been translated into English, with an introduction, under the title *English Portraits* (1875).—See C. A. Sainte-Beuve, *sa Vie et ses Œuvres*, by D'Haussonville (1875); and an article in No. 281 of the *Quart. Rev.*

SAINTE-CLAIRE DEVILLE, HENRI ETIENNE, French chemist, was b. Mar., 1818, at St. Thomas, West Indies, and was educated in France. On quitting college, he constructed at his own cost a chemical laboratory, and for nine years, without master and without pupils, devoted himself to patient studies and skillful researches. In 1844 he was commissioned to organize the faculty of sciences of Besançon, of which, in the following year, he was appointed dean and professor. In 1851 he succeeded M. Balard in the chair of chemistry in the école normale. Since 1853 he has supplied the place of M. Dumas in the faculty of sciences of Paris. In 1861 he was chosen a member of the academy of sciences of the institute, in place of M. Berthier in the section of mineralogy.

Sainte-Claire Deville's earliest investigations relate to different essences and resins, and the most important are in the department of mineral chemistry. In 1849 he made known the mode of preparation and the properties of anhydrous nitric acid, a compound whose existence had been up to that date ignored. In 1852 he published an important paper on metallic carbonates and their combinations; and in the following year, a new method of mineral analysis, known as the middle way, in which he proposes the exclusive employment of gases and volatile reagents, against the errors arising from the use of the filter.

About the same time he began his researches into aluminium, a metal discovered in 1827 by Wöhler of Göttingen, but still very imperfectly known, and set forth its special properties. Being commissioned by Louis Napoleon to seek the best method of obtaining aluminium at a low price, he made numerous experiments, jointly with M. Debray, in the factory at Javel; and, after some months, succeeded in producing ingots of the metal, which were shown in the exposition universelle of 1855. These experiments, and the properties of aluminium, have been described by Sainte-Claire Deville in scientific

periodicals; and among his later papers are—on the “Three Molecular States of Silicon;” on the “Metallurgy of Platina;” on the “Density of Vapors at very High Temperatures;” on the “Measurement of High Temperatures;” on the “Permeability of Iron to Gases at a High Temperature;” on the “Phenomena of Dissociation in Homogeneous Flames;” and on the “Industrial Preparation of Aluminum and its Compounds.” These papers are published in the *Mémoires* and *Comptes Rendus* of the académie des sciences de l’institut, and in the *Annales de Chimie et de Physique*.

SAINTE GENEVIEVE, a co. in n. Mississippi, adjoining Illinois; drained by the Mississippi river, its n.e. boundary, and by Saline creek; about 500 sq.m.; pop. '70, 8,384—7,208 of American birth. The surface is hilly, but fertile in the valleys; wheat, oats, corn, cattle, and pork are the staples. Limestone, copper, and marble are found. Co. seat, St. Genevieve.

SAINTE-MARGUERITE. See LÉRINS ISLANDS, *ante*.

SAINTE MARIE-AUX-MINES (Ger. *Markirch*), a t. of Germany, in Alsace, on the Liepvrette, 12 m. n.w. of Colmar, at the foot of the Vosges mountains. It formerly owed its prosperity to its silver mines, but these are no longer worked. Its chief manufactures are cotton fabrics of various kinds, paper, and cherry-brandy. Pop. '71, 12,319; '76, 11,672.

SAINTES, an old t. of France, in the department of Charente-Inférieure, on the left bank of the Charente, 43 m. s.e. of La Rochelle. In ancient times this town, under the name of *Mediolanum*, was the capital of the Santones, from whom the subsequent province derived the name of Saintonge. It contains interesting Roman remains, as a triumphal arch, and the ruins of an amphitheater, circus, etc. Pop. '76, 11,150.

SAINT FRANCIS, a co. in e. Arkansas; drained by the St. Francis and Languille rivers; traversed by the Memphis and Little Rock railroad; 625 sq.m.; pop. '80, 8,389—8,255 of American birth, 3,468 colored. The surface is level and fertile; wheat, cotton, tobacco, corn, and pork are the staples. Co. seat, Forrest City.

SAINT FRANCIS RIVER, in Arkansas, rises at the base of Iron mountain in Missouri, is the boundary between Arkansas and Missouri for a little distance, flows through n.e. Arkansas, and, after a course of 450 m., empties into the Mississippi.

SAINT FRANÇOIS, a co. in s.e. Missouri; drained by the St. Francis and Big rivers; traversed by the St. Louis, Iron Mountain, and Southern railroad; 440 sq.m.; pop. '80, 13,822—12,739 of American birth; 653 colored. The surface is hilly and heavily wooded. The soil is moderately fertile; corn, oats, and wheat, are staples; but the chief export is iron, of which valuable mines are found in Iron mountain. Lead is also found. Co. seat, Farmington.

SAINT GEORGE'S ENSIGN is the distinguishing flag of the British navy. It consists of a red cross on a white field, with a union-jack in the dexter chief corner. Formerly it was usual that an admiral, vice-admiral, or rear-admiral should have his flag red, white, or blue, according to the squadron to which he belonged. By a regulation of 1864, this old custom was altered; the squadrons are abolished, and the white St. George's ensign is the badge of all ships in the navy. The red and blue ensigns are now left to government vessels—not being ships of war—and merchant vessels respectively. The ensign is borne at the peak, or, in harbor, on a flag-staff at the stern; in boats, the latter is the only mode of flying it. A full-dress ensign is the largest flag used, being often but little smaller than the quarter-deck of the ship which hoists it.

SAINT GERMAIN, COUNT DE, b. 18th c.; in what country is unknown. He came to Paris in 1840 with the marquis de Belle Isle. He soon became famous for his acquaintance with the natural sciences, his powers of conversation, and his apparent great wealth. He is said to have given anecdotes implying acquaintance with persons who were dead generations before his time. His character and career were mysterious throughout. It is supposed that he was a spy in some governmental employ.

SAINT-GERMAIN-EN-LAYE, a t. of France, in the dep. of Seine-et-Oise, on an elevation on the left bank of the Seine, 14 m. by railway w.n.w. of Paris. It contains three handsome squares, a parish church, with a monument erected by George IV. over the remains of James II., several learned and other societies, and some factories. Pop. '76, 16,978.

Saint-Germain-en-Laye had its origin in a monastery built by king Robert in the beginning of the 11th c., on the summit of the hill which was surrounded by the forest of Lyda (*Laye*), and dedicated to St. Germain. The town, as well as the royal château, which was built either during the reign of king Robert, or soon after, was sacked by the English in 1346, in 1419, and in 1438. At Saint-Germain-en-Laye the marriage of Francis I. was celebrated, and this king rebuilt the château in 1547. From before the time of Philippe-Auguste, Saint-Germain-en-Laye had been the residence of the French court during a portion of the year, but Louis XIV. transferred the court to Versailles, and from this time the fortunes of Saint-Germain-en-Laye declined. Later the château of Saint-Germain-en-Laye was assigned by Louis XIV. as the residence of the dethroned James II. of England, and here in exile that monarch held his morose court, devoting

almost the whole day to religious observances. The château is now used as barracks and for other purposes. The forest of Saint-Germain-en-Laye comprises 10,873 English acres.

SAINT HELENA, a parish in e. Louisiana, adjoining Mississippi, watered by the Amite and Tickfaw rivers, and Natalbany creek; about 460 sq.m.; pop. '80, 7,504—4,178 colored. The surface is rolling, and mostly woodland. The soil along the streams is fertile. The principal productions are corn, cotton, wool, and cattle. Co. seat, Greensburg.

SAINT HELENS, a municipal borough of Lancashire, on a small affluent of the Mersey, 3½ m. n.e. of Prescott by railway. It is a straggling, ill-built, but thriving town, with an extensive trade in coal, and containing plate-glass, copper, bottle, and other works. The town also contains potteries, breweries, tan-yards, iron and brass foundries. Pop. '61, 18,396; '71, 45,134.

SAINT HELIERS, capital of Jersey (q.v.), the chief of the channel islands, is situated on the s. shore of the island, and on the e. side of St. Aubin bay, lat. 49° 11' n., long. 2° 6' west. It is defended by Elizabeth castle, on a rocky island off the shore, approached by a causeway at low water, and by fort Regent, on the s.e. side of the town, built about 1855, on a scarped granite rock, at an enormous expense. In the year 1857 a great extension of the harbor works was found to be necessary. At spring tides, the water rises 40 feet. Victoria college—a handsome edifice, built on an eminence, in 1851—the hospital, the theater, and the churches, are the chief buildings. The area of the town has rapidly increased within recent years. An active trade is carried on with England, France, and India. Pop. of town and parish '71, 30,756, including a garrison of upward of 500 men.

SAINT HYACINTHE, a co. in s. Quebec, dominion of Canada, having the Richelieu river for its w. boundary; intersected by the Grand Trunk railway; 265 sq.m.; pop. '71, 18,310. It is drained by the Richelieu and Yamaska rivers, the latter forming its e. boundary. Its surface is generally level, and the soil is fertile. It has manufactures of woollen goods, wooden ware, lace, iron castings, organs, boots and shoes, etc. Co. seat Saint Hyacinthe.

SAINT HYACINTHE, a city in s.w. Quebec, dominion of Canada, on the w. bank of the river Yamaska, and on the Grand Trunk railway; pop. '71, 3,743 in the city proper; in the parish of Saint Hyacinthe, 2,581, and in Saint Hyacinthe le Confesseur, 783. It is 35 m. n.e. of Montreal, and has daily communication by steamboat with St. Césaire on the river 20 m. above. The river is here crossed by 4 long bridges. It contains a court house, an academy, a city hall and market, and a Roman Catholic cathedral. It is the seat of Saint Hyacinthe college, having a fine edifice 700 ft. long. It is the see of a bishop, and has a bishop's palace, a hospital, and a convent of gray nuns. It has 2 banks, several hotels, 3 newspapers, and a monthly magazine, 4 weekly in English, the rest in the French language. It is the center of an active trade, and has important manufactures; the leading industries being the manufacture of mill machinery, leather, lace, boots and shoes, woollen goods, etc.

SAINT IGNATIUS'S BEANS. See **IGNATIUS (St.) BEANS**, *ante*; **NEX VOMICA**, *ante*.

SAINTINE (the pseudonym of JOSEPH XAVIER BONIFACE), 1798–1865; b. Paris; published in 1823 a collection of poems of some merit. He won in 1837 the Monthyon prize by his story, *Picciola*, the most popular of his novels. He published in conjunction with Scébe and other dramatists, more than 200 plays.

SAINT IVES, a municipal and parliamentary borough of England, in the co. of Cornwall, beautifully situated on the n.e. shore of the bay of the same name, with an outlook on the Bristol channel, about 10 m. n.e. of Penzance. It is a very old and picturesque town; its church, a granite building of the early part of the 15th c., stands on the beach, and is reached by the spray in rough weather. Its harbor admits vessels of 200 tons. Saint Ives is the headquarters of the pilchard-fishery. In the vicinity are several important tin and copper mines. Pop. '71 of parliamentary borough, which returns one member to parliament, 10,034.

SAINT IVES, a small market t. of England, in Huntingdonshire, is situated on the left bank of the Ouse, 6 m. e. of Huntingdon. A very large weekly cattle and corn market is held here. Brewing and malting are the chief branches of industry. Pop. '71, 3,248.

SAINT JACOB, a Swiss hamlet a mile s. of Basle, noted as the scene of a great battle in 1814 between 1600 Swiss and a much larger French force. The Swiss fought for ten hours, and slew three times their number, but were themselves all destroyed except ten men. The place is known as the *Swiss Thermopylæ*, and the wine of the neighborhood is called *Schweizer blut*, or *Swiss blood*.

SAINT JAMES, a parish in s.e. Louisiana, bounded by lake Maurepas on the n.e.; drained by the Mississippi; on the New Orleans, Mobile, and Texas railroad; about 825 sq.m.; pop. '80, 14,714—9,864 colored. The surface is level. The soil is fertile. The principal productions are corn, cotton, tobacco, rice, molasses, and sugar. Capital, Convent.

SAINT JAMES OF THE SWORD, a military order in Spain, first instituted in the reign of Ferdinand II., king of Leon and Galicia. In the first instance it was organized with a view to stopping the inroads of the Moors, and its members pledged themselves to secure the safety of the roads. They entered into a league with the brethren of St. Eloy, and the order was confirmed by the pope in 1175. The highest rank in the order is that of grand-master, which is united to the crown of Spain. The knights were obliged to prove their noble descent at least four generations back, and to show that they numbered among their ancestors no Jews, Saracens, or heretics, and had never been cited by the inquisition.

SAINT JAMES'S PALACE, a large inelegant brick structure, fronting toward Pall Mall, succeeded Whitehall as the London residence of the British sovereigns, and remained as such from William III. to Victoria. It was reconstructed and made a manor by Henry VIII., having before been a hospital dedicated to St. James; Henry also annexed to it a park, which he inclosed with a brick wall, to connect St. James's with Whitehall, the then royal residence. Additions and improvements gradually made, totally changed the original palace, so that at the present time little, if any, of the old structure remains. In 1837 the royal household was transferred to Buckingham palace, and St. James's is now used only for levees and drawing-rooms.—The court of St. James's is the usual designation of the British court.

ST. JAMES'S PARK lies southward from the palace, and extends over 87 acres. Within the last 40 years it has been greatly improved, and is now richly embellished with avenues of trees, and a fine piece of water in the center, which is stocked with waterfowl. On the e. side is the *parade*, where the body-guards on duty are mustered, and where the regimental bands perform in fine weather. On the outskirts are situated the Buckingham and St. James's palaces, Stafford house, Marlborough house, etc.

SAINT JANUARIUS, a martyr of the Christian faith under Diocletian, was a native of Benevento, or at least became bishop of that see in the latter part of the 3d century. According to the Neapolitan tradition, he was taken prisoner at Nola; and the place of his martyrdom, in 305, was Pozzuoli, where many Christians suffered the same fate. His body is preserved at Naples, in the crypt of the cathedral, and in a chapel of the same church are also preserved the head of the martyr, and two phials (*ampulæ*) supposed to contain his blood. On three festivals each year, the chief of which is the day of the martyrdom, Sept. 19, and on occasions of public danger or calamity, as earthquakes or eruptions, the head and the phials of the blood are carried in solemn procession to the high-altar of the cathedral, or of the church of St. Clare, where, after prayer of greater or less duration, the blood, on the phials being brought into contact with the head, is believed to liquefy, and in this condition is presented for the veneration of the people, or for the conviction of the doubter. It occasionally happens that a considerable time elapses before the liquefaction takes place, and sometimes it altogether fails. The latter is regarded as an omen of the worst import; and on those occasions when the miracle is delayed beyond the ordinary time the alarm and excitement of the congregation rise to the highest pitch. Those who are curious as to the literature of the controversy regarding this celebrated legend, will find many documents in the 6th volume of the Bollandist *Acta Sanctorum* for September.

SAINT JANUARIUS, ORDER OF, an order of knighthood, founded by king Charles of Sicily (afterward Charles III. of Spain), on July 6, 1738. It was abolished after the French invasion of 1806, and reintroduced in 1814. The badge is a gold octagonal white and red enameled cross, with gold lilies in the upper and side angles. The obverse represents St. Januarius in episcopal robes, with an open book. The round middle of the reverse shows a golden open book, and two phials partly filled with blood. The knights are called *Cavalieri di Giustizia*, who must count four noble generations, or *Cavalieri di Grazia*.

SAINT-JEAN-D'ANGÉLY, a small t. of France, dep. of Charente-Inférieure, 15 m. n.e. of Saintes. Pop. '76. 6,309.

SAINT JEAN MOLENBEEK. See MOLENBEEK.

SAINT JOHN, the most considerable river of New Brunswick, in British North America, rises in a lake of the same name in the state of Maine, and after a s.e. course of 450 m., the last 225 of which are within British territory, it falls into the bay of Fundy by an estuary 5 m. in width. Near the sea it is navigable for large vessels; while for craft of 120 tons it is practicable as far as Fredericton, which is 80 m. from its mouth, and the seat of the colonial government. The stream is of some historical interest in connection with the long-contested adjustment of the international boundary. Through most of its upper course, it separates Maine from Canada.

SAINT JOHN (*ante*), a river in Maine and New Brunswick, 550 m. long, the dividing line between Somerset co., Maine, and Dorchester co., Quebec; drainage, 26,575 sq. miles. It is known as the s.w. branch at its rise in the Metjarmette portage, as the Walloostook or Maine St. John, for the first 112 m., and 150 m. below its source unites with the St. Francis running along the n. boundary of Mainé for 75 miles. Just beyond the line it descends in the Grand Falls, with a perpendicular fall of 75 feet. It is navigable at high water to Woodstock, 145 m., and in the spring as high as 40 m. above

Grand Falls, by lighters, to the mouth of the Madawaska. By the Ashburton treaty navigation is free to United States citizens. At its entrance into the bay of Fundy it contracts into a narrow channel, and the passage of vessels in and out of the river depends on the state of the tide. At high tide the harbor is from 5 to 8 ft. higher than the river, at low tide the river falls 12 ft. to reach the level of the harbor. It has 11 branches; the principal affluents are the Allequash, the St. Francis, the Madawaska, and the Aroostook.

SAINT JOHN, a co. in s. New Brunswick, lying on the bay of Fundy and drained by the St. John and Kennebecasis rivers; traversed by the Intercolonial and the Grand Trunk railroads, 585 sq. m.; pop. '71, 52,120—30,128 of Irish descent. This is the most populous co. in the province. The surface is diversified and the soil fertile. The greater part of the inhabitants are engaged in fishing and ship-building.

SAINT JOHN, the commercial capital and largest city of New Brunswick, stands on the n. or left bank of the estuary of the river of its own name, in lat. 45° 14' n., and long. 66° 3' west. Pop. '71, 28,805. The harbor, which is protected by batteries, is good, and accessible to the largest vessels at all seasons of the year. Ship-building and the timber-trade are the chief industries. In June, 1877, a fire destroyed the greater part of the town, and caused a loss of 10 to 15 million dollars.

SAINT JOHN (*ante*), capital of St. John co., N. B., is built on a rocky peninsula, sloping up from the harbor. The streets are laid out at right angles; they are wide, and some of them are cuttings 40 ft. deep through solid rock. There are many fine public buildings and private houses. The principal building materials are brick and stone. Among the public buildings are the court-house and jail, the provincial insane asylum, market house, post-office, almshouse, city hospital, city hall, opera-house, academy of music, Roman Catholic cathedral, the Victoria hotel, the barracks, the mechanics' institute, and the Dominion penitentiary. The city has a fire department, a police force, a system of water-works, furnishing water from Little river 4 m. distant, and having a capacity of supplying 5,500,000 gallons daily. The streets are lighted with gas. Horse cars run through the city, and to Portland and Indiantown. There is a fire-alarm telegraph. There are between 30 and 40 churches, schools, banks, academies, orphan asylums, several newspapers, good hotels, a natural history society, a historical society, etc. The city government consists of a mayor, and one alderman and one councilman from each of the nine wards. The manufacturing industries are extensive, including ships, lumber, machinery, tools, paper, leather, carriages, boots and shoes, cottons, etc. The city is connected with points in Maine by the European and North American railroad, and with Nova Scotia by the Intercolonial railroad. Steamers run from it to Boston, Portland, and various points along the river and in Nova Scotia. The entrance to the harbor, which is one of the best on the continent, is protected by Partridge island, on which are a lighthouse and a quarantine hospital. The channel is protected on the e. by a breakwater. The foreign trade is considerable. The chief article of export is lumber. There is a suspension bridge 640 ft. long over the gorge through which the river is discharged.

SAINT JOHN, HENRY. See **BOLINGBROKE**, *ante*.

SAINT JOHN, JAMES AUGUSTUS, b. Caermarthenhire in 1801; went to London in 1817; edited a Plymouth radical paper, and published a poem *Abdallah*; was subsequently sub-editor of J. S. Buckingham's *Oriental Review*; in 1827 with David Lester Richardson started the *Weekly Review*; in 1829 removed to Normandy. He has traveled extensively in Egypt and Nubia. The following are the most important of his numerous works: *History of the Manners and Customs of Ancient Greece*, 3 vols.; *History of the Manners and Customs of the Hindus*, 2 vols.; *Description of Egypt and Nubia*; *Isis, an Egyptian Pilgrimage*; *Journal of a Residence in Norway*, 2 vols.; *The Nemesis of Power*; *Causes and Forms of Revolution*; *There and Back Again in Search of Beauty*, 2 vols.; *Philosophy at the Foot of the Cross*; *History of the Four Conquests of England*; *Life of Sir Walter Raleigh*.

SAINT JOHN, OLIVER, 1598-1673; b. England; educated at Cambridge and called to the bar. He distinguished himself as one of Hampden's counsel in the ship-money trial in 1637; married in 1638 Elizabeth, cousin of Oliver Cromwell, and was elected to parliament in 1640. He was solicitor-gen. in 1641, and lord chief-justice of the common pleas in 1648. He had no share in the trial of Charles I., but barely escaped proscription after the restoration, when he was forced to take refuge on the continent under an assumed name. He was ambassador to the Netherlands in 1651, and the same year commissioner for the affairs of Scotland, and a member of the council of state.

SAINT JOHN, PERCY BOLINGBROKE, b. England, 1821; traveled with his father James Augustus, and aided him in the preparation of his works. The following are some of his numerous published works: *Young Naturalist's Book of Birds*; *King's Muskdeer*; *Poor Paddy*; *Trapper's Bride*; *The Enchanted Rock*; *White Stone Canon*; *Père-side*; *Three Days of the French Revolution*; *Quadroona, or The Slave Mother*; *The Creole Bride*; *Good as Gold*. He has also contributed tales to Cassell's *Illustrated Magazine*.

SAINT JOHN OF JERUSALEM, KNIGHTS OF, otherwise called KNIGHTS OF RHODES, and afterward OF MALTA, the most celebrated of all the military and religious orders of

the middle ages. It originated in 1048 in an hospital dedicated to St. John the Baptist, which some merchants of Amalfi were permitted by the calif of Egypt to build for the reception of the pilgrims from Europe who visited the holy sepulcher. The nurses were at first known as the hospitaler brothers of St. John the Baptist of Jerusalem. The Seljuk Turks, who succeeded the Egyptian and Arabian Saracens in Palestine, plundered the hospice, and on the conquest of Jerusalem by the crusaders under Geoffroy de Bouillon in 1099, the first superior, Gérard, was found in prison. Released from durance, he resumed his duties in the hospice, gave material aid to the sick and wounded, and was joined by several of the crusaders, who devoted themselves to the service of the poor pilgrims. By advice of Gérard, the brethren took vows of poverty, chastity, and obedience before the patriarch of Jerusalem. Pope Pascal II. gave his sanction to the institution in 1113. Raymond du Puy, the successor of Gérard in the office of superior, drew up a body of statutes for the order, which was confirmed by pope Calixtus II. To the former obligations was afterward added those of fighting against the infidels and defending the holy sepulcher. Various hospices, called *commanderies*, were established in different maritime towns of Europe as resting-places for pilgrims, who were there provided with the means of setting out for Palestine. The order having become military as well as religious, was recruited by persons of high rank and influence, and wealth flowed in on it from all quarters. On the conquest of Jerusalem by Saladin in 1187, the hospitalers retired to Margat in Phenicia, whence the progress of infidel arms drove them first in 1285, to Acre, and afterward, in 1291, to Limisso, where Henry II., king of Cyprus, assigned them a residence. By the statutes of Raymond, the brethren consisted of three classes, knights, chaplains, and serving brothers; these last being fighting squires, who followed the knights in their expeditions. The order was subsequently divided into eight languages—Provence, Auvergne, France, Italy, Aragon, England, Germany, and Castile. Each nation possessed several grand priories, under which were a number of commanderies. The chief establishment in England was the priory at Clerkenwell, whose head had a seat in the upper house of parliament, and was styled first baron of England.

In 1310, the knights, under their grand-master, Foulkes de Villaret, in conjunction with a party of crusaders from Italy, captured Rhodes and seven adjacent islands from the Greek and Saracen pirates, by whom it was then occupied, and carried on from thence a successful war against the Saracens. In 1523, they were compelled to surrender Rhodes to sultan Solymán, and retired first to Candia and afterward to Viterbo. In 1530, Charles V. assigned them the island of Malta, with Tripoli and Gozo. The knights continued for some time to be a powerful bulwark against the Turks; but after the Reformation a moral degeneracy overspread the order, and it rapidly declined in political importance; and in 1793, through the treachery of some French knights and the cowardice of the grand-master, D'Hompesch, Malta was surrendered to the French. The funds still remaining to the order were also about this time confiscated in almost all the European states; but though extinct as a sovereign body, the order has continued during the present century to drag on a lingering existence in some parts of Italy, as well as in Russia and Spain. Since 1801 the office of grand-master has not been filled up; a deputy grand-master has instead been appointed, who has his residence in Spain. The order at first wore a long black habit, with a pointed hood, adorned with a cross of white silk of the form called Maltese on the left breast, as also a golden cross in the middle of the breast. In their military capacity, they wore red surcoats with the silver cross before and behind. The badge worn by all the knights is a Maltese cross, enameled white, and edged with gold; it is suspended by a black ribbon, and the embellishments attached to it differ in the different countries where the order still exists.

SAINT JOHN'S, a co. in n.e. Florida, drained by the St. John's river and its affluents; about 900 sq.m.; pop. '80, 4,535—1365 colored. The surface is level and low, with much marsh, and forests of live oak. The soil is fairly fertile. The principal productions are corn, rice, sugar, and molasses. Co. seat, St. Augustine.

SAINT JOHN'S, a co. in s.w. Quebec, Canada, adjoining New York; drained by the Richelieu river, its e. boundary; intersected by the Rouse's Point division of the Grand Trunk railway; 175 sq.m.; pop. '71, 12,122—9,415 of French descent. The surface is diversified and the soil fertile; wheat, oats, hay, potatoes, and dairy products, are the staples. Co. seat, St. John's.

SAINT JOHN'S, the chief t. of Newfoundland, stands on the e. coast of the island, in lat. 47° 33' n., and long. 52° 43' west. It has an excellent harbor, which is well fortified. Pop. 74, 23,890. Being the nearest port in America to Europe (distance 1665 m.), and connected with continental America by telegraph, St. John's has recently acquired importance in the commercial and political world in connection with steam-navigation between the two continents. It has suffered severely from repeated conflagrations; in 1846 it was more than half destroyed.

SAINT JOHN'S (*ante*), a city in s.e. Newfoundland, 2,000 m. from Liverpool, 1,640 m. from Valentia, Ireland, 900 m. from Quebec, 540 m. from Halifax, Nova Scotia, 65 m. n. of cape Race, 18 m. s. of cape St. Francis, 1,665 m. w. of Galway (the shortest distance between any American and European sea-port); pop. '71, 22,553. At the entrance to the harbor are the narrows, 360 fathoms across outside, 220 yards at the

narrowest, measuring from Chain rock to Pancake rock. On the n. side of the narrows is a cliff of sandstone and slate rock, 300 ft. high, and above that towers Signal hill, 510 ft. above the level of the sea. On the s. side of the narrows there is a hill 650 ft. high, on which is a light-house called fort Amherst. There were formerly batteries posted on these hills, while it was a garrisoned town. At the narrows there are 12 fathoms of water in the channel, which, however, will admit of the passage of only one vessel at a time. Inside the narrows the harbor widens and expands toward the s.w. It has 90 ft. of water in the center, accessible to vessels of the deepest draught, there being no perceptible tide to interfere. The city is built principally on the n. side of the harbor, on sloping ground admirably situated. The n. and s. sides are connected by a causeway and bridges. The principal street is more than a mile in length, on which the buildings are all of brick or stone, wooden buildings not having been allowed there since the fire of 1846; on other streets the law does not apply. It has substantially built stores, warehouses, and wharves. Cape Spear and fort Amherst lights give guidance to vessels entering the harbor, and in addition 2 red lights are shown from sunset to sunrise on points further back. It has a dry-dock capable of raising vessels of 600 tons, and a marine railway. The average number of vessels entering annually is 1200, having a burden of 250,000 tons, clearances 724, tonnage 195,392. At the foot of the ridge of steep hills on the s. side of the harbor which extend at the same altitude for miles into the interior, are the steam seal-oil factories and store-houses. The Roman Catholic cathedral stands on the top of the hill above the city 225 ft. above the sea, erected at a cost of \$800,000. There is also an Episcopal cathedral costing \$120,000. The water supply is brought 6 m. from Twenty-mile pond. It is lighted by gas, has 3 banks, and an efficient police force. It is the seat of St. Bonaventure college, and a theological institution for training missionaries, under the direction of the church of England; and has 10 churches and several convents. It has academies under the supervision of different denominations; 19 life, fire, and marine insurance companies, agricultural, horticultural, and fishermen's societies, and many benevolent and charitable organizations. It has a medical society incorporated 1867, the St. John's atheneum, having a library of 5,000 vols., and the library of the St. Joseph's Catholic institute. It has 12 newspapers. Among the conspicuous public buildings are the government-house, the residence of the governor, costing \$240,000, the house of assembly, the lunatic asylum 4 m. from the city, the public hospital, market-house, and court-house. It is the seat of government of the island. The city is governed by the legislature. It is a station of the Allan line of European steamers, fortnightly in all months but February, March, and April, when they run monthly. Regular fortnightly lines of steamers ply between this place and the principal ports on the coast. It receives the bulk of the imports of the colony, and has an important trade in clothing, fishermen's and hunter's outfits, and provisions. Its capitalists are mostly non-resident. The manufactures are principally ship-bread baked by machinery, nets, iron, boots and shoes, furniture, etc. It has distilleries, block-factories, oil refineries, breweries, and tanneries. Business connected with the fisheries absorbs great attention; employing steamboats in the place of sailing vessels, exporting seal, cod, and oil. Most of the oil is manufactured in the city.

SAINT JOHN'S, a t. of Canada, in the province of Quebec, is situated on the left bank of the river Richelieu, opposite the town of St. Athanase, with which it is connected by a bridge, and 21 m. s.e. from Montreal. It contains glass-works, potteries, foundries, saw-mills, etc., and carries on a considerable trade in lumber, firewood, horses, and grain. Pop. '71, 3,022.

SAINT JOHN'S, a city of the West Indies, capital of the island of Antigua (q.v.), and the residence of the governor-in-chief of the Leeward islands, is situated at the western side of that island, close to the shore. Pop. 8,515. The town is well laid out, having spacious streets, of which the principal run e. and w., being so arranged in order to obtain full advantage of the refreshing easterly or trade winds, which prevail here from April to August. The harbor is comparatively shallow, and there is a bar across the mouth of it, so that vessels heavily laden are obliged to drop anchor outside. The cathedral, the court-house, and the new market-house are the chief edifices. Water is scarce here, and in long dry seasons the inhabitants suffer greatly from the want of it. Wells have been sunk in the town, but the water obtained is brackish, so that rain-water collected in iron and other cisterns forms the only supply of this invaluable element. The maximum heat is 96°; the minimum, 62°. The average fall of rain is said to be 45 inches.

SAINT JOHN'S EVE, one of the most joyous festivals of Christendom during the middle ages, was celebrated on mid-summer eve. From the account given of it by Jakob Grimm in his *Deutsche Mythologie* (Bd. i. pp. 583-593), it would appear to have been observed with similar rites in every country of Europe. Fires were kindled chiefly in the streets and market places of the towns, as at Paris, Metz, etc.; sometimes, as at Gernsheim, in the district of Mainz, they were blessed by the parish-priest, and prayer and praise offered until they had burned out; but, as a rule, they were secular in their character, and conducted by the laity themselves. The young people leaped over the flames, or threw flowers and garlands into them, with merry shoutings; songs and dances were also a frequent accompaniment. At a comparatively late period, the very

highest personages took part in these festivities. In England, we are told (see R. Chambers's *Book of Days*, June 24), the people on the eve of St. John's "were accustomed to go into the woods and break down branches of trees, which they brought to their homes, and planted over their doors, amid great demonstrations of joy, to make good the prophecy respecting the Baptist, that many should rejoice in his birth. This custom was universal in England till the recent change in manners. Some of the superstitious notions connected with St. John's eve are of a highly fanciful nature. The Irish believe that the souls of all people on this night leave their bodies, and wander to the place, by land or sea, where death shall finally separate them from the tenement of clay. It is not improbable that this notion was originally universal, and was the cause of the widespread custom of watching or sitting up awake on St. John's night, for we may well believe that there would be a general wish to prevent the soul from going upon that somewhat dismal ramble. In England, and perhaps in other countries also, it was believed that, if any one sat up fasting all night in the church porch, he would see the spirits of those who were to die in the parish during the ensuing twelve months come and knock at the church door, in the order and succession in which they were to die. We can easily perceive a possible connection between this dreary fancy and that of the soul's midnight ramble." The kindling of the fire, the leaping over or through the flames, and the flower-garlands, clearly shown that these rites are essentially of heathen origin, and of a sacrificial character. They are obviously connected with the worship of the sun, and were doubtless practiced long before the Baptist was born. In old heathen times, midsummer and yule (q.v.), the summer and winter solstices, were the two greatest and most widespread festivals in Europe. The church could not abolish these; it could only change their name, and try to find something in the history of Christianity that would justify the alteration.

SAINT JOHN'S BREAD. See CAROB.

SAINT JOHNSBURY, a t., co. seat of Caledonia co., Vt.; 38 m. n.e. of Montpelier, on the Portland and Ogdensburg, and the Connecticut and Passumpsic Rivers railroads; pop. '80, 5,800. It contains 3 villages, St. Johnsbury, St. Johnsbury Center, and St. Johnsbury East. The town contains the works of the Fairbanks scales company, which employs nearly 600 men. There are other factories and foundries, a fine court-house, large public library and art gallery, 3 banks, 2 papers, an academy, and many churches and schools. The place is exceedingly pleasant as a residence and thriving in business.

SAINT JOHN'S COLLEGE, at Fordham in the city of New York, a Roman Catholic institution, but open to students of all religious denominations, was organized in 1841. It enjoys the powers and privileges of a university, and is conducted by the Jesuit fathers. The grounds are extensive, well laid out for college purposes, and afford uncommon facilities for athletic sports, for bathing, and for skating. Ample opportunities are also provided for indoor amusements. The buildings are spacious, thoroughly ventilated, well heated by steam, lighted by gas, and provided with bath-rooms. The college has no endowment, and no revenue but the fees of the students and the products of the farm. The laboratories and their apparatus, and the cabinet of natural history, occupy a separate building. The library contains 20,000 volumes, besides a circulating library of 5,000 volumes. The correspondence of students is under the supervision of the college authorities. No books, papers, periodicals, etc., are allowed among the students until they have been examined and approved. Students are not permitted to go beyond the college bounds without leave, and without the company of an officer. Number of professors (1880) 11; other instructors, 17; students, 161; alumni, 390. President, rev. F. W. Goekeln, s.j.

SAINT JOHN'S COLLEGE, Cambridge, was founded in 1511 by lady Margaret, countess of Richmond, and mother of Henry VII.; but her death happening before the design was completed, her executors, one of whom was Fisher, bishop of Rochester, carried her intentions into effect. The site of the college had been long before devoted to pious uses, but three times was the disposition of the property altered—1st, when Neal, bishop of Ely, founded here a hospital for canons regular in 1134; 2dly, when Hugh de Balsham made it into a priory, dedicated to St. John the evangelist; 3dly, when lady Margaret's executors converted it into a college. The foundation is for a master, who is elected by the society; 56 fellows, 60 scholars, and 9 proper sizars. There are also numerous exhibitions of considerable value, and 8 minor scholarships open every year to competition for students who have not yet commenced residence in the university. Among names of interest may be mentioned William Grindal, tutor to queen Elizabeth; Roger Ascham; Cecil lord Burleigh; Richard Bentley (who became master of Trinity college); Kirke White, the poet; Henry Martyn, etc. See Cooper's *Memorials of Cambridge*.

SAINT JOHN'S RIVER, in s.e. Florida, rising in Cypress swamp, Brevard co., Fla., flows through Orange co., forming the dividing line between Marion, Putnam, and Clay on the w., and St. John's co. on the e., emptying into the Atlantic ocean in Duval co., 15 m. e. of Jacksonville. It runs in a channel due n. and s. 20 m. from the coast and parallel with it, until it reaches Jacksonville, whence it takes an e. course to the sea. It is nearly 400 m. long, and is navigable by large steamers 330 m. to Enter-

prise (a fashionable winter resort with sulphur springs), and for lighters 60 m. above. For the first 100 m. from its source it forms a sheet of water 5 m. in width, then deepening and forming a channel it measures 1 m. in width for two-thirds of its course, expanding into a few small lakes in the s. and lake Monroe and lake George, considerable bodies of water, farther north. It is a smoothly flowing stream, bordered by orange groves, with little perceptible current. It will admit vessels of from 14 to 15 ft. draught at Jacksonville (above the bar, which has a minimum depth of 7 ft.), of 10 ft. to Pilatka, and of 8 ft. to lake George.

SAINT JOHN'S WORT. See *HYPERICACEÆ*.

SAINT JOHN THE BAPTIST, a parish in s.e. Louisiana; bounded e. by lake Pontchartrain, n. by lake Maurepas, and intersected by the Mississippi river; 260 sq. m.; pop. '80, 9,686—9,415 of American birth, 5,831 colored. The surface is level and very low; corn, sugar, molasses, and rice are the staples. Chief town, Bonnet Carré.

SAINT JOSEPH, a co. in n. Indiana adjoining Michigan; drained by the Kankakee and Saint Joseph rivers; on the Lake Shore and Michigan Southern and the Chicago and Lake Huron railroads; about 450 sq. m.; pop. '80, 33,176—27,669 of American birth. The surface is level prairie or woodland. The soil is extremely fertile. The principal productions are corn, wheat, oats, dairy products, and live stock. Co. seat, South Bend.

SAINT JOSEPH, a co. in s. Michigan, adjoining Indiana, drained by the St. Joseph, the Portage, the Prairie, and the Fawn rivers; on the Lake Shore and Michigan Southern, the Michigan Central, and the Grand Rapids and Indiana railroads; about 500 sq. m.; pop. '70, 26,275—23,591 of American birth. The surface is rolling. The soil is fertile. The principal productions are corn, wheat, wool, hay, and dairy products. Co. seat, Centreville.

SAINT JOSEPH, a city of Missouri, on the left bank of the Missouri river, on the eastern border of Kansas, 496 m. by water from St. Louis. Five lines of railway center here, and it has a large wholesale trade in agricultural products, etc., amounting to \$18,000,000 in 1874. It has a court-house, 17 churches, a convent, several large hotels, 7 newspapers, 3 of which are dailies, steam-mills, and factories, and a large trade with the interior of the continent. Pop. '70, 19,565.

SAINT JOSEPH (*ante*), the co. seat of Buchanan co., Mo.; about 100 m. from Kansas City, on the Hannibal and St. Joseph, the St. Joseph and Des Moines, the St. Joseph and St. Louis, the St. Joseph and Western, the St. Louis, Kansas City and Northern, and the Kansas City, St. Joseph and Council Bluffs railroads; pop. '80, 32,484. An iron railway bridge across the river was completed in 1873 at a cost of \$1,500,000. The railroad connections of St. Joseph have made it the center of an extensive trade, and have rapidly increased its growth during the last ten years. It has a wholesale trade of more than \$20,000,000 per year, and is the largest wholesaling place in the interior w. of St. Louis and Chicago. Among its manufactures are steam-mills, pork-packing establishments, iron-foundries, breweries, carriage-factories, furniture-factories, brick-yards, shoe factories, clothing factories, etc. It has a fine opera-house, a theater, national and savings banks, gas-works, etc. The state insane asylum is here. The city is the seat of a Roman Catholic bishop, and of the Roman Catholic college of St. Joseph. St. Joseph was founded by Joseph Robitieux in 1813. During the excitement over the discovery of gold in California in 1849, it was the starting-point of most emigrants for that state. It became a city in 1851, having then a population of 4,000. Its prosperity, which was interrupted during the rebellion, has since been great.

SAINT JOSEPH RIVER, rises in Hillsdale co., Michigan, flows into n. Indiana, thence to Michigan again, and after a general w. course of 250 m., discharges into lake Michigan at St. Joseph. It is navigable for 125 m. from its mouth.

SAINT JUST, **LOUIS ANTOINE DE**, a notable figure in the first French revolution, was b. at Decize, in Nivernais, Aug. 25, 1767; educated at Soissons by the Oratorians, and afterward went to Rheims to study law, but soon returned to his native village, where he devoted himself exclusively to literature. When the revolution broke out, Saint Just was transported with enthusiasm, and became one of its most ardent apostles. Probably no man in France was a more genuine fanatical believer in the brilliant delusions of the period. Spotless, even austere, in his morals, reserved in manner but eloquent in speech, and rigorously earnest in his convictions, he rapidly rose into consideration among the inhabitants of his native commune, who elected him lieut. col. of the national guard, sent to Paris in 1790 to assist at the fête of the federation. In 1791 appeared his *Esprit de la Révolution et de la Constitution de la France*, in which the various causes of the revolution are sketched in a calm, keen, precise sort of way; and in the following year he was chosen deputy to the convention by the electors of Aisne. Saint Just entered Paris on Sept. 18, 15 days after the frightful massacres which Lamartine in his *Histoire des Girondins* with melodramatic inaccuracy represents him as ordering in conjunction with Robespierre! He voted for the death of the king, and in an oration full of stern but exaggerated republican sentiment, gave his "reasons." It was this speech that made him famous and influential. The Girondins tried to win him over, but in vain. In all the fierce debates of this period, Saint Just took a leading part; but he also displayed a great capacity for administrative organization, and on Feb. 11, 1793, carried

his project for the formation of a committee to superintend the war. After the fall of the Girondins in June (Saint Just took no part in their overthrow, and never once spoke during the disastrous struggle between the two sections), the civil war broke out, and it is from this point that we date the exhibition of that intense and merciless republicanism which fitted him so well to be the associate of Robespierre. It is commonly thought that Saint Just—perhaps because he was so young—was merely an instrument in the hands of Robespierre; but the known facts of his career lead to a very different conclusion, and some writers have not scrupled to make Saint Just the real head of the extreme party who exercised government in France during the *reign of terror*. Almost all the energetic, or, as some would prefer to say, sanguinary measures drawn up to repress the royalists and timid republicans at home, and to repel the forces of the allied monarchs on the frontier, were devised by him. On Feb. 19 he was elected president of the convention. He drew up the terrible report which led to the arrestment and execution of Hebert, Danton, and their adherents. Saint Just had no scruples in cutting off his opponents. The intensity of his convictions rendered him indifferent to deeds of cruelty, however appalling. When the political reaction set in, and the party of moderation had got the upper hand in the convention, Robespierre and Saint Just were seized and imprisoned (July 27, 1794), and ordered to be guillotined next day. Saint Just suffered with sullen calmness—not a word escaping his lips. See Ern. Hamel's *Histoire de Saint Just* (Paris, 1859).

SAINT KILDA, a small island lying off the w. coast of Scotland, in lat. $57^{\circ} 49' 20''$ n., 50 m. w. of the peninsula of Harris, to the parish of which it is reckoned as belonging. It presents bold and lofty precipices to the sea, except at two points, one on the s.e., the other on the w. side of the island. At each of these points there is a bay with a low shore. Besides the main island, there are several small islets, and the whole group has an area of from 3,000 to 4,000 square acres. Pop. 71, 71. Situated in the midst of the gulf stream, St. Kilda enjoys a mild climate, although the weather is often boisterous. On the main island there are 80 or 90 head of black cattle, and nearly 2,000 sheep (among which is a Spanish breed, whose wool is highly prized) are grazed on it and on the surrounding islets. Immense numbers of wild-fowl are killed annually, the flesh of which is very generally eaten and the feathers sold. The sea abounds in delicious fish, easily caught from the rocky shore without the use of boats. The inhabitants formerly were able to export more or less grain annually; but although the population has decreased within late years, they now consume all the cereal produce of the island, besides an additional quantity, which they import. The present inhabitants habitually consume much more farinaceous food than their forefathers did. They do not receive any gratuitous assistance from the proprietor. The principal exports are kelt or rough woolen cloth, blankets, feathers, fulmar-oil, salted ling, young cattle, cheese, and tallow. See Seton's *St. Kilda*, 1877.

SAINT LANDRY, a parish in s.w. Louisiana, lying w. of Atchafalaya bayou, and drained by Teche, Nezpique, and Courtableau bayous; 2,100 sq.m.; pop. '80, 40,002—9,475 of American birth, 19,531 colored. The surface is low and swampy, but the soil is very rich; cotton, corn, sugar-cane, and pork are the staples. Co. seat, Opelousas.

SAINT LAWRENCE, a co. in n. New York, having the river St. Lawrence for its n. and n.w. boundary; 2,800 sq.m.; pop. '80, 85,993—70,580 of American birth, 132 colored. It is intersected by the Ogdensburg and Lake Champlain railroad, and the Rome, Watertown and Ogdensburg. It is drained by the Indian, Grass, Oswegatchie, Raquette, St. Regis, and Deer rivers; also by 3 large lakes, Long, Black, and Cranberry, and little ponds and streams. The surface is generally even, especially the banks of the St. Lawrence river, which for miles spread into level, fertile plains. It is thinly populated in the s.e., where a large portion is covered with pine, oak, and birch forests, and groves of sugar-maple, elm, and beech. Its soil is very fertile, yielding large crops of grain, potatoes, and wool, and is adapted to stock-raising and dairy products. Large quantities of honey and maple sugar are produced, and it has an active trade in lumber. Its mineral products are granite, iron ore, lead, limestone, and sandstone used for building purposes. The leading industries are the manufacture of agricultural implements, brick, carriages and wagons, cheese, iron castings, metallic wares, etc. Co. seat, Canton.

SAINT LAWRENCE, GULF OF, a western inlet of the northern Atlantic, washes at once all the British provinces, properly so-called, of North America—Newfoundland, Canada, New Brunswick, Nova Scotia, and Prince Edward's Island. It has three communications with the ocean—the strait of Belleisle, between Newfoundland and Labrador; the gut of Canso, between the island of cape Breton and the peninsula of Nova Scotia; and a far wider passage than either, with the island of St. Paul in the middle, between cape Breton and Newfoundland; while in the opposite direction it narrows, at the w. end of Anticosti, into the estuary of the mighty river, to which, as far even as its sources, it has gradually extended its own name. Besides Anticosti, St. Paul's, and Prince Edward's, already mentioned, this arm of the sea contains very many clusters of islands, and, more particularly in its southern half, the Magdalen and the Birds; these islands being, one and all, rendered more dangerous to shipping by the thickness of the fogs and the uncertainty of the currents. The gulf of St. Lawrence is celebrated for the productiveness of its fisheries; but perhaps it is best known as a

channel of traffic connecting, as it does, the busiest thoroughfares of maritime trade with one of the most extensive systems of inland navigation in the world.

SAINT LAWRENCE RIVER constitutes by far the largest body of fresh water in the world. Including the lakes and streams, which it comprises in its widest acceptation, it covers, according to the lowest estimate, fully 73,000 sq. m.; and as nearly the whole of this area averages considerably more than 600 ft. in depth, the aggregate cannot represent less than 9,000 solid miles—a mass of water which would take upward of 40 years to pour over the falls of Niagara, at the computed rate of a million cubic feet in a second. As the entire basin of this water-system falls short of 300,000 sq. m., the surface of the land is only three times that of the water.

This mighty artery of north-east America rises, under the name of the St. Louis, on the spacious plateau which sends forth also the Mississippi toward the gulf of Mexico, and the Red river of the n. toward Hudson's bay—all three being said, in wet seasons, occasionally to mingle their floods. Lake Superior, the next link in the chain, finds its way to lake Huron through the rapid of St. Mary, which has been overcome by a ship canal on the right, or American side. Below lake Huron, which receives lake Michigan from the s., the river St. Clair, lake St. Clair, the river Detroit, and lake Erie maintain pretty nearly the same level, till the river Niagara descends 334 ft. to lake Ontario, which is its l. still 230 ft. above sea-level. From this, the last of the connected series of inland seas, issues the St. Lawrence proper, which, with a few comparatively insignificant expansions, presents the character first of a river, and then of an estuary, down to the gulf. Between lake Ontario and the city of Montreal, which marks the head of the navigation, there are various cataracts or rapids, which, besides having been gradually ascertained to be more or less practicable, may be all avoided by means of canals on the British side. At about two-thirds of the distance from lake Ontario to the city of Montreal, the intersection of the parallel of 45° determines the point where the St. Lawrence, after having been an international boundary from the head, or nearly so, of lake Superior, becomes exclusively Canadian. Immediately above the island of Montreal, the St. Lawrence is joined by its principal auxiliary, the Ottawa, from the n.w.; and a little more than half-way between this confluence and Three rivers, the highest point of tidal influence, the Richelieu or Sorel, from the s., brings in the tribute of lake Champlain. Between Montreal and Quebec the St. Lawrence has recently been much deepened (see MONTREAL). At Quebec, after a run of nearly 400 m. from lake Ontario, it steadily widens into an estuary of about the same length. The entire length, including the chain of lakes, is about 2,200 miles.

In connection with the improvements on itself and its affluents, the St. Lawrence offers to sea-going ships the noblest system of inland navigation in the world, embracing a continuous line of about 2,000 m.; its advantages, however, are materially impaired by the severity of the climate, which binds it in the chains of winter at least five months in the year.

SAINT LEONARDS, EDWARD BURTENSHAW SUGDEN, Baron, 1781–1875; b. London; called to the bar in 1807. He restricted himself to chancery practice after 1817, and was made king's counsel in 1822. He was returned to parliament in 1828, made solicitor-general in 1829, and lord chancellor of Ireland in 1835, and 1841–46. He was lord chancellor of England in 1852, and was raised to the peerage. He published several valuable legal treatises—*Law of Vendors and Purchasers*, 1805; and *Practical Treatise on Powers*, 1808.

SAINT LÔ, an old t. of France, capital of the department of Manche, built on a rocky elevation on the right bank of the river Vire, 55 m. by railway s.e. of Cherbourg. From the high central part, several streets, more or less steep, branch off in different directions. The town, which is said to owe its origin and its name to a St. Lô, bishop of Coutance, who caused a church to be built here in the 6th c., was destroyed by the Normans in 888, and taken by the English in 1346, and again in 1417. Noteworthy are the beautiful churches of Sainte-Croix, founded in 805, and of Notre Dame, which dates from the 15th century. Flannels, druggets, and cotton fabrics, cutlery, and leather are manufactured, and a considerable supply of horses for cavalry are here obtained. Pop. '76, 9,519.

SAINT LOUIS, a co. in n.e. Minnesota, bounded on the n. by Namekan river and lake, and on the s.e. by lake Superior, drained by the St. Louis, Vermilion, Cloquet, and other rivers; traversed by the Northern Pacific railroad; about 6,500 sq. m.; pop. '80, 4,504—2,518 of American birth. The surface is uneven, heavily timbered, with several lakes. The soil is partly fertile, and grows wheat, corn, etc. Much lumber is exported. Co. seat, Duluth.

SAINT LOUIS, a co. in e. Missouri, bounded by the Missouri river on the n. and n.w., and by the Mississippi on the e.; drained by the Meramec; between fifteen and twenty railroads traverse the co.; 520 sq. m.; pop. '80, 31,888 (outside of the city), 25,299 of American birth. The soil is fertile; all ordinary agricultural products are found. There are several kinds of building limestone, and mines of bituminous coal; there are also extensive manufactures of bricks, beer, tobacco, iron, and many other articles. Co. seat, St. Louis.

SAINT LOUIS, a port of entry of Missouri, U. S., the chief city and commercial metropolis of the central Mississippi valley, stands on the right bank of the Mississippi, 18 m. below its confluence with the Missouri, and 174 m. above the mouth of the Ohio. It is regularly built upon the limestone bank of the river, on two terraces, rising 20 and 40 ft. above high water, with wide and well-built streets running parallel to the river, crossed by others at right angles. The principal structures are a city hall, court house, custom house, arsenal, merchants' exchange, mercantile library, city hospital, post-office, marine hospital, university, cathedral, and several of the largest hotels in the world. There are 162 churches and missions, of which 38 are Roman Catholic; numerous general hospitals, asylums, and convents; the St. Louis university, under charge of the society of Jesus, with 23 professors; the Washington university, academy of sciences, German institute, normal and high schools, 84 newspapers and periodicals, of which 10 are daily, and 12 in German, an opera-house, and 5 theaters. Several city railways have replaced the omnibuses, and the water supply is pumped from the Mississippi. Among the manufactories are flour and lumber mills, sugar refineries, lard and linseed-oil factories, provision packing-houses, manufactures of hemp, whisky, tobacco, and vast iron-foundries and machine shops, which in the year 1874 produced goods valued at \$240,000,000. Saint Louis has a vast trade by steam-boats to the whole Mississippi valley, 68,000 tons being owned there, and extensive railway connections. It is also the chief center of the American fur trade, and of a vast traffic in agricultural produce. There are 26 banks and 31 insurance companies. In 1764, Saint Louis was the depot of the Louisiana Indian trading company; in 1768, it was captured by a detachment of Spanish troops; in 1804 was ceded with the whole country w. of the Mississippi to the United States; the first brick house was erected in 1813; in 1820 its population was 4,590; in 1830, 151,780; in 1870, 310,834.

SAINT LOUIS (*ante*), the principal city of Missouri, capital of St. Louis co., on the w. bank of the Mississippi river, about 20 m. below its confluence with the Missouri; lat. 38° 37' 23" n., long. 90° 15' 16" west. Its fortunate situation has of recent years, and especially since the development of its railroad system, caused an immense growth in population and general prosperity. Founded in 1764 as a mere trading post with the Indians, by Pierre la Clade Liégeois, who named it after Louis XV. and erected a large house and four stores; it numbered in 1770 some 40 families, and at the time of its acquisition by the United States in 1803 it held about 1500 inhabitants, and its yearly shipment of furs was valued at \$200,000. In 1820 the population was 4,598; in 1840, 16,469; in 1860, 160,773, and in 1870, 310,834. In 1830 the population was 350,522. It was incorporated as a town in 1803, chartered as a city in 1822. The first newspaper was established in 1803; the first bank in 1816. In 1817 the first steamboat arrived here, and in 1851 the first railroad was commenced. The city suffered severely from cholera in 1832 and in 1849. The latter year was also the year of the great fire which destroyed a large portion of the old town. This was composed mainly of wooden structures which were replaced by more substantial buildings—the favorite material being a sort of limestone found on the spot which though soft when first quarried is soon hardened by exposure. The city is built on rising ground with gentle undulations; at the highest point it is about 200 ft. above the level of the river. In the older portion near the river, which is entirely given up to trade, the streets are narrow and crooked; the modern section is laid out regularly in broad streets and avenues. The principal thoroughfares are Grand avenue, which intersects the city from n. to s.; Front street, which extends along the levee; Main street and Second street in which are the principal wholesale houses, and Fourth street, which contains the chief retail stores and is the fashionable promenade and shopping street. Lindell boulevard and Forest Park boulevard in the western part of the city are the favorite drives. The handsomest residences are in Lucas place, in Chouteau avenue, at the w. end of Washington avenue, and in Pine, Olive, and Locust streets. There are nearly 400 m. of paved and macadamized streets and alleys and 18½ m. of river frontage. Total area 62½ miles. Besides its many public squares, the city is remarkable for the number of its parks, comprising in all nearly 2,500 acres. The largest of these is the Forest park, 4 m. w. of the court house, containing about 1374 acres mostly covered with primitive trees. O'Fallon park (180 acres) also is remarkable for its magnificent trees as well as for the fine view which it commands of the Mississippi river; Tower Grove park (277 acres) in the s.w. part of the city has beautiful green lawns intersected by carriage roads which afford the pleasantest drives in the city; and Shaw's garden (109 acres) immediately adjoining, is exquisitely laid out, contains all the ornamental and fruit trees which can be raised in the climate, and has numerous conservatories filled with rare exotics. Although at present the property of Henry D. Shaw, it is open to the public and the title will vest in the city on the death of the owner. The most beautiful spot in the city, however, is Lafayette park in the s. portion, containing only 30 acres, artistically laid out and adorned with statuary, etc. The Fair grounds (83 acres), superintended by the St. Louis agricultural and mechanical association, are attractive on account of their halls of industrial and mechanical exhibits; they contain also a zoological garden claimed to be one of the completest in the world, and an amphitheater with a seating capacity for 40,000 people. The annual fairs are held here, usually in the first week of October.

Other parks are Northern park (180 acres), Lindell park (60 acres), Carondelet park, etc. The two cemeteries, Bellefontaine and Calvary, both in the n. part of the city, are beautifully laid out and decorated with trees and shrubbery.

The general style of architecture in the city is substantial rather than ornamental, although of late a lighter and more artistic order has come into vogue for the residences of the wealthy. One of the finest public buildings is the court house, occupying the square between Chestnut and Market and 4th and 5th streets, a massive limestone building with columned porticoes, surmounted by a huge iron dome, in which are the five county court rooms, the supreme court room, the law library, and the offices of the various county officials. The criminal business of the city is transacted in the four courts, in Clark ave., the criminal courts, the jail, and the police headquarters; being all within its precincts. The new custom house and post-office, on Eighth street, an immense structure of red and gray granite, not yet completed, will be one of the finest public buildings in the United States. The entire cost will probably exceed \$5,000,000. The chamber of commerce, in Third street, a solid building of gray limestone; the Columbia life insurance building, constructed of rose-red granite in florid architecture, the masonic temple, with its richly decorated interiors, and the mercantile library building with its collection of over 50,000 vols., are noteworthy structures. There are 162 churches, as follows: 28 Roman Catholic, 23 Presbyterian, 23 Methodist (of which 4 are colored), 22 German Evangelical, 16 Baptist (6 colored), 15 Episcopal (1 colored), 4 Hebrew, 4 Congregational, 3 Christian, 2 New Jerusalem, 2 Unitarian, 2 Independent, 1 Friends' meeting-house, and 8 miscellaneous. Of these the finest are the Roman Catholic cathedral, with its Doric portico, its front of polished free-stone and its lofty spire containing a fine chime of bells; Christ church (Episcopal), of stone in the Gothic cathedral style; St. Georges (Episcopal) a rather plainer structure; the first Presbyterian, in Lucas place, an elaborate and ornate building of the English Gothic order, whose spire is remarkable for its graceful elegance; and the Jewish temple, corner of 17th and Pine. Other fine buildings are the church of the Messiah (Unitarian), the Second Presbyterian; St. Alphonsus and Sts. Peter and Paul (both Roman Catholic); the Union church (Methodist); the Congregational church in Locust street, and the Presbyterian churches in Pine and Walnut streets. St. Louis is remarkable for the number of its charitable institutions many of which are under denominational charge. Thus the deaf and dumb asylum in Christy avenue, the St. Louis hospital in Montgomery street, the convent of the Good Shepherd for the reformation of fallen women, and many minor charities, are controlled by the Roman Catholic religious orders; St. Luke's hospital is under the direction of the Protestant Episcopal sisterhood of the Good Shepherd. The Emigrants' home and the Widows and Infants' asylum were endowed by private individuals. The county insane asylum on the Arsenal road is a large brick and stone building with elegant grounds. The institution for the blind, under the control of the state, has facilities for 200 pupils, who are taught various industries. Many of the educational institutions also are under sectarian administration, the Roman Catholics alone having about 100 parochial, private and conventual schools. The principal of these are the college of the Christian Brothers, the academies of Loretto, the Sacred Heart, and the Visitation, the Ursuline convent, and the St. Louis university. The latter, founded in 1829, chartered in 1832, is the oldest educational establishment in the city. It has a valuable museum and library, and complete apparatus for the study of the natural sciences. There are about 350 pupils. The Concordia college (German Lutheran) which includes a theological academy was established in 1839. Of unsectarian institutions the chief is Washington university, which includes the following departments: the college proper, the law school, the polytechnic institute, and the Mary institute for the education of women. There are 35 instructors and nearly 1000 pupils. The public school system is at a high standard of efficiency; there are 104 school buildings, with an attendance of 50,000 pupils in the day schools, and more than 6,000 in the night schools. Of newspapers and periodicals there are 10 dailies (4 German), most of which publish also weekly, tri-weekly, and Sunday editions; 28 weeklies (5 German and 1 French); 3 semi-monthlies (1 German); 28 monthlies (2 German and 1 Spanish); 2 bi-monthlies; and two quarterlies. There are many fine hotels, the chief of which are the Lindell, the Planters', the Laclede, Barnum's and the Grand Central. The Southern hotel, one of the largest and best, was destroyed by fire in 1877. A remarkable and magnificent structure is the bridge which connects the city with East St. Louis, a city in St. Clair co., Illinois, on the opposite (eastern) bank of the Mississippi. The bridge, begun in 1869 and finished in 1874, at a cost of nearly \$10,000,000, is 2,225 ft. long and 54 ft. wide. The super-structure is of steel and cast iron, upon 4 piers of granite and limestone. The central span is 520 ft., the longest in the world, and is raised 60 ft. above the level of the water—this permits the passage of steamboats in any state of the water. The designer of the bridge, which is generally looked upon as one of the greatest triumphs of American engineering skill, is capt. James B. Eads.

As an industrial and commercial center, St. Louis ranks among the most important cities in the United States. The total value of the products of its manufacturing establishments during the year 1880 is estimated at not far from \$250,000,000. It is now ranked as the third city in the union in general manufactures, while in the manufacture of flour it stands first. The river and railroad advantages which the city commands

make it one of the two chief centers of trade in the inland west. It is in direct communication with more than 6,000 m. of navigable waters; and steamboats ply regularly between St. Louis and nearly every important point along this route. In addition to this its railroad facilities are almost unequaled. Sixteen lines of railroad center here, among others such important routes as the Ohio and Mississippi, the Atlantic and Pacific, the Missouri Pacific, the St. Louis, Kansas City and Northern, the Chicago and Alton; the Wabash, St. Louis and Pacific, the St. Louis, Iron Mountain and Southern, the Illinois and St. Louis, the Indianapolis and St. Louis, and the Vandalia line.

SAINT LOUIS, the capital of the French possessions in Senegambia, is situated on a small low island of the same name, at the mouth of Senegal river. The town covers almost the whole island. With its fortifications, it presents an imposing appearance from the sea, but the interior is mean and dirty. The harbor is good. The principal building is the government house. There are 600 stores for goods. Saint Louis possesses a botanic garden, founded in 1822. Pop. about 18,000.

SAINT LUCIA, one of the windward division of the Caribbees (see ANTILLES), lies about 30 m. to the s. of Martinique, having its southern extremity in lat. 13° 41' n., and long. 61° west. The island is of volcanic origin, and the crater of the *Soufriere*, or *Sulphur mountain*, is still in energetic operation. Saint Lucia is remarkable for its picturesque and romantic scenery. Much of the surface is covered with hills, generally well wooded, and occasionally rising to the height of nearly 3,000 feet. Area, 248 sq. m., or 158,720 acres, of which, in 1860, 9,626 acres were under crops. Pop. '71, 21,610, of whom 837 were whites. As the coast abounds in secure, commodious, and defensible harbors—all the more valuable from their comparative scarcity in the neighborhood—the island has been perhaps, to an unexampled extent, an object of contention between France and England. In the hands of the latter, however, it has remained since 1803. In 1860 Lucia contained 18 schools, with 1470 scholars. In 1873 its revenue was £19,908; its expenditure, £20,347; public debt, £18,000. The total tonnage of vessels (exclusive of coasting trade) that entered and cleared the ports in 1873 was 37,589. The value of the total imports amounted, in the same year, to £116,037; the exports to £151,012. The chief article exported is sugar. The exports to Great Britain were £124,523; the imports from Great Britain were £38,855.

SAINT LUCIE BARK. See CARIBBEE BARK.

SAINT MALO, a fortified seaport of France, in the dep. of Ille-et-Vilaine, at the mouth of the river Rance. It stands on a small island less than three miles in circumference, called *Le Rocher d'Aaron*, which lies close off-shore, and is connected with it by a causeway, 650 feet long, called *Le Sillon*. The island is completely covered by the town; the streets are narrow, filthy, and ill-ventilated, and the houses are built to the height of five and six stories. The harbor is spacious and secure, but its entrance is narrow, and is thickly set with rocks and shallows. It is perfectly dry at ebb-tide, but the flood-tide rises here from 45 to 50 feet. Numerous strong forts, both on the mainland and on the small islands that stud the roads, protect the harbor and town. The harbor works were completed under the second empire, and cost nearly 20 million francs. Ship-building is the principal industry. On the island of Grand-Bé, near the rampsarts, is the tomb of Chateaubriand (q.v.): Many vessels are employed in the mackerel, cod, and whale fisheries, and active commerce is carried on. Saint Malo communicates with Rennes (the capital of the dep.) by railway. Pop. '76, 10,061. In the year ended Oct. 31, 1872, Saint Malo sent exports to Great Britain of the value of £1,514,415, chiefly butter, valued at more than £1,000,000.

SAINT MARC GIRARDIN. See GIRARDIN, *ante*.

SAINT MARTIN, one of the Lesser Antilles, West India Islands. It belongs partly to France, and partly to the Netherlands. Area about 30 sq. miles. Its products are sugar, cotton, tobacco, maize, etc., and large quantities of salt. Slavery was abolished in 1863. Pop. '75, 6,500.

SAINT MARTIN, ALEXIS. See BEAUMONT, WILLIAM.

SAINT MARTIN'S, a parish in s. Louisiana; bounded on the s. by lake Chetimaches; drained by Atchafalaya and Teche bayous; about 500 sq. m.; pop. '80, 12,662—6,880 colored. The surface is level and well wooded. The soil is fertile. The principal productions are corn, cotton, and sugar. Co. seat, St. Martinsville.

SAINT MARY AND ALL SAINTS, LINCOLN, commonly called LINCOLN COLLEGE, Oxford, was founded for a rector and seven fellows, in 1427, by Richard Fleming, bishop of Lincoln. In 1475 Thomas Scot, commonly called Rotheram, from the place of his birth, then bishop of Lincoln, afterward archbishop of York, finished the building, added five fellowships, and gave statutes to the society. The object of both founders was to extirpate the Wyclifite heresy, by training up theologians for that purpose. The fellowships were restricted to the dioceses of Lincoln, York, and Wells. By the ordinances under 17 and 18 Vict. c. 81, they are thrown open, the rector and fellows are empowered to reduce the number to ten, as vacancies occur, should this seem expedient, and their value is not to exceed £300. Various benefactors have bestowed scholarships on the college to the number of 24. By the ordinances 16 of these are thrown

open, of about £80 per annum, and tenable for 16 years from matriculation, which may be extended to 20 if the rector and fellows think fit. This college presents to 10 benefices.

SAINT MARY HALL, Oxford. In 1239 Henry Kelpie, a citizen of Oxford, presented a tenement, on the site of the present St. Mary Hall, to the rector of St. Mary's church, to be the parsonage house. In 1835 Edward II. gave the church, together with the parsonage, to Oriel college. The college converted the parsonage into a place of education, and it gradually grew into an independent hall. It possesses 4 scholarships of £60 per annum, tenable for four years, and 1 exhibition.

SAINT MARY'S, a parish in s. Louisiana, having the Gulf of Mexico on the s. and s.e., Chefmaches lake on n. and n.e., Atchafalaya bayou on the e., the waters of the gulf forming Côte Blanche bay and Atchafalaya bay in the s. and s.w.; 450 sq.m.; pop. '80, 19,891—19,921 of American birth, 13,174 colored. It is intersected by the navigable bayou Teche, and also drained by the Atchafalaya. Its surface is low and marshy and subject to overflow, but in the arable portions having a fertile soil. In the marshes are forests of live oak, with a thick undergrowth of cypress, gum, etc., and the soil produces large crops of grain, sweet potatoes, and sugar cane. The principal industries are the manufactory of cooperage, bricks, and stoves, sugar and molasses.

SAINT MARY'S, a co. in s. Maryland, bounded on the e. by Chesapeake bay, on the n.e. by the Patuxent river, and on the s.w. by the Potomac; about 360 sq.m.; pop. '80, 16,934—16,873 of American birth. The surface is level and heavily timbered. The soil is fertile. Principal productions are corn, wheat, and tobacco. Co. seat, Leonardtown.

SAINT MARY'S, a t. in s.w. Ontario, dominion of Canada, in Perth co., 22 m. n. of London, 98½ m. s.w. of Toronto, at the junction of the London branch with the Grand Trunk railway; pop. '71, 3,130. It is pleasantly situated on the river Thames, and is substantially built. Limestone is found in great abundance in the vicinity, and quarried for building purposes. It has 6 churches, a branch bank, 2 newspapers, several hotels, and 2 railway viaducts. It has an active trade in grain, and the principal industries are represented by manufactures of iron castings, agricultural implements, lumber, woolen goods, leather, etc.

SAINT MARY'S STRAIT, or **RIVER**, the outlet of lake Superior, runs from the e. end of the lake, takes a general s.e. course and is about 60 m. in length, entering lake Huron by several channels. It forms the boundary between upper Michigan and the province of Ontario, Canada. There is a ship canal on the Michigan shore, built to avoid the rapids at Sault Sainte Marie where there is a fall of 20 feet. St. Joseph's, Sugar, and Drummond islands, are the largest of several in the strait.

SAINT MAURICE, a co. in s. Quebec, dominion of Canada, having lake St. Peter on the s., and the river St. Maurice, for its s.e. boundary; 7,300 sq.m.; pop. '71, 11,144. It is intersected by the North Shore railway and the Three Rivers branch of the Grand Trunk railway, forming a junction at its co. seat. The surface is level and largely covered with forests which supply lumber for an important trade. It is drained by Black Beaver lake and other small lakes, and streams, and the soil is fertile. Its manufacturing interests are of great importance, principally the manufacture and sale of lumber, and iron, the immense forges at its co. seat having a wide reputation. Co. seat, Three Rivers.

SAINT MAURICE RIVER, in central Quebec, dominion of Canada, 400 m. long, rising in lake Oskelania, forming the connecting link to a chain of lakes, and descending through the n. wilderness and the co. of Champlain, enters the St. Lawrence river at the city of Three Rivers, 9 m. above lake St. Peter. Its source is 216 m. n.w. of Montreal. Its drainage area is 16,000 sq.m., the length of its valley is about 223 m., width 140 miles. Its banks present magnificent scenery, sometimes rising to the height of from 200 to 1,000 feet. In its course it has many branches, expands into lakes containing small picturesque islands, and descends in falls and cascades, the most remarkable of which are the falls of Grande Mére, and those of Shawnegan 22 m. above its mouth, 160 ft. in height. It is navigable near its mouth, and after an interruption of 40 m. is again navigable for 75 miles. The climate is too cold for the production of grain, but it affords transportation for an extensive lumber region, in which 500,000 logs are cut annually. It is crossed by 2 bridges, 1400 and 600 ft. in length.

SAINT MICHAEL'S, the largest and most important of the Azores (q.v.), and with the exception of St. Mary's the most eastern island in the group. Area 224 sq.m., or 143,000 acres; pop. about 105,404. The island is mountainous, and rises in its highest summit to 3,560 feet. Of the whole acreage, 40,000 acres are arable, and about 5,000 acres are pretty equally divided between orange gardens and vineyards. Hot springs abound in many parts of the island, and in the western extremity are the Caldeiras or boiling fountains, whence the water ascends in columns to the height of 12 ft. and then disappears in vapor. In 1872 the total value of the exports—by far the larger portion of which consists of oranges, and goes to Great Britain—was £85,279; and of the imports, mainly from Great Britain, £91,943. The chief town is Ponta Delgada (pop. about 16,000).

SAINT MICHAEL'S MOUNT, a conical and isolated rock in Mount's bay, Cornwall, 3 m. e. of Penzance. It communicates with the shore by a causeway 400 yards long, which, however, is covered with water 8 hours out of the 12. The mount is 195 ft. high, is about one mile in circumference, and is crowned by an old and picturesque castle—now used as a manorial residence—surmounted by a tower, on one angle of which there is a projecting stone lantern, popularly called *St. Michael's chair*. At the base of the mount is a fishing village, of about 30 houses. This hill is to the geologist one of the most curious of localities, and, indeed, it is said to have "excited more geological controversy than any mountain of the world." At a very early period Saint Michael's mount was the seat of a religious house, and the apparition of St. Michael is said to have appeared on one of its craggy heights. At the conquest the monastery of St. Michael was annexed to the abbey of St. Michael in Normandy. It long remained in the possession of the monks, and afterward became the residence of several families in turn, until it was sold in 1660 to its present proprietors, the *St. Aubyns*.

SAINT MICHEL, MONT, an extraordinary rock in Cancale bay, in the n.w. of France, 7 m. s.w. of Avranches. It is a solitary cone of granite, 5 m. in circumference at the base, and rising to the height of 400 feet. It rises sheer out of a level expanse of sand, and though its elevation is not great, its perfectly flat environment and its pointed crest render it a most striking feature in the landscape. It is crowned by a church and castle, under which are conventual buildings, with their lofty turrets and high walls, and lower down still are the houses of the small town, which seem to adhere to the steep rock like limpets. A good road leads from the shore to the wide sands which surround the mount, and which are covered with water at every tide, except at neap-tides. At low-water there is a dry and firm track, about a mile in length, across the sands; but on both sides of it are dangerous quicksands. In the 8th c. an abbey which replaced an ancient temple of Jupiter was founded on the summit of the rock. A church, and an almost impregnable fortress were afterward founded by the Normans. After the revolution the main building was changed into a prison. The castle has recently undergone restoration.

SAINT NAZAIRE, a thriving sea-port of France, in the dep. of Loire-Inférieure, at the mouth of the Loire, on the n. bank of that river, and 38 m. w. of Nantes, with which it is connected by railway. Almost unknown till within recent years, it is now one of the most important ports on the w. coast of France. In 1851 it contained 2,391, in 1861, 6,500, and in 1876, 14,761 inhabitants. Here the government constructed a floating dock of 25 acres area; and another dock, of double the area, is in progress. St. Nazaire is the port for the transatlantic steamers to the West Indies and Mexico. One cause of the rapid rise of this port is that the navigation of the Loire is becoming year by year more difficult, owing to the sand brought down by the river: so that the chief ship-owners of Nantes prefer to leave their vessels at St. Nazaire, and have the cargoes transported inland by railway.

SAINT NEOTS, a small market t. in the co. of Huntingdon, 8 m. s.s.w. of the town of that name, occupies low ground on the banks of the Ouse. Its beautiful parish church has a tower 156 ft. high. St. Neot's has a large iron-foundry, an engine factory, breweries, steam flour-mills, etc. About a mile from the town are large paper-mills. Pop. '71, 3,200.

SAINT NICHOLAS, a flourishing manufacturing and market t. of Belgium, in e. Flanders, 20 m. e.n.e. of Ghent, on the Ghent and Antwerp railway. It stands in the midst of the Pays de Waes, a densely peopled and productive agricultural district, and is said to be the seat of the largest flax-market in the world. The market is held in the great square of the town, one of the largest in Belgium, but which, however, is too small to accommodate comfortably the immense numbers who crowd hither on market-days. St. Nicholas is a manufacturing town of the first class; and among the articles largely manufactured are cotton, woolen, and silk stuffs, carpets, hats, lace, tobacco, and pipes. There are print-fields, dye-works, and tanneries, and a flourishing trade is carried on in shawls, linens, and other manufactured goods, as well as in flax, corn, hops, etc. Pop. '77, 25,440.

SAINT OMER, a t. of France, and fortress of great strength, in the department of Pas-de-Calais, on the Aa, 26 m. s.e. of Calais by railway. It is surrounded by irregular but well-appointed fortifications, is well built amid marshes, and contains numerous fountains and more than one important ecclesiastical edifice. Woolen cloths, blankets, pottery, and clay pipes are manufactured, and there is considerable general trade. Pop. '76, 21,404. A college for the education of English and Irish Catholics was opened at St. Omer during the penal times. It was closed, however, during the revolution; but still exists as a seminary, and is attended by from 15 to 20 students.

SAINT PANCRAS, one of the northern suburbs of London (q.v.).

SAINT PAUL, a city, port of entry, and capital of Minnesota, is on both banks of the Mississippi river, 2,080 m. from its mouth, and 9 m. below the falls of St. Anthony; lat 44° 52' 46" n., long 93° 5' west. It is chiefly built on the e. bank upon a plain 80 ft. above the river, and 800 ft. above the gulf of Mexico. Hills near the city abound with springs of excellent water. St. Paul is at the head of navigation for the

large steamboats of the lower Mississippi and its branches, and the center of a large and growing trade in flour, lumber, furs, etc. It has a state-house, cathedral, college, 38 churches, numerous hotels, 4 daily newspapers, and educational and charitable institutions. In 1846 there were 10 white inhabitants. Pop. '60, 10,277; '70, 20,030.

SAINT PAUL (*ante*), a city in Ramsey co., s.e. Minnesota, incorporated 1854, its name derived from a primitive chapel dedicated to that saint by a Jesuit missionary 1841; pop. '80, 41,498. It is 10 m. e. of Minneapolis, 400 m. from Chicago, a terminus of 3 divisions of the Chicago, Milwaukee and St. Paul railroad, of the St. Paul and Manitoba, the St. Paul and Duluth, the St. Paul and Sioux City, the Chicago, St. Paul and Minneapolis, and the St. Paul, Stillwater and Taylor's Falls railroads. It is built on terraced hills with a pleasing irregularity, the finest portion having been built within a few years, profiting by the impetus to progress in tasteful architecture given by a sudden and remarkable activity in trade. It is 5 m. below the mouth of the Minnesota river which is navigable during 7 months of the year. Across the Mississippi river a bridge is thrown, connecting it with West St. Paul, which was taken from Dakota co. and added to the city in 1874. Limestone, quarried in the vicinity, is much used for building purposes. It has a custom-house and post-office, an elegant granite structure, 2 theaters, several hotels, a court-house, a capital erected 1853, subsequently enlarged, and seriously damaged by fire in 1881, 4 public libraries with 24,000 volumes, and 4 private circulating libraries. It has 3 daily and 11 weekly newspapers, a number in the Swedish and German languages. Its water supply is drawn from lake Phalon, 3 m. from the city, without artificial pressure. It contains the state reform school, an academy of natural sciences, a state historical society with a cabinet of 126,000 specimens, public schools, 2 orphan asylums (one Catholic and one Protestant), a commercial and a business college, and Roman Catholic parochial schools with an attendance of over 2,000 pupils. It has a beautiful public park of 260 acres on the shore of lake Como, and several public squares. Among its public institutions are the home for the friendless, and 2 Magdalen reformatories. It is divided into 6 wards; has a mayor, a council of 3 members from each ward, and an efficient police force. It is lighted by gas, and has a fire department with an electric alarm, and street railways. It has 2 grain elevators, and in one year there was shipped 1,458,800 bushels of wheat, and 180,112 barrels of flour. The steamboat arrivals average over 800 annually. It has 6 national banks with an aggregate capital of \$2,150,000, 3 private banks, a savings bank, a fire, a marine, and a life insurance company. The leading industries are the manufacture of machinery, agricultural implements, blank books, ale and beer, furniture, carriages, boots and shoes, lumber, sashes, doors, and blinds, etc. It has an extensive wholesale trade.

SAINT PAUL DE LOANDA, a considerable sea-port on the s.w. coast of Africa, the principal Portuguese settlement in Lower Guinea, stands at the mouth of the river Bengo, in lat. about 8° 54' south. It is the largest and most important European settlement on this coast, and contains 12,000 inhabitants, of whom 830 are white, 2,400 mixed, and 9,000 black. The climate is comparatively healthy, the harbor is beautiful, and protected by one large and two small forts. The houses are good, the streets unpaved, and there are three churches and three market-places. Abundance of fruit and vegetables, bullocks, and goats are obtainable in the markets. Ivory and bees-wax are the principal exports.

SAINT PAUL'S CATHEDRAL in London is noted from its being the largest and most magnificent Protestant church in the world, and second only to St. Peter's in Rome among the religious structures of modern times. The site of the present building was occupied about 610 by a Christian church dedicated to St. Paul. This church continued till 1083, when it was destroyed by fire. From its ruins arose a much more splendid edifice—the immediate precursor of the present cathedral. In 1137 the building suffered severely from fire; but, that being the great age for splendid churches, it was soon restored with great magnificence, the bishops and the people contributing most liberally to defray the cost. Old St. Paul's was the largest church in the country, being 690 ft. in length, 130 in breadth, and about 150 ft. high. The total height of the stone tower and the spire, covered with lead, which surmounted it, was 520 feet. The cloister was 90 ft. square, with a beautiful chapter-house in the center. In 1666 the great fire of London completely destroyed the old cathedral, along with a large portion of the city and most of the churches; and thereafter sir Christopher Wren was employed to design about 50 of the new churches, and, among others, the new cathedral. In 1673 he submitted several designs for a new cathedral to the king, who selected one, and ordered a model of it on a large scale to be prepared. This was done by Wren, and the model still exists. Its plan is in the form of a Greek cross, having a large dome over the center, supported on eight arches. This was, however, eventually departed from; and the new design was modeled on that of a Gothic cathedral, with an interior length of 460 ft., width 240 ft. across transepts, and a nave 94 ft. wide. The dome and the eight supporting arches of the model are preserved; but in the new design the angle arches lead to no spacious compartment, but to small dark passages only, while the upper portions of these great arches are blocked up with other arches, introduced for constructive purposes, but very destructive of the architectural effect. The plan of supporting the dome on eight arches had the charm of novelty, and also of simplicity of construction,

but it made the arches themselves too small in proportion to the great span of the dome. The constructive skill displayed by Wren in this building is universally acknowledged and admired; but it is thought that he has allowed the mechanical exigencies of the work to interfere too much with its decorative requirements. The dome, for example, is constructed on a new and most masterly principle, the thrust of the vault being counterbalanced by the weight of a brick cone, which is carried up to support the stone lantern over the exterior dome. But in order to carry this out with the least expenditure possible, the drum, or plain cylindrical wall under the dome, is sloped inward, so that the columns with which it is decorated appear to the spectator below to be falling inward, thus producing a painful and disagreeable effect. Great exception is taken to the fact that the external dome is of *wood*, and not of stone, and so liable to premature decay; but the same may be said of the wooden roofs over the vaults of Gothic cathedrals; and by making it of wood sir Christopher was enabled to raise it to a height which makes it one of the noblest buildings of the kind in the world. The design of the nave, from the classic vaulting with which it is covered, is necessarily to a great extent a failure. When domes, or intersecting vaults, are used in a classic building the compartments must be about square; there can therefore be but a small number of nave piers, as compared with those of a Gothic cathedral, and the perspective effect of the latter is thus entirely wanting. The same is the case at St. Peter's. The dome is particularly successful, and is admitted to be the finest in existence; no other being so graceful and varied in outline, and yet so massive in general effect. Its height from the pavement to the top of the cross is 404 feet. The w. front, as seen from Ludgate hill, is most striking; the two campaniles group most harmoniously with the dome, and, together with the portico, produce a most pleasing and remarkable effect. This front must, however, be condemned, along with the screen-walls, if strictly criticised. The upper portico *appears* to indicate an upper story where there is none, and the actual construction and true form of the building are not expressed at all. St. Paul's is the burial-place of many heroes and men of distinction, whose tombs are in the crypt, and whose monuments adorn the interior of the cathedral. Among these are Nelson and Wellington, Collingwood, Abercromby, Moore, Howe, St. Vincent, Picton, Rodney, and many other celebrated soldiers and sailors; Howard, Johnson, Reynolds, Barry, Opie, West, Astley Cooper, sir William Jones, sir Christopher Wren, and other distinguished civilians. Several of the monuments are by Flaxman, Chantrey, Bacon, and Rossi; but it must be confessed that they savor generally too much of heathen mythology to be appropriate in a Christian cathedral.

SAINT PETER, a city in s. Minnesota, on the w. bank of the Minnesota river; pop. '70, 2,680. It is in Nicollet co., at the junction of the Winona and St. Peter and the St. Paul and Sioux City railroads, 75 m. s.w. of St. Paul. It has 10 churches, and is the seat of Gustavus Adolphus college. It has a fine court-house, a national bank, public schools, Roman Catholic parochial schools, and the state hospital for the insane, completed in 1875, built of limestone from a ledge on the premises, at a cost of \$500,000, damaged by fire in 1881. It has 2 weekly newspapers, 5 hotels, and marble works, foundries and machine-shops, breweries, and a furniture factory.

SAINT PETERSBURG, a maritime government of Russia, one of the Baltic provinces, between lake Ladoga on the n. e. and lake Peipus on the s. w. Area, 17,057 sq. m.; pop. '70, 1,325,471. The soil is damp and thin, and woods and marshes cover two-thirds of the level surface. In the vicinity of the capital much ground is laid out in market-gardens. The usual crops are grown, but the quantity of corn produced is greatly less than the quantity consumed. The chief town is the capital, *Saint Petersburg* (q. v.).

SAINT PETERSBURG, the capital of the Russian empire, and of the government of the same name, stands upon and around the lower branches of the Neva, and on the shores of the eastern extremity of the gulf of Finland, 16 m. e. of Cronstadt, its port. Lat. 59° 56' n., long. 30° 19' east. The Great Neva, the most southern branch of the Neva, divides the city into two great sections—the Petersburg side on the n., and the Great side on the south. The former is built on the islands which are formed by the delta of the Neva, the chief of which are the Vassili Ostrov, the Citadel island, and the islands Aptekarskoi, Kammennoi, Petrovskoi, Krestovskoi, and Elagin'skoi. The Great side, s. of the Great Neva, is compactly built, and contains the residences of the court and of the nobility, and more than half the population. The city covers an area of 42 sq. m., stands 56 ft. above the level of the sea, upon plains which were formerly malarious marshes, but are now for the most part drained and laid out in meadows and gardens. Pop. '63, 539,475; '78, about 900,000.

The climate, severe in winter, is pleasant and mild in summer. The mean temperature in summer is 63°; in winter, 14° Fahr. The extremes of temperature are 99° and -51°. Fourteen arms of the Neva, irrespective of the smaller branches, ramify through St. Petersburg, and there are seven canals.

General View of St. Petersburg.—Approaching the city from Cronstadt (q. v.), the port and fortress of the Russian capital, the first indications of the great city are the gilded dome of the church of St. Izak, and the lofty spire of the admiralty, which are seen rising apparently from the water's edge. The Admiralty square faces the English quay on the s. bank of the Great Neva, and may be considered the center of the city. From

the spire, with its numerous galleries, the whole plan of the city can be clearly seen. Right opposite it is the populous Vassili Ostrov, on the s. shore of which are the Bourse, academy of sciences, corps of cadets, etc. To the n. is the Citadel island, and further n. the densely peopled Aptekarskoi island, and the Kammennoi, and other islands, which are for the most part studded with wood-embosomed villas, and laid out in charming gardens. Considering the river on the n. as the chord, and the admiralty as the center, the semicircle that might be drawn with a radius of $2\frac{1}{2}$ m. would pretty nearly describe what is called the Great side of St. Petersburg. This section of the city is divided into three or four portions by the Moika, St. Catharina, Fontanka, and New canals; and it is intersected by three spacious streets, which radiate e.s.e., s.e., and s. from the great center, the admiralty. The streets are named respectively the Nevski Prospekt (Neva Perspective), Gorokhovaia Oulitza (Peas street), Vosnosenskoï Prospekt (Resurrection Perspective). Extensive suburbs also are rising on the eastern bank of the Neva, and there are five railway stations.

Streets, Squares, Monuments, Bridges, Churches, etc.—The street architecture of St. Petersburg, unlike that of Moscow, with its pale-yellow walls and red and green roofs, is almost destitute of color. Here the rigid, military aspect of the streets, with the houses drawn up in long regular lines of gray, or massed together in blocks like the squares of battalions, is one of the first features of the Russian capital that impress themselves upon a traveler. Except in the more fashionable quarters the greater number of the houses are built of wood; but owing to the liability of such houses to catch fire, building in this material is very much discouraged. St. Petersburg contains 500 streets, and among these lanes and alleys are unknown, as, while the finest streets have a breadth of 120 ft., the narrowest are 42 ft. broad. The Nevski Prospekt is the most splendid street in St. Petersburg; and for architectural grandeur, as well as for natural beauty, for proportions, and for variety, is considered the finest street in Europe. It is 130 ft. broad, and about 4 m. long, is planted on both sides with trees, contains a large number of the most beautiful palaces, of highly ornamented churches, and splendid warehouses, and increases in breadth and magnificence as it advances from the admiralty. For the first mile it does not contain more than about 50 mansions, each of which, however, is of colossal magnitude. The houses are built of brick faced with stucco, are three and four stories high, and are in many cases furnished with ornamental porches, colonnades, gilded balconies, and parapets that gird the flat roofs. About ten of the other streets of the city are distinguished for their grandeur, though none of them equals the Nevski Prospekt. There are 64 squares in the city, and of these the Admiralty square is one of the most famous. It contains one mass of buildings, presenting to the Neva a fine façade, nearly half a mile in length, while its sides are 650 ft. long. In the Palace square, adjoining the Admiralty, stands Alexander's column, an immense monolith, erected in 1834. It consists of a shaft of red granite, standing on a pedestal of the same material, and supporting a capital, above which rises the figure of an angel and a cross. The length of the shaft is 80 ft., and that of the whole column 150 feet. Peter's square contains the noble and well-known equestrian statue of Peter the great, 18 ft. high, and erected 1768-82. The Field of Mars, large enough to allow of 40,000 men being put through military evolutions, contains the bronze statue of Suwaroff, and a monument to Catharine II.—*Bridges.*—Of the 150 bridges that unite the islands, cross the canals, and span the Neva, the Annitchkoff bridge, leading across the Fontanka canal, consists of five arches, is 110 ft. long, and is decorated with four spirited groups, in bronze, of wild horses and their tamers, by a native artist. The Nikolayevski bridge, a magnificent structure in granite, and the only permanent bridge save one that crosses the Neva—the others being temporary bridges supported on boats, and removed every autumn and spring—was completed in 1850. It crosses the Neva from the English quay on the s. bank of the Vassili Ostrov shore, is 1200 ft. long, and consists of seven elegant arches, supported upon ponderous piers of granite. At the northern end of the bridge there is a draw-bridge which affords a passage to ships. No part of St. Petersburg affords a foundation solid enough to support weighty structures. The foundation for the Nikolayevski bridge was not obtained until three sets of piles had been driven into the oozy bed of the river, the one on the top of the other, and so close that all the timbers touched each other all the way across.—*Palaces, etc.*—St. Petersburg might be called a city of palaces, from the number of edifices of that description which it contains. The Winter palace, destroyed by fire in 1837, but soon after rebuilt, is certainly the largest, and, in one sense, probably the most magnificent palace in the world. It is 450 ft. long and 340 wide, has an imposing façade, and contains 800 inhabitants, and, during the residence of the emperor within it, is inhabited by 6,000 people. It has numerous ample halls, decorated in the most artistic manner, and containing collections, furniture, and articles of *certu* of immense value. The Hermitage, situated on the Neva like the Winter palace, is connected with that structure by several galleries. Its gallery of 2,000 paintings is famous for its specimens of the Spanish school. The library of this palace contains the collections of Diderot, Voltaire, etc., and possesses in all 120,000 vols. The Annitchkoff palace is the residence of the cesarewitch. The imperial library, one of the first in Europe, contains 1,100,000 vols. and 35,000 MSS. The gilded tower of the admiralty buildings, which is said to be visible from Cronstadt, and certainly forms in these flats a most conspicuous land-mark, is 220 ft. high. The old and new arsenals are

surrounded by cannon taken from the Turks and Persians.—*Churches*.—St. Petersburg contains about 350 churches, 300 of which are orthodox. Within the citadel stands the church of St. Peter and St. Paul, finished in 1727. It is surmounted with a slender tower, crowned by a gilded spire, the whole being 345 ft. high. The cathedral of St. Izak, though destitute of architectural beauty, is remarkable for its rude magnificence, and is one of the most considerable buildings of modern times, is 330 ft. long, 290 ft. broad, and 310 ft. high. It is surmounted by a great gilded dome, and by four smaller domes. The domes are made of bronze, and the value of the plate-gold by which they are overlaid is stated at £50,000. Each of its four sides is adorned with a peristyle of 12 or 16 red granite monolith pillars from Finland. Other notable churches are the cathedral of Our Lady of Kazan, and the Vladimir church.

Academies, Scientific Institutions, etc.—The academy of sciences, with a library of 150,000 books and MSS., was founded by Peter the great in 1725. In the institute of technology, founded in 1828, 200 pupils are taught silk-spinning, the manufacture of cloth, silk, and woolen stuffs, wood-carving, and engraving on copper. The university, founded in 1829, is attended by 1400 students, and has between 80 and 100 professors. The new national museum of antiquities, painting, and sculpture, completed in 1851, is a noble structure, built entirely of marble and metal. There are numerous benevolent institutions, a number of splendid theaters, and an Italian opera, a magnificent structure.

Manufactures and Commerce.—About 3,000 ships annually leave the port. The exports have a value of over £5,000,000; the imports of about £15,000,000 a year. Of the manufacturing cities of Russia, St. Petersburg is one of the most important. The principal private factories are mills for spinning and weaving cotton. The immense imperial establishments produce admirable specimens of Gobelin tapestry, mirrors, articles in bronze, playing-cards, crystal, and porcelain.

St. Petersburg is little more than a century and a half old, and yet it takes rank among the first capitals in the world. It was founded by Peter the great, May 27, 1703. After a long struggle against the severe climate, insalubrious from the exhalations of wide extended marshes, and from the arctic rigor which even yet can cover the Neva with ice a yard and a half thick, at length the town was founded and declared the capital in 1712. Under the successors of Peter, the improvement, embellishment, and extension of the city were carried on. Catharine II. constructed the great canals which, while they afford means of ready communication, serve also to drain the marshlands, to render the atmosphere more healthy, and to mitigate the rigors of winter. The city suffered great damage and the loss of several hundred lives in 1824 from an inundation of the Neva; and every April, when the ice breaks up, the lower regions of the city are threatened with a similar disaster. At St. Petersburg all the ministers from foreign courts are bound to reside.

SAINT PETER'S CHURCH, at Rome, is the largest cathedral in Christendom. It stands on the site of a much older basilica, founded by Constantine, A.D. 306, over the reputed grave of St. Peter, and near the spot where he is said to have suffered martyrdom. This basilica was of great size and magnificence; but had fallen into decay, when pope Nicholas V., in 1450, resolved to erect a new cathedral, worthy of the dignity and importance of the Roman pontificate, then in the zenith of its power. A design was accordingly prepared by Rossellini on a very grand scale, and the tribune was begun, when the pope died. The new building remained neglected for about half a century, when Julius II. resolved to carry out the building, and employed Bramanté, then celebrated as an architect, to make a new design. This design still exists. The foundation stone was laid in 1506; and the works carried on with great activity till the death of the pope in 1513. Bramanté, who died the following year, was succeeded by Baldassare Peruzzi. Almost every architect who was employed during the long course of time required for the erection of this great edifice, proposed a new design. That of San Gallo, who succeeded Peruzzi, is one of the best, and is still preserved. It was not till his death in 1546, when the superintendence devolved on Michael Angelo, then 72 years of age, that much progress was made. He designed the dome; and had the satisfaction, before his death in his 90th year (1564), of seeing the most arduous part of the task completed; and he left such complete models of the remainder that it was carried out exactly in conformity with his design by his successors, Vignola and Giacomo della Porta, and successfully terminated by the latter in 1590 in the pontificate of Sixtus V. The design of Michael Angelo was in the form of a Greek cross, but the building was actually completed as originally designed by Bramanté as a Latin cross, under Paul V., by the architect Carlo Maderno. The portico and façade were also by him. He is much blamed for altering Michael Angelo's plan, because the result is that the projecting nave prevents the dome (the *great* part of the work) from being well seen. The façade is considered paltry, and too much cut up into small pieces. It is observable that this entrance façade is at the *east* end of the church, not the west, as it would certainly have been n. of the Alps. But in Italy the principle of orientation was little regarded.

Maderno's nave was finished in 1612, and the façade in 1614, and the church dedicated by Urban VIII. in 1626. In the front of the portico is a magnificent atrium in the

form of a piazza, inclosed on two sides by grand semicircular colonnades. This was erected under Alexander VII., by the architect Bernini.

The façade of the cathedral is 368 ft. long and 145 ft. high. As already mentioned, the design is not generally approved, but some allowance must be made for the necessities of the case. The balconies in the front were required, as the pope, at Easter, always bestows his blessing on the people from them. Five open arches lead into a magnificent vestibule, 439 ft. long, 47 ft. wide, and 65 ft. high, and adorned with statues and mosaics. Here is preserved a celebrated mosaic of St. Peter walking on the sea, called the *Navicella*, designed by Giotto in 1298, and preserved from the old basilica. The central bronze doors are also relics saved from the old church. On entering the interior of the cathedral, its enormous size does not produce the impression its grandeur of proportions should do on the spectator. This arises from the details being all of an excessive size. The pilasters of the nave, the niches, statues, moldings, etc., are all such as they might have been in a much smaller church, magnified. There is nothing to mark the scale, and give expression to the magnitude of the building. The figures supporting the holy water fountain, for example, appear to be those of cherubs of a natural size, but when more closely approached, turn out to be 6 ft. in height, and the figures in the niches are on a still more colossal scale. The cathedral is 613 ft. long, and 450 ft. across the transepts. The arch of the nave is 90 ft. wide, and 153 ft. high. The diameter of the dome is 195½ feet. From the pavement to the base of the lantern is 405 ft., and to the top of the cross 434½ ft. The dome is thus 50 ft. wider, and 64 ft. higher than that of St. Paul's (q.v.) in London.

The walls of the interior are adorned with plates of the richest marbles, and copies of the most celebrated paintings executed in mosaic. The arch piers have two stories of niches with statues of saints, but these, unfortunately, are in a debased style of art. The pavement is all in marbles of different colors, arranged in beautiful patterns designed by Giacomo della Porta. The dome is, however, the finest part of the cathedral; it is supported on four great arches. Immediately under the dome stands the high altar over the grave of St. Peter. It is surrounded by a magnificent baldacchino or canopy, in bronze, which was designed by Bernini in 1633, and executed with bronze stripped from the pantheon by pope Urban VIII. Beneath the high altar is the shrine, in which 112 lamps burn day and night. The building is adorned with many remarkable monuments and statues, some of them by Michael Angelo, Canova, and Thorwaldsen. The most of the monuments are erected in memory of the popes, but there is one to "James III., Charles III., and Henry IX., kings of England," the remains of the exiled Stuarts being buried in the vaults beneath. The "*grotte Vaticane*," or crypt, has been most carefully and religiously preserved during all the changes and works of the cathedral; so much so, that the ancient pavement remains undisturbed.

As a work of architectural art, St. Peter's is the greatest opportunity which has occurred in modern times; but, notwithstanding the great names of the men who were engaged upon the work, it is universally admitted to be a grand and lamentable failure.

SAINT PETER'S COLLEGE, Cambridge, commonly called Peter-house, was founded before any other college now existing in England—viz., in 1257, by Hugh de Balsham, bishop of Ely, and was endowed by him in 1282, with a maintenance for a master and 14 fellows. In addition to the 14 original foundation-fellows, there are two bye-fellows on different foundations, and 23 scholars. The master is elected by the society.

SAINT PETER'S LE PORT, or commonly *St. Peter's*, the chief town of Guernsey, one of the channel islands. See GUERNSEY.

SAINT PIERRE, the chief t., though not the seat of government, of the island of Martinique (q.v.), belonging to France, stands at the head of a bay, 16 m. n.w. of the capital, Fort-la-France (formerly Fort Royal). It is the largest town in the Antilles, with a pop. of 30,000, and is the chief entrepôt of those islands.

SAINT PIERRE, a t. of the island of Bourbon (q.v.), or Réunion, on the s.w. coast, 34 m. s.w. from Saint Denis. Pop. 14,132.

SAINT PIERRE, CHARLES IRÉNÉE CACTEL, Abbé de, 1658–1743, b. France; entered the priesthood. He was appointed chaplain to the bishop of Orleans in 1702, and soon afterward received the abbey of Tiron. He accompanied cardinal Polignac to the congress of Utrecht in 1712, and the next year appeared the first part of his *Projet de Paix perpétuelle*. He was expelled from the academy on account of his *Discours sur la Polygynie*, 1718, which favored a constitutional government, and attacked Louis XIV. He continued to advocate his views in the so-called *club de l'entresol*, which was closed by Fleury in 1731.

SAINT-PIERRE, JACQUES HENRI, BERNARDIN DE. See PIERRE, ante.

SAINT PIERRE AND MIQUELON, a French colony s. of Newfoundland, opposite the gulf of St. Lawrence, consisting of the islands of Great and Little Miquelon and St. Pierre; about 80 sq. m.; pop. 70, 4,750. The chief occupation is fishing. Capital, St. Pierre.

SAINT-PIERRE-LES-CALAIS, a t. of France, in the department of Pas-de-Calais. It may almost be regarded as the south-eastern suburb of Calais, to which it nearly adjoins,

but has grown to a size exceeding that of Calais itself. It is famous for its manufactures of tulle (q v.). Other branches of industry are also actively prosecuted, as the manufactures of leather and beet-root sugar. Pop. '76, 22,349.

SAINT POLTEN, is a fortified t. of lower Austria, 35 m. w. of Vienna. It is the seat of a cathedral, and has manufactures of cotton, paper, glass, and stone-ware goods. Pop. '69, 7,779.

SAINT QUENTIN, a thriving manufacturing t. in the n. of France, department of Aisne, is situated on the Somme, about 80 m. n.e. of Paris. Its population has more than doubled in 25 years, and in 1876 was 37,980. St. Quentin has a celebrated church—"one of the finest, boldest, and purest Gothic buildings in this part of Belgic Gaul." St. Quentin is the center of a manufacture of linen, muslin, lace, and gauze. The *canal of St. Quentin*, connecting the basin of the Somme with that of the Scheldt, was finished by Napoleon in 1810. It is carried through the intervening hills by tunnels. At St. Quentin a battle was fought, ^{July 29,}_{Aug. 10,} 1557, between the Spaniards, assisted by a body of English troops, and the French, in which the latter were defeated.

SAINT REGIS, a village in n. New York and s. Canada, province of Quebec, on the s. bank of the river St. Lawrence; pop. '70, 1,400. It is inhabited by the St. Regis family of the Iroquois tribe of Indians, by whom it was settled in 1760. They speak the Mohawk language, and are generally of the Roman Catholic faith. They are divided, like the town, into British and American; the former numbering 800, and the latter 683, the allegiance due either government being transmitted through the female line. The reservation in Canada is rather larger than that on this side the line, which is 14,000 acres. The national boundary passing through it places it partly in Franklin co., N. Y., and partly in Huntingdon co., Quebec. It is connected with Cornwall on the opposite bank by a ferry. It has two post-offices; one at St. Regis, Quebec, and one at Hogsburg, N. Y.

SAINTS, a name applied in the New Testament to the members of the Christian community generally, but restricted by ecclesiastical usage from very early times to those who, whether under the old or under the new dispensation, have been specially remarkable for their personal virtues and their eminent services to the cause of religion. Of the old dispensation, the "patriarchs and prophets" are commonly designated as saints. But the word is used much more of the Christian church. In the ages of persecution the quality which most of all challenged the admiration and reverence of the faithful was naturally courage and constancy in the profession and the defense of the Christian faith; and thus the earliest of those whom the church reverences for sanctity of life, are also, for the most part, revered as champions of the faith. In general, however, the saints are distributed into several classes, chiefly in relation to the special services which the church has appropriated to their honor. Thus we find enumerated: 1. Apostles and evangelists; 2. Martyrs; 3. Confessors, a name applied primitively to those who had exhibited great constancy in professing the faith, although without the final crown of martyrdom, but in later times understood of all who, without being martyrs, were eminent for sanctity of life; 4. Doctors or men eminent for sacred learning; 5. Virgins; 6. Matrons and widows distinguished for holiness of life. Anciently the character and appellation of saint were bestowed upon individuals, as it were, by acclamation, and by the common voice of the members of the particular Christian community to which the individual belonged, or to which his merits were most familiar. The earliest examples, as may be seen in the letter of the church of Smyrna on the martyrdom of Polycarp, of such judgments as to individuals were in the case of martyrs. Altars were erected at their tombs, and the people assembled for worship on the anniversary of their martyrdom. Even then, however, the letters of St. Cyprian (Epp. 37 and 39) show that caution was observed by the bishops to guard against the recognition of undeserving individuals. The honors of the martyrs, even before the age of persecution had passed, were extended to confessors of the faith, and eventually to all who were eminent for holiness of life, and especially to those who obtained the reputation of performing miracles. The names of those who were so honored were placed in the register (or diptych) of each church. It was not, however, till a comparatively late period that a regular form of procedure was established in the Roman church for the purpose of testing the claim of individuals to the authentic reputation of sanctity. From the 4th c. downward, examples of reference to Rome—as, for instance, in the Acts of Virgilius, bishop of Trent—are cited by Catholic writers. But the first recorded example of a solemn and public decree is in the case of Udalric or Ulric, bishop of Augsburg, to whom the honors of sanctity were adjudged by pope John XVI. (see Hardouin, Council. VI. P. I., p. 727) in the end of the 10th c. (993). Since that time the procedure of the church of Rome as to the public recognition of the saints has been matured and methodized. It consists of two stages, that are called respectively "beatification" and "canonization." The former is but a preliminary process, and consists in a declaration by the pope that the "beatified" person is entitled, by reason of his (or her) eminent virtues, attested by miracles, to be regarded as a saint, and as such honored and invoked. This authorization, however, is not in beatification extended to the entire church, but is always limited to a particular church, or province, or religious order; and

the nature of the honors permitted to be paid to the beatified person is strictly defined either by the terms of the decree, or by local usage, if such have already existed. But although the effect of a decree of beatification is less comprehensive than that of the subsequent and final declaration in canonization, the preparatory inquiry is in all substantial particulars the same. The details of both are explained at great length and with curious minuteness by the learned pope Benedict XIV. (Lambruschini) in a special work on the subject, which has the further interest of containing, as an appendix, the minutes of the entire proceedings in the canonization which took place during his own official connection with that department. The inquiry in both procedures is conducted by the congregation of cardinals, called the congregation of rites, and consists first in an examination of the writings (if there be any) of the individual, then of the holiness of his life and conversation, and finally of the miracles alleged to have been performed by him in life, or obtained through his relics, and intercession after death. Two such miracles at least must be established by what is considered satisfactory evidence. Upon all these points sworn depositions are required, and all are subjected to a most rigorous scrutiny, in which the office of impugnator is discharged by an advocate called *promotor fidei*, and popularly nicknamed the devil's advocate, his duty being to raise every possible difficulty in the way of the acceptance of the evidence of sanctity. This inquiry is generally a very protracted one; and after it has been completed, and its results recorded in writing, the acts are submitted to the cardinals, who meet three times in private congregations, and finally, if all appears satisfactorily established, in a public congregation, by which the decision is made known to the pope. Should the decision be approved by the pope the solemnization is proceeded with. The solemnity takes place in the Vatican church. The cardinal prefect of the congregation of rites hands the pope's brief to the cardinal, arch-priest of the Vatican, by whom it is read; the *Te Deum* is intoned; the image of the beatified individual is uncovered to receive the veneration of the assembly; high mass, with the collect, in his honor, is sung; and in the afternoon the pope goes solemnly to the church to pay reverence to the image. The procedure, in case of a martyr, is somewhat different. In both, however, the process is but preliminary to the solemn canonization. The effect of the latter comprises: 1. A declaration that the canonized person is to be recognized as a saint throughout the entire church; 2. That he is to be invoked in the public prayers; 3. That churches and altars may be erected in his honor; 4. That he may be invoked in the mass and public service; 5. That a festival may be celebrated in honor of him; 6. That his image may be set up in public; and lastly, that his relics may be preserved and publicly honored. The solemnity of canonization, which is preceded by a new inquiry similar to that of the beatification, and a new judgment of the congregation of rites confirmed by the pope, is one of the most gorgeous in the entire ceremonial of the Roman church. It takes place in the Vatican church (St. Peter's), and is generally attended by a large assembly of bishops from various parts of the church. In many respects it resembles that of the beatification, but its distinctive characteristic is the solemn publication, by order of the pope in person, after the hymn of invocation of the Holy Ghost has been sung, of the decree of canonization. This is followed by mass, also celebrated by the pope in person, and sometimes by a homily of the pope in honor of the newly canonized. The church of St. Peter's is specially decorated at a vast cost for the ceremonial, and the entire expenditure on such occasions has been estimated at not less than £20,000. Roman Catholics hold that in such decrees the judgment of their church is infallible; and to deny that any particular canonized individual is really a saint is held to involve, if not actual heresy, at least a grievous act of contumacy against the faith of the church. On the doctrine of saint worship, see INVOCATION OF SAINTS; and on that regarding the honor paid to relics of saints and martyrs, see RELICS.

SAINTS' DAYS, days set apart in honor of particular saints and martyrs. The practice dates from the times of persecution, when the people were wont to assemble at the tombs of martyrs on the anniversary of the martyrdom. In the multiplication of such celebrations, a record of the days fixed for each saint or martyr became necessary. This was called *calendarium*. The days so appointed were celebrated with more or less solemnity, according to the dignity of the saint, or the degree of devotion with which he was regarded. In some cases the saint's day was kept as a holiday of obligation, in which no servile work was permitted to be done. Other days are of various minor degrees of solemnity, and are called double (greater or lesser), semi-double, and simple, from the peculiar form of the office set apart for each. In particular countries, provinces, dioceses, or parishes, the day of the patron saint is specially celebrated; and in all churches the festival of the saint to whom the church is dedicated.

SAINT SERVAN, a sea-port of France, in the dep. of Ile-et-Vilaine, stands at the mouth of the Rance, opposite St. Malo (q.v.), to which there is communication by land at low-water. The harbor, called port Solidor, is secure. Saint Servan, which is frequently spoken of as a suburb of St. Malo, is much frequented as a watering-place, and carries on ship-building and considerable commerce, especially in timber. Pop. '76, 9,912.

SAINT SIMON, CLAUDE ANNE, Marquis de, 1743-1819; b. France; educated in the Strasbourg military school. After serving in Flanders and Poland, he was sent to Mar-

tinique and fought with Rodney, the English admiral. In 1780 he entered the Spanish army and was made field-marshal. He had a command in the Yorktown campaign in America; afterward returned to the Spanish service and took the patriot side at the elevation of Jerome to the throne in 1808. For this he was condemned to death, but was pardoned and afterward became capt.gen. and a grandee of Spain.

SAINT SIMON, LOUIS DE ROUVROI. Duc de, whose family claimed to be descended from Charlemagne, was born in Jan., 1675. After receiving a careful education under the superintendence of his mother, he entered the army in 1693, but considering his promotion not equal to his deserts, he resigned his commission in 1702, and devoted the remainder of his life to a sort of court statesmanship. Saint Simon's position was as singular and as anomalous as his character. Profoundly ambitious, his pride was yet greater than his ambition. His ideas of aristocratic rights and privileges were perhaps more outrageously fanatical than any ever entertained in modern ages; and the whole aim of his life was to nullify the influence of the parliament, and to place the government of France in the hands of the *grands seigneurs*—the great territorial lords. The middle class he abhorred; and the rise to distinction of any one belonging to that order—any *novus homo*, tortured his patrician soul almost beyond endurance. We have not space (nor would it be worth our while, if we had) to recount his career of haughty and insolent conspiracy against the political rights of commoners, which marks him out as the most thoroughgoing oligarch in principle of whom we have any record. During the latter part of Louis XIV.'s reign, and the regency of the duke of Orleans, he enjoyed much consideration, and his aristocratic policy more than once enjoyed a temporary triumph; but with the accession to the regency of the duke of Bourbon he fell into disgrace, and withdrew from public life. He died at Paris, Mar. 2, 1755. Saint Simon's last years were occupied chiefly in the composition of his famous *Memoires*, a work of incalculable historical value. Though the style is far from faultless, it so admirably expresses the meaning of the author, that one would not wish it other than it is. The *Œuvres Complètes de Louis de Saint Simon* appeared at Strasburg in 1791, in 13 vols., but the best edition is that of MM. Cheruel and Regnier (20 vols. Paris, 1853, et seq.). See A. Lelèvre Pontalis, *Discours sur la Vie et les Œuvres de Saint Simon* (Paris, 1855).

SAINT SIMON and SAINT SIMONIANISM. **CLAUDE HENRI, Comte de SAINT SIMON,** a French social philosopher, founder of the sect named after him, *Saint Simonians*, belonged to a different branch of the same family as the preceding, and was born at Paris, Oct. 17, 1769. Although destined to become the propagator of the most revolutionary and democratic ideas of modern times, he was reared in a perfect hot-bed of aristocratic prejudice. Nevertheless, from his earliest years, Saint Simon exhibited a decided hostility to the established system of things, mainly, however, it would seem (according to the anecdotes in vogue) from a certain puerile vehemence and obstinacy of nature. He was cursed, moreover, with a precocious vanity. What are we to think of a lad scarcely 16 giving his servant orders to rouse him every morning with such a flattering summons as *Levez-vous, Monsieur le Comte, vous avez de grandes choses à faire*, especially when, in point of fact, he had *nothing* to do? Saint Simon was pretty well educated in philosophy, like most of the young nobles of his time, and had D'Alembert among others for his tutor. At 18 he entered the army, served in America, and distinguished himself on the day when Lord Cornwallis surrendered at Yorktown (Sept. 17, 1781), with all his forces. Captured by the British on his return home, he was taken to Jamaica, where he remained till the peace in 1783 restored him to liberty and France. But the monotony of garrison life did not suit his restless and impatient spirit, and in 1785 he quitted the service, and traveled in Holland and Spain, busying himself with various industrial schemes, such as connecting Madrid with the sea by means of a canal, and introducing *diligences* into Andalusia—the latter of which proved successful. The great revolution found in him—noble though he was—an enthusiastic disciple, and he voted in his patrimonial canton for the abolition of titles of nobility, but did not take any part in the political events that followed. His energies were devoted to matters more profitable than patriotic—viz., the purchase of confiscated property—and it is unhappily not at all doubtful that when France was laboring in the agony of a mighty struggle after new life, Saint Simon was consumed by an ignoble passion for enriching himself. But then, as his disciples have naïvely observed, it was necessary that he should acquire a fortune in order that he might be able to devote himself satisfactorily to ideas. It was during the revolution, and while suffering a temporary imprisonment in the Luxembourg, that visions of a new social system, based on scientific principles, and not on political conventionalities, first unfolded themselves before his ardent imagination. His ancestor Charlemagne appeared to him one night in a dream, and said: *Depuis que le monde existe aucune famille n'a joui de l'honneur de produire un héros et un philosophe de première ligne. Cet honneur était réservé à ma maison. Mon fils, tes succès comme philosophe égaleront ceux qu'j'ai obtenu comme militaire et comme politique.* Saint Simon, though now 38 years of age, commenced to study "science," of which he was as yet quite ignorant. The plan he adopted was pleasant and ingenious. He took a house opposite the *ecole polytechnique*, and invited to his table the professors of mathematics, of physics, and of astronomy, from whose lips—in the intervals of their feeding—he acquired the necessary information. Then he changed his lodgings, and fixed himself near the *ecole de médecine*, where, pur-

suing the same method with the physiologists, he learned from them something of the structure of organized bodies. In 1801 he married, and threw open his *salons* to all the savants and artists of Paris; but his lavish hospitalities—prodigalities, perhaps, they ought rather to be called—soon dissipated the fortune he had amassed during the revolution. Meanwhile a notable social idea seized him. Hearing that the husband of Madame de Staël had just died, he resolved to marry the widow, whom he considered to be the only woman fit to associate with him in his great project for the regeneration of society. To be sure there was a little impediment in the way—viz., his being already married; but in France there is never any difficulty in getting a divorce; and Saint Simon was soon as good as a bachelor again. Betaking himself to Coppet, he unfolded his plan to the lady, and begged her concurrence, urging his suit (it is said) by the most impressive considerations; *Madame, vous êtes la femme la plus extraordinaire du monde; comme j'en suis l'homme le plus extraordinaire; à nous deux nous aurions, sans doute, un enfant plus extraordinaire encore.* Madame de Staël, however, declined to further the philanthropic projects of Saint Simon in the way he wanted, and the reformer—now beginning to be in straits—published at Geneva a *Lettre d'un Habitant de Genève à ses Contemporains* (1803), in which he proposes (among other things) that there should be an annual subscription for the benefit of men of genius—mathematicians, physicians, chemists, physiologists, literateurs, painters, and musicians—that spiritual power should be in the hands, not of the clergy, but of savants, and temporal power in the hands of the landed proprietors, while the privilege of choosing “chiefs of humanity” should belong to everybody; finally, he asserts that religion is only a human invention. Saint Simon’s proposal (so obstinately prejudiced are men against what is right) was not adopted—was not even noticed, either by “men of genius” or others, and in the course of a few months he was glad to accept the office of copyist at the Mont-de-Piété. Even this humble means of making a livelihood he had to resign from ill health, and he would probably have died of starvation had he not fallen in by chance with an old revolutionary friend called Diard, who took him into his house and furnished him with means to publish one of his most important works, the *Introduction aux Travaux Scientifiques du Dix-neuvième Siècle* (Par. 1807). The death of Diard, in 1810, once more plunged Saint Simon into misery. Soon after, we find him writing to Lacépède, Cuvier, Degérando, Cambacérès, etc., in this style: “*Monsieur, soyez mon Sauveur, je meurs de faim . . . Depuis quinze jours, je mange du pain et je bois de l'eau; je travaille sans feu et j'ai rendu jusqu'à mes habits pour fournir aux frais des copies de mon travail.*” There is nothing ludicrous here—it is the plain unaffected agony of utter want. In 1812 his wretchedness came to a crisis; he left Paris, betook himself to Peronne, where he fell dangerously ill, but recovered through the attentions of his family, who now settled a small pension on him; he then returned to Paris. After the restoration, he began—in spite of his extravagant vanity—to reap the never-failing reward of enthusiasm and perseverance—a crop of disciples. Of these the most distinguished was Augustin Thierry, who assisted him in the redaction of his *Réorganisation de la Société Européenne*—a work intended to demonstrate the inutilty of the congress of Vienna, and the incapacity of all mere political congresses to establish a durable peace. He proposes the institution of a European parliament, having the right to arbitrate in cases of difference among the various nations, and adds that the first step toward the reorganization of Europe is the union of France and England. In 1817-18, he published *L'Industrie, ou Discussions Politiques, Morales, et Philosophiques*, partly written by himself and partly by his disciples. The third volume is the work of the celebrated Auguste Comte (q.v.). By this and other literary enterprises Saint Simon had exhausted all his funds, and as he saw no prospect of getting any more, he resolved to commit suicide, and actually discharged a loaded pistol at his own head (Mar. 9, 1823), which, however, only deprived him of an eye, and not of life. The last, and by far the most remarkable work of Saint Simon, is his *Nouveau Christianisme* (Par. 1825), which contains his final and matured convictions. According to him, Christianity has been diverted from its original design. Progressive by nature, and meant to be modified by the changing circumstances of times and countries, it has been stiffened into unalterable dogmas by ecclesiastical conclaves. The clergy, whose mission is to instruct, are ignorant of the thoughts and manners of modern times, and have exhibited a complete and deplorable incapacity. Protestantism is no wiser than Catholicism. It has set its face against the fine arts, and has shown a cruel and fatal indifference to the physical amelioration of the poor. But genuine Christianity embraces in its consideration all the needs of humanity. From its grand principle, “love one another,” it derives the proposition, that “religion ought to direct all the social forces toward the moral and physical amelioration of the class which is at once the most numerous and the most poor.” From this premise is deduced the idea of a social hierarchy based on capacity and labor—the new spiritual church comprising all functions and professions, sanctifying science and industry, regulating vocations, fixing salaries, dividing heritages, and taking the best measures to make the labors of each conduce to the good of all. Saint Simon did not live to carry out his principles in detail as far as they would have logically carried him, dying on May 19, 1825; but in the writings of Comte we find the legitimate terminus and result of his sweeping speculations. Much in the character and system of Saint Simon is unquestionably false, exaggerated, and even laughable; but the man who reckoned among his disciples names like M.M. Augustin Thierry, Auguste Comte, Olinde Rod-

rigues, Bailly (de Blois), Léon Halévy, Duvergier, Bazard, Enfantin, Cerclet, Buchet, Carnot, Michel Chevalier, Henri Fournel, Dugied, Barrault, Charles Duveyrier, Talabot, Pierre Leroux, Jean Reynaud, Emile Péreire, Félicien David, Saint Cheron, Guérault, Charton, Cazeaux, Dubochet, and Stéphane Mony—is one whom posterity will not willingly forget.

SAINT SOPHIA, CHURCH AND MOSQUE OF, a celebrated structure at Constantinople, long an object of great interest to all visitors of that city. It was originally built by the emperor Constantine in 325-326, on occasion of the translation of the seat of empire to Byzantium; and is so called as being dedicated, not, as commonly supposed, to a saint of that name, but to the *Hagia Sophia* (holy wisdom), that is to the eternal wisdom of God or the Logos, the second person of the Trinity. The building of Constantine was subsequently rebuilt and enlarged by his son Constantius; and this second church of Constantius having been destroyed in 404, was rebuilt by Theodosius the younger in 415; and it lasted unaltered till the celebrated Nika sedition, or battle of the factions of the circus, under Justinian, in 532, in which it was totally destroyed. The present building is substantially that which was erected by Justinian in expiation of this sacrilege. It occupied less than seven years in its erection, and the history of the work and of the details of its material and its construction are full of marvels. Ten thousand workmen are said to have been employed upon it. The materials were supplied from every part of the empire, and comprised remains of almost every celebrated temple of the ancient paganism. The sedilia of the priests and those of the patriarch were of silver gilt. The dome of the tabernacle was of pure gold, and was surmounted by a gold cross weighing 75 lbs., and incrusting with precious stones. All the sacred vessels and other apparatus were of gold. The altar-cloths were embroidered with gold and pearls; and the altar itself was composed of a mass of molten gold, into which were thrown pearls, sapphires, diamonds, onyxes, and every other object which could raise its costliness to the highest imaginable degree. The total cost of the structure is stated by the ancient authorities at 320,000 pounds. Some regard this as pounds-weight of silver, others as of gold. One of the latest writers on the subject, Mr. Neale (*Eastern Church*, vol. i. p. 237), adopts the latter estimate, and thus computes the cost at the enormous sum of £13,000,000.

The building may be described as a square of 241 ft., forming interiorly a Greek cross, and surrounded in the interior by a woman's choir or gallery, supported by magnificent pillars, for the most part borrowed from ancient buildings. In the center rises a dome, which is supported by two great semi-domes, which in their turn rest upon smaller semi-domes, the whole presenting a series of unexampled beauty. The height of the dome is 175 feet. The building is approached by a double porch, which is about 100 ft. in depth. The whole of the interior was richly decorated with sculptured marble and mosaics. Even in the reign of Justinian, a further reconstruction of the building became necessary, the dome having fallen in, on an earthquake; but this may be said to have been the last important change in the structure within the Christian period of Constantinople.

On the occupation of that city by the Turks in 1453, St. Sophia was appropriated as a mosque. All its purely Christian fittings and internal structures were swept away. The Christian emblems were either mutilated or covered up from view by a coating of plaster. The latter course was adopted throughout the building in the case of mosaic pictures containing representations of the human figure, which the Koran proscribes as unlawful, and thus the original mosaics of the Justinian era have in great part escaped destruction. Some years since, the late sultan, Abdul Medjid, having ordered a complete restoration of the building, these mosaics were accidentally brought to light, and, with the consent of the sultan, artists were sent out from Berlin, who, with the assistance of the architect employed by the Turkish government, made accurate copies of all these interesting relics of antiquity, which have been published at the expense of the Prussian government by M. Salzenberg, the artist thus employed by the king. The interior of the building at present is very judiciously restored for Mohammedan worship, the Christian decorations being again carefully covered up, coated with plaster in imitation mosaic-work. Like all mosques, St. Sophia is closed against Christian visitors except upon special firman, which, however, is easily obtained, and the privilege may be had at small expense by the traveler through the interposition of the masters of the principal hotels.—See Von Hammer's *Constantinopolis und der Bosphorus* (2 vols. 8vo, Pesth, 1832); Salzenberg's *Alt-Christliche Baudenkmale Konstantinopels* (Berlin, 1854); Hughes, *Aya Sofia Constantinople* (London, 1854); also *Edinb. Review*, April, 1865, p. 456, and foll.

SAINT STEPHEN, a t. in Charlotte co., s. New Brunswick, on the St. Croix river where Denny's river joins it, and a few m. from Passamaquoddy bay, which receives them both; pop. '71, 3,000. It is 86 m. from St. John by road, 116½ m. by railroad, the s.w. terminus of the St. Stephen's branch of the New Brunswick and Canada railway. The river separates it from Calais, Me., which is on the opposite bank, connected with it by a bridge, and furnishing the gas by which it is lighted. It has 6 churches, 2 newspapers, many fine residences, 2 banks, and schools. The principal industry is the manufacture of lumber, which is an important business. ♦

SAINT TAMMANY, a parish in s.e. Louisiana, bounded on the e. by the Pearl river, on the s.w. by lake Pontchartrain, watered by the Chefonte and Bogue Chitto rivers; on the New Orleans, Mobile, and Texas railroads; about 900 sq.m.; pop. '80, 6,887—2,632 colored. The surface is level and heavily timbered. The soil is poor. The principal productions are rice, corn, wool, and molasses. Much lumber is exported. Co. seat, Covington.

SAINT THO MAS, one of the most westerly of the group of Virgin islands, is situated in lat. 18° 20' n., long. 65° w.; area (*Almanach de Gotha*, 1879), 33 sq.m.; pop. about 14,000. It belongs to Denmark.

The interior of the island is mountainous, and not very fertile. Since the emancipation of slaves in 1847, the cultivation of sugar has been entirely abandoned. Cotton is planted, but only in small quantity. The climate is hot, dry, and unhealthy; yellow fever is endemic, and preys much upon Europeans, the natives being seldom affected by it.

The principal town, Charlotte Amalie, is situated on the side of the mountain, and descends nearly to the margin of the harbor. The houses, which appear from the harbor tier above tier, and have a beautiful and picturesque effect, are built of a bright cream-colored limestone, surrounded with balconies, verandas, and jalousies, fancifully painted, and the roof covered with galvanized iron or shingles (the latter gayly colored when brightened up with the rays of a tropical sun), and presenting at night, when lighted up with lamps, a very striking effect. The town itself is laid out with rather narrow streets, but there are some good stores and hotels in the place. The governor's house, to the e. of the town, is a large and imposing building; and an ancient ruin, "Blue Beard's castle," crowns an elevation. The harbor is land-locked on three sides; the entrance to it, fortified on both sides, is rather narrow. The harbor is spacious, and has deep water, is much occupied with shipping of many nations, and has been much improved since 1864 by dredging. The Royal Mail Steam-packet company have made it a central station for their large steamers, from whence the intercolonial steamers diverge on their different routes through the adjoining seas. About 750 British vessels of all kinds, exclusive of ships of war and mail-packets, enter the harbor annually. The average annual value of the imports, exclusive of coal, is about £1,000,000.

In Oct., 1867, a fearful hurricane took place. In Jan., 1868, Denmark agreed to a treaty for the sale of St. Thomas and St. John to the United States; but as the United States legislature declined to ratify it, the treaty never took effect.

SAINT THOMAS, an island off the w. coast of Africa in the gulf of Guinea, belonging to Portugal, 260 m. s.w. of Fernando Po. Area about 120 sq. miles. Of its inhabitants, 1000 are white and mulattoes, and 15,000 are blacks. Sugar was formerly grown extensively; coffee is now the chief article of export. In 1876 slavery in St. Thomas was abolished by the Portuguese government. The chief town is St. Thomas or Chaves, a bishop's see, with about 4,000 inhabitants, who live in miserable wooden huts, and few of whom can write or even read.

SAINT THOMAS, CHRISTIANS OF, a remarkable religious community settled from a very early date on the Malabar coast of the Indian peninsula. They take their name from the apostle St. Thomas, who, according to a very ancient tradition, for which, however, no very positive evidence or satisfactory authority can be alleged, preached in India, and is regarded as the apostle of that country. As early as the 6th c. the well-known voyager, Cosmas Indicopleustes, reports of numerous Christian communities settled in India, under the pastoral care of bishops sent from Persia. To this circumstance it may be attributed that the Indian Christians, like those of what may be called the mother church of the Persian kingdom, lapsed into the Nestorian heresy, which, after the decrees of Ephesus and Chalcedon, having been suppressed by the civil laws of the Roman empire, was driven beyond the limits of Roman authority, and found its most favored seat among the hostile Persians. Once established among the people, these opinions continued to be professed by the Christians who survived in those regions the vicissitudes of the revolutions of which India in mediæval times was the scene. Their seat was almost entirely along the Malabar coast, and extended from the s. cape, Comorin, as far as Calicut; and they are found scattered throughout this length over the whole space from the western declivity of the Ghauts to the sea. From the time of their lapsing into Nestorianism, their bishops were ordained by the Nestorian patriarch of Babylon, and they possessed certain civil rights under the successive dynasties which ruled in the s. of India. On the whole, however, they were much oppressed; and on the arrival of the Portuguese in 1598, the Christians of St. Thomas, although Nestorians, regarded them as their deliverers. Nevertheless, the diversity of creed was at once recognized by the western missionaries, and attempts were made by the successive bodies of missionaries, Franciscans, Dominicans, and finally Jesuits, to reconcile them to the Roman church. A union, more or less real, was effected by a synod held at Diamper in 1599; and one of the Jesuit fathers, padre Roz, was named bishop in 1601. This union, however, was not lasting; they fell away once again from the Roman communion, and the expulsion of the Portuguese from Cochín by the Dutch completed the disruption. A considerable number of them, however, were again united to Rome through the missionaries of the Carmelite order; and toward the close of the 17th

c., the emperor Leopold I. obtained the leave of the Dutch to send a bishop and 12 priests of that order to the Malabar coast. One of the most serious impediments to the influence of those missionaries, as well with the schismatics as with the heathen, was found in the intrigues and jealousies of the Portuguese. In later times, the Christians of St. Thomas, have for the most part been absorbed in the native Christian population. Their tenets were in the main those of the Nestorians of Chaldaea and Mesopotamia, about the precise details of which much controversy has prevailed, and many conflicting statements have been made, according to the religious views of the various travelers or missionaries who have reported regarding them. Much of this conflict of testimony arises from a confusion of names rather than of things. See NESTORIANS.

SAINT VINCENT, a British island of the West Indies, belongs to the Windward group, and lies about 28 m. s. of St. Lucia, and 100 m. w. of Barbadoes. Lat. $13^{\circ} 10' \text{ n.}$, long. $61^{\circ} 5' \text{ west.}$ It is $1\frac{1}{2}$ m. long, 11 m. broad, has an area of 131 sq.m., and contained (Dec. 1875) 39,000 inhabitants, of whom a few were white, about a fifth part were colored, and all the rest black. A chain of mountains traverses the island from n. to s., and throws out lateral branches, between which are ravines, which widen into valleys as they approach the sea-shore. Evidences of volcanic action are everywhere visible on the island—strata are upheaved and disturbed, and huge masses of rock have been displaced. In the interior is a volcanic mountain, 3,000 ft. high, the crater of which is half a mile in diameter. The climate is hot, the temperature ranging from 75° to 87° . The annual rainfall is about 76 inches. No valuable minerals have as yet been discovered. The chief products are sugar, arrowroot, rum, cotton, and molasses; the value of the exports in 1875 was £200,444—that of the imports, chiefly linen, cotton, and woolen manufactures, manures, flour and wheat, fish, dried or salted, pork, salted or cured, hardware and cutlery, leather and leather manufactures, timber, butter, and mules, was £152,081. Nearly 700 vessels enter and clear the ports annually. Religion and morality are at a low ebb—more than half the children are reported as illegitimate. There are above 30 schools, attended by over 2,000 children. The revenue, derived chiefly from export duties, was in 1875, £27,852; the expenditure, £29,693, of which a considerable sum was employed in the completion of public works, etc. The government consists of a lieutenant-governor, a legislative council, and 12 elective members of assembly. The capital is Kingston (q.v.), and the other one or two small towns or villages are of little note. In 1861 the importation of coolies from India was commenced, 500 of them having been brought to the island in that year. Shocks of earthquake are frequent; hurricanes occur at intervals, and the violent rains occasionally damage the crops and roads.

SAINT VINCENT, CAPE, in Portuguese *Cabo da Sao Vicente*, a promontory forming the south-western corner of Portugal and of Europe, off which several important naval battles have taken place. On June 16, 1693, admiral Rooke, with 20 English men-of-war, was here attacked by a vastly superior French fleet, and defeated with the loss of 12 men-of-war and 80 merchantmen which were sailing under his convoy; on Jan. 16, 1780, admiral Rodney here destroyed several Spanish ships; on Feb. 14, 1797, the great battle of cape St. Vincent, between 15 British line-of-battle and 6 frigates, under admiral Jervis (afterward created earl St. Vincent), and 27 Spanish line-of-battle and 12 frigates, resulted in the total defeat of the latter and capture of 6 of their largest ships (of which, however, 4 only were ultimately secured). The effect of this last victory was to frustrate the formidable Spanish-French scheme of invading England. The fourth naval fight off cape St. Vincent took place between the fleet of queen Maria of Portugal, commanded by sir Charles Napier (q.v.), and that of Dom Miguel, in which a portion of the latter was destroyed, and the rest captured, 5th July, 1833.

SAINT VINCENT, EARL OF. See JERVIS, JOHN, *ante*.

SAINT VI TUS DANCE. See CHOREA

SAIS, an ancient Egyptian city, called in the hieroglyphs *Sa*, and existing at the time of the old monarchy, was situated on the right bank of the Canopic branch of the Nile, in $31^{\circ} 4' \text{ n. lat.}$ It is at present called Sa el Hagar, or Sa of the Stone, from some modern stone buildings in the neighborhood. There are, however, no remains of temples or palaces on the site; all that remains being a wall of unburnt brick 70 ft. in thickness, perhaps the peribolos of the temple. Traces of the Temenos, 720 ft. long, still exist, and of the citadel, but the temples and tombs which stood within the city walls have been completely stripped; many fine statues of basalt of the 26th or Saite dynasty, from this spot, being found in the different collections of Europe. Sais gave its name to a nome, and also to two Egyptian dynasties, the 24th and 26th, founded by natives of the city. The goddesses principally worshiped there were Neith or Minerva, and Ceres or Isis. Neith was said to be the mother of the sun, and is constantly called in the hieroglyphical legends the mistress of Sais; and an inscription in the temple of Neith is said to have declared of her, "I am past, present, and future; no one has lifted my veil; the fruit I have brought forth is the sun." At Sais there was also a sepulcher of Osiris. The tombs of the kings, contrary to Egyptian and resembling the Greek custom, were within the walls. The tomb of Amasis consisted of a stone edifice with columns, and a chamber with doors. Sais was important as a religious capital. Toward the decline of

the monarchy, it rose to great splendor. The 26th dynasty transferred hither the capital of the kingdom. Amasis transported a monolithic shrine of granite from Elephantine to Sais after three years' labor, employing 2,000 men in the undertaking. Solon and Pythagoras visited Sais, and Plato was instructed in its colleges. There seems to have been a considerable Greek population in the city; but although Sais continued to be mentioned after the 26th dynasty, its political importance then declined, and Memphis became the seat of government. The intercourse between Sais and Athens subsequently gave rise to the idea of Athens having been colonized from it. Lepsius, *Briefe*, p. 12; Wilkinson, *Modern Egypt*, vol. i. p. 183; Herodot. ii, 28, 59, 169; Strabo, xvii. p. 801; Champollion, *L'Égypte*, ii. p. 219; *Lettres*, p. 50.

S'AIVAS is the name of one of the three great divisions of Hindu sects. See INDIA. The word designates the votaries of S'iva, and comprises different special sects, which varied in number at different periods of mediæval Hinduism. To judge by the number of shrines dedicated to S'iva in his form as Linga, it would seem that the worship of this deity was the most prevalent of all the modes of adoration; but these temples are scarcely ever the resort of numerous votaries, and they are regarded with comparatively little veneration by the Hindus. In upper India, the worship of S'iva has, indeed, never assumed a popular form. No legends are recorded of this deity of a poetic or pleasing character; the S'aivas, unlike the Vaishnavas, have no works in any of the common dialects, such as the *Rāmāyaṇa*, the *Vārtā*, or the *Bhaktamālā*; no establishments in Hindustan, like S'ināth or Puri; and their teachers of repute, like S'ankara (q.v.), are too philosophical and speculative to be really popular. The worship of S'iva seems, therefore, to have been, from a remote period, more that of the learned and speculative classes, than that of the masses of the people. In a renowned work called the *S'ankara-digvijaya*, or the victory of S'ankara over the world, composed by Anandagiri, one of the disciples of S'ankara, several subdivisions of the S'aivas are named—viz., the *S'aivas*, properly so called—who wore the impression of the Linga on both arms—the *Raudras*, who had a trident stamped on the forehead; the *Ugras*, who had the drum of S'iva on their arms; the *Bhāktas*, with an impression of the Linga on their foreheads; the *Jangamas*, who carried a figure of the Linga on their head; and the *Pās'upatas*, who imprinted the same symbol on the forehead, breast, navel, and arms. The present divisions of the S'aivas, however, are the following: The Dan'd'ins and Das'nāmi-Dandins; the Yogins; the Jangamas; the Paramahansas; the Aghorins; the Urdhabāhus; Akās'mukhins and Nakhins; the Gūdaras; the Rūkharas, Sūkharas, and Ukharas; the Kārālingins; the Brahmachārius; and the Nāgas.

The *Dan'd'ins*, or staff-bearers, properly so called, are the representatives of the fourth order, or mendicant life, into which a Hindu is to enter after he passed through the stages of a religious student, householder, and hermit. The Dan'd'in is distinguished by carrying a *dan'da*, or small staff, with several projections from it, and a piece of cloth dyed with red ochre—in which the Brahmanical cord is supposed to be enshrined—attached to it. He shaves his hair and beard, wears only a cloth round his loins, and subsists on food obtained ready dressed from the houses of the Brahmans once a day only, which he deposits in the small clay pot that he always carries with him. He should live alone, and near to, but not within a city; this latter rule, however, is rarely observed. The genuine Dan'd'in is not necessarily of the S'aiava sect; but those who worship S'iva, especially in his form as Bhairava, or the Terrific, have, at the ceremony of initiation, a small incision made on the inner part of the knee, the blood drawn by this process being deemed an acceptable offering to the god. The *Das'nāmi-Dan'd'ins* are included in this class; but they admit none but Brahmans into their body, and are considered to be the descendants of the original members of the fraternity, who refer their origin to the celebrated *S'ankara* or *S'ankarāchārya* (q.v.). He is said to have had four disciples, who are called Padmapāda, Hastāmalaka, Sures'wara or Mandana, and Trōṭāka. Of these, the first had two pupils, Tirtha and As'rama; the second two, Vana and Aran'ya; the third had three, Saraswati, Puri, and Bhārati; and the fourth had also three, Giri or Gir, Pārvata, and Sāgara. These ten constitute collectively the *Das'nāmi* (from *das'an*, ten, and *na'man*, name); and when a Brahman enters into either class, he attaches to his denomination that of the class of which he becomes a member: as Tirthia, Giri, etc. The philosophical tenets of this sect are mainly those of the *Vedānta* (q.v.), as taught by S'ankara and his disciples; but they generally superadd the practice of the *Yoga* (q.v.), and many of them have adopted the doctrines of the *Tantras* (q.v.).

The *Yogins* are, properly speaking, followers of the *Yoga* (q.v.) system; and the term implies a class of men who practice the most difficult austerities, in order to become absorbed into the universal spirit, and thus liberated from repeated births. The votaries of S'iva, so called, hold that, by dint of these practices—such as continued suppressions of respirations, sitting in 84 different attitudes, fixing the eyes on the top of the nose—they will be finally united with S'iva, whom they consider as the source and essence of all creation. The principal sect of this class is that of the *Kānpātā Yogins*, who trace their origin to a teacher named *Gorakhnāth*, who seems to have lived in the beginning of the 15th c., and, according to his followers, was an incarnation of S'iva. A temple of Gorakhnāth exists at Gorakhpur; a plain, called Gorakhhetr, is near Dwārikā, and a cavern of his name at Haridwār. The Yogins of Gorakhnāth are called *Kānpātās*,

from having their ears bored and rings inserted in them at the time of their initiation. They may be of any caste; they live as ascetics, single or in colleges; officiate as priests of S'iva in some places; mark the forehead with a transverse line of ashes, and smear the body with the same substance; they deal in fortune-telling, profess to cure diseases with drugs and spells; and some play and sing, and exhibit animals.

The *Jangamas*, or *Lingarats*, are likewise not an important division of the S'aiva sect. Their essential characteristic is the wearing of the Linga emblem on some part of their dress or person.

The *Paramahansas* are ascetics who pretend to be solely occupied with the investigation of Brahman, and to be equally indifferent to pleasure or pain, insensible of heat or cold, and incapable of satiety or want. In proof of this, they go naked in all weathers, never indicate any natural want, and receive from their attendants what is brought to them as their alms or food.

The same apparent worldly indifference characterizes the *Aghorins*; but they seek occasions for its display, and demand alms as a reward for its exhibition. Their practices, too, seem to betray that originally their worship was not of an inoffensive kind, but required even human victims for its performance. They eat and drink whatever is given to them, even ordure and carrion; and in order to extort money from the credulous, they resort to the most disgusting devices.

The *Urdhabahus* are solitary mendicants; they extend one or both arms above their heads till they remain of themselves thus elevated. They also close the fist, and the nails being suffered to grow, completely perforate the hand. They usually assume the S'aiva marks, and twist their hair so as to project from the forehead, in imitation of the matted hair of S'iva.

The *Ākās'mukhins* hold up their faces to the sky till the muscles of the back of the neck become contracted and retain it in that position.

The peculiarities of the other sects we cannot afford space to specify; they are equally trifling and, sometimes disgusting. For fuller details on the S'aivas, see H. H. Wilson, *A Sketch of the Religious Sects of the Hindus*; Works, vol. i. (edited by Dr. R. Rost, Lond. 1862), pp. 188, ff.

SĀKA. See S'ĀLIVĀHANA.

SĀKATĀYANA is the name of a celebrated Hindu grammarian, who preceded Pāṇini (q.v.) and Yāska (see NIRUKTA), for he is quoted by both these authors. His grammatical work, however, seems to be lost, for no portion of it has as yet been forthcoming; and an attempt recently made to identify with it a grammar of a Sākātāyana, copies of which are met with at the India office library, London, and at Madras, has signally failed. The latter Sākātāyana is a Jaina (q.v.), who is not only later than Kātyāyana (q.v.), but, in all probability, a modern writer.

SAKHALIN', commonly written SAGHALIEN, native name TARAİKA, a long and narrow island, runs from n. to s. close off the shores of Asiatic Russia, in the s.w. of the Sea of Ochotsk. It formerly belonged partly to Russia and partly to Japan, but the whole of the island now belongs to Russia, Japan having surrendered its portion in 1875. The estimated area is 47,600 sq.m. Pop. '72, 13,000. It is 588 m. in length, and about 120 m. in extreme breadth. Lat. 45° 54'–54° 24' n. In lat. 52° the island approaches to within 6 m. of the mainland, from which it is separated by the shallow Mamia strait. A mountain-chain with craggy summits, which in lat. 52° are covered with snow throughout the year, traverses the island from n. to south. There are no important natural harbors. The chief rivers are the Ty, falling into Patience gulf, and 90 ft. wide and 7 ft. deep at its mouth, and the Tymy flowing north-east. The rivers and the coasts swarm with fine fish. Immense stores of fish are preserved in a frozen state during winter, and upon these the natives and their dogs in great part subsist. On the e. coast of the island the vegetation, especially in the n., has a stunted appearance. On the w. coast luxuriant grass clothes the valleys, and forests of pine, fir, birch, larch, oak, and maple trees cover the mountains. Among the animals are the reindeer, the stag, roe, elk, and musk ox. In the northern part of Sakhalin the climate is even more rigorous than at Nikolaevsk (q.v.). At Aniva bay, in the s., the coldest day in the winter of 1853–54 showed a temperature of 13° Fah. The inhabitants carry on an inconsiderable barter trade with their fish, furs, and seals. Coals have been discovered in several localities and explored by the Russians. Ravenstein's *Russians on the Amur* (Trübner & Co., Lond. 1861).

SAKHALIN ULA HOTUN, now commonly and more properly called Aigun, a t. of Manchooria, on the right bank of the Amur, 14 m. below the junction of the Dzyra with that river. Lat. 50° 15' n., long. 127° 40' east. It is the chief place of the Manchoo on the Amur, and is somber in appearance, though it contains many gayly-painted temples. The great quadrangle, containing the government and other buildings, is 230 yards square, and is surrounded by double rows of palisades. Paper lanterns hang across the streets, and fantastic figures, dragons, etc., cut in paper, are fixed to poles above the shops. Millet, tobacco, and other products are grown in the vicinity for export. Pop. 15,000.

SAKI, a kind of beer which the Japanese make from rice. It is the common alcoholic liquor of Japan. It is clear, and has a peculiar taste, which Europeans generally

reckon unpleasant. The Japanese usually heat it before drinking, and pour it into flat cups or saucers of lackered wood. It produces a very speedy and transient intoxication.

SAKI, *Pithecia*, a genus of American monkeys, having the tail, which is not prehensile, covered with very long hair, whence they are often called *fox-tailed monkeys*. The head is round, and the muzzle short, the ears not unlike those of the human race. The whole body is covered with long hair.

SAKTAS is the name of one of the great divisions of Hindu sects (see INDIA). The term is derived from the Sanskrit *śakti*, which means "power, energy;" but, in its special application, denotes the energy of the deity, and particularly that of the gods of the Hindu triad, Brahma, Vishnu, and Siva. This energy, originally spoken of as the wish or will of the Supreme Being to create the universe, and afterward dilated upon in metaphorical and poetical speech, assumed at the Pauranic period (see *Hindu Religion* under INDIA) the form of a separate deity, thought of as the wife of the god to whom it belongs. Accordingly, Sarasvatī (q.v.) became the Sakti or wife of Brahma; Lakshmi (q.v.), the Sakti or wife of Vishnu; and Devī, or Durgā, or Umā (q.v.), the Sakti or wife of Siva. *Śākti*, properly speaking, means, therefore, a worshiper of any of these female representations of the divine power; but, in its special and usual sense, it is applied to the worshiper of the female energy or wife of Siva alone; and the Sāktas, properly so called, are, therefore, the votaries of Durgā, or Devī, or Umā (q.v.). Since Siva (q.v.) is the type of destruction, his energy or wife becomes still more so the type of all that is terrific; and, in consequence, her worship is based on the assumption that she can be propitiated only by practices which involve the destruction of life, and in which she herself delights. That such a worship must lead to the brutalization, and degenerate into the grossest licentiousness, of those addicted to it, is but natural; and it will easily be understood that the Sākta religion became the worst of all forms which the various aberrations of the Hindu mind assumed. Appealing to the superstitions of the vulgar mind, it has its professors, chiefly among the lowest classes; and, among these again, it prevails especially in Bengal, where it is cultivated with practices even scarcely known in most other provinces. The works from which the tenets and rites of this religion are derived, are known by the collective term of *Tantras* (q.v.), but as in some of these works the ritual enjoined does not comprehend all the impure practices which are recommended in others, the sect became divided into two leading branches, the *Dakṣiṇācārins* and *Vāmācārins*, or the followers of the right-hand and left-hand ritual.

The *Dakṣiṇācārins* are the more respectable of the two. They profess, indeed, to possess a ritual as pure as that of the Vedas. Nevertheless, they annually decapitate a number of helpless animals, especially kids, and in some cases pommel the animal to death with their fists, or offer blood without destroying life—practices contrary to the Vedic ritual. The *Vāmācārins*, on the other hand—the type of the Sākta—and among these especially that branch called Kaula or Kulina, adopt a ritual of the grossest impurities. Their object is, by reverencing Devī, who is one with Siva, to obtain supernatural powers in this life, and to be identified after death with Siva and his consort. "According to the immediate object of the worshiper," Professor Wilson says, "is the particular form of worship; but all the forms require the use of some or all of the five letters M—viz., māṇsa, matsya, madya, maithuna, and mudrā—i.e., flesh, fish, wine, women, and certain mystical gesticulations. Suitable *mantras* (or formulas) are also indispensable, according to the end proposed, consisting of various unmeaning monosyllabic combinations of letters, of great imaginary efficacy. Where the object of the ceremony is to acquire an interview with, and control over, impure spirits, a dead body is necessary. The adept is also to be alone, at midnight, in a cemetery or place where bodies are burned or buried, or criminals executed; seated on the corpse, he is to perform the usual offerings, and if he does so without fear, the Bhūtas, the Yōginis, and other male or female goblins, become his slaves. In this, and many of the observances practiced, solitude is enjoined; but all the principal ceremonies comprehend the worship of Sakti, and require for that purpose the presence of a female as the living representative and type of the goddess. This worship is mostly celebrated in a mixed society, the men of which represent Bhairava (or Siva as the Terrific), and the women, Bhairavi (Sakti or Devī as the Terrific). The Sakti is personated by a naked female, to whom meat and wine are offered, and then distributed among the assistants; the recitation of various mantras and texts, and the performance of the mudrā, or gesticulations with the fingers, accompanying the different stages of the ceremony; and it is terminated with the most scandalous orgies among the votaries." The same author adds that, "in justice to the doctrines of the sect, it is to be observed, that these practices, if instituted merely for sensual gratification, are held to be as illicit and reprehensible as in any other branch of the Hindu faith;" but full assent must be given to his remark which follows a text quoted by him in support of this view, for he says: "It is only to be added that if the promulgators of these doctrines were sincere, which is far from impossible, they must have been filled with a strange frenzy, and have been strangely ignorant of human nature."

"The members of this sect are very numerous, especially among the Brahmanical

caste; all classes are, however, admissible, and equal at the ceremonies of the sect. The particular insignia of these Sâktas are a semicircular line or lines on the forehead, of red sanders or vermillion, or a red streak up the middle of the forehead, with a circular spot of red at the root of the nose. They use a rosary made of the seeds of the cleocarpus, or of coral beads, but of no greater length than may be concealed in the hand; or they keep it in a small purse, or a bag of red cloth. In worshiping, they wear a piece of red silk round the loins, and decorate themselves with garlands of crimson flowers. Two other sects are likewise mentioned as belonging to the Sâktas, the *Kāñchuliyas* and *Karâvins*, but it is doubtful whether they are still in existence. The former are said to have belonged to the s. of India; and the latter seem to have been worshippers of Devi in her terrific forms, the offering to her of human sacrifices being the principal feature of their ritual. If there are still any votaries of this sect, Professor Wilson believes that they are the miscreants who, more for pay than devotion, at certain festivals, inflict upon themselves bodily tortures, such as piercing their flesh with hooks or spits, reclining upon beds of spikes, gashing themselves with knives, etc.—See H. H. Wilson, *A Sketch of the Religious Sects of the Hindus*; Works, vol. i. (edited by Dr. R. Rost, 1862), pp. 240, ff.

SAKUNTALA is one of the most pleasing female characters of Hindu mythology. She is mentioned as a water-nymph in the *Yajurveda* (see VEDA); she is the subject of a beautiful episode of the *Mahâbhârata* (q.v.), and is spoken of in the *Purânas*; but her name has become especially familiar in Europe through the celebrated drama of Kâlidâsa (q.v.), which, introduced to us by sir William Jones in 1789, became the starting-point of Sanskrit philology in Europe. The principal features of the legend of Sakuntala, as narrated in the *Mahâbhârata*, are the following: Sakuntala was the daughter of the saint Viś'va-mitra (q.v.) and the Apsaras, or water-nymph, Menakâ. Abandoned by her parents, she was adopted by the saint Kan'wa, who brought her up in his hermitage as his daughter. Once upon a time, king Dushyanta went a-hunting in the forest, and accidentally coming to the hermitage of Kan'wa, saw Sakuntala, and fell in love with her. He persuaded her to marry him according to the rite of the Gandharva marriage, and promised her that the son she would bear him should be the heir to his throne, and that he would take her home as his queen to his royal city. Kan'wa, who had been absent while this event happened, returned to the hermitage, and through his divine knowledge, knew the whole secret, though it had not been confessed to him by Sakuntala. She in due time was delivered of a son, and remained at the hermitage until the boy was six years old; but as Dushyanta, unmindful of his promise, did not send any messenger for her Kan'wa directed her to proceed with her boy to the residence of Dushyanta. This she did; but when she arrived at his residence, she was repudiated by the king. Nor did her speech, however touching and eloquent, move his heart, until at last a heavenly voice assured him that Sakuntala had spoken the truth, and that he saw before him his lawful son. Thereupon, Dushyanta recognized Sakuntala as his queen, and her son as his heir. The latter was named Bharata, and became the founder of the glorious race of the Bhâratas. In the drama, Kâlidâsa's genius had full scope to work out the incidents of this legend, so as to display the accomplished female character of Sakuntala, and likewise to show that the obstacle which arose to her recognition was not the fault of Dushyanta, but the consequence of a curse which Sakuntala had incurred from a wrathful saint who, when once on a visit to Kan'wa's hermitage, had considered himself neglected by her. Since, in the drama, Dushyanta recognizes Sakuntala by means of a ring he had given her at the hermitage, the name of the drama is *Abhijñâna-Sakuntala*, or "the drama in which Sakuntala (is remembered) by a token." There are two versions in which this drama now exists—an older and a more recent one. The latter was first edited at Calcutta, 1761, then at Paris, 1830, by A. L. Chézy, who also gave a French translation of it; later and better editions of it (Cal. 1860 and 1864) were prepared by the Pandit Prem Chunder Tarkabâghish, under the superintendence of prof. Edward B. Cowell, the principal of the Sanskrit College at Calcutta. The older version has been edited by Dr. O. Boethlingk (Bonn, 1842), by prof. M. Williams (Hertford, 1853), and by a Bombay pandit at the Induprakâśa press (Bomb., 1861). The first English translation of it is that by sir William Jones (Cal., 1789); the second was made by prof. M. Williams (Hertford, 1856); it deserves the highest acknowledgment, on account of the consummate taste with which it has rendered the metrical part of the original. Among the various German, Italian, Danish, and other translations of this drama, the German translation by Ernst Meyer (Stutt., 1852) is worthy of especial notice.

SÂKYAMUNI, or the SAINT SÂKYA, is a name of the Buddha, the founder of the Buddhist religion. See BUDDHISM.

SAL, *Vateria robusta*, a tree of the natural order *dipteraceæ*, one of the most valuable timber trees of India. Great sal forests exist along the southern base of the Himâlyâ mountains, but in many places they have been nearly cut down. The care of government is now extended to their preservation.

SALA, GEORGE AUGUSTUS HENRY, b. London, 1828; son of an Italian who married a favorite English singer of West Indian extraction. He was educated to be an artist, but devoted himself to literature. He became a contributor to *Household Words*, the

Welcome Guest, the *Illustrated London News*, *All the Year Round*; and was the founder and first editor of the *Temple Bar Magazine*. He came to America in 1863 as special correspondent for the *Daily Telegraph* of London; and in 1864 published *America in the Midst of the War*. He acted as correspondent to the same paper in Algeria in 1864 and 1875; at the Paris exposition 1867; during the Franco-German war 1870-71; in Spain, Morocco, and Venice 1875; and in Russia 1876. In 1879 he visited America as a lecturer. He has published, among other works: *A Journey Due North*; *Twice Round the Clock*; *Seven Sons of Mammon*; *Strange Adventures of Captain Dangerous*; *From Waterloo to the Peninsula*; *Notes and Sketches of the Paris Exposition*; *Rome and Venice*; and *Under the Sun*.

SALAAM (*Salām*, Arab. = Heb. *Shalom*, peace), the general term of salutation among the Mohammedans. They are generally very formal in their social manners, although their demeanor and conversation are unrestrained enough, both among men and women. Several of their social usages in this respect are founded upon religious precepts; among these is the custom of greeting each other with the words: "*Es-salāmu alaikum*" (Peace be with you), which is answered by: "With you be peace, and the mercy of God, and his blessings!" This salutation is neither to be addressed to nor to be received from any non-Mohammedan. The reply, when one Moslem salutes another, is obligatory, while the address itself is rather arbitrary. Should the saluted refuse to reply, then the other may revoke his salutation, as he does in the case of his discovery that the person saluted is not a true believer, with the words: "Peace be on us and on all the righteous worshippers of God." Generally the rider salutes the person on foot, the passer-by those who sit down or stand still; the smaller party salutes the larger, the young the older, etc. Salutation is to be the first and the last thing on entering a house. The following is the rising scale of the different modes of obeisance with the Moslem: 1. Placing the right hand upon the breast; 2. Touching the lips and the forehead or turban (or forehead and turban only) with the right hand; 3. Doing the same, but slightly inclining the head during that action; 4. The same, but inclining the body also; 5. the same, previously touching the ground with the right hand; 6. Kissing the hand of the person to whom the obeisance is paid; 7. Kissing his sleeve; 8. Kissing the skirt of his clothing; 9. Kissing his feet; 10. Kissing the ground. This, however, is to be understood (against De Saey) as merely touching the ground previous to touching the lips and forehead with the right hand. The first five modes are accompanied by the "Peace be with you," and the reply given above. The sixth mode is observed by servants or pupils to their master, wife to husband, and children to father, and sometimes mother, by the young to the aged, and the less learned to the learned and pious (Lane, *Notes to Arab. Nights*, etc.).

SALAD, the name given to a preparation of raw herbs for food. It derives its name from the fact that salt is one of the chief ingredients used in dressing a salad. The principal salad herbs are lettuce, endive, chicory, celery, mustard, and cress; water-cress, onions, radishes, chervil, and a few savory herbs used to give flavor. They are usually cut up and mixed with salt, vinegar, oil, and other condiments, according to taste. Sugar is also frequently added. Cresses, seed-leaves of mustard, etc., are often eaten without any addition. Salad has always been a favorite food with civilized nations, and has very little varied in its composition. The Romans used it, and made it thus: Cultivated endive was cut small after careful washing and draining, then gravy and oil were poured over it, and finely-minced onions were strewn over the whole, then a little vinegar and honey was added, and the salad served up. The great value of salads is in the fact that they are uncooked, and consequently contain a larger quantity of mineral matter, such as potash, soda, etc., than if boiled. Salads are sometimes prepared with animal food, such as boiled lobsters, crabs, eggs, etc.

SALADIN, the name given by western writers to SALAH-ED-DIN YUSSUF IBN AYUB, the sultan of Egypt and Syria, and the founder of the Ayubite dynasty in those countries. As the great Moslem hero of the third crusade, and the beau ideal of Moslem chivalry, he is one of the most interesting characters presented to us by the history of that period. He belonged to the Kurdish tribe of Ravad, and was born at Tekreit (a town on the Tigris, of which his father Ayub was *kutub* or governor under the Seljuks) in 1137. Following the example of his father and uncle, he entered the service of Nouredin (q.v.), prince of Syria, and accompanied his uncle in his various expeditions to Egypt in command of Nouredin's army. Saladin was at this time much addicted to wine and gambling, and it was not till at the head of a small detachment of the Syrian army he was beleaguered in Alexandria by the combined Christians of Palestine and Egyptians that he gave indications of possessing the qualities requisite for a great captain. On the death of his uncle Shirkoḥ, Saladin became grand-vizier of the Fatimite caliph, and received the title of *El-melek-el-nasr*, "the victorious prince;" but the Christians of Syria and Palestine, alarmed at the elevation of a Syrian emir to supreme power in Egypt, made a combined and vigorous attack on the new vizier. Saladin foiled them at Damietta, and transferred the contest to Palestine, taking several fortresses, and defeating his assailants near Gaza; but about the same time his newborn power was exposed to a still more formidable danger from his master, Nouredin, whose jealousy of the talents and ambition of his able young lieutenant required all the skill and

wariness at Saladin's command to allay. On Nouredin's death in 1174, Saladin began a struggle with his successor, which ended in his establishing himself as the sultan of Egypt and Syria, a title which was confirmed to him by the caliph of Bagdad. The next ten years were occupied in petty wars with the Christians, and in the arrangement and consolidation of his now extensive dominion. The plundering by the Christians of a rich pilgrim caravan on its way to Mecca, an infringement of the treaty with Saladin, brought down upon them the latter's vengeance; their army suffered a dreadful defeat at Tiberias (July 4, 1187); the king of Jerusalem, the two grand-masters, and many other warriors of high rank were taken captive; Jerusalem was stormed (Oct. 2), and almost every other fortified place in Palestine was taken. The news of this great success of the infidels being brought to western Europe, aroused the enthusiasm of the Christians to its highest pitch, and a powerful army of crusaders, headed by the kings of France and England, speedily made their appearance on the scene of strife. They captured Acre in 1191, and Richard Cœur-de-Lion, at the head of that portion of the crusading army which adhered to him, continued the war with success, twice defeated Saladin, took Caesarea and Jaffa, and finally obtained a treaty for three years (Aug., 1192), by which the coast from Jaffa to Tyre was yielded to the Christians. In the following year Saladin died at Damascus of a disease under which he had long suffered. Saladin was not a mere soldier; his wise administration left behind it traces which endured for centuries; and the citadel of Cairo and sundry canals, dikes, and roads are existing evidences of his careful attention to the wants of his subjects. In him the warrior instinct of the Kurd was united to a high intelligence; and even his opponents frankly attribute to him the noblest qualities of mediæval chivalry, invincible courage, inviolable fidelity to treaties, greatness of soul, piety, justice, and moderation.

The Ayubite dynasty of which he was the founder ruled over Syria till 1259, when it was dispossessed by the Perso-Mongols, and over Egypt till the rise of the first Mameluke kingdom under Ibeg in 1250.

SALADO RIVER, in the Argentine republic, rises in the n.w. of the province, flows s.e., and after a course of about 600 m. empties into the Paraná below Santa Fé. It is navigable below the Salta lowlands.

SALAMANCA, one of the three modern provinces of Spain into which the ancient kingdom of Leon (q.v.) was divided. Area about 4,940 sq. m.; pop. '70, 280,870.

SALAMANCA, a famous t. of Spain, capital of the modern province of the same name, stands on three rocky hills on the right bank of the Tormes, 50 m. e.n.e. of Ciudad Rodrigo. Prior to its almost total destruction by the French in 1812, it was renowned for the number of its splendid edifices and institutions, and even yet it is a rich mine for the architect, abounding as it does in magnificent specimens of simple and florid Gothic, as well as of the richest cinque-cento. It is surrounded by a wall, pierced with nine gates, and a part of which is very old. The narrow, crooked, dark, and steep streets, containing many old and stately structures, the residences of the old nobility, give to the town an antique and venerable look. Besides the old cathedral, a simple and massive edifice, it contains five other churches of the 12th century. The new cathedral, begun in 1513, is a magnificent structure in florid Gothic, in the adornment of which painting, gilding, and sculpture have been largely and most successfully used. At the close of the 18th c. Salamanca contained 27 parish churches, 39 convents, and 25 colleges. Of the colleges, 20 were destroyed by the French while the town was in their possession, as well as about 20 of the convents, for the purpose of obtaining materials for the erection of fortifications, and for fire-wood. The university of Salamanca, with which the university of Palencia (q.v.) was incorporated in 1243, was founded in 1200. It consisted of a number of colleges, divided into *mayores* and *menores*, or larger and smaller colleges. Of the former, there were only six in Spain, and four of these were at Salamanca: the other colleges were 21 in number. In the 14th c. the university was attended by 17,000 students; the attendance is now only 200. The library, according to the most recent statements, contains 30,000 volumes and 1500 MSS. The school of Salamanca is interesting to British subjects as having, from an early period, included a college for Irish students, which supplied many of the ecclesiastics who continued to minister to their countrymen during the penal times, and which is still in existence. One of the most highly-prized works in Roman Catholic divinity is the great collection of controversial and moral theology, by the members of the college of Carmelite friars in Salamanca, who are known by the name of *Salmantenses*, or the *Salamanca theologians*. The *Plaza Mayor* is the largest square in Spain, and when fitted up as a bull arena, as it was so recently as 1863, it accommodates from 16,000 to 20,000 persons. The bridge across the Tormes rests on 27 arches, and is of Roman foundation. Manufactures of cloth, leather, and earthenware are carried on. Pop. 14,000.

Salamanca, the ancient *Salmantica*, was a Roman *municipium*. In the vicinity was won one of the most famous victories of the peninsular war, by the British under Wellington against the French under Marmont, July 22, 1812.

SALAMANDER, in the superstitions of the middle ages, denoted a being possessing the shape of a man, whose element was the fire, or who at least could live in that element. Paracelsus placed salamanders among the elementary spirits.

SALAMANDER, *salamandra*, a genus of batrachians, of the family *salamandridæ*, to which newts (q.v.) also belong. The name is, indeed, sometimes extended to the whole family; newts being called *aquatic salamanders*, and the name *terrestrial salamander* being given to this genus, the species of which inhabit water only in their tadpole state, and return to it only to deposit their eggs, generally living in moist places, as under stones, roots of trees, etc. The general form is very similar to that of newts, but the tail is round, not flat as in newts. Several species are found in Europe; none of them, however, in Britain. The SPOTTED SALAMANDER (*S. maculosa*), 6 or 8 in. long, black, with bright yellow stripes on its sides, and livid blue beneath, is widely spread throughout Europe. The BLACK SALAMANDER (*S. atra*) is much smaller, black, the body and tail ringed, the tail almost as if formed of beads. It is abundant in the Alps and mountains of southern Germany. Other species are found in Spain, Italy, etc.; Asia and North America also produce numerous species. Salamanders feed on worms, slugs, snails, and insects. They are inert and sluggish creatures, and timid to the utmost extent that their stupidity permits. The brain is very small. They are perfectly harmless, although exuding, when alarmed, from pores on the back and sides, a milky humor, which is injurious to very small animals. But they have long had, and still retain, a popular reputation of extreme venomousness, and are therefore objects of the utmost dread to the vulgar in almost all countries which they inhabit. Strange fables have been current concerning them from remote ages, particularly concerning the icy cold which envelops their body, and enables them not only to endure fire without burning, but to extinguish fire. Pliny, indeed, records that he tried the experiment, and the poor salamander was burned to powder; yet the fable continued to be credited until very recent times.

SALAMIS (modern name, *Koluri*), in ancient times called also *Pityoussa* (island of Pines), an irregularly-shaped, mountainous island of Greece, off the coast of Attica, and forming with it the bay of Eleusis. Its area is about 30 sq. m., and it has a modern population of about 4,600, the chief town being Koluri, on the w. coast. It had anciently two principal towns, Old and New Salamis, the former on the s., and the latter on the n.e. coast. Salamis is remembered chiefly on account of the great naval battle between the Greeks and Persians, which was fought (480 B.C.) a few days after the battle of Thermopylæ, in the narrow strait between the e. coast of Salamis and the w. coast of Attica. The Grecian fleet, consisting of about 360 vessels, was drawn up at the entrance of the bay forming the harbor of New Salamis, Themistocles being leader of the Athenian contingent, and Adimantus of the Corinthian, while the whole was under the command of the Spartan Eurybiades. Great dissensions prevailed among the Grecian leaders, which would probably have led to a general break-up, had not Themistocles by a stratagem induced Xerxes, king of the Persians, to bring up his fleet, and give immediate battle to the Greeks. Xerxes drew up his ships, numbering at least 1000, during the night previous to the battle, opposite the Grecian fleet, along the coast of Attica, almost completely blocking up both entrances to the straits; and confident of victory if he himself superintended operations, he took his seat on a throne erected on a lofty height on the Attic coast, almost opposite New Salamis. Both Greeks and Persians fought with great bravery, but the latter were entirely defeated, owing, perhaps, chiefly to their immense, unwieldy fleet being compressed into so small a space, which rendered it almost unworkable, and completely at the mercy of their opponents. The only name mentioned on the Persian side with distinction is that of Artemisia, queen of Halicarnassus, who is said to have fought with desperate bravery. The loss of the Greeks is said to have been 40, and that of the Persians 200 ships, exclusive of those which were captured.

SAL AMMONIAC (known in chemistry as HYDROCHLORATE OF AMMONIA) is an article of considerable importance in the *materia medica*. It is obtained on a large scale by decomposing with common salt (chloride of sodium) the sulphate of ammonia, which is formed in the manufacture of coal gas, or the carbonate of ammonia, obtained by the distillation of bones. It is sold in large, crystalline, grayish-white, semi-transparent cakes, convex on one side, and concave on the other. It is inodorous, but possesses an acrid, bitter, and nauseous taste. Its specific gravity is 1.45; it volatilizes without decomposition when heated, and is freely soluble in water. Its aqueous solution, when heated with caustic potash, evolves gaseous ammonia; and when treated with nitrate of silver, yields a white, curdy precipitate of chloride of silver. This salt is largely given in France and Germany in cases of pneumonia and of inflammation of the serous membranes, in mucous diarrhea, in chronic rheumatism and gout, and in passive dropsies. Neligan recommends it in cases of low fever, in subacute laryngitis, in chronic affections of the liver, and in facial neuralgia. It may be given in doses varying from 10 to 30 grains, dissolved in some aromatic water. As a local external application, it is of great value in promoting the absorption of effused blood; and there is probably no remedy so effectual for that common but disfiguring affection popularly known as a *black eye*, as a moderately strong solution of this salt, kept constantly applied as a lotion. If it is desired to apply cold to any part of the body, an excellent refrigerant (q.v.) may be obtained by dissolving 5 parts of this salt and 5 parts of niter in 16 parts of water.

Sal ammoniac is employed for various purposes in the arts. It is used in soldering,

and in the tinning of copper and iron to prevent the oxidation of the surface to be tinned. It is exported from Britain to Russia, where it is used by dyers.

It occurs as a mineral, as an efflorescence on the surface of rocks, or as a sublimate in fissures, crystallized in small crystals, or forming crusts, stalactites, etc. It is found in volcanic regions, but is produced during the time of the quiescence of active volcanoes, rather than during their eruptions. It occurs in Britain, near burning beds of coal. It is found in Persia, Tartary, Siberia, and many other countries, where there are no active volcanoes. Formerly all Europe was supplied with it from the neighborhood of the temple of Jupiter Ammon in Egypt, whence its name.

SALDANHA BAY. See CAPE OF GOOD HOPE.

SALDANHA, JOÃO CARLOS, OLIVEIRA E DAUN, Duke of, 1791-1876; b. Portugal; educated at Coimbra. In 1810 he was a prisoner in England. On his release he visited Brazil, where he was employed in the military and diplomatic services. Returning to Portugal, he became minister of foreign affairs in 1825, governor of Oporto in 1826, and minister of war till 1827. In 1832, with the duke of Terceira, he overthrew the usurper dom Miguel. In 1835 he was made minister of war and president of the council; in 1846 he formed a ministry, which fell in 1849. He was again at the head of affairs 1851-56, was minister to Rome 1862-64, and 1866-69, and was again head of the cabinet May-Aug., 1870.

SALE, GEORGE, an eminent oriental scholar, was b. toward the end of the 17th c., and died at London in 1736 under 40 years of age. Almost nothing is known of his private life. He is supposed to have been born in Kent; and he received his education at the King's college, Canterbury. Brought up to the law, he is believed to have practiced it almost to the end of his life. That he spent 25 years in Arabia, as Voltaire and many after him asserted, is a complete fiction. He assisted in getting up the *Universal History*—together with Swinton, Shelvocke, Campbell, George Psalmanazar, and A. Bower, each remarkable enough in his way—for which he wrote the cosmogony and several portions of oriental history. He was also one of the authors of the *General Dictionary*; but he is best known by his unrivaled translation of the Koran, "with explanatory notes taken from the most approved commentators, to which is prefixed a preliminary discourse" (1734). This "preliminary discourse," which is of great value, and proves Sale to have been deeply versed in oriental literature, treats, among other things, "of the Arabs before Mohammed, or, as they express it, in the "time of ignorance"—their history, religion, learning, and customs; of the state of Christianity, particularly of the eastern churches, and of Judaism, at the time of Mohammed's appearance; and of the methods taken by him for establishing his religion, and the circumstances which concurred thereto; of the doctrines, precepts, and peculiarities of the Koran, and of the principal Mohammedan sects." Sale's work was translated into French by Duryer (Antw. 2 vols. 1770). This translation formed a new epoch in the study of Islam and its literature; and though many other translations have been attempted since, in nearly all European and oriental languages, it still bears the palm. See KORAN. That his contemporaries fastened the charge of heresy upon one who spoke philosophically and humanely of other creeds, is not to be wondered at. After his death, a catalogue of his oriental MSS. was published, and the contents are now in the Radcliffe library, Oxford.

SALE, Sir ROBERT HENRY, 1782-1853, b. England. A commission in the army was given him when a mere child, and he was engaged in the storming of Seringapatam in 1799. He was also present at the victories of Travancore, 1809; Mauritius, 1816; and Rangoon, 1824; in 1838 was given command of a brigade in the Afghanistan expedition, and was wounded while leading the storming party at Ghuznee. For his gallant conduct he was knighted and made maj.gen. (local rank). In 1841 he was driven back upon Jellalabad, where he was besieged by Akhbar khan for five months. In April, 1842, he made a sortie and routed the Afghans. He was given a vote of thanks by parliament, and became known as the "hero of Jellalabad." Sir Robert took part in the actions of Teezen and Cabool, was quartermaster in the Punjab campaign, and was mortally wounded at the battle of Moodkee, Dec. 18, 1845.

SALE, or SLA. See SALLEE, *ante*.

SALE OF GOODS is a contract by which the seller, in consideration of a price, transfers the property in the goods to the purchaser. Where the consideration is not money, but goods, the contract is called exchange or barter. The law on the subject is not the same in England and Scotland. In England, when the bargain is struck, and the sale relates to specific goods—that is, goods already made, and existing, and identified—the property vests at once in the purchaser, so that in the event of any damage or destruction happening to the goods, the loss is that of the purchaser and not of the seller, even though the goods have not been delivered, and whether the price has been paid or not. The contract may be made either by word of mouth or by writing; but when the price exceeds £10, the statute of frauds enacts that the contract shall not be binding unless it is in writing. If, however, the buyer shall have accepted part of the goods sold, and actually received the same, or if he shall have given something in earnest to bind the bargain, or in part payment, then a verbal contract will be binding though the

exceeds £10. Many nice questions have occurred and constantly recur as to what amounts to an acceptance and delivery of the goods, so much so, that the general policy of restricting the proof of the contract to writing in any case has been much complained of in late years; and efforts have been made, but as yet in vain, to repeal the statute of frauds which, it is said, encourages rather than discourages fraud. When a contract of sale is made, the duty of the seller is to deliver the goods as soon as the buyer has performed all the conditions agreed upon. If no time was specified for delivery, then he must deliver the goods in a reasonable time. In general, if nothing is agreed to the contrary, the seller need not deliver till the price is paid; but he must do so if the bargain was, that delivery was to take place before payment; in other words, if the sale was on credit. On the other hand, it is the duty of the buyer to accept the goods and pay for them. If either party fail at any stage in his performance of the duties arising out of the contract, the other may bring an action which varies according to the nature of the breach of contract. One valuable right of the seller, when he has sent his goods to the buyer, and they are not delivered, is to stop them *in transitu*. Stoppage *in transitu* (q.v.) is chiefly resorted to when the seller hears of the bankruptcy of the buyer after he has sent him goods. The law regulating the sale of goods by agents (q.v.) or documentary titles is contained in the factory acts, 1823-25-42-77. See FACTOR. The chief difference between the laws of England and Scotland is that in Scotland no writing is necessary to make the contract binding, whatever the price; and that property in the goods does not pass until they are actually or constructively delivered. See Paterson's *Compendium*, 2d ed. ss. 520-544.

SALE OF LAND differs from sale of goods in several respects. An agreement for the sale of land must be in writing, otherwise it cannot be enforced. When once a contract for the sale of land has been entered into, a court of equity will, contrary to the general rule which prevails when a contract is broken, enforce specific performance of the contract; that is, will compel the seller or buyer to carry out his contract, and transfer or accept conveyance of the land. When a sale of land is agreed upon, and nothing is said as to the matter, it is understood as part of the contract, that the vendor shall be able to make a good title; and a doubtful title cannot be forced on the vendee even though it is accompanied with an indemnity. The rule is, that the abstract of title—i.e., a short account of the series of former transactions relating to the possession and property—must go back for sixty years. The expense of making searches into registers during that period falls on the purchaser. It is the duty of the purchaser's solicitor to prepare the draft of the conveyance, and tender it for approval to the vendor's solicitor; and unless there is an agreement to the contrary, the purchaser pays the expense of the conveyance. When the vendor has delivered possession of the estate to the purchaser without receiving the purchase-money, he still retains a lien on the estate for the unpaid price. In England there is no general register which contains copies of all the deeds relating to land, so that everything depends on the preliminary inquiries between the two parties, and the certainty that the purchaser has obtained all the material information that exists. The consequence is, that the sixty years' title or previous history of the estate involves the parties in great expense. This expense requires to be renewed on every fresh sale, for a solicitor who neglects to go through the same train of inquiries as his predecessor at the time of the last preceding sale would be personally liable for any loss that occurred thereby. The great expense attending the conveyance of land has of late years been loudly complained of, and the manufacturing interest, familiar with the rapidity of similar transactions relating to goods, have demanded a simplification of the process. In order to meet this demand, which has been largely shared by the public in general, two acts of parliament were passed in 1862, for the purpose of founding a land registry, and enabling an owner of land to have his title examined and registered once for all, so that in the event of future transactions he may be saved the expense and delay required under the old system. These acts of parliament were not compulsory, and little progress was made, but the legislature has been maturing a scheme for making them compulsory in all but trifling sales of land. In Scotland, the law relating to the sale of land has always been on a more satisfactory footing, for there are registers in which an intending purchaser can with certainty find all the deeds and nearly every burden that can attach to the land he wishes to buy; so that he can almost at a glance ascertain what are the dangers and drawbacks attending the transaction. See REGISTRATION OF DEEDS AND WRITS. In Scotland the expense of the conveyance of land falls on the vendor, if there is no agreement to the contrary, and the vendor's solicitor prepares and tenders the draft conveyance, while the purchaser pays his own solicitor for perusing and approving the draft conveyance; but in practice the expenses of conveyance are usually equally divided between vendor and purchaser.

SALE OF GOODS AND OF LAND (*ante*). The term sale, though applied in ordinary language to the transfer of real property, properly applies only to the transfer of personal property. As to the transfer of real estate, see CONVEYANCE and the titles there cited. To make a valid sale requires three things: 1. A thing to be sold. Though if one sell a thing which was destroyed at the time of the sale, there is no sale; so if a mistake were made as to the thing sold. 2. A price agreed upon; and this price must be certain, though it may be left to a third person to fix it; it must be fixed in money, or the trans-

action is a barter. 3. The consent of the parties to the contract, i.e., an agreement on the part of the seller to sell a certain thing to the buyer for a certain price, and of the buyer to buy the same thing for the same price. In the absence of evidence of a sale on credit, an agreement for instant payment is presumed; in default of which the vendor may recover the goods. If the goods have been actually delivered, and part payment or earnest made by the seller, the presumption of payment is rebutted; but though earnest be accepted, the vendee cannot take the goods, unless that be a condition of sale, and if he fail to appear within a reasonable time, on request, the vendor may rescind the contract. If, however, the terms of sale expressly agree upon a future payment or delivery, the property vests at once in the vendee. The vendor cannot bring suit for the price till he has made tender, or delivery of the goods. If the price be unpaid, whether the sale be for cash or not, the vendor has a lien upon the goods for the price while he keeps possession of them; but he loses his lien by delivering the goods. A sale unaccompanied by a delivery is not good against an innocent third purchaser without notice. Delivery is not necessary for the validity of the agreement as between vendor and vendee; but as between the vendor and his creditors, want of delivery is a strong, though not conclusive, evidence of fraud. If the goods be of such kind that delivery is impossible, a personal possession by the vendee is not necessary. Whenever, in a contract of sale, the parties agree upon the performance of a particular act by either of them, in regard to the object sold, there is a conditional sale. A common instance of it occurs in the case of the so-called "contracts of sale or return" where the vendee receives possession of the chattels, and may either retain them or return them within a time specified; and if he do not return them the sale is complete. As to the sale of goods *in transitu*, in case of bankruptcy or insolvency of the vendee, while the price is unpaid, see STOPPAGE IN TRANSITU.

SALEM, a co. in s.w. New Jersey bounded by the Delaware river on the w., and drained by several creeks; traversed by the West Jersey railroad and its branches; 540 sq.m.; pop. '80, 24,580—23,698 of American birth. The surface is in general level and fertile; wheat, corn, oats, sweet-potatoes, and dairy products are the staples. There are many factories of carriages, harness, paper, machinery, and other articles. Co. seat, Salem.

SALEM, a city and port of entry of Massachusetts, 14 m. n.e. of Boston, on a peninsula 2 m. long by $\frac{3}{4}$ of a mile broad, with irregular but well-built streets, and a fine harbor, from which was formerly carried on a large trade with China, the East Indies, and eastern Africa. The principal institutions of Salem are: the East India marine society, whose extensive and unique museum of oriental curiosities is now united with that of the Peabody academy of science; the Essex institute, with a library of 18,000 vols., and a picture gallery; and the Salem atheneum, with a library of 13,000 vols. There is a normal and high school, 5 newspapers, 7 banks, 20 churches, a cotton-mill with 65,000 spindles, and manufactures of chemicals, varnishes, leather, shoes, machinery, etc. Salem was settled in 1626, and is the oldest town, except Plymouth, in New England. The first church was organized in 1629. In 1692 a great witch mania broke out, and 19 persons were hanged for "witchcraft." In the war of the revolution, Salem sent out 153 privateers, which took 455 prizes. Pop. '60, 22,252; '70, 24,117; '75, 26,063.

SALEM (*ante*), capital of Essex co., Mass., on the Eastern railroad, and for a long time was the most populous city in the county. The harbor, though safe and spacious, has not sufficient depth of water for large vessels; the foreign commerce, formerly large, has been transferred to Boston and New York; but the coasting trade is extensive, large quantities of coal being landed here, and sent by rail to the interior. The fisheries, which ceased when the East India trade was prosperous, have again become important. Ice is shipped in large quantity. The city has an alms-house, a hospital, an orphan asylum, 20 churches, a high school, a state normal school for girls, a city hall, a court-house, a dispensary, a reformatory, a custom-house, 7 national banks, 2 savings banks, and 5 insurance companies. Manufacturing is a prominent interest. The streets are lighted with gas, and the city is supplied with water by aqueduct from Wenham lake, 4 m. distant. In the e. part of the city is a fine park of $8\frac{1}{2}$ acres, called Washington square. Harmony Grove cemetery, containing 65 acres, is in the w. part. The city is connected by the Salem and Lowell railroad with Lowell, by the Eastern railroad with Boston, and by branch railroads with Marblehead, Lawrence, and Wakefield. Horse-cars run through the principal streets and to the adjacent towns. In 1774, Oct. 7, in this city, the house of representatives of the province of Massachusetts, with John Hancock in the chair, declared itself an independent political power. At the North Bridge, Feb. 14, 1775, col. Leslie, the British commander, was foiled in his search for cannon and compelled to return to Boston. More than 150 privateers sailed from this port in the revolutionary war, capturing 445 British vessels. Salem introduced and long carried on the East India trade; its merchants were among the most thriving and enterprising of any in America in the last century.

SALEM, a city in e. New Jersey, the co. seat of Salem co.; on a branch of the West Jersey railroad; pop. '80, 5,057. It is pleasantly situated on Salem creek, 14 m. s.e. of Wilmington, Del. It has many beautiful residences, a court-house, 11 churches, a col-

legiate institute, a conservatory of music, a national bank, and two newspapers. Canning fruit is one of its leading industries, and it is the shipping point for the produce of a fruit and grain growing country. Among its manufactures are glassware, iron, flour, hollow ware, and oil-cloth, and it has fruit-canning establishments and ship-yards.

SALEM, a village in n.e. Ohio, on the Pittsburg, Fort Wayne and Chicago railroad; pop. '70, 3,700. It is in Perry township, Columbiana co., 20 m. s.w. of Youngstown; the center of a fertile agricultural district. It contains 5 churches, 2 Friends' meeting-houses, water-works, gas-works, 2 national banks with an aggregate capital of \$325,000, 2 private banks, and 2 newspaper offices. Its leading industries are the manufacture of flour, galvanized iron-cornices, engines, furniture, stoves, etc.

SALEM, the capital of Oregon and seat of justice of Marion co., on the e. bank of the Willamette river and on the Oregon and California railroad, 28 m. n. of Albany and 50 m. s. of Portland; pop. '80, 5,000. It has connections about 8 months of the year with Portland by steamers, which ascend the river to this point. The streets are straight and 99 ft. wide. The city is surrounded by a fertile prairie, and is furnished with water-power by the falls of Mill creek. It contains the state capital, a new building 261 ft. in length, 75 ft. wide, with wings projecting 100 ft.; a state library of 7,000 volumes, the state prison, a brick court-house finished in 1874, a deaf and dumb asylum founded in 1873, and an institution for the blind, the Willamette university, organized in 1851, an academy, churches, banking-houses, daily and weekly newspapers. It has manufactories of woollen goods, farming implements, leather, lumber, oil, sash and doors, flour mills, foundry and machine shops. It was settled in 1834, incorporated as a city in 1853, and made the capital in 1860. It is the second town in population in the state.

SALEM, a t. in s.w. Virginia, on the Roanoke river and the Atlantic, Mississippi and Ohio railroad; 145 m. s.w. of Richmond; pop. about 2,000. It is built at the head of the valley of Virginia, between the Blue Ridge and the Alleghany mountains, and is celebrated for the salubrity of its climate and charming scenery; sulphur and chalybeate springs are an additional attraction for summer residents, invalids, and tourists. It contains several hotels, a national bank, 2 public schools for white and colored pupils, 2 newspapers, a monthly magazine, 8 churches, and a fine town hall. It is the seat of Roanoke college, Lutheran, founded 1853, with a library of 16,000 vols., a valuable cabinet, and chemical and philosophical apparatus. It is also the seat of the theological seminary of the Evangelical Lutheran church, removed from Lexington, S. C., 1873. The river furnishes water-power, which is utilized by tobacco factories and manufactories of chairs, carriages, etc.

SALEM, a t. in the s. of India, capital of the collectorate of the same name. The collectorate is the chief seat of the Indian *steel manufacture*—a branch of industry as curious as it is ancient. The town stands in an elevated valley, 1070 ft. above sea level, bounded on the n. and s. with hills, 193 m. s.w. of Madras. It is well built, contains a number of handsome two-storied houses, and is surrounded by land in a high state of cultivation. Cotton is grown in the vicinity in quantity more than sufficient for the use of the numerous cotton weavers, who, together with the silk weavers, form the great mass of the non-agricultural inhabitants of the town. Pop. 50,000.

SALEMI, a t. of Sicily, in the province of Trapani, 39 m. s.w. from Palermo. Pop. about 12,000.

SALEP, the tubers of many species of *orchis* and other *orchideæ*, dried and used as an article of food. Of the two tubers usually found at the roots of these plants, only one is gathered for salep, the younger and more solid of the two. The tubers are gathered when the stalk is about to fall. They vary from the size of a cherry-stone to that of an olive. They are cleaned, dipped for a few minutes in boiling-water, and dried as quickly as possible, by which process they are rendered hard and horny. The greater part of the salep of commerce is brought from the east, and much of it from Persia; it is supposed to be obtained from species of *culophia*; but most of the European species of *orchis* are used for it.

Before coffee became so common in Britain, salep was an article of considerable importance, and large quantities were imported from Turkey, Persia, and India. In France it is still in considerable request. For use it is ground into a fine powder, and mixed with boiling water, sugar and milk being added according to taste. As a diet-drink, it was considered very nutritious and wholesome, and forty years ago it was sold, ready prepared, to the working-classes of London early in the morning from the numerous street stalls. Its principal constituents are *bassorine*, starch, and phosphate of lime.

SALERATUS (saturated salt), a name long ago applied to an imperfectly carbonated bicarbonate of potash, made by exposing a neutral carbonate to the action of carbonic acid gas. The salt may be considered as a sesquicarbonate of potash. It has been displaced for culinary purposes by bicarbonate of soda, a more preferable article, and more easily assimilated by the system. See *POTASSIUM* and *SODIUM*, *ante*.

SALERNO (ancient *Salernum*), a city of southern Italy, chief t. of the province of Salerno, on the gulf of the same name, 32 m. e.s.e. of Naples, with a pop., '72, of 20,610.

A Gothic wall, built of huge stones without mortar, encircles it; the streets are paved with lava, and, with the exception of the two principal ones, are narrow, irregular, and dirty. It has a strong castle, and a very small harbor. The old and beautiful Gothic cathedral was erected by the Normans, and has around it a portico of porphyry and granite pillars brought from Paestum by Robert Guiscard. It has many famous sepulchers, among others, those of Robert and Guillaume Guiscard, of Margaret of Anjou, and of Gregory VII. It was celebrated in the middle ages for its school of medicine (the *Schola Salernitana*), founded by Robert Guiscard about the end of the 11th c., and which was long the first medical school in Europe. The university has fallen into decay. In its neighborhood, which produces excellent wine, are the ruins of Paestum, which was destroyed by the Saracens in the 9th century. Of ancient Salernum, or Salurnum, there still exist the temple of Neptune, that of Ceres, and the ruins of an amphitheater and of a theater. Salerno was founded by the Greeks; it became important under the Roman empire, then passed into the possession of the Goths, and of the Lombards. Robert Guiscard made himself master of it in 1076. Charles V. united it to the kingdom of Naples.

SALERNO, GULF OF (anc. *Sinus Paestanus*, on whose shores, in early times, the Greek city of Paestum [q.v.] stood), is a nearly semicircular indentation on the western shores of southern Italy, s.e. of the bay of Naples, from which it is separated by the promontory ending in Point Campanella. The gulf is 36 m. wide at its entrance, and sweeps inland for 24 miles. On its shores are the towns of Amalfi and Salerno.

SALES, FRANCIS DE, a most distinguished saint of the Roman Catholic church, was b. Aug. 21, 1567, at the family castle of Sales, near Annecy in Savoy. He was the heir of the family honors, and his education was designed by his father to fit him for the career of distinction to which his position seemed to entitle him. From the provincial colleges of La Roche and Annecy, he was sent to Paris in 1578, where he entered the then brilliant school of the Jesuits, and completed under their care the course of rhetoric and philosophy. In 1584 he went to Padua, for the course of civil law, and pursued his studies there with great distinction till 1591. At this time his father, who had obtained for him a place in the senate, proposed to him a very brilliant and advantageous marriage, but he had already resolved to devote himself to the ministry, and with much difficulty obtained his father's consent to enter into orders in the diocese of Geneva. He soon became distinguished as a preacher, and the zeal with which he discharged the ordinary duties of his ministry was no less remarkable. Very soon after his ordination he was employed by his bishop in a mission for the conversion of the Calvinistic population of Chablais, which had been recently annexed to the duchy of Savoy, and in which the duke was desirous of having the Catholic religion re-established. The success of this mission was almost unprecedented. With a companion equally devoted, he traveled on foot from town to town, and in a short time he succeeded in reclaiming many to the church. One of the most remarkable incidents of his mission was a conference with the celebrated Calvinist leader, Theodore de Beza. Of this interview very different accounts are given by the rival partisans; but all agree in admiration of the gentleness and enlightened liberality of Francis de Sales. At the termination of this mission, Francis was, in 1596, appointed coadjutor to the bishop of Geneva, Mgr. Granier, with the title of bishop of Nicopolis. It was with much difficulty that the pope, Innocent IX., induced him to accept this dignity. Some time afterward, having occasion to go to Paris, he was invited to preach the lent in the chapel of the Louvre; and his lectures, which were partly controversial, were reputed to have had so much influence in bringing about the conversion of several of the Huguenot nobles, that the king tried to induce him to accept a French bishopric; but in vain. He returned to his diocese; and soon afterward, on the death of Mgr. Granier, he succeeded to the bishopric of Geneva. His administration of this charge, upon which he entered in Dec., 1602, was beyond all praise. Being again invited to preach the lent at Dijon, in furtherance of the plans of Louis XIV. for the conversion of the Huguenots, he was again pressed by that monarch to accept a French bishopric. But he again declined this honor, as he also declined in 1607 the offer of the cardinalate from the pope Leo XI. It was about this time that he published his well-known *Introduction to a Devout Life*, which has continued to the present day one of the most popular manuals of piety and the ascetic life. Among his measures for the renovation of the monastic spirit, a very important one was the establishment of a congregation of nuns of the order of the Visitation, under the direction of the now celebrated Mme. de Chantal, with whom he long maintained a correspondence on every subject connected with the spiritual and religious life, which was published in 1660, and which still remains a subject of almost undiminished interest for the spiritualist. In 1608 his infirmities compelled him to solicit the assistance of a coadjutor in the charge of his diocese. He continued, however, to labor to the last. His last sermon was delivered at Lyons, on Christmas eve in 1622; on Christmas-day he was seized with paralysis, and on the 28th of the same month he expired. He was buried in the church of the Visitation in that city, but his remains were afterward translated to Annecy. More than 40 years after his death, in 1665, he was solemnly canonized as a saint by Alexander VII. His festival is held on Jan. 29, the day of the translation of his relics to Annecy. His works were published in a collected form in 2 vols. folio at

Paris in 1641; but the separate works (especially the *Devout Life*, which has been translated into almost every European language), have passed through innumerable editions, and still retain their popularity.

SALEYER ISLANDS, Three, lie in the Indian ocean, to the s. of Celebes. Upward of thirty of the group are small, hilly, densely wooded, and, with few exceptions, uninhabited. Great Saleyer, in $5^{\circ} 44' - 6^{\circ} 26'$ s. lat., and $120^{\circ} 23' - 120^{\circ} 37'$ e. long., is upward of 40 m. in length, and 7 in breadth, the area being 336 sq. miles. The mountains on the e. coast rise abruptly out of the sea, and along the w. is a slip of level land planted with cocoa-nut trees. Pop. 60,000. Great Saleyer and the smaller islands produce fine timber, including ebony and teak. Indigo, coffee, and mustard are grown; but millet, maize, earth-fruits, and cotton are the staple cultures, the grounds being carefully fenced. Agriculture is the chief employment, and fishing, making salt, etc., are also carried on. The exports are cocoa-nuts, cocoa-nut oil, cotton, and cotton fabrics. Imports—rice, gambir, tobacco, yarns, iron and copper wares. Since the Netherlands' government made Macassar a free port, sea-going ships are not permitted to anchor at Saleyer; and the trade is carried on by small vessels, which sail between that island, the light of Boni, Sumbawa, Bali, Borneo, Java, Macassar, and Singapore. The sea is rich in various kinds of fish—a long and thin species, the Saleyer, giving a name to the island. Value of oil exported in 1874, £8,174.

The Saleyer islands are governed by fourteen rajahs, superintended by a Netherlands agent. The natives are Mohammedans, each large village having a mosque and priest. The high priest resides near the political agent, has a seat in the council, and is consulted on religious questions. Some of the rajahs and notables have tables and chairs, tea and dinner services, silver spoons and forks, mattresses, cushions, and even satin bed-curtains.

SALFORD, a municipal and parliamentary borough, Lancashire, is considered as virtually a portion of the city of Manchester (q.v.).

SALIANS or **SALIC FRANKS**, a tribe of Germans who originally inhabited the country between the Meuse and the Rhine, but in the 5th c. invading and conquering Gaul under Clovis, they founded the French monarchy. They are called Salians, perhaps from the river Saale in Saxony, on the banks of which they lived before they emigrated to Gaul. Their code of laws was called Salic law (q.v.).

SALICINE ($C_{26}H_{18}O_{14}$), is a member of the group of organic compounds to which the term *glycosides* has been recently applied by chemists—a group which is specially characterized by the fact, that each of its members, when exposed to certain chemical agencies, breaks up (usually after the absorption of water) into glycoses (or grape-sugar) and other compounds. It occurs in the bark of the various species of willow, and poplar, in the blossoms of several species of *spiraea*, and probably in the animal secretion known as *castoreum*. It may be obtained in small, colorless, glistening prisms of an intensely bitter taste, which are readily soluble in hot water and in alcohol, and moderately soluble in cold water, and are insoluble in ether and oil of turpentine; and its solutions exert a left-handed rotatory action upon a ray of polarized light. When heated to 248° , salicine fuses; and at a higher temperature, it is entirely decomposed. It dissolves in strong sulphuric acid, the solution being of a purple or blood color. Salicine is manufactured to a considerable extent as a cheap substitute for quinia. There are various modes of extracting it from the macerated bark; and 1 pound of the bark of *salix pentandra* yields, according to Erdmann, 5 drams of salicine. If it is not so certain in its action as a febrifuge as quinia, there can be no doubt that it is an excellent tonic; and it possesses this advantage over the latter substance, that it is less liable to irritate the stomach. Dr. Neligan, in his excellent work on *Medicines*, states that he has used it very extensively as a tonic in the debility following acute diseases, particularly in cases accompanied by irritability of the digestive organs, and considers its powers to be fully equal to those of sulphate of quina. As a tonic, two grains may be given three or four times a day; as a febrifuge, from one to two scruples in divided doses, during the intermission. It may be prescribed as a powder mixed with sugar, or dissolved in water, with the addition of some agreeable syrup.

SALIC LAW. The code known as the *salic law* is a collection of the popular laws of the Salic or Salian Franks (see FRANKS) committed to writing in barbarous Latin in the 5th c., while the people were yet heathens. There exist several texts of this code, and considerable obscurity rests over its history. It relates principally to the compensation and punishment of crimes, and there is a chapter containing provisions regarding the succession to what are called *salic lands*, which seems to have been inserted at a later date. It is difficult to determine precisely what these lands were. The *terra salica* was probably so called from its being more especially attached to the *sal* or hall of the lord or proprietor (some derive *salic* as applied to the people from the same word); it thus came to designate inherited land as opposed to property acquired otherwise. Although the Frankish law did not in general exclude females, the succession to these Salic lands, whatever they were, was confined to males, probably from the importance of securing the military service of the chief proprietors. It was but a doubtful analogy that led the rule of succession to Salic lands to be extended to the succession to the French crown, and it seems to have been only in the 14th c. that the exclusion of females from

the throne became an established principle. The accession of Philip the Long was probably the first occasion on which it received public sanction, and the fact that Edward III. rested his claim on female succession, doubtless led to that instance being regarded as an unquestionable precedent for all future time.—See Hallam's *Europe in the Middle Ages* (ch. ii. pt. 1, and notes); Guizot *Essais sur l'Histoire de France*, p 94.

SALICYLIC ACID AND SALICYLATES. Salicylic, or ortho-oxybenzoic acid, occurs in a free state in the flowers of meadow-sweet (*spirea ulmaria*) and as a methylic ether in oil of wintergreen (*gaultheria procumbens*), from which it may be obtained by distillation with potash. See GAULTHERIA and WINTERGREEN, Oil of. The resulting salicylate of potassium is then decomposed by hydrochloric acid. It may also be obtained from salicine, indigo, and some other organic matters by adding to them hydrate of potassium heated to fusion. It is, however, more commonly prepared by heating carbolate of sodium in a stream of carbonic acid gas. Carbolate of sodium in solution is introduced into a retort and the carbonic acid passed through it by means of a glass tube while heat is applied to the retort, gradually heating from 212° Fahr. to 428° Fahr. and not higher than 464°. Carbonic acid enters into the molecule of carboic acid (phenol), producing salicylate of sodium and carbonate of sodium, while one-half of the carboic acid distils over. The following equation represents the reaction: $2(\text{NaC}_6\text{H}_5\text{O}) + \text{CO}_2 = \text{Na}_2\text{C}_7\text{H}_5\text{O}_3 + \text{C}_6\text{H}_6\text{O}$. The residue in the retort is then dissolved in boiling water, filtered, and decomposed by muriatic acid. On cooling, impure salicylic acid, having a reddish-brown color, is precipitated in the form of a crystalline powder. In the last operation the reaction is as follows: $\text{Na}_2\text{C}_7\text{H}_5\text{O}_3 + 2\text{HCl} = 2\text{NaCl} + \text{C}_7\text{H}_6\text{O}_3$, which latter body is salicylic acid. Chloride of sodium (common salt) remains in solution. The impure acid is purified by dissolving it in boiling water or weak alcohol, treating the solution with animal charcoal, adding a little hydrochloric acid, and crystallizing the filtrate. Squibb purifies by subliming with the aid of steam heat. By the above process the acid is obtained in small acicular crystals; white, inodorous, and of an acid, acid-sweetish taste. It may be obtained from the alcoholic solution by spontaneous evaporation, in large, monoclinic prisms, and if the aqueous boiling solution is slowly and carefully cooled it may be crystallized in long, slender needles of the same crystalline formation. It requires about 1800 parts of cold water to dissolve it, and the aqueous solution imparts a deep, beautiful violet color to ferric salts. It melts at 311° to 312° Fahr., and if carefully heated sublimes unaltered. By increasing the heat carboic acid is given off, and when still more highly heated with powdered glass and quicklime it is decomposed into both carboic and carbonic acids (CO_2 and $\text{C}_6\text{H}_6\text{O}$). It decomposes carbonates with effervescence, forming salicylates with the bases. Salicylate of sodium is prepared in two ways: by neutralizing the acid with caustic soda or by neutralizing with carbonate and bicarbonate of soda, evaporating to dryness in either case. By the first method the composition of the salt is $\text{Na}_2\text{C}_7\text{H}_5\text{O}_3$, but by the second method, $\text{NaHC}_7\text{H}_5\text{O}_3$; a molecule of hydrogen replacing one of the sodium molecules. Salicylate of ammonium is prepared in a similar manner by neutralizing the acid with ammonia or carbonate of ammonia and evaporating, the acid salt crystallizing in needles. If the liquid is rendered alkaline by excess of ammonia, the neutral salt will be formed. These salts are readily soluble in water. Salicylic acid and the salicylates, particularly the two just described, have been recently used to a considerable extent in medicine. Plants watered with salicylic acid die soon because the acid prevents those organic changes necessary to assimilation. It will prevent the germination of seeds, acting in this respect like carboic acid, by arresting the action of diastase on the germ. This is the peculiar action of most organic antiseptics, and is the cause of its beneficial action as a medicine in cases where it is applicable. Physiological action on animals: If a grain of salicylate of sodium is introduced under the skin of a frog the animal soon becomes languid and the heart paralyzed. When administered to animals in sufficient doses it produces paralysis of the spinal nerves. Rochefontaine concluded that the acid, 1, impairs the general reflex sensibility by its action on the brain and spinal cord; 2, muscular contractility is suspended; 3, respiratory movements are suspended; 4, the heart's action is arrested. More recent observers say that the primary action of salicylate of sodium increases the cardiac force and that paralysis is a secondary or reactionary effect. The results of various experiments are conflicting. According to Fürbringer the acid has no power in reducing the temperature in inflammatory fever, but has such power in septic fever. Zimmerman, however, found that septic fever resulting from injecting putrid fluids in the veins of rabbits was not controlled by the acid, a result which might have been expected. Such experiments have but little value to the medical practitioner. As regards the effects of salicylic acid and salicylates upon the human organism, very large doses cause severe headache, muscular weakness and tremor, tingling in the extremities, and raising the pulse to 140 beats per minute. The urine gives a violet color on the addition of perchloride of iron soon after administration, showing a rapid passage through the system. It undergoes some change, however, in passing through the kidneys, because the urine does not have the power of checking fermentation. The effects vary with circumstances and with different individuals. A patient having rheumatism took six drams of salicylate of sodium in the course of 22 hours, and suffered no pain in the stomach, but the appetite was improved. In one

case alarming symptoms, attended with delirium, followed the administration of one dram. Sometimes there is roaring in the ears, disorders of vision, maniacal fury and loss of power in the limbs. Gastric disturbance sometimes takes place resembling that of corrosive poisoning. Children are more apt to be affected in this way than adults. In one case of articular rheumatism a rapid cure was thought to be taking place, when buzzing in the ears, profuse sweats and extreme prostration came on, and the patient died suddenly. Abelin states that acute nephritis (inflammation of the kidney) may occur during the use of the drug. A case of urticaria is recorded as having taken place from its use. In acute inflammations there is much contradictory evidence in regard to the use of the medicine. One physician boasting of the antiphlogistic action of salicyline reported a mortality of 11 cases out of 35, an unfavorable result. In diphtheria some report favorable and others unfavorable results. There is but little doubt however, that when carefully administered in smaller doses than, unfortunately, are too often employed in modern practice, it may prove beneficial in some cases of septic disease, and in hay fever. It has been reported to have cured cases of diabetes, but this may be doubted; it may have suspended the elimination of sugar by the kidneys, but such an action does not necessarily constitute a cure of this disease, which is one essentially of assimilation and nutrition, depending usually on a profound affection of the nervous system, and not to be gotten rid of in any summary manner. As an external application it has been used with benefit in several skin diseases, but it is probable that in all the cases in which it has been used internally and externally, an equal or better effect could have been accomplished by minute doses and applications of carbolic acid. As to its administration, that is to be left entirely to the physician, whether given in the form of salicine (q.v.) salicylic acid or salicylates. It may be remarked here that when salicine is given it is converted in the organism into salicylic acid.

SALIENT, in heraldry, an attitude of a lion or other beast, differing but slightly from *rampant* (q.v.). He is supposed to be in the act of springing on his prey, and both paws are elevated. Two animals *counter-salient* are represented as leaping in opposite directions.

SALIENT, in fortification, is that which points outward from the interior of any work. For example, the central angle of a bastion, pointing toward the enemy, is a salient angle.

SALIEN-TIA, a name sometimes applied to the order *batrachia*, or *anoura*, embracing the frogs, tree-frogs, and toads. See **BATRACHIA**, **FROG**, **TREE-FROG**, and **TOAD**, *ante*.

SALITÉRI, ANTONIO, 1750-1825; b. in the state of Venice; studied music in St. Mark's cathedral, and in 1766 at Vienna under Gassman. In 1770 he produced his first opera, *Le Donne Letterate*. He became famous as a composer of dramatic and church music. Of his operas, *Les Danaïdes* and *Tarare* are considered the best. He wrote in all 46 operas, 3 oratorios, 8 cantatas, 2 symphonies, and many miscellaneous compositions.

SALIFEROUS SYSTEM, the name given by the earlier English geologists to the new red sand-stone (q.v.) formations, because the deposits of salt in England occur in these strata. As, however, this substance has been found associated with strata of all ages in different parts of the world, the name has been given up.

SALIFIABLE BASE, a term applied in chemistry to any substance capable of uniting with an acid to form a salt.

SALINA, or **SALINI**, one of the Lipari islands (q.v.).

SALINE, a co. in central Arkansas, crossed by the Cairo and Fulton railroad, and drained by Saline river and its branches; 800 sq.m.; pop. '80, 8,953. The surface is undulating, and partly covered with forests of oak, hickory, and pine; the soil is fertile. The principal products are corn, tobacco, honey, butter, wool, and cotton. It contains large quarries of marble and soapstone, also slate and blue limestone. Co. seat, Benton.

SALINE, a co. in s. Illinois, drained by the middle and s. forks of the Saline river, on the St. Louis and South-eastern, and the Cairo and Vincennes railroads; about 390 sq.m.; pop. '80, 15,940-15,809 of American birth. The surface is rolling and heavily timbered. The soil is fertile. The principal productions are corn, wheat, tobacco, and live stock. Co. seat, Harrisburg.

SALINE, a co. in central Kansas; drained by the Smoky Hill and Saline rivers; traversed by the Kansas Pacific railroad; 720 sq.m.; pop. '80, 13,810-10,398 of American birth. The surface is mostly fertile prairie; wheat, corn, oats, hay, potatoes, and butter are the staples. Co. seat, Saline.

SALINE, a co. in central Missouri, bounded n. and e. by the Missouri river, and drained by branches of La Mine river; 750 sq.m.; pop. '80, 29,938-28,683 of American birth, 4,936 colored. The surface is mostly prairie land, and the soil rich. Coal, lead, and building stone, are found. Tobacco, corn, sweet-potatoes, and sorghum are staples. Co. seat, Marshall.

SALINE, a co. in s.e. Nebraska, crossed by the Burlington and Missouri River railroad, and drained by the Big Blue, and the north fork of Turkey creek; 576 sq.m.;

pop. '80, 14,491. The surface is rolling; the soil is fertile. The principal productions are corn, hay, live stock, and potatoes. Co. seat, Pleasant Hill.

SALINE PLANTS are those which require for their healthy and vigorous growth a considerable supply of *chloride of sodium* (common salt) and other salts, and which are therefore limited to peculiar situations. Few of them are strictly aquatic plants, except the marine alga, or sea-weeds, which grow immersed in salt water, either always or in certain states of the tide, and derive their nourishment from it through their fronds, and not by roots, from the rock to which they are attached. Grass-wrack (q.v.), however, is an instance of a phanerogamous plant living entirely and always immersed in salt-water. Other phanerogamous plants grow chiefly or only on the sea-shore and in salt marshes. Some of these, however, as the sea-kale, may be cultivated in gardens remote from the sea, but they succeed best when liberally supplied with salt. Asparagus is another well-known garden-plant, which derives much benefit from similar treatment. Some of the saltworts (q.v.) and other saline plants yield much soda when collected and burned, and the produce was at one time largely imported into Britain from Spain and other countries under the name of *barilla* (q.v.). The dry steppes of Russia and Tartary, having in many places a strongly saline soil, are covered with a very peculiar vegetation. Among the ornaments of these steppes is *halimodendron argenteum*, a shrub of the natural order *leguminosae*, often cultivated in gardens for its beautiful rose-colored flowers and silvery-gray leaves. Saline plants have their whole tissues impregnated with salt.

SALINE POWDER, COMPOUND, is a very popular and harmless form of aperient medicine. The ordinary method of preparing it is by drying, at a gentle heat, and then pulverizing 4 oz. of pure chloride of sodium (common salt), 4 oz. of sulphate of magnesia (Epsom salts), and 3 oz. of sulphate of potash. These salts must then be mixed and triturated together, and kept in an air-tight vessel. Two or three drams dissolved in half a pint of water, and taken before breakfast, usually act efficiently. Dr. Neligan states that if 4 oz. of sulphate of soda be used instead of the sulphate of potash, and a sufficiently high temperature be employed to expel all the water of crystallization from the different ingredients, one dram of the resulting compound acts as energetically as two or three drams of the ordinary powder.

The following is a more agreeable form than the preceding, and equally efficacious. Take half an ounce of carbonate of magnesia, and an ounce of each of the following substances—viz., sulphate of magnesia, bicarbonate of soda, tartrate of soda and potash, and tartaric acid. Expel all the water of crystallization, and mix. This powder, if kept dry, effervesces when mixed with water, and one or two teaspoonfuls form the average dose. The addition of a drop of oil of lemon and a little powdered white sugar to each dose, makes this one of the most agreeable laxatives that can be prescribed.

SALINS (anc. *Salinae*), a t. of the department of Jura, France, 52 m. n. by w. from Geneva, on the Furieuse, a feeder of the Doubs. It is situated in a narrow rocky gorge between two lofty hills, looking upon a fertile and beautiful valley. It derives its importance from its salt-works, from which also it has its name. The salt is obtained from brine-springs, and the evaporation of the brine is mostly carried on in a great building, in the valley below the town, which has long borne the name of the *Salines Royales*; but that of the weaker springs is conveyed in pipes to the forest of Chaux, 15 m. off, where it is first slowly evaporated in *maisons de graduation*, and afterward by boiling. There are iron-works, soda-factories, tanneries, and quarries of gypsum in Salins and its immediate neighborhood. Pop. '76, 5,577.

SALISBURY, a village in n.w. Connecticut, on the Housatonic river and the Connecticut Western railroad; pop. '80, 3,715. It is in Litchfield co. in the midst of a fertile region, noted for its picturesque scenery. The surface is mountainous, and in the vicinity are 5 beautiful lakes. It is 63 m. from Hartford. Iron ore abounds. It has 7 ore mines, 2 blast furnaces, the railroad repair shops of the Housatonic railroad, 2 iron foundries, 2 woolen mills, and a manufactory of railway car wheels. It is the seat of an institution for feeble-minded persons, and comprises the villages of Salisbury, Chapinville, Lakeville, Lime Rock, and Ore Hill. Its scenery makes it an attractive summer resort.

SALISBURY, or **NEW SARUM**, the capital of Wiltshire, is an episcopal city, and a municipal and parliamentary borough, and stands in a fertile valley on the Avon, at the junction of that river with two of its affluents, 83 m. s.w. of London by the South-western railway, and 23 m. n.w. of Southampton by a branch of the same. Its several parts are connected by 3 bridges. The town dates from 1220, in which year the cathedral was founded, and the inhabitants of Old Sarum (see SARUM, OLD), 2 m. to the n., removed to Salisbury, attracted to the new site by the abundant supply of water. At the foundation of the town, the ground was divided into squares, or "chequers" as they are called, to which the town is indebted for its appearance of airiness and regularity. The cathedral, the principal building of Salisbury, is one of the finest specimens of early English in the country. It was begun in 1220, and was finished in 1258. The spire, which was added after the building was completed, is the "most elegant in proportions and the loftiest in England." Its height from the pavement is 400 ft., only 60 ft. less than that in

Strasburg. The cathedral is 449 ft. long; height in the interior, 81 ft.; width of great transept, 203 feet. It is in the form of a double cross, is perfect in its plan and proportions, and in the main uniform in style. The w. front is still rich, beautiful, and graceful, though now denuded of statues, upward of 100 in number, with which it was once enriched. The cathedral has been recently restored. The manufactures of cutlery and cloth, for which it was once famous, have long declined, and its trade is now chiefly in retail. Pop. '71, 13,839. It returns two members to parliament.

SALISBURY, EDWARD E., a distinguished oriental scholar and linguist, professor of Sanskrit at Yale college for 13 years, from 1841, and of Arabic for nearly 20 years. Prof. Salisbury has for many years been editor of and contributor to the *Journal* of the American oriental society, of which he was one of the founders. The present Sanskrit professorship of the college was endowed by him.

SALISBURY, ROBERT ARTHUR TALBOT GASCOYNE CECIL, Marquis of; b. England, 1833; educated at Eton and Oxford. He was a conservative member of parliament, 1853-68, when he succeeded to the title. During this time he contributed much to periodicals. He was secretary of state for India in lord Derby's third administration in 1866, but resigned the next year, differing with him as to the reform bill. He was again secretary of state for India in the Disraeli cabinet of 1874. Two years later he was sent as special ambassador to Turkey, and with sir Henry Elliot represented Great Britain at the conference of Constantinople, in whose proceedings he took a leading part. In 1878 he succeeded lord Derby as secretary of state for foreign affairs, and soon afterward, with the earl of Beaconsfield, represented Great Britain at the conference of Berlin. He went out of office with the Beaconsfield administration in 1880, and has since vigorously opposed the foreign policy of the Gladstone government. He is now (1881) leader of the conservatives in the house of lords, and a candidate for the leadership of that party.

SALISBURY PLAIN, an extensive tract of undulating chalk country, in Wiltshire, between Salisbury and Devizes, about 20 m. long from n. to s., and about 14 m. broad. Its rolling surface resembles that of the ocean heaving after a storm. On this plain, about 8 m. n. of Salisbury, is Stonehenge (q.v.). Until within recent years, the expanse of Salisbury plain remained in a state of nature, and was covered with a fine turf, which afforded pasture to sheep. The natural features of the plain, however, are now much changed. North and s. of Stonehenge, wild slopes of thistle-covered turf still extend; but both e. and w. of it, the country is laid out in cultivated fields; and within gun-shot of the desolate old relic, is a neat modern farm-house.

SALISHI, or **SELISHI**, an Indian family of the Columbian group, in Idaho, Montana, and Washington territories; between the Sahaptins and the Shushwaps. They comprise the Flatheads in Montana; the Spokanes on the river of that name; the Skitsuish on lake Skitsuish; the Pisuorises on the Columbia; the Kalispels, of whom there are three groups, and the Colvillis, about Kettle Falls, on the Columbia. Many of these tribes are Roman Catholics. Their language and customs are not much different from a number of tribes of the Shushwap family.

SĀLIVAHANA is the name of a Hindu prince who is said to have reigned in Magadha or South Behar. He instituted an era which bears his name, and the beginning of which took place when 3,179 years of the Kali-yuga, or the present mundane age, had expired; that is, 78 years after the beginning of the Christian era. This era is called SĀlīvāhana Sāka, or simply Sāka. Thus 1865 of the Christian era would be tantamount to Sāka (i.e., in the Sāka era), 1787. The Sāka year is the same as, and begins with, the common solar year.

SALIVARY GLANDS. Under this name we designate three pairs of glands—the parotid, the submaxillary, and the sublingual, each gland having an efferent duct, which conveys the glandular secretions into the mouth, where, when mixed with the mucus secreted by the follicles of the mucous membrane lining the mouth, they constitute the ordinary or mixed saliva.

The *parotid gland*, so called from the Greek words *para*, near, and *ous*, the ear, is the largest of the three glands occurring on either side. It lies upon the side of the face immediately in front of the external ear, and weighs from half an ounce to an ounce. Its duct is about two inches and a half in length, and opens into the mouth by a small orifice opposite the second molar tooth of the upper jaw. The walls of the duct are dense and somewhat thick, and the caliber is about that of a crow-quill.

The *submaxillary gland* is situated, as its name implies, below the jawbone, and is placed at nearly equal distances from the parotid and sublingual glands. Its duct is about two inches in length, and opens by a narrow orifice on the top of a papilla, at the side of the *frænum* of the tongue.

The *sublingual gland* is situated, as its name implies, under the tongue, each gland lying on either side of the *frænum* of the tongue. It has a number of excretory ducts, which open separately into the mouth.

The minute structure of the parotid gland is described in the article GLANDS, and the other salivary glands are similarly constituted. True salivary glands exist in all mammals, except the cetacea, in birds, and reptiles (including amphibians), but not in fishes; and glands discharging a similar function occur in insects, many mollusks, etc. The

chemical and physical characters of the saliva are sufficiently described in the article DIGESTION.

The most common disease of the parotid gland is a specific inflammation, which has been already described in the article MUMPS. The term *parotid tumors* is given to tumors of various kinds occurring in front of the ear and over the parotid gland. With regard to surgical interference, Liston recommends that "if there be reason to suspect that the disease is of a malignant nature, and not thoroughly limited by a cellular cyst, no interference is admissible; if, on the contrary, it be at all movable, has advanced slowly, possesses a smooth surface, and is firm, then an operation may be contemplated."

Certain functional disorders of the salivary glands require notice, of which the most important is that known as *salivation* (q.v.), or *ptyalism*, which consists in a much increased secretion of saliva. *Deficient secretion* is indicated by clamminess or dryness of the mouth, and is common in low forms of fever. It is important as indicating the condition of the system, and seldom requires treatment. If it should occur as an original affection, it must be treated by local sialogogues (q.v.), such as liquorice, horse-radish, pellitory, etc. *Alteration of the saliva* is not unfrequent in disease. For example, it sometimes loses its alkaline character, and becomes acid, as in acute rheumatism, diabetes, etc.; whilst in other cases, it becomes so fetid as to be a source of annoyance both to the patient and his friends, as, for example, in scurvy, various forms of dyspepsia, salivation, etc. The undue acidity may be corrected by the administration of carbonate or bicarbonate of soda, while the fetor may be relieved by attention to diet, and by the use, both local and general, of creosote, nitro-muriatic acid, charcoal, chlorate of potash, etc.

Ordinary inflammation of these glands (distinct from mumps) may proceed from cold or local injury, but it is often produced by decayed teeth.

SALIVATION, or **PTYALISM**, (from the Gr. *ptyalon*, the saliva), is the term employed to designate an abnormally abundant flow of saliva. It most commonly arises from a specific form of inflammation of the parotid glands, induced by the action of mercury, in which case it is termed mercurial salivation; but it occasionally arises from the action of other drugs, especially iodide of potassium; and sometimes it occurs without any apparent cause, in which case it is said to be *idiopathic*, or spontaneous.

Mercury, in some form or other, is so common an ingredient in the quack medicines whose advertisements are unfortunately allowed to occupy a large space in many of our newspapers (especially in those medicines which are falsely stated to be of purely *vegetable origin*), that a popular knowledge of the most remarkable manifestations of this powerful mineral should be as widely diffused as possible. When this medicine is given in such a way as to excite salivation, a metallic taste in the mouth is soon recognized by the patient, and a remarkable but indescribable smell, known as the mercurial fetor, may be detected in his breath; the gums become swollen and spongy at their edges, and usually present a few slight ulcers; and an increased flow of saliva takes place, accompanied by pain in the teeth on pressure. If these symptoms be not checked (and *a fortiori* if more mercury be given), the tongue, cheeks, and throat swell and ulcerate, and the saliva that flows away amounts to several pints in the course of the day. This peculiar action of mercury varies extremely in different persons. Dr. Watson, in his 14th lecture, records several remarkable cases in which a single small dose of mercury produced the severest salivation. Cases of the opposite kind, in which no impression on the gums or salivary glands can be made by the freest use of mercury, are by no means uncommon. It is worthy of notice that salivation is rarely produced in children below the age of ten years. Until a comparatively recent period, profuse salivation was deemed the only certain indication that the system was duly under the influence of mercury (and, indeed, it was believed that the cause of the disease was carried out of the body with the saliva); but now it is well known that all that is requisite is, that the gums should become distinctly tender, and that the mercurial fetor should be unmistakably present, and that those symptoms should be kept up for a certain time. Unfortunately, however, the physician cannot always stop the action of the mercury at that definite stage, and salivation to a distressing extent often occurs, even when the greatest care has been taken in the administration of the medicine. To check this excessive salivation, the internal administration of chlorate of potash in scruple doses, three times a day, together with the frequent use of a gargle of the same salt, has been recommended by several high authorities. Dr. Watson strongly advocates the use of a gargle composed of one part of brandy to four or five of water, and the application of moistened tannin to the gums; and when there is much external swelling, he applies eight or ten leeches beneath the edges of the jaw-bones; followed by the application of a soft hot poultice to the neck.

It is worthy of notice that, in the confluent form of small-pox, there is almost always more or less abundant salivation, which lasts for several days; and if it cease abruptly, the peril is usually great. Moreover, there is a more or less marked tendency to salivation in scurvy, hysteria, hydrophobia, some forms of mania, and not unfrequently in pregnancy.

Various cases of spontaneous salivation have been collected by Dr. Watson in his 44th lecture. In one instance of a girl ten years old, under his own care, no less than three pints of saliva were excreted in twelve hours. Medicine had no effect; but the

salivation finally ceased spontaneously after a severe attack of influenza. In these cases, astringent washes, as a solution of alum, or the infusion of catechu, or a few drops of creosote suspended by mucilage in water, are deserving of trial.

SALIX. See **WILLOW**.

SALLE, JEAN BAPTISTE DE LA. See **LA SALLE**.

SAL LEE, or **SIA**, a seaport t. of Morocco, in the territory and former kingdom of Fez, 106 m. w. from Fez. It stands on a low sandy point of the shore of the Atlantic, at the mouth of the Bu-Regreb, on the northern side of the river, while opposite to it, on the southern side, is the town of Rabat. Both Sallee and Rabat were bombarded and nearly destroyed by the French in 1851. Sallee was in former centuries noted as a haunt of pirates, and a *Sallee rover* was the dread of peaceful mariners in the Atlantic and Mediterranean. It is particularly noted for the carpets which it produces, of fine texture and bright colors. They are mostly used in Morocco itself. The chief export from Sallee is wool. Pop. estimated at about 12,000, of whom 3,000 are Jews.

SALLET, FRIEDRICH VON, 1812-43; b. Germany; entered the Prussian army in 1829. In 1830 he was condemned to imprisonment for 10 years, in punishment for a novel reflecting on the military service; but he was released after two months. He retired from the army in 1838. Among his works are *Gedichte*, 1835; *Schön Irla*, 1838; and *Laienerangelium*, 1845.

SALLOW, the popular name of a number of species of willow (q.v.), trees or low shrubs with downy branches, and generally ovate or obovate, wrinkled leaves, having stipules. The **GRAY SALLOW** (*salix cinerea*) is one of the most common British species, growing in moist and swampy places. Other common species are the **ROUND-EARED SALLOW** (*sallow aurita*) and the **GREAT ROUND-LEAVED SALLOW** (*sallow caprea*), the latter remarkable for preferring a dry soil, and becoming a small tree, the wood of which is used for the handles of agricultural implements. The **LONG-LEAVED SALLOW** (*sallow acuminata*) differs from the other kinds in its lanceolate leaves. It is frequent in Britain. None of the willows produce such long and slender twigs as the osiers, nor are they adapted for any but the coarsest wickerwork, and some of them are so apt to break that they cannot easily be used in that way. But shoots of two years' growth are split up, and used for making hoops of barrels.

SALLOW-THORN, *Hippophaë*, a genus of plants of the natural order *eleagnaceæ*, consisting of large shrubs or trees with gray silky foliage, and entire leaves. They have dioecious flowers: the perianth is tubular, becomes succulent, incloses an enachnium, and forms an acid fruit. Few species are known: one only is European, *H. rhamnoides*, sometimes called the **SEA BUCK-THORN**, a large shrub or low tree, a native of the sandy sea-coasts of England and the continent of Europe. It is found also throughout great part of Tartary. It is sometimes planted to form hedges near the sea, growing luxuriantly where few shrubs will succeed. The berries are orange-colored. They are gratefully acid. They are used for making a sauce in the s. of France; a rob or jam is made of them on the shores of the gulf of Bothnia, to impart flavor to fresh fish; and a preserve or jelly made from them is a favorite luxury of the Tartars. The *stellate* hairs of the under side of the leaf, covering it like scales, are a beautiful microscopic object.

SALLUST, CAIUS CRISPUS, a Roman historian, was b. 86 B.C., at Amiternum, in the Sabine country. Though of a plebeian family, he rose to official distinction, first as quaestor about 59, and afterward as tribune of the people in 52, when he joined the popular party against Milo, who in that year had killed Clodius. His reputation for morality was never high; and his illicit connection with Milo's wife is assigned as the cause of his being expelled in 50 from the senate, although his attachment to Cæsar's party is a more plausible reason of his expulsion. In the civil war he joined the camp of Cæsar; and in 47, when Cæsar's fortune was in the ascendant, he was made prætor-elect, and was consequently restored to his former rank. When in Campania, at the head of some of Cæsar's troops, who were about to be thence transhipped to Africa, he nearly lost his life in a mutiny. In 46, however, we find him engaged in Cæsar's African campaign, at the close of which he was left as governor of Numidia. His administration was sullied by various acts of oppression, particularly by his enriching himself at the expense of the people. He was, for these offenses, accused before Cæsar, but seems to have escaped being brought to trial. His immense fortune, so accumulated, enabled him to lay out those magnificent grounds, still known as the gardens of Sallust, on the Quirinal, to retire from the prevailing civil commotion into private life, and to devote his remaining years to those historical works on which his reputation rests. He died 34 B.C., four years before the battle of Actium. His histories, which seem to have been begun only after his return from Numidia, are: 1st, *The Catilina* or *Bellum Catilinarium*, descriptive of Catiline's conspiracy in 63, during the consulship of Cicero; 2d, *The Jugurtha*, or *Bellum Jugurthinum*, commemorating the five years' war between the Romans and Jugurtha, the king of Numidia. These, the only genuine works of Sallust which have reached us entire, are of great but unequal merit. The quasi-philosophical reflections which are prefixed to them are of no value, but the histories themselves are powerful and animated, and contain effective speeches of his own composition, which he puts into the mouths of his chief characters. With its literary excellence, however, the

value of the *Jugurtha* stops, as in military, geographical, and even chronological details, it is very inexact. His now lost work, *Historiarum Libri Quinque*, is believed to have described the events occurring between Sulla's death, 78 B.C., and the year of Cicero's praetorship, 66. The *Duae Epistolae de Republica Ordinanda* and the *Declamatio in Ciceronem* are of doubtful authenticity.

Apart from his literary qualities, which are rather those of an artificial than a natural writer, and which are not enhanced by his affectation of brevity, and his love of archaic expressions, Sallust has the merit of having been the first Roman who wrote what we now understand by "history." In official public life, he was more of a politician than a statesman, and the views which he supported were liberal, not so much because he loved the people, as because he hated the nobility. The best editions of his literary remains are those of Corte (Leip. 1724), Gerlach (Basel, 1823-31), Kritz (1828-34), Fabri (1831), Dietsch (1842), and the German critical edition of 1859.

SALLY-PORT, a gate or passage by which the garrison of a fortress may make a sally (through Fr. from Lat. *salio*, I leap or spring) or sudden attack on the besiegers. The name is applied to the postern leading from under the rampart into the ditch; but its more modern application is to a cutting through the glacis, by which a sally may be made from the covert way. When not in use, sally-ports are closed by massive gates of timber and iron.

SALMASIUS, CLAUDIUS, the Latinized name of a celebrated French scholar, CLAUDE DE SAUMAISE, who was b. at Semar, April 15, 1583. His father, Benigne de Saumaise, a man of superior erudition, was his first teacher. At the age of ten, young Salmasius translated Pindar, and composed Greek and Latin verses. He studied philosophy at Paris, under the superintendence of Casaubon. From Paris he proceeded to Heidelberg, where he devoted himself to the science of jurisprudence, and publicly professed Protestantism, to which form of the Christian religion he had been secretly attached for many years. So insatiable at this time was his thirst for knowledge—book-knowledge, at least—that he was wont to devote two whole nights out of three to hard reading, in consequence of which he brought himself to within an inch of the grave. In 1603 he published from MSS. two treatises of the sectary, Nilus, archbishop of Thessalonica, and a work of the monk Barlaam on the primacy of the pope. In 1629 appeared his chief work, *Plinius Erreclatatus in Cuii Julii Solimi Polyhistora* (3 vols., Par. 1629); after the publication of which he set himself vigorously, and without the help of a master, to acquire a knowledge of Hebrew, Arabic, Coptic, and other oriental tongues. In 1631 he was called to Leyden, to occupy the chair that Joseph Scaliger had held there, and it is from this period that his European reputation as a scholar and critic dates. Various efforts were made (1635-40) to induce Salmasius to return to France, but he declined them on the ground that his spirit was too "liberal" for his native land. Queen Christina of Sweden, however, managed to bring him to Stockholm, and fix him there for a year (1650-51), after which he returned to Holland. He died of a fever caught by imprudently drinking the waters at Spa, Sept. 6, 1658. Salmasius was certainly a great scholar of the old-fashioned clumsy sort; but neither his wit nor his acumen was sufficiently keen to give an intellectual and critical value to his lucubrations; and though all his distinguished contemporaries, Casaubon, Gronovius, Grotius, Vossius, etc., deluged him with praise; though Balzac pronounced him *infallible*; though the curators of the university of Leyden declared that "their university could no more do without Salmasius than the world without the sun;" though Queen Christina went the length of saying, with truly royal flattery, "that she could not live without him,"—he is remembered, not for his inexhaustible stores of erudition, his editions of the classics, or his treatises on classical antiquities, but for his controversy with John Milton, scarcely his inferior in scholarship, and infinitely his superior in power of brain, and in all the arts of literary warfare. The question at issue was the lawfulness of the execution of Charles I. Apart altogether from the merits of the case, the great poet utterly overwhelmed his adversary, partly by the magnificence of his language and sentiments, and partly by the unscrupulous fury of his invective. Salmasius also is grossly abusive and acrimonious in his treatise (*Defensio Regia pro Carolo I.*, 1649): *asinus* (ass), *pecus* (beast), and such-like expressions being showered about quite freely; but he is deficient in logic, in real force of sarcasm, and in intellectual vigor generally.

SALMON, *Salmo*, a genus of fishes of the family *salmonide* (q.v.), which, as characterized by Cuvier, has teeth on the vomer, both palatine bones, and all the maxillary bones; and includes numerous species more recently divided by Valenciennes into three genera, *salmo*, *fario*, and *salar*: the first characterized by a few teeth at the end of the vomer; the second by a single line of teeth running down the vomer; the third by two rows of teeth on the vomer, without any remarkable group at its upper end. To many naturalists, however, this division seems too artificial; and the characters, although excellent for distinguishing species, not such as ought to divide genera; an opinion confirmed by the fact, that the teeth are numerous along the vomer in the young of the species, as the common salmon, which finally retain only a group of them at the end. The division made by Valenciennes separates the salmon, the salmon trout, and the gray or bull trout, the only British species which ascend rivers from the sea, into the two genera *salmo* and *fario*; whilst the common trout is referred to *salar*. A much more

natural division, having regard to characters really conspicuous and important, and to the habits of the species, is the simple one of Mr. Pennell (*The Angler Naturalist*, 1863), which is really nothing more than a formal recognition of groups practically recognized by every one acquainted with the fishes which compose them; "1. The silver or migratory species (i.e., those migrating to and from the sea); 2. The yellow, or non-migratory species; 3. The charrs, or orange and red-coloured species." The present article is devoted to the first of these groups. The second is noticed in the article Trout; the third, in the article Charr.

By far the most important of the three *salmonidæ* which ascend the rivers of Britain from the sea is the SALMON (*salmo salar*), in commercial importance far superior to any other fresh-water fish, both on account of the abundance in which it is procured in the northern parts of the world, and of its rich and delicious flavor. From ancient times it has furnished important supplies of food; and the salmon fisheries of Britain have long been a subject of anxious attention to the legislature. Even rivers of Iceland now yield a rent, and are regularly netted for the supply of the British market, to which the salmon are brought, as from other northern regions, fresh, in ice. Many rivers and streams, also, are rendered valuable by the salmon which periodically visit them, as affording sport to anglers with which nothing of the same kind is deemed worthy of comparison, and those of Norway, as well as those of Britain itself, are now frequented by British anglers.

The salmon is one of the largest species of the genus, having been known to attain the weight of 83 lbs., whilst salmon of 40 or 50 lbs., and even upward, are occasionally brought to market. Very large salmon, however, are not common, owing to the eagerness with which the fishery is prosecuted. No fish is more symmetrical or beautiful than the salmon; and its form is admirably adapted to rapid motion even against powerful currents, by the regular tapering from the front of the first dorsal fin both to the snout and to the tail, but more suddenly in the former direction, by the nearly equal convexity of back and belly, and by the perfect smoothness and want of angularity. The head is about one-fifth of the whole length of the fish. The under-jaw of the male becomes hooked during the breeding season with a kind of cartilaginous excrescence, which is used as a weapon in the combats then frequent, wounds so severe being inflicted with it that death sometimes ensues. The lateral line is nearly straight. The scales are small, and the color a rich bluish or greenish gray above, changing to silvery-white beneath, sprinkled above the lateral line with rather large black spots. The opercular bones show a rounded outline at the hinder edge of the gill-covers, which at once distinguishes this species from the only other British species that can be confounded with it, the salmon trout and the gray or bull trout. The tail is forked in the young salmon, but becomes nearly square in the adult. The mouth of the salmon is well furnished with teeth; a line of teeth on each side of the upper jaw; an inner line on the palatine bone, two or three in the adult state at the end of the vomer, two rows on the tongue, and one row along the outer edge of each lower jaw-bone. This array of teeth indicates voracity, and the salmon seems to prey readily on almost any animal which it is capable of capturing, though it is a somewhat singular fact that the stomach when opened is rarely found to contain the remains of food of any kind: two or three herrings of full size have, however, been found in its stomach; the sand-lance and other small fishes seem to constitute part of its food; and when in fresh water, the minnow, trout-fry, or the fry of its own species, worms, flies, etc. The angler catches salmon with the artificial fly, or with the minnow or the worm; and no bait is more deadly than the roe of the salmon itself, the use of which is indeed prohibited in British acts of parliament intended for the protection of the salmon fisheries. The eggs of crustaceans have also been found in the stomach of the salmon in such quantities as to show that they form a very considerable part of its food.

The salmon is found on the coasts of all the northern parts of the Atlantic, and in the rivers which fall into that ocean, as far s., at least, as the Loire on the European side, and the Hudson on the American. Slight differences can be noted between the American and the European salmon, but they are not generally thought sufficient to distinguish them as species. The salmon frequenting one river are, indeed, often characteristically different from those of another river of the same vicinity. The salmon is not found in the Mediterranean nor in the Black sea, nor in any of the rivers falling into them; and in the Arctic ocean and its rivers, as well as in the northern parts of the Pacific ocean, other species of the same genus take its place. The preservation of salmon in a fresh state by means of ice, being an invention of recent times, this fish never appeared at the luxurious tables of ancient Rome except dried or salted, although its excellence was well known, the Romans having become acquainted with it in their northern conquests. Salmon is in perfection for the table only when recently taken from the water, whilst the fatty "curd" remains between the flakes of its flesh, which, however, begins to disappear within 12 hours, although otherwise the fish is quite fresh. Hence the peculiarly high value formerly ascribed in London to *Thames salmon*.

The salmon, after its first migration to the sea, passes a great part of its life in it, although under the necessity of periodically ascending rivers, in which the salmon that ascend to spawn or for other causes in autumn, often remain during most of the winter. Salmon return, in preference, to the same rivers in which they have passed

the earliest part of their existence; as appears both from records of marked salmon, and from the characteristic differences already alluded to. Salmon ascend rivers to a great distance from the sea, as the Rhine to the Falls of Schaffhausen, and the Elbe to Bohemia. The speed with which they glide through the water in their most rapid movements is very great; it is said to be not less than 1500 ft. in a minute, or at the rate of 400 m. a day; but this, of course, is sustained only for a few moments, and the ordinary rate of progress in ascending rivers is supposed to be from 10 to 25 m. a day. The fish, also, almost always chooses to lie for a time in some spot, waiting a fresh flood in the stream. The perpendicular height which the salmon can pass over by leaping, when there is abundance of water in the river and sufficient depth in the pool below the fall, seems to be not more than 12 or 14 feet; they attempt higher leaps, but often fall back exhausted, or fall on adjacent rocks, where they die or are captured. They do, however, rush up steep and broken cataracts of much greater height. The ascent of many rivers by salmon has been stopped by high weirs and other obstructions; but very simple and effectual means have been devised for preventing this by *fish-stairs* or *fish-ladders*, which are often very conveniently formed by partitioning off a portion of the fall, and intersecting it from alternate sides, two-thirds of its width, by transverse steps of wood or stone, so as partially to divide it into a succession of falls. The salmon soon find out the ladder, and leap up from one step to another. By this, the interests of manufacturers and of fishery proprietors are in some measure reconciled.

As the time of spawning approaches salmon undergo considerable changes of color, besides the change of form already noticed in the snout of the male. The former brilliancy of the hues gives place to a general duskiness, approaching to blackness in the females, much tinged with red in the males; and the cheeks of the males become marked with orange stripes. Salmon in this state are "foul fish," being considered unfit for the table, and the killing of them is prohibited by British laws, notwithstanding which, however, multitudes are killed by poachers in some of the rivers, nor do those who eat them either fresh or "kippered" (i. e., dried) seem to suffer from any unwholesomeness, such as is sometimes alleged to belong to them, although they are greatly inferior in quality to salmon in other states. Salmon which have completed their spawning, continue for some time, at least if in fresh water, very unfit for the table. Their capture is prohibited by British laws. They are called "*foul fish*," or more distinctively, "*spent fish*," or *kelts*; the males are also called *kippers*, *kip* being a name for the cartilaginous hook of the under jaw, and the females *shedders* or *baggits*. Such names, originally local, have become of more general use from having been introduced into acts of parliament. The name *kelt*, in particular, is now very commonly employed. When they remain for a considerable time in fresh water after spawning, kelts recover very much, and increase in weight, whereas, before spawning, there is a diminution of weight. "A well mended kelt" approaches in quality to a good or "clean" salmon, although far from being equal to it.

The time of spawning is from the end of autumn to the beginning of spring, or even the beginning of summer; differing considerably in different rivers, whilst in each river it is prolonged throughout months, the elder and stronger fish of the former year probably ascending to spawn first. The difference of season in different rivers is probably to be accounted for by the temperature of the water as affected by latitude, and by the relations of the river to lakes, to low warm plains, and to snow-covered mountains.

Salmon spawn on beds of fine gravel, in shallow parts of rivers, such as are used for the same purpose by trout. Some beds of this kind, in salmon-frequented rivers, have been notable from time immemorial as favorite spawning-places; and large numbers of fish, both the salmon and its congeners, deposit their spawn in them every year. The spawning female approaches the bed, attended by at least one male fish, sometimes by more than one, in which case fierce combats ensue; she makes a furrow in the gravel, with her tail, and deposits her spawn in it, on which the male afterward pours the vivifying milt. It was formerly believed that the furrow was in part made by the snout of the fish, and to this the snout of the male at the spawning season was supposed to be particularly adapted; but it has been found by observation that the snout is not used in this work. The eggs, when deposited and vivified, are covered by the action of the tail of the female; the male doing nothing but depositing his milt, and fighting with any other of his sex that may attempt to dispute his place.

The time occupied by a female salmon in spawning is from three to twelve days. After spawning the salmon generally soon descends to the sea. The descending *kelts* are very ravenous, and therefore a great annoyance to anglers who desire to take none but *clean fish*, and must return the kelts to the water.

The eggs deposited in the spawning bed are liable to be devoured by trouts and other fishes, which are ever ready, and by insect larvæ of many kinds, which work their way even through the gravel; ducks and other waterfowl also search there for their food; and sometimes a flood changes the bed so much as either to sweep away the eggs, or to overlay them with gravel to a depth where they are never hatched, or from which the young can never emerge. The number of eggs hatched in ordinary circumstances must be small in proportion to the number deposited, and by far the greater part of the fry perish before the time of descent to the sea.

In from thirty to sixty days after the deposition of the eggs in the spawning bed

they begin to show signs of life, and the eyes appear as small specks. The time which elapses before the egg is hatched varies according to the temperature of the water, and therefore is generally shorter in England than in Scotland, 140 days being sometimes requisite in cold climates and late springs; while it has been found that in a constant temperature of 44° F. sixty days are enough, and in a higher temperature eggs have been hatched even in thirty days. A temperature above 70° F. is, however, fatal to them. Salmon eggs are easily hatched in an aquarium, in which proper care is taken to prevent stagnation of the water, so that the conditions may resemble those of a bed of gravel in a running stream, and many interesting observations have thus been made by Mr. Frank Buckland on the development of the young salmon, of which the results have from time to time been given to the world through the columns of the *Field* newspaper, and his excellent work on *Fish-Hatching*.*

The young fish lies coiled up in the egg, which it finally bursts in its struggles to be free, and it issues with a conical bag (umbilical vesicle) suspended under the belly, containing the red yolk of the egg and oil globules, which afford it nourishment during the first five or six weeks. The mouth is at first very imperfectly developed, as are the fins, and the whole body has a shape very different from what it is seen to assume, and is very delicate, and almost transparent. The slightest injury is fatal. The length, at first, is about five-eighths of an inch. About the seventh or eighth week, the young salmon has changed into a well-formed little fish about an inch long, with forked tail, the color light brown, with nine or ten transverse dusky bars, which are also more or less distinctly visible in the young of other species of this genus, just as the young of many feline animals exhibit stripes or spots which disappear in their mature state. The fry, previously very inactive, now begin to swim about, and seek food with great activity, and are known as PARR or SAMLET, and also in some places by the names *pink*, *brandling*, and *fingerling*. The parr was formerly supposed to be a distinct species (*S. salmulus*), an opinion to which many anglers, eager to enjoy their summer holidays, and catching parr by scores with the artificial fly or worm when they can catch nothing else, have clung tenaciously, after it has been shown to the satisfaction of all naturalists that the parr is nothing else than the young salmon. The honor of proving this belongs to Mr. Shaw, of Drumlanrig, Dumfriesshire, whose observations and experiments, first made in 1834-35, we have not space to detail. They have, however, been fully confirmed at the salmon-breeding ponds of Stormontfield, on the Tay.

It was long urged, to prove the parr a distinct species, that the male parr is very often found with the milt perfect, to which, however, it was replied that the female parr is almost never found with perfect roe. But the remarkable fact has now been abundantly proved that the male parr is capable of impregnating the roe of the female salmon, and thus a provision seems to be made in nature to prevent an otherwise possible loss of roe. And, indeed, ridiculous little parrs seem to be always ready at hand to perform this service during the combats of the great fish, or in their absence. Another remarkable fact has been discovered, that some parrs descend to the sea in their first year, while others remain in the fresh water, and in the parr state, without much increase of size for another year, and a few even to the third year. At Stormontfield it has been found that about one-half of the parrs migrate when a year old. No reason can be assigned for these things; the facts alone are known to us, and have but recently been established.

The parr attains a size of from 3½ to 8 inches. When the time of its migration comes, usually in May or June, it assumes brilliant silvery hues, the fins also becoming darker, and is then known as a *smolt*. Groups of smolts, 40 to 70 in a group, now descend not very rapidly, to the sea. They remain for a short time in brackish water, and then depart from the estuary. Of their life in the sea nothing is known, except that they increase in size with wonderful rapidity; for it has been found that smolts which had been marked, returned to the same river in six or eight weeks as *grilse* of three to five pounds, or after a longer period even of eight or nine pounds. Some re-ascend the river when only a pound and a half or two pounds weight; and these are in some places known as *salmon peol*. Grilse are captured in great numbers in the latter part of summer and in autumn, but very few are seen in the earlier part of the fishing season. The grilse usually spawn on its first return to the fresh water—often remaining there for the winter, and on again descending to the sea assumes the perfect characters of the mature salmon. Little increase of size ever takes place in fresh water; but the growth of the salmon in the sea is marvelously rapid, not only on its first migration, but afterward. A kelt caught by the late duke of Athole on March 31st weighed exactly ten pounds. It was marked, and returned to the Tay, in the lower part of which it was caught, after five weeks and two days, when it was found to weigh twenty pounds and a quarter.

The statistics of salmon fisheries are, like those of other fisheries, very imperfect. It is impossible to ascertain the total annual value of the salmon fisheries even of Great Britain and Ireland; but it must be reckoned by hundreds of thousands of pounds. "From the reports of the Irish commissioners, we learn that in 1862, apparently an ordinary year, three Irish railways conveyed 400 tons, or about 900,000 lbs. of salmon, being equal in weight and treble in value to 15,000 sheep, or 20,000 mixed sheep and lambs. In Scotland, the Tay alone furnishes about 800,000 lbs., being equal in weight and treble

in value to 18,000 sheep (and lambs). The weight of salmon produced by the Spey is equal to the weight of mutton annually yielded to the butcher by each of several of the smaller counties. . . . And in making comparisons between the supplies of fish and of flesh, it must be kept in mind that fish, or at least salmon, though higher in money value, cost nothing for their keep, make bare no pasture, hollow out no turnips, consume no corn, but are, as Franklin expressed it, 'bits of silver pulled out of the water.'—(Russel, *The Salmon*, p. 12.) In 1876, the number of boxes of salmon sent from Scotland to London was 25,645; from Ireland, 7,064; from England, 1508. The other British species yet to be noticed in this article are reckoned with the salmon itself in all that relates to salmon fisheries.

The salmon fisheries of the British rivers have in general much decreased in productiveness since the beginning of the present century, which is very much ascribed to the introduction of fixed or standing nets along the coast, by which salmon are taken in great numbers before they reach the mouths of the rivers to which they are proceeding, and in which alone they were formerly caught; it having been discovered that salmon feel their way, as it were, close along the shore for many miles toward the mouth of a river, feeding, meanwhile, on sand-lanices, sand-hoppers, and other such prey. It is also partly owing to the destruction of spawning fish by poachers; and in no small measure to the pollution of rivers consequent on the increase of population and industry, and to the more thorough drainage of land, the result of which has been that rivers are for a comparatively small number of days in the year in that half-flooded condition in which salmon are most ready to ascend them. The last of these causes is the most irremediable; but if the operation of the others were abated, it would not of itself be sufficient to prevent a productiveness of our rivers much greater than the present. The efforts which have begun to be made by breeding-ponds (see PISCICULTURE) to preserve eggs and fry from destruction, and so to multiply far beyond the natural amount the young salmon ready to descend to the sea, promise also such results as may yet probably make the supply of salmon *far* more abundant than it has ever been. There is reason to think that the productiveness of the waters may be increased as much as that of the land.

The stake net is the most deadly of all means employed for taking salmon; and its use is prohibited in estuaries and on some other parts of the coast. It consists of two rows of net-covered stakes so placed between high and low water marks, that salmon coming up to them, and proceeding along them, are conducted through a narrow opening into what is called the *court* of the net, from which they cannot find the way of escape. The *cruise*, which is now illegal in all parts of Britain, is an inclosed space formed in the wall of a dam or weir, into which the salmon enter as they ascend the stream, while a peculiar kind of grating prevents their return. The nets employed for catching salmon in rivers and estuaries are of many different kinds. In many places a small boat, or *salmon coble*, is used to carry out a seine net from the shore, setting (*shooting*) it with a circular sweep, the concavity of which is toward the stream or tide, and men stationed on shore pull ropes so as to bring it in by both ends at once with whatever it may have inclosed. Coracles (small boats of basket-work or a light wooden frame covered with canvas and tar, or other waterproof material) are used in salmon fishing in the Severn and other Welsh rivers. Nets which a single man can carry and work are also used in many rivers and estuaries, as those called *halves* on the Solway, which may be described as a bag attached to a pole. Dogs have sometimes been trained to drive salmon into nets, and some dogs have attained great expertness in catching salmon without any assistance.

THE SALMON TROUT (*S. trutta*, or *Fario argenteus*), also very commonly called the SEA TROUT, is rather thicker in proportion to its length than a salmon of the same size, and has the hinder free margin of the gill-cover less rounded. The jaws are nearly equal, the teeth strong, sharp, and curved, a single row running down the vomer, and pointing alternately in opposite directions. The colors are very similar to those of the salmon; the sides, chiefly above the lateral line, are marked with numerous X-shaped dusky spots, and there are several round dusky spots on the gill-covers. The salmon trout does not attain so large a size as the salmon, but has been known to reach 24½ lbs. The flesh is pink, richly flavored, and much esteemed, although not equal to that of the salmon. Great quantities of salmon trout are brought to market in London and other British towns; this fish being found from the s. of England to the n. of Scotland, and plentiful in many rivers, particularly those of Scotland. Its habits are generally similar to those of the salmon. Large shoals sometimes congregate near the mouth of a river which they are about to enter, and sometimes afford excellent sport to the angler in a bay or estuary, rising readily to the fly. The young are not easily to be distinguished from parr. *Phinock*, *hurling*, and *whirling* are local names of the salmon trout on its first return from the sea to fresh water, when it has its most silvery appearance, in which state it has sometimes been described as a distinct species (*S. albus*).

THE GRAY TROUT or BULL TROUT (*S. erior*), the only other British species migrating like these, is already noticed in the article BULL TROUT. The gill-cover in this species is more elongated backward at the lower angle than in the other two. On the banks of the Tweed and some other rivers, it is often called the sea trout, a name quite as appropriate to it as the salmon trout. The seasons at which the gray trout ascends rivers are

partly the same with those of the salmon and salmon trout, and partly different. The laws relative to the fishing of salmon apply equally to the bull trout.

Of other species of salmon our notice must be very brief. Cuvier has described as a distinct species a salmon with hooked lower jaw, known in France by the name of *becard*. Agassiz and Bloch regard it as merely the old male of the common salmon. The hooked lower jaw of the male of the common salmon in the spawning season has been already noticed. But Valenciennes adheres to the opinion of Cuvier that the *becard* is a distinct species, and insists on the greater length of the intermaxillary bones as a sure distinctive character; asserting also that the colors are always different from those of the common salmon; a general reddish-gray, the belly dull white, the back never blue, nor the belly silvery. The subject seems to require further investigation.—The HUCHO of the Danube, called *reo* in Galicia (*S. hucho*), attains a weight of 30 lbs., and it is said even of 60 lbs. The body is longer and rounder, the head more elongated than in the common salmon. The color is grayish-black, tinged with violet on the back, the sides and belly silvery. The tail is forked. The hucho spawns in June, making holes for the purpose in gravelly bottoms; and these holes are so deep that the fish lying in them often escape the nets of the fishermen. The flesh is white, but very pleasant. The same, or a very similar species, is found in the Caspian sea, and in rivers which flow into it.—The rivers of North America which flow into the Arctic ocean, produce several species of salmon, of which perhaps that most nearly resembling the common salmon, in the quality of its flesh, is *S. hearnii*. In these regions, Ross's Salmon (*S. rosii* or *fario rosii*) is extremely abundant. It is of a more slender form than the salmon, with remarkably long lower jaw and truncated snout; the scales separated by naked skin; the back greenish-brown, the sides pearl-gray, the belly orange or red. In the quality of its flesh it is very inferior to the salmon.—*S. scouleri*, or *salar scouleri* ascends the Columbia and other rivers of the n.w. coast of North America in vast multitudes. In arms of the sea on that coast it is sometimes impossible for a stone to reach the bottom without touching several; and the channel of a river or a brook is often densely crowded with them. The flesh is excellent. The same species seems to ascend the rivers of Kamtchatka; but that country, the Kurile isles, and Siberia have also species of their own. Concerning many of the species, there is still great uncertainty. See PISCICULTURE.

ANGLING FOR SALMON.—The capture of the salmon by rod and line affords the most exciting sport of the kind. The pleasures of it have been descanted on by numerous writers, and whole treatises have been written on the minutiae of the art. Among the more modern writers on the subject, we may name Davy, Stoddart, Colquhoun, Younger, Stewart, Francis, and Russel. The tackle used is sufficiently described in the article ANGLING; and the general principles of fly-fishing there laid down are applicable in this case. The chief specialty in salmon angling is to be able to maintain perfect coolness and vigilance when the fish is hooked. The rod must be kept at such an elevation as to bring its elasticity into play; and by allowing the line to run out as the fish dashes off, and winding it up as he returns, or by following his motions, if need be, in person, a constant and equal strain must be maintained; a sudden tug at an unyielding line, or a momentary slackening, being equally fatal. After struggling for from a quarter to half an hour (sometimes, though rarely, for two or three hours) against a steady pull, the fish generally yields to his fate and allows himself to be drawn into the shallow and landed. This is done either with the gaff, or the fisher, winding his line up within rod length and holding the top landward, without slackening, seizes the fish with one hand by the root of the tail, and lifts or rather slides him head-foremost on to the gravel or grass.

Those rivers of Britain where the fishing is strictly preserved still afford good sport; but of late years the take of fish, by rod as well as by net, has greatly fallen off, and many fishers now betake themselves annually to the rivers of Norway and Sweden. In Scotland the Tay, Tweed, Don, Spey, Dee, Thurso, and some others are still preserved in many places, and command high rents from salmon anglers.

SALMON-FISHERY LAWS.—Owing to the peculiar excellence of the salmon, it is singled out from all other fish, and protected by peculiar laws in the United Kingdom, but those laws are not the same in the three kingdoms. I. As to England.—The right to fish salmon in the sea and navigable rivers belongs to the public as a general rule; and the right to fish salmon in rivers not navigable belongs to the riparian owner on each bank, the right of each extending up to the center line of the stream. But though the public have, as a rule, the right to fish in the sea and navigable rivers, there are various exceptions, which arose in this way. Previous to magna charta, the crown, whether rightly or wrongly, assumed power to make grants to individuals—generally the large proprietors of lands adjacent—whereby an exclusive right was given to such individuals to fish for the salmon as well as all other fish within certain limits. This right, when conferred, often applied to the shores of the sea, but generally prevailed in navigable rivers and the mouths of such rivers. The frequency of such grants was one of the grievances redressed by magna charta, which prohibited the crown thenceforth from making like grants. But the then existing grants were saved, and hence every person who at the present day claims a several or exclusive fishery in navigable rivers, must show that his grant is from the crown, and is a sold as magna charta. It is not, however, in any way necessary that he be able to produce a grant or chain of grants of such antiquity; for if

he has been in undisturbed possession for a long time—say 60 years and upward—it is presumed that such title is as old as magna charta, and had a legal origin. When a person is entitled to a salmon fishery (and if he is entitled to a salmon fishery he is entitled also to the trout and other fish frequenting the same place), he is nevertheless subjected to certain restrictions as to the mode of fishing salmon. These restrictions are imposed by the salmon fishery acts of 1861, 1865, and 1873, which repealed prior acts of parliament. No person is now entitled to use lights, spears, gaffs, strokehalls, snatches, or other like instruments for catching salmon; nor can fish roe be used for the purpose of fishing. All nets used for fishing salmon must have a mesh not less than 2 in. in extension from knot to knot, or 8 in. measured round each mesh when wet. No new fixed engine of any description is to be used. A penalty is incurred for violating these enactments, and also for taking unseasonable salmon, or for taking, destroying, or obstructing the passage of young salmon, or disturbing spawning salmon. The close time, during which no salmon shall be fished, extends from Sept. 1 to Feb. 1 following, except that for rod fishing the close season shall not commence till Nov. 1. These periods may by by-laws be slightly varied for each district. During close time no salmon can be legally sold or be in the possession of any person for sale; and such fixed engines as are still legal shall be removed or put out of gear during close time. Moreover, throughout the year, there is a weekly close time—that is to say, no person can, except with rod and line, lawfully fish salmon between 12 A.M. (noon) of Saturday to 6 A.M. of Monday following. Though owners of dams need not make fish-passes, there must be free gaps made in fishing weirs of a certain width. For the purpose of supervising the enforcement of the acts, fishery inspectors are appointed for England. Fishery boards were established in 1866, and by by-laws can change close seasons, license duties for fishing instruments, mesh of nets, and other matter, within limits. See also POACHING.

II. In Scotland there are various important differences from the law of England as regards salmon fisheries. In Scotland, the general rule is that all salmon fisheries in the rivers and surrounding seas are vested in the crown, and hence no person is entitled to fish with nets or engines except he can show a grant or charter from the crown. If he can only show a general grant of fishings without specifying salmon, then it is necessary not only to produce such grant, but to show that he has been in exclusive possession for 40 years and upward of the salmon fishings. Moreover, while this right to catch salmon by nets is vested in the crown, or in some grantee of the crown, the right to angle for salmon is now held to be included, and does not belong to the riparian owner. The public, *qua* public, have no right anywhere in Scotland to fish for salmon either with net or rod. By virtue of many old statutes, all fixed engines for catching salmon are illegal, and it is settled that everything is in the nature of a fixed engine which is not held in the hand of the fishermen while they are fishing; but a mechanical contrivance, which enables the fisherman to go a little further into the river with his coble or boat, which is to drag the net, is not illegal. Stake nets, however, are not illegal if they are not in a river or the mouth of a river. In 1862 and 1838, statutes were passed regulating the Scotch salmon fisheries. By these acts fishery districts are authorized to be managed by boards. These boards consist of the large proprietors of fisheries. The boards appoint constables, water-bailiffs, and watchers, forming a kind of river police. The board has power to assess the various proprietors in sums so as to raise funds for paying the expenses of working the act—like funds being raised in England only by license duties. The annual close time for salmon fishing is fixed by the commissioners, and varies in each district, but it generally extends from Aug. 27 to Feb. 10 following; the angler's close time commencing about Oct. 16. The commissioners are appointed by the home secretary, their duties being to fix the limits of fishery districts and of rivers, to make general regulations as to close time, cruives, nets, etc. The Scotch acts imitate the English acts in prohibiting fishing with lights or salmon roe, with nets having small meshes, etc. And there is a weekly close time from 6 P.M. on Saturday to 6 A.M. on Monday following.

III. Ireland.—The Irish salmon fishery laws are regulated chiefly by statutes distinct from those of England. Fishery districts are there established, and the fisheries are subject to rates and license duties for the purpose of raising funds. There is an annual and weekly close time, and fixed engines are prohibited, and free gaps enforced in all fishing weirs.

SALMONIDÆ, a very large and important family of malacopteroous fishes, of the sub-order *abdominales* (having the ventral fins on the abdomen and behind the pectorals), nearly allied to *clupeidæ* (the herring family), but at once distinguished by the second dorsal fin, which they all have, and which is merely a fold of the skin, inclosing fat, whence it is called the *adipose fin*, and destitute of rays. They were all included by Linneus in the genus *salmo*, although now divided not only into numerous genera, but by many naturalists into several families, of which one retains the name of salmonidæ, and the other principal ones are *characinidæ* and *scopelidæ*. The salmonidæ are generally very muscular, and possess great strength, swimming with great rapidity, even against strong currents, and some of them are capable of leaping up falls of considerable height, when there is sufficient depth of water beneath. Some of them are sea-fishes, never entering rivers, although, like the herring, pilchard, etc., they approach the shore

to spawn; others are generally inhabitants of the sea, but ascend rivers to spawn, and some of them also on other occasions not yet well understood; others, again, are constant inhabitants of fresh-water lakes, or of rivers and streams. Most of them are esteemed for the table, and some are among the most esteemed of fishes.

The restricted salmonidæ of those naturalists who divide the family, are all scaly fishes, but with the head destitute of scales and the cheeks fleshy; the upper part of the mouth is formed by the premaxillary and maxillary bones together; the branchiostegial rays are numerous; the air-bladder is large and simple; the teeth are usually small, sometimes very numerous, the tongue being furnished with them, as well as the other parts of the mouth, although others have the teeth few and small, or even wanting. They are generally voracious fishes, feeding chiefly on other fishes, crustaceans, worms, etc. The salmon, salmon trout, bull trout or gray trout, trout, charr, grayling, and smelt are familiar British examples. The white fish of North America is one of the most important species, and to the same genus (*coregonus*) belong many others, inhabiting the lakes and rivers of the northern parts of the world, some of them, from their herring-like appearance, known as *herring salmon* and *fresh-water herring*. The capelin (q.v.) is a sea-fish, never entering fresh waters. The restricted or true salmonidæ are found only in the northern parts of the world, and chiefly in the colder regions.

The *characini* also have the body scaly and the head destitute of scales; the upper part of the mouth is formed by the premaxillaries and maxillaries together; there are only four or five branchiostegial rays; the air-bladder is divided by a constriction in the middle; the teeth are very various, wholly wanting in a few, numerous in most of the genera, present on the tongue in some, and not in others; small and feeble in some, in others large and strong; in many conical and sharp, in some flat. Most of the species feed on animal food, but a few on vegetable food alone; while some are omnivorous, eating with equal readiness worms or other soft animals and fruits which fall into the water. One of those feeding exclusively on vegetable substances is the pacu (*mylites pacu*), a fish scarcely excelled by any as an article of food, which has teeth very like the molar teeth of sheep, and employs them in browsing on the plants that grow on rocks covered with water near the cataracts of the rivers of Guiana, and in some of the tributaries of the Amazon. In form, it is very unlike the trout or salmon, being short, thick, and clumsy. This, however, is not unfrequent in the *characini*, which exhibit much greater variety of form than the salmonidæ proper. Thus, in some of the genus *serrasalmo* (see PIRAYA), of which there are many species, voracious carnivorous fishes with sharp trenchant teeth, the depth of the body is almost as great as its length. The species of *serrasalmo* are sometimes called *saw-bellied salmon*, from their keeled and serrated belly. The *characini* are all inhabitants of fresh water; some of them African, but the greater number South American. Their flesh is generally much esteemed.

The *scopelidæ* differ from both the previous sections of salmonidæ in the structure of the mouth, which is formed entirely of the premaxillary bone, the maxillary lying behind. Few of them have an air-bladder. Some are scaly and some destitute of scales. The form of the body is salmon-like in some, but deep and compressed in others. They are generally marine, as the argentine (q.v.), the only British species. They abound chiefly in the warmer seas; the Mediterranean produces some; but the greater number belong to the Chinese and East Indian seas. Some are in high repute for their fine flavor.

Australia produces none of the salmonidæ. The rivers and streams of that region, however, as well as those of New Zealand, Patagonia, and the Falkland islands, produce a number of species of *galaxius*, a genus of very trout-like form, but with no scales and no adipose fin. They are called *trouts* by the colonists in Australia and New Zealand, but are of very inferior quality for the table.

SALMON OF NORTH-WESTERN AMERICA. The rivers of north-western America abound in salmon and trout to a degree not exceeded, and perhaps not equalled, in any other part of the world. Since the article SALMON was written, a very interesting account of the most important species has been given by Mr. J. K. Lord, in his work entitled *The Naturalist in Vancouver Island and British Columbia* (2 vols. Lond. 1866), to which we are indebted also for accounts of the candle-fish, Vancouver island herring, and viviparous fish, noticed in this supplement. The first place must be given to *salmo gairdneri*, of which quinnat is one of the Indian names, a fish similar in quality to our European salmon, and sometimes 70 lbs. in weight. It is very thick in proportion to its length, the dorsal outline slightly arched, almost forming a notch with the tail. The back is light steel blue, shading to a lighter tint on the sides, and imperceptibly changing to gray or silvery white, blushed over with pink, on the belly. The upper parts, and often also the lower, are thickly spotted with black stars. Salmon of this species ascend the Columbia, the Fraser, and other rivers in prodigious numbers at the spawning season, and proceed hundreds of miles, and even in the Columbia 1000 miles, from the sea into every rivulet, "filling even pools left on the prairies and flats by the receding floods." In what multitudes they crowd up the rivers will be even better understood from the following statements of Mr. Lord, relating to a tributary of the Fraser: "About a mile from my camp was a large patch of pebbly ground, through which a shallow

stream found its way into the larger river. Though barely of sufficient depth to cover an ordinary-sized salmon, yet I have seen that stream so filled, that fish pushed one another out of the water high and dry upon the pebbles. . . . With one's hands only, or, more easily, by employing a gaff or crook-stick, tons of salmon could have been procured by the simple process of hooking them out." Mr. Lord goes on to express his opinion that thousands of the salmon ascending the small mountain-streams never can spawn from sheer want of room. He describes them as dying by scores at the base of a waterfall which they could not leap, where, however, they persisted in remaining till they died from inanition, fresh fish coming up as the dead ones floated down. A prodigious stench arises from the multitudes of dead salmon floated down the rivers. The Indians say that all the salmon of this species that come up to spawn die in the rivers; and Mr. Lord believes that few, if any, ever reach the sea again. They seem not to eat when in the fresh water, and cannot be tempted either by fly or bait, nor is any food to be found in their stomachs, although, in the stomachs of those taken in the tideway or salt water, the remains of small fish and marine animals are to be found. This kind of salmon ascends the rivers in June and July, for, unlike the salmon of Britain, it spawns in summer.—At the same time with *salmo quinnat*, a smaller species, called by the Indians, at the Kettle falls, cha-la-lool (*salmo Gairdneri*), ascends the rivers. Its average weight is only from eight to eleven pounds, but when it first arrives in the fresh water its flesh is fat, pink, firm, and most delicious.—A little later in the season comes the WEAK-TOOTHED SALMON (*salmo paucidentis*).—The autumn, also, has its supply of salmon, quite equal to that of spring in point of numbers, but inferior in quality. They ascend the rivers in September and October. The autumnal salmon (*salmo tycodon* of Pallas), a species known also in northern Asia, is a dingy hook-nosed fish, called *hooked snout* by the fur-traders. The hooked snout, however, is peculiar to the males. Salmon of this species are to be found "in every stream and rill where they can by any possibility work a passage," and they often remain in fresh water, far from the sea, for four or six months, all of them becoming emaciated, and many of them dying, while the snout of the male becomes prodigiously elongated, and the teeth also increase into tusks. As to the multitudes of the full-grown fish of this species to be found at the proper season in the rivers of north-western America, the following extract from Mr. Lord's book is conclusive: "At fort Hope, on the Fraser river, in the month of September, I was going trout-fishing in a beautiful stream, the Qua-oue-alla, that comes thundering and dancing down the Cascade mountains, cold and clear as crystal; these salmon were then toiling up in thousands, and were so thick in the fork that I had great trouble to ride my horse through; the salmon were in such numbers about his legs as to impede his progress, and frightened him so that he plunged viciously, and very nearly had me off."—The RED-SPOTTED SALMON TROUT (*salmo spectabilis*), is another valuable fish of the same regions. It seldom exceeds three pounds in weight. It ascends the rivers in October, when a great Indian fish-harvest takes place. This fish is readily taken by hooks baited with dried salmon-roe, or by a small shining strip from the belly of a trout.—The OREGON BROOK TROUT (*salmo* or *fario stellatus*) abounds in the rivers and streams of north-western America, even to a height of 7,000 ft. in the Rocky mountains. It attains a weight of three pounds, and is a delicious fish. This trout is readily taken with fly or bait.

The Indians of these regions take the salmon, as they ascend the rivers, by various contrivances. They construct weirs reaching from one side of a stream to the other, with openings, through which the fish pass into large lateral prisons of closely woven wicker. They use nets in the bays and harbors, when the salmon, pursuing anchovies and herrings, run into the net, and are caught, and thus immense numbers are taken. They construct rude scaffolds or stages of wood among the boulders on the sides of large rivers, on each of which many Indian fishers await the salmon, with small nets fastened to handles, 40 or 50 ft. in length. Thirty salmon an hour is not an unusual take for two Indians to land on a stage. Another and more curious method, practiced at falls, is by means of great wicker hampers, about 30 ft. in circumference, and 12 ft. in depth. To make these available, huge trees are cut down, lopped clear of their branches, and brought to the edge of the river, where they are fastened so that the smaller ends overhang the foaming water. To these the wicker baskets are suspended, where the salmon generally leap in their attempt to clear the falls; and in each basket two naked Indians are stationed all day, frequent relays being necessary, as they are under a heavy fall of water. As the salmon fall into the basket, the Indians catch them under the gills, kill them with a club, and fling them on the rocks. Mr. Lord says: "I have known 300 salmon landed from one basket between sunrise and sunset, varying in weight from 20 to 75 lbs." The salmon and trout of these regions have already been made in some small measure available for the markets of the more densely peopled parts of the world.

SALM-SALM, FELIX, Prince, 1828-70; b. Austria; commanded a U. S. regiment during the war of the rebellion, and rose to be brig.gen. He went to Mexico at the end of the war, was one of Maximilian's aids-de-camp, and chief of his household, and was taken prisoner with him at Queretaro; but was soon released. He joined the Prussian army, and was killed at Gravelotte.

SALNAVE, SYLVAIN, 1832-70; b. Hayti; entered the army as a common soldier, rose to the rank of capt. and was prominent in the revolution of Geffrard, by which Souleuvre

(q.v.) was overthrown. Considering himself poorly rewarded for his services in the revolution and in repulsing the Spanish invasion; he organized a counter-revolution, and in 1867 drove Gelfard from the state. In 1869 Dominique and Saget headed a third successful revolution and Salnave was put to death at Port-au-Prince, Jan. 10, 1880.

SALOMON, JOHANN PETER, an eminent musician, violin-player, and composer, b. at Bonn in 1745. When young, he was attached to the service of prince Henry of Prussia, for whom he composed several operas. In 1781 he visited Paris, and afterward London, where he met with so warm a reception that he was induced to settle there. His series of subscription concerts in London, in 1790, form an era in the history of music, in so far as they led to the production of Haydn's twelve grandest symphonies, known as the Salomon set. In 1800 Salomon retired from public life, but continued to compose songs, glees, and violin solos and concertos. He died in 1815, and was interred in Westminster abbey.

SALOMONS, SIR DAVID, 1797-1873; b. London; a banker of Jewish parentage, by special act of parliament made sheriff of London and Middlesex co. 1835, high sheriff of Kent 1839-40, elected alderman 1835-44. He refused to take the oath "on the faith of a Christian," and was not allowed to take his seat. He became a barrister in 1849, and was elected lord mayor of London 1855-56. He was the first English magistrate of Jewish parentage. He was 4 times elected M.P. for Greenwich, but on account of his peculiar ideas in relation to the oath he was ruled out until 1859, when its form received a modification allowing an Israelite to assume it. He was deputy lieut. for Kent, Sussex, and Middlesex, baronet of the United Kingdom, 1869. He published *A Defense of the Joint Stock Banks*, and several pamphlets on religious disabilities, persecutions of the Jews, currency, corn-laws, etc.

SALON.A. See SPALATO, *ante*.

SALONICA, or SALONIKI (anc. *Thessalonica*, Turk. *Selunik*), a t. of European Turkey, in the vilayet of the same name, and, next to Constantinople, the greatest emporium of commerce in the empire, is situated on the gulf of Saloniki, and rises from the shore along the face of a hill. The city is inclosed by white walls, partly ancient and partly mediæval, about five m. in circuit, and is surrounded by cypresses and other evergreens. As seen from the sea, it presents a bright and beautiful appearance; but its internal aspect is miserable in the extreme. The principal buildings are mosques, most of which were previously Christian churches. The *Citadel*, called by the Turks *Vedi-Kuleh*, or "the Seven Towers," is the ancient Acropolis within it are to be seen the ruins of a triumphal arch belonging to the time of Marcus Aurelius. Other relics of antiquity are the Propyleum of the hippodrome, a magnificent Corinthian colonnade of five pillars; the triumphal arch of Augustus, erected after the battle of Philippi (now forming the gate of Vardar or Vardari); the arch of Constantine, etc. Salonica exports the corn, cotton, wool, tobacco, bees-wax, and silk of Macedonia. Salonica is connected by railway with Uskub, nearly 100 m. inland. In 1874, 1634 vessels of 584,825 tons, entered and cleared the port. Pop. 70,000, of whom 30,000 are Turks, 20,000 Greeks, and 20,000 Jews.

Salonica was at first called *Therma*, under which designation it is mentioned in connection with the march of Xerxes through Greece. It was rebuilt by Cassander about 315 B.C., who probably named it Thessalonica in honor of his wife; and during the Roman-Macedonian wars, it figures as the principal station of the Macedonian fleet. After the close of the civil wars, its prosperity rapidly increased, and for three centuries it was the first city in Greece. It was early the seat of a Christian church. During the barbarian invasions, it proved the great bulwark of the eastern empire. It was thrice taken in the middle ages—first, by the Saracens in 904; secondly, by the Sicilian Normans in 1185; and thirdly, by the Turks under Amurath II. in 1430.

SALOOP. See SASSAFRAS.

SALOP. See SHROPSHIRE.

SAL PA, a genus of mollusca, of the division *tunicata*, in which there is no shell, but a leathery tunic with two apertures; the type of the family *salpidae*, which float in the sea, and have the tunic transparent and elongated. They are allied to *ascidia* (q.v.), although not fixed like them, and have two openings, through the hinder of which the water enters, and is expelled through the anterior by a regular contraction of the mantle, so that the animal is impelled through the water in a backward direction, without any apparent voluntary action. The *salpæ* are sometimes solitary, and sometimes united in long chains, those in chains having the contractions of the individuals simultaneous; but the solitary *salpæ* appear to be the parents of those which are in chains, and they in turn give birth to solitary individuals very different from themselves. The whole texture is very delicate, so that the animal is sometimes scarcely to be discerned, except from its iridescent hues in the sunshine, which make chains of *salpæ*, when very numerous, a conspicuous feature in the surface of the great deep in tropical regions. The orifices of the alimentary canal are not near together, as in *ascidia*, but at opposite extremities of the body. The branchial chamber of *ascidia* is represented by a wide membranous canal, traversed by a long vascular ribbon, which is continually exposed to the water

that passes through the canal. The *salpæ* united in chains have no organic connection, but apparently adhere together by little suckers.

SAL PRUNELLE. See NITER.

SALSETTÉ (native name *Sishti*), an island on the w. coast of British India, in the presidency of Bombay, lies immediately n. of Bombay, with which it is connected by a long peninsula, and by an artificial embankment called Zion's causeway. It is 18 m. long, and 11 m. in extreme breadth. Pop. about 50,000. It is beautiful, picturesque, and densely wooded, is diversified by mountain and hill, and contains many fertile tracts. Sugar, indigo, cotton, flax, and hemp are grown. Thanah, the chief town, stands on the e. coast, 20 m. n.n.w. of Bombay by the Great Indian Peninsular railway, which, after traversing the islands of Bombay and Salsetté, crosses to the continent half a mile to the s. of this town. Pop. about 12,000. A number of remarkable caves, called the caves of Kanhari or Kenery, are found in the middle of the island, 5 m. w. of Thanah. They are nearly a hundred in number, are all excavated in the face of a single hill, and contain elaborate carving. The caves are in six stories, on the ledges of the mountain, and the stories are connected by stairs cut in the rock. The cave first approached consists of three chambers, one unfinished, and dates from the 9th or 10th c. A.D.; it contains no figures or carvings. The other caves contain numerous carved representations of Buddha, many of them of colossal size. Relics and inscriptions are also found. There are caves in several localities of the island besides those at Kanhari—e.g., those of Montpezir, Magatani, and Jageshwar. The caves are frequently the haunts of serpents and tigers. On the n., on the coast, is the small watering-place of Ghorá Bandar, which has been designated the Montpelier of Bombay. The fort of Thanah and the island of Salsetté were taken by the English in 1774.

SALSIFY, or SALSIFY. *Tragopogon porrifolius*, a biennial plant growing in meadows throughout Europe, not common, and perhaps not truly indigenous in Britain; cultivated in gardens for the sake of its root, which is used in the same manner as the carrot, and is very delicate and pleasant, with a flavor resembling asparagus or scorzonera. The root is long and tapering, and in cultivation white and fleshy, with much white milky juice; the stem 3 to 4 ft. high, with smooth and glaucous leaves, which resemble those of the leek; the flowers are of a dull purple color. The seed of salsify is sown in spring, and the root is ready for use in winter. In the following spring, when the flower-stalks are thrown up, they are used like asparagus. Owing to a peculiar mode in which the roots are sometimes dressed, so as to have a flavor somewhat like that of oysters, salsify is sometimes popularly called the *oyster plant*.—The genus *tragopogon* belongs to the natural order *compositæ*, sub-order *eichoraceæ*, and is distinguished by one row of eight to ten bracts united at the base, a punctured receptacle, feathery pappus, and striated achenia with long beak.—The PURPLE GOAT'S BEARD (*T. pratensis*), a native of Britain, was formerly cultivated in England for its roots, which are similar in quality to salsify.

SALT. See SODIUM. Common salt is either procured in the solid crystalline state called *rock-salt* (q.v.), as a natural brine from wells or springs, or by the evaporation of sea-water. In the first case, it is obtained by mining, often at great depths, as at Northwich in Cheshire; at Salzbürg, Madgeburg, Berchtesgaden, and Wimpfen in Germany; Cracow in Poland; in the Punjab and other parts of the world.

Rock-salt almost always contains impurities, and therefore is dissolved in water, and the insoluble matters mixed with it are deposited at the bottom. The brine is then drawn off and evaporated by artificial heat in large iron pans.

Natural brine is obtained at Droitwich and Stoke in Worcestershire, and Nantwich in Cheshire. At Droitwich the shaft is only sunk 175 ft., and the brine rises to the surface and overflows if not pumped. There are, however, reservoirs made for it, into which it is pumped, and from which it is distributed to the various works, which are little more than large sheds, with numerous openings in their roofs to allow the steam free egress. Flues run from end to end of the floors, and on these rest the iron evaporating-pans, which are about 65 ft. long by 25 broad, and about 18 in. in depth. In other places very deep shafts have been sunk, and the brine requires to be pumped from a great depth. The flues heat the brine nearly to boiling-point, and as a large surface is exposed, the evaporation is very rapid, and the crystals are small, as in the fine table-salt. If, however, the heat is more gentle, the salt is coarser, and is fit for curing meat, fish, etc.; and when very slow, a much coarser kind, called *bay-salt*, is produced. Salt is obtained from sea-water in many parts of the world, and this is effected by simply evaporating it in brine-pits or shallow square pools, dug on the shore for the purpose. When the evaporation has proceeded to a certain extent, the liquid assumes a reddish color; a pellicle of salt forms on its surface, which soon breaks and sinks down, to be followed by another; and the crystallization then proceeds rapidly. When complete, the salt is removed to sheds open at the sides, and then piled in heaps, in order that the chloride of magnesium may be removed. This is very easy, for as it is extremely deliquescent, it liquefies by exposure to the atmosphere, and runs out. The salt is then redissolved and crystallized, if great fineness is required.

SALT (*ante*), sodium chloride—chemical symbol, NaCl—an essential constituent of food, the use of which dates from the earliest ages. The Romans are thought to

have been the first to manufacture it. Many ancient philosophers treat of it scientifically, but the correct view of its composition as the chloride of sodium is of quite recent origin, sir Humphrey Davy having first experimentally demonstrated it in 1810. Salt is present in every part of the human frame, organized in the solids and dissolved in the fluids. Besides its use as an article of food, immense quantities are consumed in the preservation of meats, etc., and for other industrial purposes. The annual rate of consumption varies in different countries, being estimated at 50 lbs. for each person in the United States, while in Great Britain it is 22 lbs., and in France only 15 lbs. The salt of commerce may be roughly classed under two general heads, that which is found in its crystalline state in deposits of rock-salt, and that which is produced by the evaporation and purification of salt brines. Deposits of rock-salt are not confined to any one series of strata, but appear at various depths in the crust of the earth and in nearly every geological horizon. Thus the great English deposits in Cheshire and Worcestershire, as well as the deposits in France and Germany, occur in different members of the triassic group; the mines of Wielizka in Austrian Galicia, those at the base of the Carpathian mountains, those in Tuscany and Sicily, belong in the tertiary; in the Austrian Alps deposits exist in the oolitic limestone; and in other places they occur in the carboniferous and even in the Silurian strata. The deposits in Petit Anse island, Vermilion bay, La., are only from 16 to 18 ft. below the surface, while those in Ontario, Canada, lie at a depth of fully 800 feet. Very little rock-salt, as such, is used either in England or in the United States, the large quantities mined in the former country being mostly exported. But the deposits of rock-salt are usually turned into artificial brines by dissolution in water while still in the mines, and the product of these brines furnishes much of the salt that is used in England. The natural brines must, of course, include the sea-water which is largely depended upon in South and Central America, in the West Indies, and in southern Europe. Very little salt is made from sea-water in the United States—not more than 400,000 bush. annually. The natural brines proper are the salt springs and wells which result from the accidental dissolution of rock-salt deposits by passing currents of water. These are found with more or less frequency in almost every country; they abound in England, in northern Italy, in Prussia, and especially in Russia. Salt lakes also are frequent in the latter country, but in the Great Salt lake in Utah the United States possesses the largest known inland body of salt water.

Manufacture.—The coarser qualities of salt are mostly made from sea-water or from brines by a natural process of evaporation, although they consist sometimes of rock-salt ground to a suitable size. Along the shores of the Mediterranean the evaporation is effected by exposing the sea-water in shallow basins to the influence of sun and air. In Russia, Sweden, and other northern countries, salt is obtained by freezing sea-water in large reservoirs. As the ice so formed is nearly pure, repeated congelations leave the mother-liquor more and more impregnated with salt, and the residuum is finally boiled down. In New York, Kansas, Michigan, Ohio, and West Virginia there are many manufactories of coarse salt from the natural brines. By mere exposure in a series of shallow wooden vats, protected from the rain by movable covers, the liquid is first freed from its principal impurities, and then evaporated by solar heat—the coarse salt so obtained being largely used in the preservation of meat and fish. The most important of these establishments is at Onondaga, N. Y., where the finer grades of salt are also made. These finer qualities of salt, often known as boiled salt, result from the application of artificial heat to the brines. In many cases, however, and especially when the brines are weak and diluted, they are submitted to a preliminary process of evaporation in the air, which not only concentrates the liquid, but frees it from the carbonic acid and the ferrous carbonates with which it is frequently impregnated. This may be done in the wooden vats already mentioned, though a favorite process, superseding all others in Europe, consists in pumping the liquor up to a high reservoir and thence allowing it to trickle down through bundles of thorn or brush built up in the form of a wall, the great amount of surface thus exposed to the wind and sun causing very rapid evaporation. This preliminary process is called “graduation.” After the liquor has been sufficiently concentrated the separation of the salt is effected by artificial heat. This may be done in various ways, the most usual being those known as the kettle, the pan, and the steam processes. The first is peculiar to the United States, and is practiced especially in the Onondaga factories. Some 50 or 60 hemispherical iron kettles, capable of holding from 120 to 150 gals., are placed in a double row along a common flue, heated by fire-places at each end. At the bottom of each of these kettles a pan with a long handle is introduced, upon which are collected the impurities precipitated during the process of concentration. From time to time the pan is removed and cleaned until the salt crystals begin to appear, when it is not replaced. After the salt has separated it is washed in the remaining pickle, hung in baskets over the kettles, where it is drained for a few hours, and then emptied into the store-rooms. Here it remains for a couple of weeks—a law in New York state makes a two weeks’ drying in the store-room obligatory—and is then ready for the market. The pan process, not often practiced in this country, is a favorite in England. The brine, after it has been “graduated” to a sufficient specific gravity, is placed in large shallow iron pans called the “foreheaters,” where it is boiled until the impurities have been deposited, and then when it has almost reached the saturation point is run off into similar pans and evaporated to dryness. In the steam pro-

cess the graduated brine is placed in wooden vats called settlers, about 800 ft. long, 8 ft. wide, and 6 ft. deep, heated by means of a number of 4 in. steam pipes passing through them from end to end. The impurities having been deposited in the settlers, the liquid is drawn into other vats called "grainers," of the same length and width, but only a foot or two in depth. The salt forms very rapidly, and is lifted, drained, and stored in the same way as in the kettle process. The steam process is used in various places in the United States, particularly in the Saginaw valley in Michigan, where the kettle process is also practiced. The fineness of the salt in all cases depends upon the rapidity with which the evaporation is conducted, the most rapid boiling producing the finest grained salt. The United States is remarkable for the number of its salt manufactories; no less than 23 of the states are or have been actively engaged in the production of the various grades of salt. Of these New York and Michigan are the chief. The former state has produced as much as 9,053,874 bush. in a single year (1862), but since that time the yield has declined and does not now average 800,000 bush. a year. The saline springs are principally in Onondaga county, in the towns of Syracuse, Salina, and Geddes. They are the property of the state, which supplies the brine to manufacturers and receives a royalty of one cent per bushel. The salt industries of Michigan are of quite recent development, although as early as 1838 unsuccessful efforts had been made by the state authorities to work the valuable licks and springs. In 1859, prompted by the offer of a bounty of 10 cts. a bushel, offered by the legislature for salt made in the state, a company was organized in East Saginaw, and in a few years the production of salt had reached such extensive proportions as to largely encroach upon the market formerly commanded by New York. Nearly 700,000 bush. are now made yearly in Michigan. West Virginia, Ohio, and Pennsylvania have each of them at different periods been among the leading states in the union in this branch of industry, but they have seriously declined of late years. In Indiana, Illinois, Kentucky, and the New England states, the business has become unproductive; in Missouri and Tennessee it has been abandoned. Some of the western states and territories, Kansas, Arkansas, New Mexico, Utah, and California, contain important saline springs and lakes, which have been only slightly worked as yet, and which with the settlement of the country will probably be fully developed. In Louisiana the deposit of rock-salt in Petit Anse (see SALT DEPOSIT IN LOUISIANA) yields about 100,000 bush. annually. The demand for salt in the United States, however, is still largely supplied by importation, especially from Canada, the annual consumption being placed at nearly 40,000,000 bush., and only about one-half of that amount is of home production.

Agricultural uses.—These are two-fold: first, as a fertilizer of the soil, and second, as a necessary article of food for farm stock. Salt can be only sparingly used as a manure; its effects depend so much not only upon the character of the crops, but also on the nature of the soil, that in the hands of an ignorant person it is liable to do more harm than good. In the rice fields of the east sea-water is said to have been used from a very early antiquity with beneficial results. In sandy soils, especially in those devoted to the cultivation of mangold-wurtzel, the English farmers have found salt very successful and it is also recommended as a top-dressing in pasture-lands, checking the rank growth of the grass, but greatly increasing its quality and succulence. Used in connection with nitrate of soda, in the proportions of two parts of salt to one part of nitrate of soda, the beneficial effects of the latter manure are largely increased. On stiff soils, however, salt is practically inoperative, and in many cases where its use has been recommended, as in the growth of cereals, cabbage, etc., experience has shown that it is of little or no benefit. As an essential portion of the food of live stock salt is a necessity upon every farm. Animals which are subject to lively exercise during the day are especially dependent upon salt for their health, and instances are not uncommon where beasts of burden have died for want of it. Milch cows, it is well known, need a daily allowance of salt in order to preserve the sweetness of their milk, and the quality of the fleece of sheep depends to a great extent upon their obtaining a sufficient measure of salt. A custom practiced by many farmers, which may be generally recommended, is that of keeping a stock of salt in the corner of a pasturage to which ready access is had by the cattle, there being no danger of their eating more than nature requires, except in cases where it had previously been denied them for an undue length of time.

Industrial uses.—It is estimated that more than one-half of the total amount of salt consumed in this country is used in the packing and preserving of meats and fish, and the preservation of the products of the dairy. In the case of beef and pork a small portion of saltpeter is often added to the salt, which withdraws the moisture from the meat. Sugar is also used in connection with salt in the curing of hams. For dairy purposes none but the finest grades of salt should be used; in the packing of beef and pork the coarser kinds are the best. It has often been suggested that salt might be employed advantageously in the seasoning of timber, but experience teaches that timber so seasoned is liable to contract moisture, with all the attendant evils of warping and increasing in bulk and in weight. Of course, in the case of wood-work constantly exposed to water, as in the joints and intersections of ships, this objection does not hold, and the experiment in such cases has often been tried with success. In refrigerating mixtures salt is invaluable, and in the manufacture of ice-cream large quantities of salt are annually consumed. As salt is the source from which soda is derived, it is really the

basis in the manufacture of soaps and glass. In the United States, however, very little salt is converted into soda, the latter article being principally imported. England turns fully one-half of its annual production of salt into soda-ash. Other chemical products of salt are the chlorine used in the bleacheries and hydrochloric or muriatic acid—the latter being formed in the manufacture of soda.

SALT, Sir Titus, 1803–76; b. England; educated at Wakefield; began business as a woollen manufacturer at Bradford, 1834; founded in 1853 near Shipley on the river Aire a manufacturing village, called Saltaire. The factory works cover about 20 acres, and there are 1000 convenient dwellings for the operatives. He was mayor of Bradford; president of the chamber of commerce; a member of parliament for Bradford 1859–61; made a baronet in 1869. He was the head of the mercantile house of Titus Salt, Sons and Co. and liberally aided several benevolent institutions, schools, and libraries. He was remarkable for his care for the physical and moral welfare of his great host of work-people.

SALTA, a province in the n.w. of the Argentine republic, bounded by Bolivia, Santiago, Catamarca, Tucuman, and Jujuy; 59,000 sq. m.; pop. '69, 85,959. It is drained by the San Francisco, Bermejo, Juramento, and very many other rivers. The surface is mountainous, traversed by many spurs of the Andes, some peaks of which are 15,000 ft. high. The soil is remarkably productive; and among the many exports are coffee, cotton, cocoa, wine, sugar, rum, and molasses. Copper, iron, and the precious metals, are found.

SALTA, a town in the n.w. of the Argentine confederation, capital of a state of the same name, and about 150 m. distant from the Araucanian and Bolivian frontiers. It stands on the banks of the upper waters of the Salado, at the height of upward of 3,900 ft. above sea-level; but even with this elevation its climate is unhealthy. It is well built, contains a number of good edifices, and about 11,000 inhabitants.

SALT-CAKE is the term employed to designate the crude sulphate of soda made from oil of vitriol and common salt, and used in the preparation of carbonate of soda.

SALT COATS, a seaport on the firth of Clyde, county of Ayr, 30 m. s.s.w. of Glasgow. Though its shipping trade has declined, Saltcoats is a thriving place, and a great resort of sea-bathers. Fine sea-salt is manufactured. Pop. '71, 4,624.

SALT DEPOSIT IN LOUISIANA, a remarkable deposit of rock-salt occurs on Petit (or Petite) Anse, a small island of Iberia parish, La., lying in a marsh near Vermilion bay 10 m. s. of New Iberia in lat. 29° 50' n., long. 91° 55' w. Its discovery was accidentally made in 1861, an opportune time for the southern confederacy, as almost their entire supply of salt was drawn from this source during the later years of the war. The deposit is covered by a mere drift mass 16 to 18 ft. deep. It is remarkably pure and so far as mined is found to lie in one solid mass without split or cleavage. Its dimensions have not yet been ascertained, a shaft has been driven through it to the depth of 50 ft. and it has been tunneled from e. to w. to the extent of about 150 yards without reaching the margin. In sinking the shaft a large number of fossil remains of human beings, and mastodons, mammoths, and other animals were found, together with pottery ware and stone implements. The latter also are strewn in great profusion over the island, and it is conjectured that the place formerly abounded in game, attracted thither probably by the salt-licks, and was consequently a favorite hunting-ground, but hunters and hunted seem to have been involved in a common catastrophe.

SALTER, WILLIAM D., 1794–1869; b. N. Y.; entered the navy as midshipman 1809; rose through successive grades to capt. 1839; was commandant at the Brooklyn navy-yard 1856–59, and commodore on the retired list 1862. In 1863–66 he was inspector of vessels of war. In the war of 1812 he served on the *Constitution* in the engagement with *The Guerrière*, and was an officer of approved valor, distinguished for gallant services.

SALTILLO, a city of Mexico, capital of the state of Coahuila, 250 m. w.s.w. of Matamoros. It is regularly laid out, contains a public square and fountain, and carries on manufactures of blankets and ponchos. Pop. 15,000. Seven m. s. is Buena Vista, famous for the battle fought there, Feb., 1847, when the Mexican forces were repulsed by an inferior U. S. army.

SALTING, the process by which animal and vegetable substances are preserved for food by the aid of common salt. This is either done by rubbing dry salt into the flesh to be preserved, and repeating the process from time to time, until it has absorbed sufficient to arrest decomposition; or the salt is liquefied with a little water, and made into brine, in which articles are placed until required for use, when a little soaking and washing removes the superfluous salt. Vegetables are only salted in the latter way; and continental nations use it extensively for the preservation of various kinds of vegetable food for winter consumption. A little saltpeter is often added, and very much increases the efficiency of the common salt. See ANTISEPTICS, FOOD.

SALTIRE, one of the ordinaries in heraldry, its name of uncertain etymology, representing a bend-sinister conjoined with a bend-dexter, or a cross placed transversely like the letter X. Like the other ordinaries, it probably originated, as Mr. Planché suggests,

in the clamps and braces of the shield. The form of the saltire has been assigned to the cross on which St. Andrew is said to have been crucified; hence the frequency of this ordinary in Scotch heraldry. A saltire is subject to the variations of being engrailed, invected, etc., and may be *couped*. When two or more saltires are borne in a shield, they are couped, not at right angles, but horizontally; and as they are always so treated, it is considered superfluous to blazon them as couped. Charges disposed in the form of a saltire are described as placed *saltireways*, or *in saltire*. The former term is more properly applied to two long charges, as swords or keys, placed across one another (in which case the rule is, that the sword in bend-sinister should be uppermost, unless otherwise blazoned); and the latter to five charges placed two, one, and two.

SALT LAKE, a co. of n. Utah, s.e. of Great Salt lake, intersected by the Jordan river, and traversed in the e. by the Wahsatch mountains; pop. 18,337; sq.m. 1200. The soil along the base of the mountains is naturally barren, but is made fertile by irrigation. The co. is crossed by several railroads. The staples are wheat, hay, potatoes, wool, and butter. There are mines of gold, silver, and lead; many manufactories, and smelting works, flouring and saw-mills, tanneries, and breweries.

SALT LAKE CITY, the chief town and ecclesiastical capital of the Mormon territory of Utah, is on the e. bank of the river Jordan, between lake Utah and Great Salt lake, 20 m. s. of the latter, and 4,350 ft. above the level of the sea, 650 m. e.n.e. of San Francisco, and 1190 w. of the Mississippi. It was settled by the Mormons (q.v.) in 1847, and contains 260 lots of ten acres each; 4 public squares; shaded streets 128 ft. wide, through each of which flows a stream of pure water from the neighboring mountains, 10,000 ft. high, from which the gardens are irrigated. The houses are chiefly built of adobes, or sun-dried bricks, each wife in the polygamic families having a separate entrance. The principal edifices are the Mormon temple, the titling-house or treasury, and the social hall, which serves for ball-room and theater. Pop. in 1860, 8,236; in 1870, 12,854.

SALT LAKE CITY (*ante*), capital of Salt Lake co. and of Utah territory, at the base of the Wahsatch mountains; 2 m. e. of the river Jordan, 12 m. s.e. of the great Salt lake. It was laid out when the region was a wilderness, by a company of 143 Mormons led by Brigham Young; pop. in '75, 20,000. The site of the city covers about 9,000 acres, only a quarter of which is occupied. It is connected by the Utah Central railroad with the Union and Central Pacific railroads at Ogden, 36 miles. The city is divided into 20 wards, in almost every one of which is a public square. The city is lighted by gas, and has 5 m. of street railroad. It contains a city hall, the Mormon tabernacle, Episcopal, Presbyterian, Methodist, Congregational, and Catholic churches, 2 national banks, a savings bank, the university of Deseret, graded schools, a public library, a museum, several newspapers, and two monthly periodicals. The Mormon tabernacle, costing \$500,000, accommodates 15,000 people, and has an immense organ. There are many halls and a large theater.

SALTONSTALL, GURDON, 1666-1724; b. Mass.; graduated at Harvard in 1684; ordained pastor of the First church (Congregational), New London, 1691; was prominent in politics, and was elected governor of Connecticut in 1707, which position he held until his death. He was an eloquent speaker. He bequeathed £1000 to Harvard college to aid in the education of young men for the ministry.

SALTONSTALL, LEVERETT, LL.D., 1783-1845; b. Mass.; studied at Phillips academy, Exeter, N. H.; graduated at Harvard college 1802; commenced practice of law in Salem 1805; and became eminent in his profession; was often member of the legislature; a state senator in 1831; mayor of Salem 1836-38; member of congress 1838-43. He was a member of the Massachusetts historical society, to which he contributed *Historical Sketch of Haverhill*; also of the academy of arts and sciences. He bequeathed most of his library to Phillips academy, Exeter, and some money to the library of Harvard college.

SALTONSTALL, Sir RICHARD, 1586-1658; b. England; nephew of sir Richard, lord mayor of London in 1597; the ancestor of those in New England who bear that name, and one of the fathers of Massachusetts colony. He came to Massachusetts with gov. Winthrop in 1630, was assistant-governor that year, and, with Mr. Phillips, commenced the settlement of Watertown; returned to England in 1631, where he continued the friend of the colony and a patentee of Connecticut. In 1651 he wrote a letter to the ministers Cotton and Wilson, protesting against persecution for religious opinions.

SALTPETER See NITER, *ante*.

SALT RANGE, or KALABAGH MOUNTAINS, a mountain range in the Punjab, India, lies in an e. and w. direction, in lat. 32° 30'—33° 20'. The range rises on the w. bank of the Jhelum, runs w. to the Indus, and after affording a passage to the river, reappears on its w. side, and pursues the same direction till it meets with the Suleiman mountains. The Salt range is about 200 m. in length, and varies from 2,000 to 5,000 ft. in height. Its appearance is exceedingly bleak and barren; vegetation is seldom met with; there are no trees; and the bold and bare precipices which frequently occur give to the range a forbidding aspect. Rock salt is found in inexhaustible quantities, and so pure that after being pounded it is ready for use. Alum, iron ore, coal, gypsum, and limestone abound; gold-dust is washed down in the sands of the rivers, and graphite is also found.

SALT OF SATURN, an old name for acetate of lead.

SALT OF SORREL, the common name for binoxalate of potash.

SALT, SPIRITS OF, the old name for muriatic or hydrochloric acid.

SALTS, SMELLING, a preparation of carbonate of ammonia with some of the sweet-scented volatile oils, use as a restorative by persons suffering from faintness. The pungency of the ammonia is all that is useful, and the oils are added to make it more agreeable. Oils of lavender, lemon, cloves, and bergamot are those chiefly used. The celebrated Preston smelling-salts are scented with oils of cloves and pimento. The manufacture of ornamental bottles to contain this preparation is an important branch of the glass and silversmith's trades.

SALTS, THEORY OF. Any substance which is produced by the combination of a base with an acid, is commonly termed a *salt*. The base is in most cases a metallic oxide, which is capable of uniting with an acid, and of more or less completely neutralizing the distinctive properties of the latter; in some cases, however, the base is non-metallic and organic in its nature, as in the case of ammonia, morphia, quinia, strychnia, creatinine; etc.

The salts derive their generic name from common salt, now known as chloride of sodium, but till the time of Davy regarded as a compound resulting from the union of hydrochloric (or as it was then termed, *muriatic*) acid and soda. See SODIUM. Davy, however, showed that during their action upon each other, both the acid and the alkali undergo decomposition, and that while water is formed by the union of the oxygen of the alkali (NaO) and the hydrogen of the acid (HCl), the sodium of the former combines with the chlorine of the latter to form chloride of sodium (NaCl). Hence, strangely enough, the very substance from which the salts derive their name as a class, was the means of overthrowing the old idea that a salt, as a matter of necessity, must result from the union of a base with an acid. It was then proposed to divide salts into two classes—those formed by the union of a base with an oxyacid, such as nitrate of potash (KO.NO₃), formed by the union of oxide of potassium with nitric acid, sulphate of soda (NaO.SO₃), carbonate of lime (CaO.CO₂), etc., which were termed *oxysalts*; while the other class consisted, like chloride of sodium, of a metal combined with the characteristic element (chlorine, iodine, bromine, fluorine) in a hydrogen acid or hydracid (as, for example, hydrochloric, hydriodic, hydrobromic, or hydrofluoric acid). The salts of this second class, of which chloride of potassium (KCl) and fluoride of calcium (CaF) may be quoted as examples, being constructed on the same plan or type as sea-salt, were termed *haloid salts* (q.v.), from the Greek word *hals*, the sea. The chlorine, iodine, bromine, or fluorine, which, in combination with a metal, forms a haloid salt, is by some writers termed a *salt-radical*.

The great resemblance in properties between the two classes of saline compounds, the haloid and oxysalts, has very naturally led to the supposition that both might possibly be alike constituted; and that the latter, instead of being considered compounds of an oxide and an acid, might with greater propriety be considered to contain a metal in union with a compound salt-radical, having the chemical relations of chlorine and iodine. On this supposition, sulphate and nitrate of potash will be constituted in the same manner as chloride of potassium, the compound radical replacing the simple one.

Old View.	New View.
KO + SO ₃	K + SO ₃
KO + NO ₃	K + NO ₃

Hydrated sulphuric acid will be, like hydrochloric acid, a hydride of a salt-radical, H + SO₄. When the latter acts upon metallic zinc, the hydrogen is simply displaced, and the metal substituted. No decomposition of water is supposed to occur, and consequently the difficulty of the old hypothesis is at an end. When the acid is poured upon a metallic oxide, the same reaction occurs as in the case of hydrochloric acid; water and a haloid salt are produced. All acids must be, in fact, hydrogen acids; and all salts acid salts, with either simple or compound radicals."—Fownes's *Manual of Elementary Chemistry*, 9th ed. 1863, p. 269.

This view, which is frequently termed the *binary theory* of salts, was originally suggested by Davy, but it remained for many years nothing more than (to use the words of prof. Miller) "an elegant hypothesis," till it was further illustrated by certain of Liebig's researches in organic chemistry, and till, in certain special cases, it received direct confirmation from the voltaic researches of Daniell and Miller, who found that when a current from two or three of Grove's cells was transmitted through fused nitrate of silver (Ag₂O.NO₃), the latter was resolved into crystals of silver (Ag) at one pole, and NO₂ (which at once broke up into red fumes of peroxide of nitrogen and free oxygen) at the other.

But although the binary theory serves to explain in the most satisfactory way many chemical changes, as, for example, the modifications of phosphoric acid and phosphate of soda (see Miller's *Inorganic Chemistry*, 2d ed. 1860, p. 333; or Galloway's *Second Step in Chemistry*, 1864, pp. 128-130), there are many objections to it, and it will probably give place to other views regarding the constitution of salts. For a notice of these objections, we must refer to the above-mentioned works of Miller and Galloway. Some of

our most eminent chemists, as, for example, the editors of Fownes's *Manual*, take a more hopeful view. According to Drs. Bence Jones and Hofmann, "the general application of the binary theory still presents a few difficulties. But it is very probable that the progress of discovery will ultimately lead to its universal adoption, which would greatly simplify many parts of the science."

The salts may be arranged according to their mode of composition into:

1. *Neutral or Normal Salts*; 2. *Acid Salts*; and 3. *Basic Salts*. A salt is *neutral* which is composed of as many atoms or equivalents of the acid as there are of oxygen in the metallic base. If the base is a protoxide, or contains 1 atom of oxygen, 1 atom of the acid is combined with it. Sulphate of potash ($\text{K}_2\text{O}, \text{SO}_4$), nitrate of copper (CuO, NO_3), and carbonate of potash ($\text{K}_2\text{O}, \text{CO}_2$) are all neutral in their composition, each consisting of one atom of the acid in combination with one atom of a metallic protoxide. But all these salts are not neutral, if we judge of their neutrality by their exerting no action on litmus or turmeric paper, for while the first is neutral to test-paper, the second exhibits an acid, and the third an alkaline reaction; and hence the use of the term *normal*, in preference to that of *neutral*, as applied to this class, has been judiciously advocated by Miller and other chemists. If the base is a sesquioxide, three atoms of the acid combine with one atom of the base to form a neutral or normal salt: thus, the sulphates of alumina and of sesquioxide of iron are represented by the formulæ $\text{Al}_2\text{O}_3, 3\text{SO}_4$ and $\text{Fe}_2\text{O}_3, 3\text{SO}_4$; and as these salts not only redden litmus, but have an acid taste, they afford an additional reason for our preference to the term *normal* over *neutral* salts.

Acid Salts are generally formed by dissolving normal salts in the same kind of acid which they contain, by which means a new salt is often but by no means always formed. Thus, if normal sulphate of potash ($\text{K}_2\text{O}, \text{SO}_4$) be dissolved in hot sulphuric acid, tablets of a new and strongly acid salt will appear as the solution cools. These crystals consist of bisulphate or acid sulphate of potash, and their composition is represented by the formula $\text{K}_2\text{O}, \text{HO}, 2\text{SO}_4$, or $\text{K}_2\text{O}, \text{SO}_4 + \text{HO}, \text{SO}_4$, in which the atom of water may be regarded as acting in the character of a weak base. If a similar experiment is made of dissolving nitrate of potash in hot nitric acid, no new salt will be formed, the niter crystallizing out unchanged. Why some acids should have the power of forming acid salts, and others should not possess the property, is unknown.

In *Basic Salts*, or *Sub-salts*, as they are often termed, the proportion of base predominates over that of the acid, there being two or three or more atoms of the basic oxide combined with one atom of the acid. Thus nitric acid forms with oxide of lead not only the normal salt, PbO, NO_3 , but three basic salts—viz., $2\text{PbO}, \text{NO}_3$, $3\text{PbO}, \text{NO}_3$, and $6\text{PbO}, \text{NO}_3$. Sulphuric acid forms with oxide of mercury not only the normal salt, HgO, SO_4 , but the basic salt commonly known as *turpeth mineral*, and represented by the formula $3\text{HgO}, \text{SO}_4$.

There is one other class of salts requiring a brief notice—viz., the *Double Salts*. Many neutral salts containing the same acid, but different bases, may be made to combine so as to form salts of the class now under consideration. Thus sulphate of potash and sulphate of alumina (both of which are neutral sulphates) by combining, give rise to the double salt popularly known as alum, and represented by the formula $\text{K}_2\text{O}, \text{SO}_4 + \text{Al}_2\text{O}_3, 3\text{SO}_4 + 24 \text{Aq}$. Similarly, double salts of silicic acid are of common occurrence. Thus the varieties of feldspar are double silicates of alumina with potash, soda, lithia, or lime, but most commonly with potash, and they may be represented by the general formula $\text{MO}, \text{SiO}_2 + \text{Al}_2\text{O}_3, 3\text{SiO}_2$, where MO stands for potash, soda, etc.

The salts at ordinary temperatures are solid bodies, with a strong tendency to crystallization, although a considerable number are amorphous. They may be either colorless or colored. When a colorless acid combines with a colorless base, the resulting salt does not exhibit color. A colored base combining with a colorless acid transmits its color to the resulting salts, and if a colored acid combine with a colorless base, a similar but less marked result ensues. The salts usually have a decided taste, which is usually dependent on the base; the sulphites are, however, an exception to this rule, as their taste resembles that of the acid. They are variously influenced by high temperatures: some remain unchanged; while others volatilize, fuse, and either simply lose their water of crystallization, or become decomposed. Most salts are soluble in water, and some, as, for example, carbonate of potash and chloride of calcium, have so strong a tendency to dissolve in that fluid that they abstract the moisture of the atmosphere. Such salts are termed *deliquescent*. As a general rule, hot water exerts a far more powerful solvent action than cold. There are, however, some remarkable exceptions to this law. Thus, the solubility of common salt (chloride of sodium) is very nearly the same, whatever be the temperature of the water, and certain salts of lime are more soluble in cold than in hot water.

It has been already shown that an atom of water enters into the composition of certain salts in precisely the same way as an atom of potash or any other base. Such water is termed *basic water*, and is an integral constituent of the salt, from which it cannot be expelled by an ordinary heat. This water is quite distinct from the *water of crystallization*, which is taken up by many salts in a definite quantity, when crystallizing from water, and which is readily expelled by a gentle heat without altering the chemical properties of the salt. The crystalline form of salts which contain water of crystallization is much influenced by the proportion in which the latter occurs. Thus, green

vitriol (sulphate of iron) crystallizes in two different forms and with two different proportions of water according to the temperature at which the salt separates from its solution. The number of equivalents of water of crystallization may vary from 1 to 24, which is the highest number yet observed. In order to distinguish the water of crystallization from water acting as a base, we characterize it by the symbol Aq. (from the Latin *aqua*, water). The ordinary phosphate of soda is represented by the formula $2\text{NaO}, \text{HO}, \text{PO}_5 + 24 \text{ Aq.}$ Many salts which contain water of crystallization (for example, sulphate or carbonate of soda) give off the whole or a part of their water of crystallization in a dry atmosphere, and crumble to powder; such salts are said to *effloresce*. Salts which contain no water of crystallization are termed *anhydrous*; of which niter (KO, NO_3) is an example. All salts, when dissolved in water, are readily decomposed by the electric current, the base going to the negative, and the acid to the positive, pole. In consequence of this result the acid is termed the electro-negative, and the base the electro-positive constituent of the salts. When a haloid salt is similarly treated, the halogen (chlorine, etc.) is separated at the positive pole, while the metal is liberated at negative pole.

SALT OF TARTAR, a commercial name for carbonate of potash in a very crude form.

SALT OF TIN is the term employed by the dyer and calico-printer for protochloride of tin, which is extensively used as a mordant, and for the purpose of deoxidizing indigo and the peroxides of iron and manganese.

SALT-WORT, *Salsola*, a genus of plants of the natural order *chenopodiaceæ*, having hermaphrodite flowers, with 5-parted perianth, and a transverse appendage at the base of each of its segments, five stamens and two styles, the seed with a simple integument. The species are numerous, mostly natives of salt-marshes and sea-shores, widely diffused. One only, **PRICKLY SALT-WORT** (*S. kalm*), is found in Britain. It has herbaceous prostrate much-branched stems, awl-shaped spine-pointed leaves, and axillary solitary greenish flowers. It was formerly collected in considerable quantities on the western shores of Britain, to be burned for the sake of the soda which it thus yields. *S. sativa* is the chief barilla (q.v.) plant of the s. of Spain.

SALUTE is a compliment paid in the navy and army, when a royal or other distinguished personage presents himself, when squadrons or armed bodies meet, when officers are buried, and on many other ceremonial occasions. There are several modes of saluting: firing great guns and small arms, dipping colors, flags, and topsails, presenting arms, manning the yards, cheering, etc. A royal salute consists in the firing of 21 great guns; in the lowering by officers of their sword-points, and the dipping of the colors. Persons of less elevated rank, entitled to be saluted, receive less extensive honors. A form of salute of more frequent occurrence is when a soldier "presents arms." The various forms of military salute, such as the firing of guns, lowering swords, and presenting arms alike render the ship or soldier so doing powerless for aggression. They thus symbolize friendliness, the putting of yourself in the power of the person saluted, submission.

SALUTE (*ante*), a compliment by the military or naval authorities to a ship or an officer, etc., is indicated by manning the yards, firing guns, dipping the colors. The national U. S. salute is a gun for every state; 21 guns are fired for the president; 17 for the vice president; 15 for cabinet officers, generals in command, and governors of states; 13 for maj. generals, U. S. or foreign ambassadors; 11 for brig. generals, etc.

SALUZZO, an episcopal city of northern Italy, in the province of Cuneo, at the foot of the Alps, 22 m. e. of mount Viso. It is a fine old city, and contains a semi Gothic cathedral built in 1480, with pillars of rare marbles, and colossal statues exquisitely sculptured, a seminary for priests, a royal college, and several elementary and infant schools. The tower of the Commune, an ancient and singular building, is worthy of notice; also the abbey of Staffarda, founded in 1135 by the marquis Tommaso I., and destroyed in 1341; an ancient civic palace, and the old castle, formerly the residence of the marquises of Saluzzo, now a penitentiary. Its products are grain, hemp, and wine; and its manufactures are silk fabrics, iron goods, and hats. Pop. of town, '71, 9,796.

SALVAGE (from Lat. *salvare*, to save) is the payment due by the owner of a ship or cargo to persons who may have been instrumental in saving it from extraordinary danger—from the sea, fire, or an enemy. The propriety of this allowance, as an incentive to the saving of life and property, has always been admitted; and though the correctness of the principle which allows salvage to royal ships for saving vessels of their own nation may be questioned on the ground that their duty is to protect such ships under all circumstances, yet it admittedly expedient to offer a fair pecuniary reward as an additional incentive to what may often be an irksome duty.

Salvage was recognized in the earliest maritime codes—as in the laws of Rhodes, Oleron, and Wisby. The law of England divides it into two classes, civil and hostile salvage. *Civil salvage* is saving a vessel or her cargo, or part thereof, from the perils of the deep; hostile salvage recovers it from an enemy or pirate after capture. No proportion is laid down in civil salvage, as generally applicable. Each case must be decided on its own merits, the ingredients for decision being, 1st the degree of danger incurred by

the salvors; 2d, the degree of peril in which the property rescued stood; 3d, the degree of skill, labor, and time evinced in the salvage; 4th, the value and nature of the property. Except where the assistance rendered has been trifling, the salvage usually ranges from a third to a half of the property saved. A contract to render assistance negatives any claim to salvage on account of such assistance. A passenger can only claim salvage when, having had the opportunity, while the danger existed, of quitting the ship, he voluntarily remains to render help. A royal ship is bound to aid a merchantman in distress; but it can still claim salvage.

When the parties cannot agree as to the amount of salvage, the admiralty court has jurisdiction over all cases which occurred at sea, or between high and low water mark. The rules for trying salvage cases are fixed by the statute 16 and 17 Vict. c. 131 (1853).

Hostile salvage is fixed by 43 Geo. III. c. 160 (1803) at one-eighth the value of the property saved for royal ships, and one-sixth for private vessels. Ships and merchandise taken from pirates pay one-eighth as salvage, 6 Geo. IV. c. 19 (1826).

In the case of saving a vessel belonging to an allied or neutral power, reference is made in awarding salvage to the laws of such power, and to the degree of reciprocity it grants to British vessels.

SALVAGE (*ante*), in maritime law, the compensation which persons are entitled to receive, who in the absence of any obligation making it their legal duty, voluntarily save a ship or her cargo from loss by peril of the sea, which may be called civil salvage; or recover them after capture, which is termed military salvage. The whole subject lies under admiralty jurisdiction, and the method of procedure is by *libel*. The interest of the salvors is not joint, but several, and all may be joined in a libel. The salvage is to be regarded as a reward and encouragement for courage rather than as a payment *quantum meruit*. When the salvors are in possession they have a certain qualified property right in the ship, which does not, however, extinguish that of the owners. Except under very unusual circumstances the crew, pilot, officers, and passengers, are not entitled to salvage; as by duty and interest they are bound to do what lies within their power. But where the seaman's term of service has expired or the services necessary are entirely outside his ordinary duty, an exception is made, and similar exceptions are made in the other cases. Vessels belonging to the naval force of a country are bound to protect from mutineers ships sailing under the same flag, and are not entitled to salvage for such services. Where the first set of salvors are themselves assisted by a second set the salvage is divided according to the respective merits of the parties; but only at peril of the first set can justify interference on the part of the second. The rule is that only those who actually participate in the service can share in the reward, but the owners of the saving ship are allowed to obtain pay both for stores or provisions furnished and as salvage. The amount of the salvage to be paid is not fixed either by common law or by United States statutes, and the proportion will vary with the degree of danger incurred and the value of the services rendered. That maritime property is derelict which has been abandoned by the owners with no intention of return to it. Some attempt was made to establish the rule that the salvage on derelict property should be one-half; but all that can now be claimed is that higher salvage will be usually decreed in derelict cases than where an intention of returning is clear. Where no owner appears the English rule was that the property should be turned over to the crown by the lord high admiral. In the United States the property is held for a year and a day and then given up to the finder. Another distinction was formerly made between articles easily saved, such as coin or jewelry, and bulky things, but this no longer exists. While there is no absolute law regarding the distribution of salvage, the owners usually have one-third, the master twice as much as the mate, the mate double a seaman's share, and those who navigate the saved ship into port, or otherwise take the greater risk, double the share of those who remain on the salvor vessel. A claim to salvage may be barred by a contract, not extorted or unconscionable, to pay a fixed sum for the aid to be given. In such case the remedy for non-payment is at common-law and not at admiralty. Another bar is the existence of a custom of rendering assistance among vessels of the same class, as in the steam-boat navigation of the Mississippi. Theft of any of the saved property, fraud, negligence, or gross misconduct of any kind in the care of the property also acts as a bar. Salvage is on ship, cargo, or freight, but perhaps not on mails. Military salvage is given where a vessel is recaptured or saved from pirates or a public enemy, and in the war of the rebellion an award was decreed *as of salvage*, to parties who, after the capture of a harbor which had been under blockade, enticed blockade runners in by exhibiting the usual signals.

SALVANDY, NARCISSE ACHILLE, Comte de, 1795-1856; b. France; entered the army in 1813. He was master of requests 1819-21, an editor of the *Journal des Débats* in 1824, and was elected to the academy, in 1835. He was twice minister of public instruction, and in 1843 was made count, and sent as ambassador to Turin. He published *Histoire de Pologne avant et sous le Roi Jean Sobieski*, and other works.

SALVÉ REGINA, the first words of one of the most popular prayers in the Roman Catholic church, addressed to the Blessed Virgin Mary. It forms part of the daily office of the Roman breviary, and is recited at the end of "Lauds" and of "Complin." But

it is still more in use as a prayer of private devotion, and concludes with an earnest and tender appeal for the intercession of the Blessed Virgin with her Son, "that we may be made worthy of the promises of Christ."

SALVIA. See **SAGE**, *ante*.

SALVINI, TOMMASO, b. Italy, 1830; a celebrated tragedian. His parents were actors. When quite a boy he showed a rare talent for acting, and was placed under the tuition of the great Gustavo Modena. After winning renown in juvenile characters, he joined the Ristori troupe. In 1849 Salvini entered the army of Italian independence, and received several medals in recognition of his services. After the war he played in the *Edipo* of Nicolini, a tragedy written expressly for him, and achieved a great success. He next appeared in Alfieri's *Saul*, and then all Italy declared that Modena's mantle had fallen on worthy shoulders. He then visited Paris, where he played *Orasmane*, *Orestes*, *Saul*, and *Othello*, and was received with great enthusiasm. In 1865 occurred the sixth centenary of Dante's birthday, and the four greatest Italian actors, Ristori, Rossi, Majeroni, and Salvini, were invited to perform in Silvio Pellico's *Francesca di Rimini*. In 1868 Salvini visited Madrid, and in 1874 came to America, where he was so well received that he returned in 1880. He acted in London in 1875, and appeared in Brussels in 1877.

SALVO is a concentrated fire from a greater or less number of pieces of artillery. Against a body of men, a salvo is generally useless, as the moral effect is greater in proportion to the area over which devastation is spread; but with fortifications, the case is otherwise. For the purpose of breaching, the simultaneous concussion of a number of cannon-balls on masonry, or even earth-work, produces a very destructive result. At Almeida, after the French had fired a few salvos of 65 guns, the castle sunk in a shapeless mass. The effect of a salvo of modern artillery, with its enormous steel shot, against iron-plated ramparts, has never yet been tried in actual war. The concentrated fire of a ship's broadside forms a powerful salvo.

SALZBRUNN, the name of three villages, NEU, NIEDER, and OBER SALZBRUNN, in Prussian Silesia, 37 m. s.w. of Breslau. The villages are dull, and worthy of notice only from their eight mineral springs and their much-frequented baths. About 2,500,000 bottles of alkalo-saline water are annually exported. Pop. in all, from 2,000 to 3,000.

SALZBURG, a crown land in the w. of Austria, bounded on the w. partly by Bavaria and partly by the Tyrol. Area, 2,765 sq.m.; pop. '70, 153,160. The principal mountain-ranges are the Noric Alps, which traverse the s. of Salzburg from w. to e. and rise in the Grossglockner to the height of 12,360 feet; and branches of the Rhaetian Alps, which separate the Tyrol from Salzburg and ramify throughout the middle districts of the latter, rising in the Ewiger Schneeberg to 9,580 feet. Snow-fields and glaciers occur in the more elevated regions. The chief river, the Salza, drains the greater part of the crown-land, flows first e., then n., and is 147 m. in length. The climate is cold and variable, but healthy, and although, of the whole area, 2,000 sq.m. are capable of bearing crops, this crown-land is inferior to most of the provinces of the monarchy in quantity and value of products. The rearing of cattle and horses is an important branch of industry. Salt is obtained in large quantities, especially at Halle (q.v.). Salzburg is the capital.

SALZBURG (anc. *Juvavion*), perhaps the most charmingly situated town in Germany, is the capital of the Austrian crown-land of the same name, and stands on both banks, but chiefly on the left bank, of the Salza, 190 m. w.s.w. of Vienna by railway. Here the river, banked on both sides by precipitous crags, rushes through what seems to be a natural gateway, and flows northward to its junction with the Inn. The picturesque situation of the city is thus described by Wilkie: "It is Edinburgh castle and the Old Town brought within the cliffs of the Trossachs, and watered by a river like the Tay." The heights on either bank of the Salza are crowned with edifices. That on the left, called the Mönchsberg, is surmounted by the castle, called Hohen-Salzburg, an irregular feudal citadel of the 11th c., and, during the middle ages, the residence of the archbishops of Salzburg, who combined the dignity of princes of the German empire with their ecclesiastical rank. The castle itself is now dismantled, but still serves as a barrack. A statue of Mozart (q.v.) adorns one of the squares. Opposite Mönchsberg is the Capuzinerberg, with a convent. The cathedral, a large and beautiful Italian edifice, was built in the early part of the 17th century. The architectural taste of the archbishops has adorned the city with many beautiful edifices, chiefly in the Italian style. The city is surrounded by walls, here and there dismantled, and the bastions are for the most part in a state of decay. The city is the seat of an archbishop, and contains numerous libraries, museums, and educational and other institutions, among which is an upper gymnasium, and the *Mozarticum*. It carries on manufactures to some extent, is in communication with Vienna, Munich, and Innsbruck by railway, and has a considerable transit-trade. Pop. '70, 14,615.

SALZKAMMERGUT, called also the *Austrian Switzerland*, one of the most picturesque districts of Europe, forms the s.w. angle of the crown-land of Austria ob der Enns, between the crown-lands of Salzburg on the w. and Styria on the east. Area, 249 sq.m.; population, 18,000 of whom 6,500 are Protestants. The scenery combines in rare

beauty the usual features of valley, mountain, and lake. The vales are clothed with a rich verdure, and are studded with clumps of fruit and forest trees; the mountains are covered with beeches and oaks; higher up with pines and larches, and in some instances are topped with everlasting snow. The highest peak, Grosse Priel, reaches an altitude of 7,931 feet. But the district derives its reputation for beauty chiefly from its lakes, the largest and most famous of which are the Hallstadt and the Traun, or Gmunden lakes. They are bordered with lofty mountains, which rise sheer from the surface of the water; and their pit-like character, and the strong light and shade thrown on them from the mountains, combine to render the scenery, of which they form the center, unusually sublime. The Hallstadt and Traun lakes are connected, and indeed formed by the river Traun. The district of Salzkammergut derives its name from the salt which is obtained in enormous quantities from its springs and mines. Salt being a government monopoly in Austria, the works are under the management of the *Kammer*, or exchequer. From 6,000 to 7,000 of the inhabitants are employed in the salt-works, and the amount annually obtained is near 50,000 tons. The chief seats of the salt-works are Ischl (q.v.) and Hallstadt. Little or no agriculture is carried on in the Salzkammergut and the inhabitants not engaged in the main industry of the district are engaged in cattle-breeding and in the timber trade.

SALZWEDEL, a small manufacturing t. of Prussian Saxony, 54 m. n.n.w. of Magdeburg, on the Jeetze. It carries on sugar-refining and manufactures of linen, woolen, and cotton fabrics. Pop. '75, 8,265.

SAMANA. See **SAN DOMINGO** (**DOMINGO**, **SAN**, *ante*).

SAMANI AND DILEMI were two dynasties which divided between them the kingdom of Persia toward the beginning of the 10th century. They both rose to power through the favor of the caliphs, but they speedily threw off the yoke. The Dilemi, divided into two branches, exercised sovereign authority in Kerman, Irak, Fars, Khuzistan, and Laristan, always acknowledging their nominal dependence on the caliph; and during the whole period of their rule, one of the southern branches of this family was vested with the dignity of *emir-ul-umra*, or vizier, and managed the affairs of the caliphate. Several of the Dilemi were able and wise rulers, as the remains of their works of irrigation and other structures amply testify; but Mahmud of Ghizni put an end to the rule of the northern branch in 1029, and the Seljuks subjugated the southern one in 1056, by the capture of Bagdad, their last stronghold. Their more powerful rivals, the *Samanis*, had obtained from the caliph the government of Transoxiana in 874 A.D.; and to this, Ismail, the most celebrated prince of the family, speedily added Khaurizm, Balkh, Khorassan, Seistan, and many portions of Northern Turkestan. Rebellions of provincial governors distracted the Samanide monarchy toward the end of the 10th c., and in 999 A.D. their dominions n. of Persia were taken possession of by the khan of Eashgar, the Persian provinces being added by Mahmud of Ghizni to his dominions.

SAMAR, one of the Philippine islands (q.v.).

SAMARA', a frontier government of Russia, bounded on the e. by the Kirghiz steppes, and on the w. by the governments of Saratov, Simbirsk, and Kazan. Area, 64,953 sq. m.; pop. '70, 1,837,081. It was erected into a government by ukase of Dec., 1850, and was formed out of portions of the governments of Simbirsk, Orenburg, and Saratov. The Volga, which forms the western boundary, and its affluent, the Samara, are the chief rivers. The country is very fertile, and agriculture and fishing are among the chief employments of the inhabitants. Only a comparatively small portion of the country is colonized. Chief town Samara (q.v.).

SAMARA, capital of the Russian government of the same name, on the left bank of the Volga, at the junction of that river with the Samara. It is the chief grain-market on the Volga, and it contains numerous store-houses, especially for grain. A good trade in salt, fish, caviare, and tallow is also carried on. From Samara comes a great number of lambs' skins, which are famous for their fineness. Pop. '67, 34,494.

SAMARANG', an important seaport on the n. of Java, 385 m. (by steamboat course) e. of Batavia, in 6° 57' 20" s. lat., and 110° 26' 30" e. long., is the capital of the residency, and the point to which the produce of Middle Java is brought for exportation to Europe. Pop. 50,000. The city lies on the right bank of the river Samarang. A railway to the Vorstenlanden (princes' lands), 126 m. long, was completed in 1874. The Chinese, Malays, and Arabians have their own captains, and quarters of small, dark, dirty houses. The Europeans dwell partly along the seashore, but chiefly on the left of the river, by the shady road to Bodjong, the resident's house, which is 2 m. from the city. The Protestants and Roman Catholics have each a church, orphan-house, and school. There are 3 public and 12 private schools, an excellent hospital for 550 patients, and other charitable institutions.

Only small vessels can enter the river. The roadstead is exposed to the west wind, and is dangerous during the rainy season. Besides the usual trades, the natives work in gold, silver, copper, and tin. Coffee, rice, sugar, tobacco, and indigo are the chief exports, an agent of the Netherlands trading company (q.v.) being established at Samarang to attend to the government trade. In 1874 the pop. of the residency of Samarang amounted to 1,319,978 souls, 3,050 being Europeans, and 15,185 Chinese.

SAMARIA (Heb. *Shomerôn*, Chald. *Shamrayîn*, Septuagint, *Samarëia*, *Semcrôn*, etc.), anciently a city of Palestine, the chief seat of the Ephraimitic Baal-worship, and from the seventh year of Omri's reign, the capital of the kingdom of Israel. It was beautifully situated on a hill about 6 m. n.w. of Shechem, and probably derived its name (which may be interpreted "pertaining to a watch" or a "watch-mountain") from the position of the hill, which rises from the center of a wide valley, and commands an extensive prospect; but an eponymous etymology is adopted by the writer of 1st Kings, who says (chap. xvi. verse 24): "And he [Omri] bought the hill Samaria of Shemer for two talents of silver, and built on the hill, and called the name of the city which he built after the name of Shemer, owner of the hill, Samaria." The date assigned to Omri's purchase is 925 B.C., from which time Samaria became the seat of government, which had been formerly at Thirsa. It was twice besieged by the Syrians (901 B.C. and 892 B.C.), under Ahab and Joram, on both occasions unsuccessfully; but in 721 (720) B.C., it was stormed by Shalmaneser, king of Assyria, after a three years' siege. Its inhabitants, together with those of all the other "cities of Samaria" (which had become the general name for the country itself in which the city stood), i.e., the kingdom of Israel—or the "ten tribes"—were then carried off into a captivity from which they never returned. Their place was supplied, after a time, by colonists, planted there by Shalmaneser and Esarhaddon, from Babylon, Cuthah, Ava, Hamath, and Sepharvaim (according to 2d Kings, chap. xvii. verse 24; Media and Persia, Josephus's *Antiquities*, x. 9, 7), who constituted the original body of the people subsequently known as Samaritans, but whose bulk was gradually increased by accessions of renegade Jews and others. The question has been much, and on the whole unprofitably, discussed, whether these so-called "Samaritans" were a mixed race of remnant Israelites and heathen Assyrians, or whether they were exclusively the latter. The mere language of Scripture, strictly construed, seems to favor the second of these views, unless the term "cities" of 2d Kings, xvii. 24, is intended to imply that the ancient inhabitants dwelt in the open country. On the other hand, we find, apart from the other reasons against so unparalleled a wholesale deportation, Israelitish inhabitants under Hezekiah and Josiah, both in Ephraim and Manasseh. Modern authorities therefore assume that they were, to a certain extent, what they always insisted on being, Israelites—(not Jews), i.e., a people largely intermixed with Israelitish elements, that, during the exile, had adopted the worship of Jehovah. The returning Jews, however, would not recognize their claims to the participation in the national cultus and temple, and a bitter antagonism sprang up between the two nationalities. In 409 B.C. a rival temple was erected on Mt. Gerizim, and a rival priesthood and ritual organized, and henceforth the breach, for some periods at least, became apparently irreparable—"the Jews had no dealings with the Samaritans," and *vice versa*. At other periods, however, a more friendly intercourse seems to have taken place between them. The rabbinical laws respecting the "Kushites" (Cuthim), as they were called by the later Jews, are therefore strangely contradictory, and their discrepancies can only be explained partly by the ever-shifting phases of their mutual relations, and partly by the modifications brought about in the Samaritan creed itself. The later history of the city of Samaria is somewhat checkered. It was captured by Alexander the great, when the "Samaritan" inhabitants were driven out, and their place supplied by Syro-Macedonians. It was again taken (103 B.C.) by John Hyrcanus, who completely destroyed it. Soon rebuilt, it remained for the next 59 years in possession of the Jews; but Pompey, in his victorious march, restored it to the descendants of the expelled Samaritans, who had settled in the neighborhood, and it was refortified by Gabinius. Herod the great rebuilt it with considerable splendor, and called it Sebaste, in honor of the emperor Augustus, from whom he had received it as a present. In the 3d c. it became a Roman colony and an episcopal see. Its prosperity perished with the Mohammedan conquest of Palestine; and at present it is only a small village called Sebastieh, an Arab corruption of Sebaste, but contains a few relics of its former greatness. "Samaritans," as a religious sect, still exist at Nablus (anc. Shechem), as they have existed in the district uninterruptedly through all the vicissitudes of war and conquest from the time of Christ. Their present creed and form of worship agree in many particulars with that of the so-called "rabbinical" Jews, although the Samaritans pretend utterly to reject the "traditions." They alone, however, have retained the paschal sacrifice of a lamb. The language of the ancient Samaritans is a Hebrew-Aramaic dialect, but contains a number of non-Semitic (Cuthæan) words. It only survives in a few fragments of ancient literature, a translation of the Pentateuch, and some liturgical pieces. The present inhabitants speak Arabic.—See Dr. Robinson's *Biblical Researches*, Raumer's *Palästina*, and Dean Stanley's *Sinai and Palestine*, etc.

SAMARITAN PENTATEUCH, a recension of the commonly received Hebrew text of the Mosaic law, in use with the Samaritans, and their only canonical book of the Old Testament. Some vague allusions in some of the church fathers (Origen, Jerome, Eusebius), and one or two more distinct, but less generally known Talmudical utterances respecting this recension, were all the information available up to the early part of the 17th c. (1616), when Pietro della Valle acquired a complete codex from the Samaritans in Damascus. Since then, the number of manuscripts of the Samaritan Pentateuch, with and without translations (in Arabic), has considerably increased in European libraries;

and fragments, consisting of special books or chapters, are of the most frequent occurrence. In fact, writing portions of Samaritan Pentateuch on the oldest of skins, would, in the face of the great demand for the article on the part of ignorant European, especially English, travelers, appear to be a favorite and lucrative pastime, if not an established trade and business, among the modern Samaritans.

These MSS. are written in the Samaritan character, a kind of ancient Hebrew writing, probably in use before, and partly after the Babylonish exile, and vary in size from octavo to folio, the writing being proportionately smaller or larger. Their material is vellum, or cotton paper, and the ink used is black, with the exception of the Nablûs MS., which is written in gold. There are neither vowels, accents, nor diacritical points, the single words are divided from each other by dots. None of the MSS. that have reached Europe are older than the 16th century. The Samaritan Pentateuch was first edited by J. Morinus in the Paris *Polyglott* (pt. iv. 1632) from one codex (whence it found its way into Walton), and was last re-edited, written in the square Hebrew characters, by B. Blayney, Oxford, 1790. The first publication of this strange document, and principally the *Exercitationes Ecclesiasticæ*, with which J. Morinus accompanied it, mark a certain epoch in modern biblical investigation; for, incredible as it now appears, it was placed by Morinus and his followers far above the received Hebrew text, which was said to have been corrupted from it. As reasons for this, were adduced its supposed superior "lucidity and harmony," and its agreement with the Septuagint in many places. This opinion, which could only have been entertained by men devoid of knowledge, was zealously cherished, and fiercely combated for exactly 200 years, when the first proper and scientific investigation (by Gesenius) set it at rest, once for all, among the learned world at least. This absurd notion chiefly owed its popularity to the anti-Jewish as well as anti-Protestant tendency of its supporters, to whom every attack against the received form of the text—that text upon which alone the reformers professed to take their stand, was an argument in favor of the Roman Catholic dogma as to the "rule of faith" (q. v.). This boasted superiority *en bloc*, gradually dwindled down to two or three passages, in which the Samaritan reading seemed preferable, and even these have now been disposed of in favor of the authorized Masoretic text. The variants, which Gesenius was the first to arrange systematically, present simply the ordinary aspect of partly conscious, partly unconscious corruptions. They arose, for the greatest part, from an imperfect knowledge of the first elements of grammar and exegesis. Others owe their existence to a studied design of conforming certain passages to the Samaritan mode of thought, speech, and faith, more especially to show that Mt. Gerizim was the spot chosen by Jehovah for his temple. There are, however, only two essential alterations respecting the Mosaic ordinances themselves to be found, one, Exod. xiii. 7, where the Samaritan Pentateuch has "six days shalt thou eat unleavened bread," instead of "seven"; and Deut. xxiii. 17, where our "shall be no" is altered into "shall not live." A chronological peculiarity deserves special mention—viz., that no one in the antediluvian times begets his first son in the Samaritan Pentateuch after the age of 150, either the father's or the son's age being altered in proportion; after the deluge, however, the opposite method is followed of adding 50 or 100 years to the father's years before the begetting of a son. We will only further add that anthropomorphisms, as well as anthropopathisms, are most carefully expunged, and that in Deut. xxvii. 4. Gerizim is wilfully substituted for Ebal.

It is, in the absence of a critical edition, exceedingly difficult to do more than speculate on the age and origin of the Samaritan Pentateuch, and opinions remain indeed widely divergent. The principal opinions on the subject are, briefly, either that it came into the hands of the Samaritans as a natural inheritance from the Jewish people, whom they succeeded at the time of the Babylonish exile; or that it was brought to them by Manasse (Jos. *Ant.* xi. 8. s. 2, 4), when the Samaritan sanctuary on Mt. Gerizim was founded; or, again, that the Israelitish priest sent by the king of Assyria to instruct the new settlers in the religion of the country, brought it with him. Of other more or less isolated opinions, only that one deserves further notice, that it was a late and faulty recension, into which glosses from the LXX. (Septuagint) were received. This agreement between the LXX. and the Samaritan Pentateuch, to which we have already alluded, has likewise given rise to many speculations and suggestions. The foremost of these are that the LXX. have been translated from the Samaritan Pentateuch; that mutual interpolations have taken place; that both versions were formed from Hebrew codices, differing among themselves, as well as from the authorized recension; and that many wilful corruptions have been superadded at a later time; finally, that the Samaritan has been altered from the LXX. There is also a translation of the Samaritan Pentateuch (which is Hebrew) into the Samaritan idiom; it is ascribed by the Samaritans to their high-priest, Nathaniel, who died 20 years before Christ. It was probably a kind of popular version, like the Targum (q. v.), and was composed, very likely, shortly before the destruction of the second temple. The translation is done in the most slavish and incompetent manner. Another Arabic version is due to Abu Said, in Egypt (1070), based on Saadiâh's translation; and to this Samaritan-Arabic translation, a Syrian, Abu Barachat, wrote, in 1208, a commentary, which is sometimes erroneously taken to be an independent Syriac version of the Samaritan Pentateuch. Among the principal modern writers on the Samaritan Pentateuch are Gesenius, Kirchheim, and Deutsch.

SAMARITAN LANGUAGE AND LITERATURE. I. The language is made up of the Aramaic and the Hebrew, and sometimes uses forms of both in close connection. The alphabet contains 22 letters, arranged in the Hebrew order, resembling in form the ancient Hebrew and Phœnician, and pronounced like the Hebrew, except that the gutturals, being quiescent and weak, interchange freely with one another. The words are the same as in the Hebrew and Chaldee, with additions from the Arabic, Latin, and Greek. II. The literature is of small extent. 1. *The Samaritan Targum*, ascribed to Nathanael the high-priest, who died B.C. 20, and probably written about the same time as the Targum of Onkelos, which it somewhat resembles. The translation is close and literal. It is printed in the Paris and Walton polyglots, and in several recent German editions. 2. *Chronicles*; (1) The Samaritan chronicle, or book of Joshua, ascribed by critics to the 13th c., taken in part from the canonical book of Joshua, with legendary additions, that charge the Jews with being oppressors of the Samaritans, and, after the time of Eli, apostates from the faith. The narrative is continued to 350 A.D., when it abruptly ends. (2) The chronicle of "the generations"—professedly written by Eleazar ben Anan, 1142, and afterward continued by many hands—gives a calculation of sacred times, the age of patriarchs, and a list of high-priests. (3) The chronicle of Abulfath, written about the middle of the 14th c., is drawn from the two previous works, with additional legendary matter. 3. *Liturgies and hymns* belonging to different periods, the earliest being ascribed to the angels. There are 19 vols. of them in the British museum, besides collections in other places. 4. *Commentaries, theological tracts, and recent grammatical works*, written in Arabic.

SAMARCAUND was in the 14th c. the capital of the great Tartar empire of Timur. It has since remained the center of Mohammedan learning in Central Asia. It was till 1868 the second city of the khanate of Bokhara, and since that period annexed to the dominions of the czar, it has become one of the chief towns of Russian Turkestan. It is in lat. 40° 2' N., and long. 67° 3' E., 4 English m. S. of the Zer-Afshan (a river which "loses itself in the sands"), and 145 m. nearly E. by N. from Bokhara. It is situated at the foot of mount Chobanata, in a plain of exuberant fertility; and when seen from a distance, its glittering minarets, lofty domes, and prominent edifices and ruins, relieved by the brilliant green of the closely planted gardens interspersed within the walls, present an imposing effect. The river for centuries has been changing its course, and Samarcand has followed it—so that it consists of a "new city," and the ruins of those which preceded it. The "new city" is surrounded with walls, pierced with six gates, and is filled with narrow streets and lanes, which have, however, undergone many improvements since the Russian occupation. The population, which in the 14th c. exceeded 100,000, has dwindled to 20,000. The inhabitants consist chiefly of Tajiks and Usbeks. They are chiefly employed in the manufacture of silk, wool, and leather. The old or "ruined city" is the portion most interesting to Europeans, as the capital of that mighty conqueror who wielded the scepter of Asia from China to the Hellespont. Many of the ruins belong to this epoch, among which are the Hazreti Shah Zinde, at one time supposed to have been a summer palace of Timur, but now shown to have consisted of tombs and chapels only. In the center of the city, separated from each other by a wide open space, stand three medresses, or sacred colleges. Each consists of a large quadrangular court, surrounded by a range of two-storied buildings, with chambers occupied by teachers and pupils. One of the objects of interest in Samarcand is the palace of the emirs of Bokhara, built within the citadel, where, before the Russian conquest, they were in the habit of spending the summer months with their harem suite. In one of the courts is the famous Kuk-tash, or green-stone, which served as Timur's throne. The palace has now been converted by the Russians into an hospital. Samarcand was the ancient *Mavacanda*, the capital of Sogdiana. It was seized by the Arabs 707 A.D., and from this time belonged either to the caliphate or to some of the dynasties which were offshoots from it, till 1219, when it was taken by Genghis Khan. In 1359 it was captured by Timur, and ten years afterward became the capital of his empire. It remained the chief town of Turkestan till 1468, when it declined in importance with the rise of the Usbeks. It retained, however, its position as the chief seat of Mohammedan learning in Asia. Until recently it had been visited by only four Europeans—in 1404 by the Spaniard Clavijo, in 1841 by Lehmann and Chanykow, and in 1863 by Vambéry. But in May, 1868, the gates of Samarcand were opened to the Russians (see **BOKHARA**), and they have since retained possession of the city. The inhabitants have manifested less antipathy to the rule of the infidel than might have been expected, from the reputation of Samarcand as a seat of Mohammedan fanaticism. The Jews have prospered by the encouragement given to trade; and the Tajik population have shown, as in the other cities of Turkestan annexed by Russia, good-will toward their conquerors, and a desire to adopt European ideas.—See Vambéry's *Travels in Central Asia* (Lond. 1864), and paper on "Ruins of Samarkand," by Prof. Fedchenko, in *Proceedings of Royal Geographical Society*, Dec., 1871.

SAMARRAIH, at. in S.E. Asiatic Turkey, on the E. bank of the river Tigris, 65 m. N.W. of Bagdad; containing about 250 houses. It is a walled town, and among the objects of interest are two Mohammedan tombs surmounted by cupolas, visited by multi-

tudes of votaries of the Sheeah sect. It contains a spiral tower, the ruins of a college, a palace, and the Median wall.

SĀMAVEDA is the name of one of the four Vedas. See VEDA.

SAMBALPUR, a province in e. central British India; drained by the Mahanadi and smaller rivers; 4,200 sq.m.; pop. '66, 812,348—of which 666,960 were Hindus. A line of railroad has recently been built between Sambalpur and Nagpur. The climate is unhealthful and fatal to foreigners. The aboriginal people, of whom there are nearly 150,000, are of the Ghond and Dhangar tribes. Iron, rice, cotton, and silks are the chief exports. The rajahs of the district were maintained in power against the Mahrattas until 1849, when the country came under British rule and is now governed by a deputy commissioner. The success of educational efforts in this district has been remarkable. Chief city, Sambalpur.

SAMBAS. See PONTIANAK.

SAMBOO, or **SAMBUR**. See RUSA.

SAMBORE, New, a t. of the Austrian empire, in the province of East Galicia. It is a thriving and well-built town, with manufactures of linens and extensive salt-works. Pop. '69, 11,749.

SAMBUCUS. See ELDER, *ante*.

SAMMATIYA is one of the four divisions of the *Vaibhāshika* system of Buddhism; its reputed founder was *Upālī*, a disciple of the Buddha, Śākyamuni.—See C. F. Koeppen, *Die Religion des Buddha* (Berlin, 1857); and W. Wassiljew, *Der Buddhismus, seine Dogmen, Geschichte und Literatur* (St. Petersburg, 1860).

SAMNITES, an ancient Italian people of Sabine origin, who occupied an extensive and mountainous region in the interior of southern Italy. They were surrounded on the n. by the Peligni, Marsi, and Marrucini; on the w. and s.w. by the Latins, Volscians, Sidicini, and Campanians; on the s. by the Lucanians; and on the e. by the Apulians and Frentani. The Samnites were divided into four nations: 1. The *Caraceni* in the n., whose capital was Aufidena. 2. The *Pentri* in the center, whose capital was Bovianum, and who constituted the most powerful nation of the Samnite stock. 3. The *Caudini*, in the s.w. 4. The *Hirpini* in the s., whose capital was Beneventum. For an account of their origin, ethnological affinities, and history, see ROME, HISTORY OF.

SAMO'AN ISLANDS. See NAVIGATORS' ISLANDS.

SAMOS (Mod. Gr. *Samo*; Turk. *Susam Adası*), an island in the Ægean sea, is situated about a m. off the coast of Asia Minor, in the bay of Scalanova, about 45 m. s.s.w. of Smyrna. Its length is 30 m.; its mean breadth about 8 miles. A range of mountains, which may be regarded as an insular continuation of mount Mycale, on the mainland, runs through the whole island, whence its name—Samos, being an old Greek word for any height in the neighborhood of the sea. The highest peak, mount Kerkis (anc. *Cere-teus*), reaches an elevation of 4,725 feet. Samos is still, as in ancient times, well wooded. Between its eastern extremity and the mainland lies the narrow channel of Mycale (called by the Turks the *Little Boghaz*), where, in 479 B.C., the Persians were totally defeated by the Greeks under the Spartan Leotychides. Between the island and Nicaria (anc. *Icaria*), on the w. is the *Great Boghaz*, from 3 to 8 m. broad, and much frequented by vessels sailing from the Dardanelles to Syria and Egypt. Samos is well watered and very fertile, exporting considerable quantities of corn, grapes, wine, oil, valonia, etc.; its mountains furnish quarries of marble. The present capital, called Khora ("the town"), is situated on the s. side of the island, at the base of the hill (about 2 m. from the sea), on which ruins of the ancient acropolis (*Astypalaia*) are still visible. On the n. coast lies Vathy or Bathy, which derives its name from its deep (Gr. *bathys*) harbor. The pop. of the island in '77 was 35,878.

Anciently, Samos was one of the most famous isles of the Ægean. At a very remote period, it was a powerful member of the Ionic confederacy, and (according to Thucydides) its inhabitants were the first, after the Corinthians, who turned their attention to naval affairs. Their energy and resources were soon seen in the numerous colonies which they established in Thrace, Cilicia, Crete, Italy, and Sicily. But the celebrity of the island reached its acme under Polycrates (q.v.) 532 B.C., in whose time it was mistress of the archipelago. Subsequently, it passed under the power of the Persians, became free again after the battle of Mycale, stood by Athens during the Peloponnesian war, and after several vicissitudes, became a portion of the Roman province of Asia, 84 B.C. Its later history is but the melancholy record of continuous decay, nor till the rise of the modern Greeks against the Turks did it ever again acquire distinction. When the war of independence broke out none were more ardent and devoted patriots than the Samians; and deep was their disappointment when, at the close of the sharp and brilliant struggle, European policy assigned them to their former masters. They are not, however, incorporated, so to speak, with the Turkish empire, but are semi-independent, being governed by a Fanariot Greek, who bears the title of prince of Samos, and pays tribute to the Porte.

SAMOTHRACE, or THRACIAN SAMOS (Mod. Gr. *Samothraki*), an island in the n. of the Ægean, n.e. of Lemnos (*Stalimene*). It is a rugged and mountainous mass, about 8

m. long by 6 m. broad, towering to the height of 5,240 ft., and forming the loftiest land in the whole Greek archipelago. The traveler on the plains of Troy can see its white summit shining afar in the n.w. over the intervening hills of Imbros—a proof that Homer drew from personal observation when he made Poseidon watch from his Samothracian throne the events of the war. The island has not a single good port, whence Pliny calls it “the most harborless of all isles” (*importuosissima omnium*), but there are some good anchorages. Its history is quite unimportant, and all the interest attaching to it is derived from its connection with the mysterious and gloomy worship of the Cabeiri (q.v.). Pop. 5,000, almost all Greeks.

SAMOYEDES, the name of a race widely spread over the extreme n. of Europe and Asia, and forming one of the four families of the great Altaian stock. Originally, the Samoyedes inhabited the whole of the vast Siberian plain from the Altai to the Arctic sea, but for many hundred years Mongolian peoples have forced themselves in among them. Their chief seat at present is the region lying between the Obi and the Yenisei. They have been very little influenced by Russian civilization or Christianity, retain in great measure their old manners and customs, and live by fishing, or the rearing of reindeer. The most important researches concerning their ethnographic and linguistic relations have been made by Castren (q.v.).

SAMPHIRE *Crithmum*, a genus of plants of the natural order *umbelliferae*; having compound umbels, and an oblong fruit, rather flattened at the back, with five winged ridges, and many *cittae* spread all over the seed. **COMMON SAMPHIRE** (*C. maritimum*) is a perennial, native of Europe, growing chiefly on rocky cliffs near the sea. It is common in the s. of England, but is rare in Scotland. Its radical leaves are triternate; those of the stem have lanceolate and fleshy leaflets. The stem is about 1½ ft. high, the flowers yellow. Samphire makes one of the best of pickles, and is also used in salads. It has a piquant, aromatic taste. It is generally gathered where it grows wild, but is sometimes very successfully cultivated in beds of sand, rich earth, and rubbish, occasionally supplied with a little salt.—*Inula Crithmoides*, a perennial plant, allied to elecampane (q.v.), and of the natural order *compositae*, a native of the sea-coasts of England, is used in the same way as samphire, and is often called **GOLDEN SAMPHIRE**.—The young shoots of *Salicornia herbacea* (see **GLASSWORT**) are also substituted for it as a pickle, and sold under the name of **MARSH SAMPHIRE**.

SAMPSON, a co. in s.e. North Carolina, bounded by South river on the w., and drained by Black river and its affluents; 940 sq.m.; pop. '80, 22,892. The surface is undulating, covered with large forests of pitch-pine. The soil is sandy; the main productions are corn, cotton, sweet potatoes, tobacco, rice, honey, wool, sheep, and swine. Co. seat, Clinton.

SAMPSON, DEBORAH, 1760-1827; b. Plympton, Mass.; shouldered a musket in the revolutionary war, and joined the 4th Mass. regiment with the pseudonym of Robert Shurtleff. She fought at Tarrytown, was wounded; took the field again at Yorktown; and when the war was over retired with a pension, and married Benjamin Gannett. Her residence from that time was a farm in Sharon, Mass. She published 1797, *The Female Review*, new edition 1866.

SAMPSON, EZRA, 1749-1823; b. Mass.; graduated at Yale college, 1773; settled at Plympton, Mass., 1775, and chaplain in the army at Cambridge in the first revolutionary campaign, 1775-76; settled at Hudson, N. Y., in 1797; associated, 1801-4, with the rev. Harry Croswell in the editorship of the *Balance*; editor in 1804 of the *Hartford Courant*; judge of the Columbia co. court in 1814. He published *Beauties of the Bible*; *The Sham Patriot Unmasked*; *The Brief Remarker*; *The Historical Dictionary*, often republished.

SAMSOE, a small island belonging to the kingdom of Denmark, is situated in the northern entrance to the Great Belt, between Zealand and Jutland. Area, 42 sq.m.; pop. 5,875. There are no towns, and the inhabitants owe the considerable comforts they enjoy entirely to the unusual fertility of their island.

SAMSON (Heb. *Shimshon*, compare *Shemesh*, sun), the son of Manoah, of the tribe of Dan, for 20 years “judge” over the south-western tribes of Israel—perhaps only of Dan. It would appear, however, as if this title had only been bestowed upon him as a kind of reward for his daring and extraordinary exploits against the neighboring Philistines, who at his birth held a great part of Palestine tributary. There is in the whole account of his deeds no sign of any superior authority vested in him. His history bears altogether more the general character of a popular tale, or saga, than that of a real historical account. His whole life is surrounded by a marvelous halo from his birth to his death. To his mother, long barren (cf. Gen. xviii. 10, 1 Sam. i. 2, etc., Luke i. 7, etc.), there appeared an angel, who promised her a son on the condition that he should become a Nazirite. He is born: his mother abstaining from all strong drink and unclean food before his birth. His hair, left to grow to its full length, in accordance with the Nazirite rules, endows him with a supernatural strength, which apparently increases with each manifestation. His first feat is his tearing a lion, when on his way to ask a Philistine woman in marriage. Returning the same road, to celebrate his wedding, he finds a swarm of bees in the lion's carcass, and forthwith propounds a riddle, which, through his wife's treachery, costs 30 Philistines their lives. We need not here recapitulate the

many similar exploits composing his well-known career, which he ended by pulling down the house upon himself and his enemies the Philistines, so that "the dead which he slew at his death were more than they which he slew in his life."

It has been matter of most contradictory speculations, how far his existence is to be taken as a reality, or, in other words, what substratum of historical truth there may be in this supposed circle of popular legends, artistically rounded off, in the four chapters of Judges (xiii.-xvi.) which treat of him. To begin with, difficulties are raised respecting the time in which he is said to have lived. While some hold him to be a contemporary of Eli and Samuel, others see in Eli his successor; others again suppose an interregnum between him and Eli. Next comes the question how he, a Nazarite, could eat honey out of the lion's carcass—a fact, by the way, entirely ignored by Josephus. The miraculous deeds he performed have taxed the ingenuity of many commentators, and the text has been twisted and turned in all directions, to explain "rationally" his slaying those prodigious numbers single-handed; his carrying the gates of Gaza, in one night, a distance of about 50 m., the probable distance from Hebron to Gaza, and some have indeed assumed that he did not carry them there all at once, but piecemeal. But the principal difficulty seemed to lie in the well that sprung out of the jaw-bone, and the early Jewish interpreters (Targum, Josephus) take the word *Lehi* to be the name of a place; a notion countenanced, so far, by Gesenius, as he allows that it might have been "derived etymologically from this myth."

The close parallel between the deeds of Samson and those of Hercules has caused some to identify the two heroes; yet whose might be the priority, is matter of contest between the different schools of biblical criticism. It is not necessary to enlarge upon this point. It is well known how Hercules slays the Nemean lion; another formidable lion at the mount of Cithæron; how he catches the stag of Diana and the Cretan bull; how he is kept prisoner in Egypt; how he comes to his death by the agency of a woman; not to mention the extraordinary circumstances of his birth, and the like. See **HERCULES**. This once popular notion, however, of seeing nothing more in Samson than the Tyrian sun-god Hercules (Baal-Shemesh, "Lord of the Sun;" Baal Chamon, "Lord of the Heat," etc.), and the attempt to explain the various "myths" accordingly, is not countenanced by most modern critics. However embellished and overlaid with legends, they say, the account in the Book of Judges may be, there is hardly any doubt as to the real existence of a man Samson, of extraordinary prowess, who turned his whole might and strength against the hereditary enemies of his people, whose land bordered on that of the tribe to which he belonged; who, with all his blemishes, was possessed by a noble, self-sacrificing patriotism, and never for one moment forgot the chief end and aim of his life, viz., to free his people from foreign yoke. Altogether, he is too human ever to have been an allegory or a parable, the moral of which would, indeed, hardly be perceptible, or to have, as some have conjectured, "been intended through his whole career to be a living mockery of the Philistine Hercules."

SAMSON, GEORGE WHITEFIELD, D.D., b. Mass., 1819; graduated at Brown university in 1839, and Newton theological institution in 1843; was pastor of a Baptist church in Washington, 1843-49. In 1847 he traveled in southern Europe, Palestine, and Syria. In 1859 he was elected president of Columbian college, Washington; in 1871 became president of Rutgers college for girls, New York; resigned in 1879, and is now pastor of a Baptist church in Harlem. In 1848 he published letters on Egypt, Palestine, and Italy, and articles on Mount Sinai, Goshen, etc.; in 1852, *To Daimonion*, which in 1860 was enlarged and republished under the title, *Spiritualism Tested; Outlines of the History of Ethics; Elements of Art-Criticism; Physical Mediæ in Spiritual Manifestations*.

SAMSON, JOSEPH ISIDORE, 1793-1871; b. France; became an amateur actor, and in 1812 began to study in the conservatory. He soon gained success, and in 1832 was elected to the *Théâtre Français*. He was many years professor of elocution at the conservatory. Samson wrote a number of dramas and farces, and a poem, *L'Art Théâtral*.

SAMUEL (Heb. *Shemuel*, heard by or asked from God), the last *shofet* or judge of Israel, the "first of prophets," the founder of the schools of prophets and of the monarchy in Israel. He was the son of Elkanah and Hannah, a woman of no ordinary gifts, and almost a Nazarite herself, who dedicated the long yearned-for child to the lord even before his birth. Elkanah was of Levitic descent, living, however, not among his own tribe, but in Ephraim. Samuel, brought up in the sanctuary at Shiloh, under the eyes of Eli, there received his first prophetic call, and from that time forth, his prophetic mission was decided. For about twenty years from the death of Eli and his sons, we hear nothing of Samuel. The first public manifestation of his assumption of the office of judge is his convoking an assembly at Mizpeh, and routing, at the head of the people, the Philistines—his first and probably his only military achievement. His occupations generally were of a more peaceful character. Dwelling in his own native city of Ramah, where he had erected an altar, he annually went "on circuit" to the three principal sanctuaries w. of the Jordan, Bethel, Gilgal, and Mizpeh, there to instruct and judge the people, and break them from their idolatrous habits, to which they were wont to yield, in imitation of the peoples around them. For the better carrying out of this purpose, he organized special schools of teachers and prophets. These seem to have formed special colonies (Naboth, Bethel, Gilgal, Jericho), and to have moved about

in large numbers. These fraternities were destined to take an important place in the commonwealth, and to exercise the greatest possible influence upon the internal as well as the external affairs of the state, while at the same time they were the teachers of the people, expounding and developing the Mosaic law, and keeping the sacred traditions alive within the houses and hearts of Israel.

The peace Samuel had restored—for during his lifetime those harassing raids from the neighboring tribes had entirely ceased—and the happy use he made of it by consolidating the religious institutions and the internal power and union of the people, must have impressed the latter with the advantage of being ruled by a firm and capable head and hand. It would have been easy enough for Samuel to have got himself elected king of Israel, but the establishment of a dynasty appeared to him utterly contrary to the theocratic character of the law. When, however, his two sons, Joel and Abiah, whom he had installed provisional or supplementary judges, “turned aside after lucre, and perverted judgment,” and the complaints of the people were loud about them, Samuel was pressed by its representatives, who foresaw a time of terrible anarchy and lawlessness at his approaching demise, and he was obliged to yield to the general wish of installing a king to judge them “like all the nations.” See **Jews and Saul**. The further events of Samuel’s life, as connected with Saul, and subsequently with David, are well known, and will be found indicated briefly under those two heads. As to his character, notwithstanding the reproaches that have been heaped upon him, we cannot but see in him one of the wisest, most sagacious, unselfish, patriotic heroes. He was, doubtless, severe and energetic in the extreme, following the path that seemed to him indicated by Jehovah as the only one leading to the common welfare. Gifted with both the spiritual and worldly supreme power over the people, at a time when they had neither political unity, nor laws, nor a *cultus*, he succeeded in rousing the public spirit, in uniting all the tribes under one banner, and in shaking off the Philistine yoke. He routed idolatry, and raised, by the institution of prophetic schools, the Mosaic religion to the highest eminence, while they at the same time formed a healthy counterpoise to priestcraft. That on finding Saul negligent to certain dicta of the law, for the protection of which alone he had been elected, he casts aside all personal love and fear, and for the sake of saving the country, and keeping its constitutions intact, chooses another more worthy head for the commonwealth, is not more than could be expected from this most zealous champion for Jehovah’s commands. The people themselves gave him the most honorable testimony for his uprightness and justice, and later ages place him side by side with Moses.

Samuel seems, after having anointed David, to have retired from public action, and to have lived in comparative seclusion at Ramah—there is, at least, no further mention of him until his death. The time of his life and the period of his judgeship are not given. It may be presumed that he died not long before Saul. If the latter ruled for twenty years, it may well be that they governed together, as Josephus has it (*Ant.* vi. 14, 9), for eighteen years; his age, however, is not easily calculated, and the opinions about it vary between sixty and ninety years. He was buried at Ramah, and his tomb is still shown at Nebi Samwil, although, according to Jerome, his remains were removed, under the emperor Arcadius, to Thrace. All Israel mourned him as they had mourned none since Moses. For his apparition at En-Dor, etc., see **NECROMANCY**.

SAMUEL (SHEMUEL), BOOKS OF, originally formed one work, but were by the LXX. and Vulg. (followed by the recent Hebrew editions since Bomberg) and the authorized version, divided into two books, the first closing with the death of Saul. The name they bear is derived from Samuel, as the principal figure in them. He not only stood at the head of the commonwealth at the period they treat of in a spiritual and worldly capacity, but also anointed Saul and David, and exercised an important influence upon their rule. Their contents beginning with the high-priesthood of Eli, the narrative concludes with the death of David, and thus three principal periods are noticeable—1. The restoration of the theocracy, of which Samuel assumes the leadership (I. i.—xii.); 2. The history of Saul’s kingship till his death (I. xiii.—xxxi.); and 3. David’s reign (II.).

The plan of the whole work is not, as has been stated, to represent one king as he ought not to be—viz., Saul, contrasted by a king after the heart of God, David; but simply to draw the development of the theocracy from the end of the period of judges to the end of David’s reign, its humiliation and its glory under Samuel and David, whose history is, to a certain extent, told with biographical minuteness, on account of their being the divinely-chosen vessels for this great work of the restoration. As to the composition and unity of the books, it has been the prevailing opinion of scholars to see in them not a loose compilation from a number of stray sources, but a consecutive narrative drawn upon ancient and authentic documents. The character of the narrative itself, occasionally dwelling at large upon biographical episodes, occasionally assuming the brevity of a mere chronicle, and at times repeating itself at length, is quite in accordance with ancient Semitic historiography. It has been supposed by some that the books of Samuel were composed by the same hand that wrote the books of Kings, but they belong to a much earlier period. The author appears to have lived after the separation of the kingdoms, but long before the Exile, the language being remarkably pure, and quite free from late forms and Chaldaisms. In all probability, the author was a

prophet of the time of Solomon. The Talmudical notion of Samuel's authorship has been rejected by the critics, as inconsistent with the contents and circumstances of the book. There are glosses in the book due to later hands. Of sources, we only find the "Book of Jashar" mentioned in the work. The author, if he did not use real annals of the empire, which were only first commenced under Solomon, had, at all events, a certain number of prophetic narratives of Samuel's, Saul's, and David's lives and doings before him. As regards the occasional verbal agreement between Samuel and Chronicles, which has often been commented upon, we may either assume that the latter drew upon the former, or that they both—which is more probable from internal evidence—drew upon the same source, and modified their accounts according to their special tendencies. Altogether, the work before us bears the character of a truly authentic record. Of modern commentators, we mention principally Hensler, Königsfeldt, Thénius, and Ewald.

SAMYDA, CEÆ, a natural order of exogenous plants, which are all trees or shrubs and all tropical, mostly American. The order contains about 80 known species, generally characterized by astringency in the bark and leaves. Some are used in medicine, to make poultices for wounds, lotions for ulcers, etc. The foliage of *casuarina esculenta* is eatable.

SANĀĀ', the principal district in Yemen or Arabia Felix, corresponding to the ancient Sāba, or Sheba, the land of the Sabæans (q.v.). Its extent is very undefined, but it may be taken to include the country round the capital bearing the same name, to a distance of half a day's journey on the w., n., and e., and on the s. it is bounded by the Tehāma and the districts of Lāhej and Yāffa.

While the dynasty of the Imāms existed, their sway extended over a much greater space, sometimes, indeed, over the whole of Yemen. Gradually it was encroached upon by the Sheikhs, who had been subject or tributary to them, and by the Turks. A bad system of government prepared the way for intestine strife; on the death of each sovereign, the succession was disputed, until at length the very shadow of regular government has passed away. In July, 1872, Sanāa was again occupied by the Turks, who afterward overran the greater part of Yemen.

The city of Sanāa, once capital of the Imāms of Yemen, is situated in a deep and beautiful valley, about 20 or 30 m. in length, and 6 or 7 in breadth, and 4,600 ft. above the level of the sea. The population of the city has been estimated at 40,000, and of the valley at about 70,000. This valley is bounded on the e. by a high range of mountains called Jebel Nikkum, and is studded throughout its length with large villages.

The city and its suburbs are both surrounded by high walls, and, including the gardens, the circumference is about five and half miles. The houses are of brick, well and strongly built, and most of them furnished with fountains, while the palaces of the Imāms almost approached magnificence. The Jews, of whom even now there are about 20,000, have a quarter to themselves, distant about half an hour's walk from the Mohammedan town; it contains many buildings, once the abode of affluence and ease, but now bearing unmistakable signs of the devastation committed by the savage and fanatical Mohammedans of the city. The city walls are of unburned brick, and mounted with cannon, but they are in a very bad condition. There are four gates, and at both e. and w. end a castle containing a palace built in the Saracenic style with extensive gardens round them, and constructed with a view to defense, but now utterly neglected. See YEMEN.

SAN ANTONIO, called also San Antonio de Bexar, a city of Texas, is built near the sources of the San Antonio river, 110 m. s.w. of Austin. It is one of the oldest Spanish towns on the continent, and in the Texan revolution of 1836 was the scene of the massacre of the Alamo, when a garrison of 150 men, led by col. Travis, and including David Crockett, was surrounded by several thousand Mexicans, and after a heroic resistance killed to the last man. It contains an arsenal, ten churches, and in 1870, 12,256 inhabitants.

SAN ANTONIO (*ante*), co. seat of Bexar co., Tex., on the San Pedro and San Antonio rivers, and the Galveston, Harrisburg and San Antonio railroad; pop '80, 20,561. It is the most important place in w. Texas, and contains a heterogeneous population, of whom one-third are of German, and one-third of Mexican birth. It comprises 3 quarters; the city proper between the rivers; Alamo, e. of the San Antonio; and Chihuahua, w. of the San Pedro. The first, which is the business part, has been mostly rebuilt since 1860. The chief business streets are Commerce and Market, running parallel from the main square. There are many fine business structures on the former. The buildings on many of the other streets are low Mexican houses, without windows. Alamo is higher than the other quarters, and mainly occupied by Germans. Chihuahua is the Mexican quarter; its houses are one story high, built of stone and wood. The land about the sources of the San Pedro is a public park. The city has schools, 6 newspapers, a Roman Catholic convent, college, and cathedral, a court-house and banks. It is the center for the trade of the surrounding country, which produces cattle, hides, corn, and wool. It has a valuable water-power, and important and growing manufactures, including large flour-mills, breweries, and ice-factories. The mild climate of San Antonio makes it a favorite resort for invalids. It was founded by Spaniards in 1714.

SAN AUGUSTINE, a co. in e. Texas, drained by Angelina river and Attoyac bayou and their branches; 680 sq.m.; pop. '80, 5,085—5,026 of American birth, 1,925 colored. The surface is level and the soil good. Cotton, corn, sweet-potatoes, and pork are the staples. Co. seat, San Augustine.

SAN BENEDETTO PO, a t. in n. Italy, on the s. bank of the Po, in the province of Mantua, 12 m. s.e. of the city of that name; pop. 10,319. It is built along the left bank of the Lirone, and has a fine church of the Benedictine order, and a monastery founded in 1004, celebrated as the abbey of San Benedetto di Po, but now appropriated to other than spiritual uses.

SAN BENITO, a co. in w. California, lying on the e. slope of the Coast Range mountains; drained by the San Benito river; traversed by the Southern Pacific railroad; pop. '80, 5,584—4,252 of American birth. This county was formed in 1874 from the e. part of Monterey. The principal industry is stock-raising. The co. seat, Hollister.

SAN BERNARDINO, a co. in s.e. California, adjoining Nevada on the n.e., and Arizona on the e.; drained by the Amargoza, Santa Anna, and Colorado rivers; about 16,000 sq.m.; pop. '80, 7,786—6,699 of American birth. The greater part of the surface is arid and mountainous. Many hot springs are found. In the s.w. are fertile valleys of fine climate and fertile soil where there are extensive vineyards; wheat, barley, corn, oats, and wine are the staples. In the mountains gold is found, and in the s.w. gold, silver, copper, tin, marble, and alabaster. Co. seat, San Bernardino.

SAN BERNARDINO, the co. seat of San Bernardino co., Cal.; on the Southern Pacific railroad; pop. '70, 3,064. It has churches, banks, schools, hotels, newspapers, etc. It has an equable climate, and is a favorite resort for consumptive persons.

SAN CATALDO, a t. in w. Sicily, in the Val di Mazzara, 5 m. s.w. of Caltanissetta, having valuable sulphur mines; pop. 12,727.

SANCASCIA NO, a city of central Italy, province of Florence, and 10 m. s.w. of the city of that name. Pop. 6,860. It is well built. The lands belonging to it produce a very strong wine, highly prized in Italy, also grain, oil, fruit, and mulberries.

SANCHUNIATHON (*SANCHONIATHON*, *SOUNIATHON*), the supposed author of a Phœnician history of Phœnicia and Egypt, called *Phœnikika*. He is supposed to have been a native of Berytus; and the accounts which speak of him as born at Sidon or Tyre probably take these cities in their wider sense for Phœnicia itself. Our principal information about him is derived from Philo of Byblus; a Greek writer of the beginning of the 3d c. A.D., who translated Sanchuniathon's history into his own tongue; but both the original and the translation are lost save a few small portions of the latter, preserved by Eusebius, who uses them as arguments in a theological dispute against Porphyry. According to Philo, Sanchuniathon lived during the reign of Semiramis, queen of Assyria, and dedicated his book to Abibalus, king of Berytus. Athenæus, Porphyry, and Suidas, on the other hand, speak of him as of an ancient Phœnician, who lived "before the Trojan war." There is also a discrepancy between the various ancient writers respecting the number of books contained in the *Phœnikika*. Orelli (1826), and after him C. Müller (1849), published the remaining fragments of Sanchuniathon, and the hot discussion raised on their genuineness and value is far from being settled yet. Several critics went so far as to deny the fact of the existence of a Sanchuniathon point blank. According to some (Lobeck, etc.), it was Eusebius; according to others (Movers, etc.), Philo, who fathered his own speculations upon an ancient authority. The latter was actuated, Movers thinks, partly by the desire of proving that the whole Hellenistic worship and religion was simply a faint imitation of the Phœnician; partly by the desire of lowering the value of the Old Testament, by showing the higher authority of the Phœnician writer; and partly, as was the fashion among the unbelieving philosophers of his age, to bring the popular creed into a bad reputation, by proclaiming his own views under the guise of an ancient sage. Yet even those who deny the authenticity of Sanchuniathon agree in allowing the fragments current under his name a certain intrinsic value, they being founded on real ancient myths. This, in fact, is now, with more or less modification on the part of the different investigators, Ewald, Bensen, Renan, etc., the prevalent opinion. Ewald contends for the real existence of a Sanchuniathon, in which he is supported by Renan. Even if there never was a Sanchuniathon, it was not Philo who forged him. There seems no doubt that we have but a very dim and confused reproduction of what, after many modifications, misunderstandings, and corruptions, finally passed the hands of Philo and Eusebius, and was by the church father, as we said, quoted in a theological disputation. Yet, even assuming the person of a Sanchuniathon, his age—and he insists on a very remote one indeed—must be placed much lower, into the last centuries before Christ, at the earliest. He would then, it seems, have endeavored to stem the tide of Greek superiority in all things, by collecting, grouping, and remodeling the ancient and important traditions of his own country, and thus proving to both his countrymen and to the Greeks their high importance, in comparison with the Greek productions, on the field of religion and philosophy. The *Phœnikika* was not only a cosmogony, it would appear, but a history of his and

the surrounding nations; and like similar ancient histories, it probably began with the creation of the world, and contained an account of the Jews. All the historical parts, however, are lost, and nothing remains but a fragmentary cosmogony, or rather two or three different systems of cosmogony, or, according to Movers, merely an Egyptian and Phenician patchwork, for a brief account of which we refer the reader to the article PHENICIA. One of the chief difficulties for us consists in the Phenician words of Sanchuniathon, which Philo either translated too freely, or merely transcribed so faultily in Greek characters as to render them an everlasting puzzle.

Eusebius further contains a fragment of a treatise by Sanchuniathon, *Peri Judaion*, but it is doubtful whether this is the work of Philo of Babylon or of Sanchuniathon; and if it be that of the latter, whether it is a separate work, or merely a separate chapter out of his larger work. A forgery, said to contain the whole nine books of Sanchuniathon, and to have been found by a Portuguese, col. Pereira, at the convent of St. Maria de Merinhão, and to have been by him intrusted to a German corporal in Portuguese service, named Christoph Meyer, was published by Wagenfield (Bremen, 1837), and translated into German (Lübeck, 1837), but was very soon consigned to disgrace and oblivion by Movers, K. O. Müller, and Grotefend, the last of whom had at first not only believed in its genuineness, but even written a preface to the *editio princeps*. There never was such a convent or such a col.; but the fac-simile taken by "Pereira" in the convent in Portugal was found to have been written on paper showing the water-marks of an Osnabrück paper-mill.

SAN CRISTOBAL, a city in Mexico, capital of the state of Chiapa, 285 m. s.e. of Vera Cruz; pop. 12,000. It is in a fertile and well-cultivated valley. The streets are good, and the houses of one story. Its chief business is weaving, pottery, and beef-packing. The town was founded in 1528 by the name of Villa Real, afterward called San Cristobal de los Llanos, and Ciudad Real. Its present name was given in 1829.

SANCROFT, DR. WILLIAM, an English archbishop, historically notable as the most distinguished dignitary among the *nonjurors* (q.v.), was b. at Fressingfield in Suffolk, Jan. 30, 1616, educated at the grammar school of Bury St. Edmunds, and at Emmanuel college, Cambridge. Sancroft was reckoned a first-rate scholar by his contemporaries, and in 1642 Sancroft was elected fellow of his college, but in the following year he was deprived of his fellowship by the Puritans for refusing the famous "engagement," after which he went abroad. On the restoration of Charles II., in 1630, he was appointed chaplain to Cosin, bishop of Durham; and, after several preferments, was in 1668 made archdeacon of Canterbury, and in 1677 was raised, against his inclination, to the first dignity in the church—the archbishopric of Canterbury. The manner in which Sancroft discharged his ecclesiastical duties deserves the highest commendation. He attended king Charles II. on his death-bed, and is said to have spoken very freely to the once "merry monarch" on the nature of his past life. In 1688, along with several of his brother-bishops, he was committed to the tower by king James II., for sending him a petition in which they explained why they could not conscientiously order his declaration in favor of liberty of conscience to be read in the churches; but in the events which immediately preceded and accompanied the great revolution, he played a somewhat ambiguous and perplexing part. At first he refused when James asked him to sign a declaration expressing abhorrence of the prince of Orange's invasion. Later (Dec., 1688), he even went the length of concurring in an address to William, yet he seems from this point to have drawn back, and to have fallen under the dominion of his theory of the divine right of kings. He was not present at the convention of the lords spiritual and temporal to meet the new monarch, and after the settlement, he refused along with seven other bishops, to take the oath of allegiance to the government, in consequence of which he was suspended by act of parliament, Aug. 1, 1689, but his actual departure from Lambeth did not take place till June 23, 1691. He then retired to his native village, where he died, Nov. 24, 1693. See Macaulay's *History of England*, vols. ii. iii. and iv.

SANCTIFICATION, in distinction from justification, in the nomenclature of Protestant theology, is the process by which the Holy Spirit renews man in the divine image, destroying within him the power of evil, and quickening, educating, and strengthening in him the life of goodness and holiness. Whereas justification is considered as a judicial act on the part of God's free grace, liberating the sinner from condemnation, absolving and pardoning him once for all, sanctification is reckoned a work or process, advancing in various stages of weakness or strength, and only completed in the future life of the believer, when removed beyond the influences of sin that now surround him. In Roman Catholic theology, this distinction between the initiative of the divine life in man (justification) and its progressive development (sanctification) is not maintained, at least in the same precise and logical manner that it has been advocated by Protestants. By the latter the distinction has been held of first rate importance in their theological systems, and no less so in their practical conception of the Christian life.

SANCTUARY, a consecrated place which gives protection to a criminal taking refuge there; or the privilege of taking refuge in such a consecrated place. Among the Jews there were cities of refuge to which the slayer might flee who killed a man un-

wares, and something analogous to a right of sanctuary may also be traced in pagan communities. In the ancient Greek states the temples, or at least some of them, afforded protection to criminals, whom it was unlawful to drag from them, although the food which was being supplied might be intercepted. As early as the 7th c. the protection of sanctuary was afforded to persons fleeing to a church or certain boundaries surrounding it. The canon and more ancient ecclesiastical law recognizes this protection to criminals as continuing for a limited period, sufficient to admit of a composition for the offense; or, at all events, to give time for the first heat of resentment to pass, before the injured party could seek redress. In several English churches there was a stone seat beside the altar where those fleeing to the peace of the church were held to be guarded by all its sanctity. One of these still remains at Beverley, and another at Hexham. To violate the protection of this seat, or of the shrine of relics, was an offense too grave to be compensated by a pecuniary penalty. Connected, in England, with the privilege of sanctuary was the practice of *abjuration of the realm*. By the ancient common law, if a person guilty of felony took the benefit of sanctuary, he might, within forty days afterwards, go clothed in sackcloth before the coroner, confess his guilt, and take an oath to quit the realm, and not return without the king's license. On confessing and taking the oath, he became attainted of the felony, but had forty days allowed him to prepare for his departure, and a port assigned him for embarkation, to which he must immediately repair with a cross in his hand, and embark with all convenient speed. If he failed to depart, or afterward returned without license, he was condemned to be hanged, unless he happened to be a clerk, in which case he was allowed the *benefit of clergy*.

By the ancient canons of the Scottish councils, excommunication was incurred by the offense of open taking of thieves out of the protection of the church. Some churches, however, by their superior sanctity, were held practically to afford a much surer asylum than others, and it was not uncommon for the Scottish kings, with the view of strengthening the hands of the church, to give a formal sanction to particular ecclesiastical asylums. One of the most celebrated sanctuaries in Scotland was the church of Wedale, now called Stow, where was an image of the Virgin believed to be brought by king Arthur from Jerusalem. David I. granted the "king's peace," in addition to the protection of the church, to all fugitives from peril of life or limb who betook themselves to the church of Lesmahagow. The Scotch law of sanctuary or *gryth* was, however, guarded from affording too easy an immunity.

A very remarkable right of sanctuary existed in Scotland under the name of the *privilege of Clan Macduff*, which was alleged to have been granted by Malcolm Canmore on recovering the throne of his ancestors. Any person related within the ninth degree to the chief of Clan Macduff, who should have committed homicide without premeditation, was entitled, on fleeing to Macduff's cross in Fife, to have his punishment remitted for a fine, or at least to be repledged from any other jurisdiction by the earl of Fife. There is evidence of this privilege having saved Hugh de Arbuthnot and his accomplices from being proceeded against for the murder of John de Melvil of Glenbervie in 1421.

While the institution of sanctuary often enabled criminals to bid defiance to the civil power, it no doubt was not unfrequently a protection to the innocent, who thus escaped oppression or private enmity pursuing them under the name of law. In rude and unsettled times it seems, on the whole, to have operated beneficially by throwing the control of society into the hands of the clergy, who were less tempted than any other class to misuse that power. But as the civil power and authority of the law were strengthened the right of sanctuary became useless and mischievous; the civil power endeavored to narrow the privilege as far as possible, while the church sought hard to preserve it. The English reformation, though it greatly restricted, did not abolish the right of sanctuary. It was not till 1534 that persons accused of treason were debarred the privilege, and the right of sanctuary for crime was finally abolished by 21 Jac. I. c. 28. Various precincts, however, in and about London, known as sanctuaries, continued to afford shelter to debtors, all which were done away with in 1697, by act 8 and 9 Will. IV. c. 26.

In Scotland there still exists a sanctuary for debtors in the abbey and palace of Holyrood, with its precincts, including the hill of Arthur seat and the Queen's park. The sanctuary is placed under the control of a bailie appointed by the duke of Hamilton as heritable keeper of Holyroodhouse. When a debtor retires to the sanctuary, he has a 24 hours' protection against personal diligence; but in order to extend the privilege longer, he must be enrolled in the books of the abbey. The sanctuary affords no protection to a criminal, a fraudulent debtor, or a crown debtor; nor is it available for protection from personal execution for debts contracted within its precincts, for which the debtor may be imprisoned in the abbey jail.

SAND, GEORGE. See D'UEVANT, MADAME.

SAND, KARL LUDWIG, 1795-1820, b. Germany; studied theology at the universities of Tübingen and Erlangen, and in 1817 joined the Teutonic society of Jena, a precursor of the *Burschenschaft*. He became a political fanatic on the subject of liberty, and considered it his mission to kill Kotzebue, as he regarded him as a spy of the Russian court. He entered the residence of Kotzebue in Mannheim, March 23, 1819, and murdered him with a dagger. He then attempted to kill himself, but the wound did not prove mortal.

He was condemned to death May 5, 1820, which sentence was executed the following October.

SANDALS, a covering for the feet, consisting of soles so attached as to leave the upper part of the feet bare. See SHOES.

SANDAL-WOOD (a name corrupted from *santal* wood), the wood of several species of the genus *santalum*, of the natural order *santalaceæ* (q.v.), natives of the East Indies and tropical islands of the Pacific ocean. Sandal-wood is compact and fine grained, very suitable for making work-boxes and small ornamental articles, and is remarkable for its fragrance, which, however, is fatal to insects, so that cabinets of sandal-wood are extremely suitable for the preservation of specimens in natural history; but it is much too expensive for general use. The odor is due to an essential oil, heavier than water.

WHITE SANDAL-WOOD, the most common kind, is the produce of a small tree (*santalum album*), a native of mountains in the south of India and the Indian Archipelago, much branched, resembling myrtle in its foliage and privet in its flowers. The trunk is seldom more than a foot in diameter. **YELLOW SANDAL-WOOD** is probably produced by another species, perhaps *S. Freycinetianum* of the Indian archipelago and Sandwich islands, and from these regions the Chinese import it, chiefly for the purpose of burning it both in their temples and in their houses. They reduce it to saw-dust and mix it with paste before burning. Dr. Seemann has, however, recently found another and previously-unknown species of *santalum* (*S. Yasi*) to yield the much-valued sandal-wood of the Fiji islands, where the tree has been almost extirpated in consequence of the demand for its wood in commerce.

RED SANDAL-WOOD, or **SANDERS**, is the produce of a very different tree, *pterocarpus santalinus*, of the natural order *leguminosæ*, suborder *papilionacæ*, a native of the tropical parts of Asia, particularly of the mountains of the south of India and of Ceylon. The tree is about sixty feet high, with pinnated leaves, having generally three leaflets, and axillary racemes of flowers. The heart-wood is dark red, with black veins, and so heavy as to sink in water. It is used as a dye-stuff, and also by apothecaries to color certain preparations. The Arabs use it as an astringent, and it is the basis of some of our tooth-powders.—A deep red dye is also yielded by the chips of *adenanthera paronina*, a tree allied to the *acacias* (q.v.), a native of the East Indies. The wood of this tree is sometimes called **RED SANDAL-WOOD**.

SANDALWOOD ISLAND, called by the natives Tjindana, Sumba, and Tanah Tjumba, lies in the Indian ocean, between 9° 18' to 10° 20' s. lat. and 118° 58' to 120° 43' e. long., has an area of 4,966 sq. m., and a pop. of 1,000,000. The coast is steep and rocky, so that, except at the w., s., and e. corners, ships can approach quite near. The produce consists chiefly in dye-woods, ebony, timber, cotton, rice, pepper, cocoa, maize, coffee, sugar, wild cinnamon, cocoa-nuts, and various fruits. Little sandal-wood is exported, though abounding in the forests, the natives refusing to cut the trees, which they believe to be the dwellings of their ancestors' souls. Exports are: horses, timber, cotton, pepper, wax, tortoise-shell, tow made from bark, maize, and edible nests. The cliffs swarm with the *collocalia esculenta*, and collecting the nests is a leading occupation of the men. The Sandalwood islanders belong to the Malay race, are well made, wiry, and of a brownish complexion. The most trifling causes lead them to commit suicide, a vice of rare occurrence in other parts of the archipelago.

The Sandalwood island is nominally subject to the Netherlands, but the rajahs and regents are almost independent of foreign influence. The principal havens are at Nangamessi on the n., and Tida about the middle of the s. coast, good anchorage being found in many other parts. Notwithstanding the repressive measures taken by the Netherlands government, and the destruction, in 1860, of ten vessels engaged in the slave-trade, it is still extensively carried on by the Sandalwood islanders.

SANDARACH, or **SANDARACH RESIN**, is a friable, dry, almost transparent, tasteless, yellowish-white resin, which is imported from the north of Africa. It is completely soluble in oil of turpentine, but not completely soluble in alcohol. When heated, or sprinkled on burning coals, it emits an agreeable balsamic smell. It exudes from the bark of the sandarach tree (*calitris quadrivalvis*), a native of the north of Africa, of the natural order *conifere*.—The quantity of sandarach used is not great; it is employed mostly for the same purposes as mastic (q.v.). The finely-powdered resin is rubbed, as *pounce*, on the erasures of writing-paper, after which they may be written upon again without the ink spreading.—The wood of the sandarach tree is highly balsamic and odoriferous, extremely durable and valuable.

SANDAY or **SANDA ISLAND**, one of the most northern of the Orkney (q.v.) group, contained, in 1871, 394 inhabited houses and 2,053 inhabitants.

SANDBACH, a small market-t. of Cheshire, 25 m. e.s.e. of Chester by railway, on an eminence on the right bank of the Wheelock. Pop. '71, 5,259, mostly employed in silk-throwing, and in making salt and shoes.

SAND-BAGS, in military works, are canvas bags about 28 or 30 in. in length by from 14 to 16 broad. They are filled with sand or earth, and form a ready means of extemporizing a parapet or traverse against the enemy's fire; they are likewise used for protecting the head of a trench, or tamping the charge in a mine. See MINES, MILITARY.

If employed as lining for embrasures or barbettes, sand-bags should be covered with raw hides to prevent them from taking fire.

SAND BLAST, a method of engraving figures on glass or metal, or cutting away or boring holes in hard substances, by means of a stream of fine sand, driven by a blast of air or steam.

SAND-BLAST (*ante*), a method of engraving, cutting, and boring glass, stone, metal, or other hard substances, by the percussive force of a rapid stream of sharp sand driven against them by artificial means. The process was invented by gen. Benj. C. B. Tilghman, of Philadelphia, who took out a patent for it in Oct., 1870. In the world of nature the abrading power of sand when driven by air or water against hard substances has long been recognized, and gen. Tilghman's invention was merely an application of this principle to the mechanical arts. The means of propulsion may be supplied either by an air or a steam blast, the former being produced by a boiler at high pressure, and the latter by a fan revolving with great velocity. In either case the abrading material, which is usually common hard sand, although small granules of iron or crushed quartz are occasionally used, is directed by a tube upon the object to be cut or engraved, the latter being so adjusted by means of slides that each part in succession can be brought under the action of the cutting particles. The engraving of the surface of glass with ornamental figures, etc., may by this process be very easily accomplished simply by laying upon it patterns of the desired objects cut out of some resistant medium in the manner of stencils. The sand, of course, does not touch the protected parts, but indents those which are uncovered, until the result sought for is attained. Another method very commonly used is to cut the proposed pattern in sheet copper or brass, which is then placed over the glass, a brush of melted beeswax being drawn over the whole. The stencil is then raised, and the pattern left in exposed glass may then be operated upon by the blast. The ornamentation of glass in colors may also be performed by the sand-blast, for as the ordinary colored glass of commerce is mere window glass, with a thin layer of color on one side only, the use of the stenciled pattern as before will entirely remove the color from the exposed parts and leave it where protected. By the use of a photographed coating of gelatine upon glass (the well-known gelatine process in photography) very beautiful reproductions of line engravings may be made upon the glass at a small cost. The sand-blast has also been used successfully in the cutting of ornaments and inscriptions upon stone. Iron stencils are sometimes used for the purpose, but the most satisfactory material is found to be sheet rubber of about 1-16th of an inch in thickness. This is cemented upon the stone and a movable jet pipe is caused to traverse the surface of the latter until the exposed portions have been sufficiently abraded. The wear upon the rubber itself is wonderfully slight and the same stencil may be used over and over again. Another use to which the sand-blast has been successfully put is in turning blocks of stone into circular and other forms in the lathe. Balcony pilasters, etc., have in this way been finished in a few hours which would have needed as many days to be cut out by hand. Upon wood the action of the sand-blast is not so satisfactory, being slow and tedious, and the only way in which it can be utilized on this material is in cutting out the large block type used in printing posters. The foregoing are only a few of the ways in which the sand-blast has manifested its usefulness, but as the invention is still in its infancy it is impossible to say what applications may not be found for it in the future. From its first appearance the sand-blast has attracted much attention both at home and abroad, many foreign patents have been taken out, and the use of the process is gradually spreading.

SAND-CRACK is a splitting or fracture of the horny fibers of the horse's hoof, extending usually from above downward; when reaching to the quick it causes lameness, and in all cases it constitutes unsoundness. Horses with thin, weak, brittle feet, spoilt by much rasping, and rattled on the hard roads, furnish the majority of cases. The horn must be thinned for an eighth of an inch on either side of the crack; across the upper and lower ends of the crack, to prevent its extension, the firing-iron should be drawn, making a line nearly through the horny crust. The opening may further be held together by winding round the foot several yards of waxed string, or fine iron wire. Except in very bad cases, slow work on soft land may be permitted, but road work is injurious. The growth of healthy horn is promoted by applying round the coronet, at intervals of 10 days, some mild blistering liniment.

SAND-EEL. See LAUNCE.

SANDEMAN, ROBERT, 1718-71; b. Scotland; studied 2 years at Edinburgh, and soon engaged in the linen trade; adopted the views of Mr. Glas (see GLASSITES, *ante*) against church establishments; became an elder in his church; published in 1757 a reply to *Hervey's Dialogues*; removed to London in 1760; attracted much attention by his preaching, and formed a congregation whose members took the name of Sandemanians (q.v.). In 1764 he removed to America, established a society in Boston, and in 1765 settled in Danbury, Conn. He published *Correspondence with Mr. Pike; Thoughts on Christianity; Sign of the Prophet Jonah*.

SANDEMANIANS. See GLASSITES.

SANDERLING, *Calidris*, a genus of birds of the plover family (*charadriadae*), or which perhaps ought rather to be referred to the snipe family (*scelopacidae*). The common sanderling (*C. arenaria*) is a very widely diffused bird, breeding in the Arctic regions, and migrating southward on the approach of winter as far as the coasts of Africa, of India, and of Brazil. It is pretty common on the British coasts, in small flocks, in winter. It is only about 8 in. long; its winter plumage very light ash-gray, under parts white. In spring the plumage acquires a reddish tinge with black markings. The sanderling feeds on marine worms, small crustaceans, etc. It is esteemed for the table, and appears in the London market.

SANDERS, CHARLES W.; b. N. Y., 1805; author of several music books and of *Sanders's Readers*, in 2 series, 1838 and 1860. Of these more than 13,000,000 copies were sold before 1860, and the sale in one year amounted to 2,000,000 copies. He has received from one New York firm \$30,000 per annum for his educational works, books, readers, spellers, cards, and charts. Assisted by his brother Joshua C., he published an *Analytical Definer* and *Higher Speller*.

SANDERS, GEORGE NICHOLAS, 1812-73; b. Ky.; a grandson of col. Nicholas, who moved the famous Kentucky resolutions of 1798. He early became prominent as a democratic speaker and politician, was U. S. consul to Liverpool during Pierce's administration, and naval agent at New York during Buchanan's. He advocated the election of Douglas in 1860, and during the rebellion was joint commissioner with Mason and Slidell to European powers. In association with Clement C. Clay and J. P. Holcomb he met Horace Greeley at the "peace conference" at Niagara Falls, July, 1864.

SANDERSON, JOHN, 1786-1844; b. Penn.; studied law at Philadelphia, and in 1835 became professor of classical languages at the Philadelphia high school. He contributed papers and sketches of travel to the *Portfolio*, *Knickerbocker*, and other magazines. He wrote *Sketches of Paris*, 1838; and with his brother, J. M., was author of *Lives of the Signers of the Declaration of Independence*.

SANDERSON, ROBERT, D.D., 1587-1663; b. England; educated at Lincoln college, Oxford; ordained in 1611; was sub-rector in Lincoln college 1613-16; proctor of Oxford in 1616; bachelor of divinity in 1617; rector of Wilberton in 1618, and of Boothby Pannell from 1616 for over 40 years; prebend of Lincoln in 1629. Upon the recommendation of Laud he became in 1631 chaplain to Charles I., who in 1642 appointed him regius professor of divinity at Oxford. At the restoration he was consecrated bishop of Lincoln; was moderator at the Savoy conference between the Episcopal and Presbyterian divines. He published *Logice Artis Compendium*; *Judicium Universitatis Oxoniensis*; *De Obligatione Conscientie Praelectiones*; *A Collection of Sermons*.

SAND GROUSE. See GANGA.

SAND-HILL CRANE, or BROWN CRANE, *Grus Canadensis*, a very large species of crane found in the Mississippi valley and western portion of the United States. It is a shy bird, with acute sight and hearing. Its body is about 4 ft. long; wings nearly 2 ft., with an immense spread. Length of tarsi about 10 in., and the bill longer than the middle toe. When wounded it is said to be dangerous to approach, as a thrust of its bill may inflict a severe wound.

SAND-HOPPER, *Talitrus locusta*, a small crustacean, of the section *edriophthalina* (q.v.) and order *amphipoda*, which so abounds on the sandy sea-shores of Britain that the whole surface of the sand often seems to be alive with the multitudes which, leaping up for a few inches into the air, fill it like a swarm of dancing flies. This activity is not, however, displayed at all times; but if a mass of sea-weed left by the retiring tide be turned over, countless sand-hoppers may be seen to leap away, or they may be found by digging in the sand, in which they burrow. The sand-hopper leaps by bending the body together, and throwing it open with a sudden jerk. It feeds on almost any vegetable or animal substance, particularly on what is already dead and beginning to decay. It is itself the food of crabs, and of many kinds of birds.

SAND HURST, a t. of Victoria, 82 m. n.n.w. of Melbourne, on the railway between Melbourne and Ebnec. It is the center of an important mining district of the Bendigo gold-fields. Pop. 71, along with its suburbs, 27,642. In the district of Sandhurst there are many Chinese.

SANDHURST, ROYAL MILITARY COLLEGE. In 1802 it was determined to institute a college for the training of military officers, in which professional education should be grafted on the groundwork of general instruction. The college was opened at Great Marlow; but, in 1812, it was transferred to a handsome stone building at Sandhurst. Up to 1862 this was devoted to the education of boys from the age of 13 upward; a description of the college as then existing is given under CADETS' COLLEGE. In that year, however, the system was changed; the course limited to one year immediately before entering the army, and the subjects of instruction confined to the higher mathematics, modern languages, and military science. Entrance was on the nomination of the commander-in-chief; and the payment by the cadet's parent or guardian varies from £100 to *nil*, according to the circumstances and rank of the parent. Those for whom no payment is made must be orphans, and are styled "Queen's cadets." Under the pur

chase system, all first commissions in the cavalry and infantry of the line, which were granted without purchase, and not to men from the ranks, were given to cadets from the royal military college, who competed for these prizes, and obtained them in order of merit.

The abolition of purchase in 1871 brought about a radical change. The students are no longer boys intending to become officers, but sub-lieutenants, who, having passed by competition for the army, spend a year at Sandhurst in acquiring the theoretical part of the war science. To be confirmed in the army as lieut., the officer must pass creditably out of Sandhurst, and then serve a year on probation with a regiment. It cannot be doubted that this change of system must tend, as years go on, to secure for the army a great body of scientific officers.

The Staff college (q.v.) is a separate institution, about 2 m. distant.

The estimated charge for the royal military college for 1878-79 was £36,281, of which about £5,000 is covered by the payments for the students.

SAN DIEGO, a co. of s. California; bounded e. by the Colorado river, s. by Lower California, w. by the Pacific ocean; traversed from n. to s. by two branches of the Coast range, which divide it into three sections, differing greatly in climate, soil, and other particulars; 13,500 sq.m.; pop. '70, 4,951. The section near the coast consists of level plains or undulating valleys, watered by the San Bernardo, San Diego, San Luis Rey, Margarita, and other rivers, and most of it is adapted to agriculture and grazing. The eastern part is a naked, sterile, sandy plain, called the great Colorado desert, and exceedingly hot, the mercury rising to 123° Fahr. in the shade. Between the mountains and the sea the soil is fertile, producing wheat, barley, oranges, olives, dates, and other tropical fruits. The mountains are covered with forests of oak, pine, fir, and cedar. The highest point is mount San Jacinto, 5,500 feet. Gold and silver are found. Capital, San Diego.

SAN DIEGO, a city in California, the capital of San Diego co., is on a bay of the Pacific ocean, 450 m. s.e. of San Francisco; pop. 4,000. It has a fine harbor, 6 m. long, formed by San Diego bay, with a depth of 22 ft. of water on the bar at low tide. It contains a court-house, 2 banks, 5 hotels, 5 churches, 2 seminaries for girls, an academy, 2 daily and 2 weekly newspapers, and a steam flouring mill. The chief exports are hides, wool, and whale-oil. Oranges, figs, and olives abound. The mild and equable climate makes it a popular resort for invalids. In all the elements of healthfulness it is said to be unsurpassed. The town of Old San Diego, the first place settled by white men in California, stands 4 m. n. within the city limits. The new town has grown mostly since 1867. This place has been fixed by act of congress as the terminus of the Texas and Pacific railroad, and seems destined to a high rank among cities on the western coast.

SANDIVER, a product of the glass furnaces. When the materials used in the manufacture of glass are melted, a scum arises which has to be removed; this is called sandiver, and is, when powdered, used as a polishing material, and formerly had a considerable reputation as a tooth-powder.

SAND-MARTIN. See SWALLOW.

SAN DOMINGO (DOMINGO, SAN, *ante*). The annexation of San Domingo to the United States has been a favorite project among certain political leaders and with democratic administrations since 1845, when negotiations to this end were begun, and an American commissioner sent to explore the island. Under president Pierce, capt. (since maj.gen.) Geo. B. McClellan was ordered to make a thorough survey of Samana bay, with a view to acquiring it as a naval station. His report was in favor of such an acquisition, and new negotiations were opened, but without practical result. In 1867 Mr. Seward, secretary of state, with other officials, visited the Dominican capital, and the matter was again reopened—and again postponed. During the beginning of gen. Grant's presidency, the Baez government of San Domingo made overtures in the direction of annexation, and at length the president sent gen. O. E. Babcock to confer with that government on the subject, when a treaty was actually drawn, by which, on payment of \$1,500,000, the Dominican republic was to become a territory of the United States. This treaty was ratified by a vote of the people of San Domingo, 15,000 to 400. The treaty was referred to the U. S. senate, where it met with bitter opposition, complicated by various personal and political questions, and where it was defeated. The president then recommended the appointment of a commission by congress to proceed to the republic and investigate and report upon all previous proceedings. Benj. F. Wade of Ohio, Andrew D. White of New York, and Samuel G. Howe of Boston were appointed such commissioners, and visited Samana bay in 1871, examining the resources of the country, the condition of the people, and popular feeling on the subject of annexation. The report of the commissioners was exhaustive, and entirely favorable to the plan of annexation. It was laid before congress by president Grant, but no action was taken concerning it. Subsequently the Samana bay company in New York leased the peninsula and bay of Samana from the Baez government, with certain trade privileges, at an annual rent of \$150,000, but met with no decided success. In 1874 the Dominican government again made overtures to the government of the

United States, urging positive action in the matter, but the annexation was not consummated.

SAN DONA. See **DONA, SAN, ante.**

SANDOVAL. FRAY PRUDENCIO DE, 1560-1621; b. Valladolid; educated for the church, took orders at the Benedictine convent of Santa Maria la Real de Naxera, and devoted years in that retirement to the study of the antiquities of Spain. He was made historiographer of Spain by Philip III., and for valuable services was rewarded by the bishopric of Tuy in 1603, and of Pomplona in 1612. He published various histories of Spain and editions of the ancient chronicles.

SAND-PAPER is made in the same way as emery-paper (see **EMERY**), but with sand in place of emery.

SANDPIPER, the common English name of a numerous group of birds, generally referred to the family *scelopacidae*, all formerly included in the genus *tringa*, but some now constituting the genera *totanus*, *pelidna*, *actitis*, etc., of ornithologists. In characters and habits they are all very similar. They are not of large size; they are very active and graceful in all their movements; their plumage not gay, but of pleasing and finely diversified colors; their legs are rather long, the lower part of the tibia naked, the tail very short, the wings moderately long; the bill rather long and slender, grooved throughout the whole or a considerable part of its length, straight in some, and a little arched in others. The feet have three long toes before, and one short toe behind; the toes in the genus *tringa*, as now restricted, are partially webbed at the base; in *totanus* they are completely separate. They are good swimmers, but are not, however, often seen swimming; they frequent sandy sea-shores, some of them congregating in numerous flocks in autumn and winter; and seek their food by probing the sand with their bills, and by catching small crustaceans in pools or within the margin of the sea itself. Many are birds of passage, visiting high northern latitudes in summer, and spending the winter on the coasts of more southern regions. The flesh of all the species is good, and some of them are in much request for the table.—The British species are numerous. The **DUNLIN** or **PURRE** (*tringa variabilis*) is noticed in the article **DUNLIN**.—The **KNOT** (*tringa canutus*), also known, in different states of plumage, as the **RED SANDPIPER** and the **ASH-COLORED SANDPIPER**, is a bird of about 10 in. in length, appearing in great flocks on the British coasts in winter, and equally common in North America.—The **LITTLE SANDPIPER**, or **LITTLE STINT** (*tringa minuta*), occasionally seen in Britain, occurs in India and in South Africa. The name **STINT** is given to a number of species of *tringa*.—The **PURPLE SANDPIPER** (*tringa maritima*), not unfrequently on the British coasts, is reckoned among the birds of Iceland, Greenland, Melville island, Nova Zembla, and Spitzbergen.—Of the genus *totanus*, to all the species of which the popular name **GAMBER** is sometimes given, one of the best-known species is the **REDSHANK** (*totanus calidris*), a bird which resides in Britain all the year, but known also as a summer bird of passage in the most northern parts of Europe and Asia, and occurring in winter as far s. as Smyrna, and even in India. It is about 11 in. long. It receives its popular name from its red legs.—The **GREEN SANDPIPER** (*totanus ochropus*) is also a pretty common British species, for the most part migrating to the north for the summer.—The **COMMON SANDPIPER** or **SUMMER SNIPE** (*totanus hypoleucos*) is in Britain a summer bird of passage.—The **GREENSHANK** (*totanus glottis*) is chiefly seen in Britain in spring and autumn, and has its name from the olive-green color of its legs.—Sandpipers of various species—some of them the same as the British, and others different—are numerous in North America, and in winter in the West Indies.

SANDPIPES are cylindrical hollows existing in chalk deposits. They descend perpendicularly into the chalk at right angles to the surface, tapering downward, and ending in a point; they reach occasionally a depth of 60 ft., and have a diameter varying from 1 to 12 feet. They are most probably produced by the chemical action of water, charged with carbonic acid, which exists more or less in all rain-water, and is especially abundant in water that has been in contact with decaying organic matter. The pipes are filled with sand, clay, or gravel from the overlying deposit.

SANDROCOTTUS, or **SANDROKRYPTOS**, is the Greek spelling of the name of the Hindu king Chandragupta, of Pataliputra or Palibothra, to whom Megasthenes was sent as ambassador from Seleucus Nicator, and who lived about the beginning of the 4th c. B. C.

SANDS, BENJAMIN FRANKLIN, b. Md., 1812; educated at the naval academy, and was appointed midshipman, 1828. He served in the coast surveys of 1836 and 1851, and was present at the capture of Tabasco, Mexico, 1847. At the beginning of the rebellion he had reached the rank of commander, and in 1862 was made capt. He took part in the attack on fort Caswell, the two on fort Fisher, and in the Wilmington blockade. In 1866 he was made commodore, was appointed supt. of the naval observatory in 1867, and in 1871 was raised to the rank of rear-admiral.

SANDS, ROBERT CHARLES, 1799-1832; b. Flatbush, L. I., son of Comfort; a member of the New York constitutional convention 1777. He graduated from Columbia college 1815; studied law, was admitted to the bar in 1820, but chose the profession of literature. He was a frequent contributor to the press in prose and verse; and, associated with others, ably edited and published several journals. The last poem from his pen,

The *Dead* of 1832, was published in the *Commercial Advertiser*, of which for the last 5 years of his life he was assistant editor. He published in 1831 the *Life and Correspondence of Paul Jones*. Selections of his writings with a memoir of his life have been published.

SANDSTONE is a rock formed of compacted, and more or less indurated sand. The grains generally consist of quartz, though other mineral substances are often mixed with this; they are colorless, or of a dull white, yellow, brown, red, or green color. The grains vary in size, forming, as the case may be, a fine or coarse grained stone. The loose sand becomes solidified by pressure simply, but more generally from being cemented together by calcareous, silicious, or ferruginous infiltrations, and the dark color of the mass is produced by the cement. Sandstones that have undergone great or continuous metamorphic action pass into quartzite; and between this and friable sand, all intermediate stages are found.

SANDUSKY, a co. in n. Ohio, bounded on the n. by Sandusky bay, drained by the Sandusky and the Portage rivers, and by Muddy and Green creeks; on the Lake Shore and Michigan Southern, the Lake Erie and Louisville, the Cincinnati, Sandusky and Cleveland, and the Toledo, Tiffin and Eastern railroads; about 425 sq.m.; pop. '80, 32,063—27,688 of American birth. The surface is level and heavily wooded. The soil is fertile. The principal productions are corn, oats, wheat, hay, and live stock. Co. seat, Fremont.

SANDUSKY, a city and port of Ohio, on the s. shore of Sandusky bay, an arm of lake Erie, 110 m. n. of Columbus. The bay, 20 m. long and 5 wide, forms an excellent harbor. The city is built upon a bed of limestone, of which its edifices are constructed, among which are a custom-house, 14 churches, 3 banks, large public halls, hotels, schools, etc. There are several newspapers, manufactures of lumber and bent wood-work for carriages, etc., with extensive fisheries. Pop. in 1860, 8,408; in 1870, 13,000.

SANDUSKY (*ante*), a city, co. seat of Erie co., on the Lake Shore and Michigan Southern, the Baltimore and Ohio (Lake Erie division), and the Cincinnati, Sandusky and Cleveland railroads; pop. '80, 15,838. It is on ground sloping to the bay, of which it affords a fine view. The streets are regular, lighted with gas, and contain many fine residences. There is a court-house and a public library. There is a large wine-growing district around Sandusky, and large amounts of wine are exported. Fish, lumber, shingles, and ice are other principal exports. The best-known of the Sandusky manufactures is that of wooden articles, such as wheel hubs and spokes, carpenters' tools, etc. There are car-works, machine-shops, manufactures of boilers, engines, etc. The city, with the islands in Sandusky bay, is a summer resort.

SAND WASP. See *SPHECIDE*, *ante*.

SANDWICH, a favorite viand which is said to have been named after the earl of Sandwich. It consists of two thin slices of bread, plain or buttered, with some savory food placed between. Formerly it was applied exclusively to bread with thin slices of ham, tongue, or beef, but of late a great variety of materials have been used; one celebrated Glasgow confectioner, Mr. Lang, has the credit of making one hundred different kinds of sandwiches.

SANDWICH (i.e., village on the sands), a Cinque port, market-t., and municipal borough of Kent, on the right bank of the Stour, 98 m. e.s.e. of London by the South-Eastern railway. Within the last 800 years the sea has here considerably receded, for Sandwich, which is now 2 m. from the shore, is described, at the commencement of the 11th c., as the most famous of all the English harbors—*omnium Anglorum portuum famosissimus*. The town is rectangular, and was surrounded by walls, along which a broad path now leads. The streets are confined; and the houses, which seem crushed together, and the architecture of which recalls the times of the Plantagenets, are peculiarly and strikingly antique in appearance. The church of St. Clement's, with a low Norman tower, is probably the most interesting edifice. Small vessels importing timber, iron, and coal, and exporting corn, flour, malt, seeds, and hops, come up to the town. Tanning, ship-building, and seed-crushing are carried on. In conjunction with Deal and Walmer, the town sends two members to parliament. Pop. (1871) of municipal borough, 3,060; of the parliamentary borough of Sandwich and Deal, 14,885.

Sandwich, the most ancient of the Cinque ports, probably occupies the site of the Roman *Rutupie*, and many interesting antiquities have been found in the vicinity. In the reign of Edward IV. its customs yielded £17,000 yearly, and 95 ships and 1500 sailors belonged to it.

SANDWICH, a t. in s.e. Massachusetts, near the coast of cape Cod bay; pop. '80, 3,544. On the w. it borders on Buzzard's bay. It is on the cape Cod division of the Old Colony railroad, 50 m. s.e. of Boston. The township contains the villages of Monument, Cohasset Narrows, North Sandwich, East Sandwich, West Sandwich, Spring Hill, and South Sandwich; has eight railway stations on the direct road and the Wood's Holl branch. The principal village is on the n. side of the cape, pleasantly situated in a valley, and from the hills which nearly surround it a view of Provincetown may be obtained. It has a large establishment for the manufacture of glassware; other industries are the manufacture of iron, jewelry boxes, tacks, etc. It is much frequented in

the season by sportsmen, having the finest facilities for boating, bathing, and fishing, and in the adjacent forests the fox, the deer, and a variety of game are found.

SANDWICH ISLANDS, forming the kingdom of Hawaii, are a rich, beautiful, and interesting chain, eight in number, exclusive of one or two small islets. The chain runs from s.e. to n.w., and lies in the middle of the Pacific ocean, in lat. 19° to 22° n., long. 155° to 160° west. Area, 7,600 sq.m.; pop. 72,56,897, of whom 2,539 were Europeans. The names, with the areas of the respective islands, are: Hawaii (formerly Owhyhee), 4,850 sq.m.; Maui, 750; Oahu, 700; Kauai, 780; Molokai, 170; Lanai, 170; Niihau, about 110; and Kahoolau, about 40 sq. miles.

Surface, etc.—Situated near the middle of the Pacific ocean, about half the distance from San Francisco in North America that they are from Melbourne in Australia, and Canton in China, the Sandwich islands form an oasis in the middle of a wide ocean waste, and offer convenient stations for the refreshment and repair of the merchantmen and whalers that traverse the Pacific. They are of volcanic origin, and contain the largest volcanoes, both active and quiescent, in the world. The most prominent physical features of the group are the two lofty mountain peaks of Hawaii, Mauna Kea, and Mauna Loa, each of which is 14,000 ft. in height, or within 1800 ft. of the loftiest of the Alps. Besides these two chief peaks, which stand apart from each other, and one of which is covered with perpetual snow, the island is traversed by other mountains, which give it a rugged and picturesque outline, and in some cases from the sea in bold, perpendicular precipices, from 1000 to 3,000 ft. in height. In general, the islands are lofty—the small islet of Lehua is 1000 ft. high, and the upland regions of Kauai are, on an average, 4,000 ft. above sea level. Within the coral reefs, which, in single, and more rarely in double ridges, skirt portions of the coasts, sandy shores, leading up to rich pasture-lands, and occasionally to productive valleys, are frequently seen. Everywhere, however, the configuration of the surface betrays the volcanic origin of the islands. Extinct and partially active volcanoes occur in most of the islands. Kilauea, on the Mauna Loa mountain in Hawaii, the largest active volcano in the world, has an oval-shaped crater 9 m. in circumference, and is 6,000 ft. above sea level. In the center of this immense caldron is a red sea, of lava, always in a state of fusion. At intervals the lava is thrown to a great height, and rolls in rivers down the mountain sides. From 1856 to 1859 this volcano was in an incessant state of eruption, forming at night a sublime spectacle, and occasionally casting forth burning streams, by one of which a small fishing-village was destroyed, a bay on the shore filled up, and a promontory formed in its place. On Maui, the crater of Mauna Haleakala (house of the sun), by far the largest known, is from 25 to 30 m. in circumference, from 2,000 to 3,000 ft. deep, and stands 10,000 ft. above sea level. Within this huge pit, about 16 basins of old volcanoes, whose ridges formed concentric circles, have been counted. Good harbors are few. The chief is that of Honolulu (q.v.), in Oahu, with $22\frac{1}{2}$ ft. of water in its shallowest parts. On the same island is Ewa, an immense basin, with 12 ft. water at low tides. During the prevalence of the trade-wind, which blows s.w. for about nine months of the year, the s. shores of the islands afford safe anchorage almost everywhere.

Climate, Soil, Rivers, etc.—Though situated within the tropics, the Sandwich islands boast a climate that is temperate rather than tropical. In the native language, there is no word to express the idea of *weather*, and this fact may be considered as evidence that extremes of heat or cold do not occur. At Honolulu the extremes of temperature in the shade during 12 years were 90° and 53° , and the diurnal range is 12° . Rains brought by the n.e. trade-wind are frequent on the mountains; but on the leeward side of the islands, little rain falls, and the sun is rarely obscured by clouds. The soil, the constituent parts of which are mainly scorie, decomposed lava, and sand, is generally thin and poor. This, however, is not universally the case. At the bases of the mountains and in the valleys, where abrasion, disintegration, and the accumulation of vegetable mold have gone on for ages, there are extensive tracts as fertile as they are beautiful. The islands produce fine pasturage in abundance, and large herds are bred and fattened, to supply meat to the whalers and merchant-ships. On the Waimoa plains, in Hawaii alone, 30,000 sheep of the merino breed are grazed. The upland slopes of the mountains are clothed with dense forests; and lower down are grassy plains and sugar and coffee plantations. Basalt, compact lava, coral-rock, and sandstone, are used for building purposes. No metals occur. Several of the islands, especially Hawaii and Kauai, are well supplied with rivers, which, from the size and conformation of the group, are necessarily small, but afford great facilities for irrigation. Vast numbers of semi-wild horses roam the islands, and while they consume the pasturage, and break down the fences, are of little use. The indigenous fauna is small, and consists mainly of swine, dogs, rats, a bat that flies by day, birds of beautiful plumage, but for the most part songless. Among the indigenous trees and plants are the sugar-cane, banana, plantain, cocoa-nut, candle-nut, various palms, the taro, a succulent root which formed the staple of the food of the natives, and is still generally used; the cloth-plant; and the *ti*, the roots of which were baked and eaten, while the leaves were used for thatching huts. Cattle and other useful foreign animals and plants were introduced by Vancouver and other navigators. There are about 30,000 mules and semi-wild horses in the kingdom.

Commerce, Products, etc.—The commerce of this young kingdom is still in its infancy,

but is gradually on the increase. Until recently the most important branch of it was maintained by vessels engaged in the whale-fisheries of the north Pacific. This branch of commerce has greatly declined within recent years. In 1872, 47 whaling-vessels, showing a decrease of 51 as compared with the number in 1870, entered the ports. Trusting no longer to the whaling business, the producers and merchants of the Sandwich islands have found out other outlets for their goods, and, without doubt, the trade of the islands will in the future be almost wholly confined to the coasts that bound the Pacific. The islands are within 16 days (by sailing-vessels) of San Francisco, 27 days from Vancouver's island, 26 days from Kanagawa in Japan, and 67 days from Hong-kong. Sugar, coffee, and rice have been proved to produce well, and all these find ready markets at hand in California, British Columbia, and Vancouver's island, which, together, can consume more than the Sandwich islands can supply. Of sugar, the 3,000,000 lbs. produced in 1862 were increased to nearly 17,000,000 in 1872; and from the number of new plantations recently organized, the amount of produce may be expected to continue increasing. The exports, consisting mostly of sugar, coffee, rice, pulu (q v.), hides, and corn, amounted in 1875 to over \$2,000,000; the imports, mostly manufactured goods, amounted in the same year to \$2,000,000.

History, Constitution, and Finances.—Of the origin and character of the inhabitants of this kingdom, of its interesting internal history, or of the much-canvassed question as to whether the native race will flourish along with or wither before the Saxon race, it is not within our limits to speak. We can only notice a few of the leading events which have occurred in these islands since their shores were first visited by what the natives called the "floating islands" of the civilized nations. Although one member of the group was seen by Gastano in 1542, the islands cannot be said to have been discovered till Cook visited them in 1778. The great navigator treated the simple and confiding natives with a cruelty and a hypocrisy which consort ill with his fame, and which were the direct causes of the brawl in which he met the death he had provoked in Kealahakua bay, Hawaii, 1779. In early times each island had a king; but under Kamehameha I., a man of shrewd sense, and of great bravery and resource, the islands were formed into one kingdom. This king, writing to George III., Aug. 6, 1810, desired formally to acknowledge the king of England as his sovereign, and to place the islands under British protection—an offer which was accepted. After inaugurating the era of advancement, this king died in 1819, and was succeeded by Liholihi, who adopted, on his accession, the name of Kamehameha II., and in whose reign idolatry was abolished simultaneously throughout all the islands. The first Christians who visited the Sandwich islands were Cook and his followers, of whom the simple natives retained no favorable impression. Vancouver, who arrived with Cook in 1778 and returned in 1792, and again in 1791, made sincere attempts to enlighten the natives, and the king and his chiefs requested Vancouver to send out religious teachers to them from England; but the first missionaries that visited the islands came from America in 1820. On their arrival, the missionaries witnessed the singular phenomenon of a nation without a religion. The instructions of Vancouver had not been forgotten, and no doubt enabled the idol-worshipping islanders to see more readily the absurdities of their system. But the spontaneous movement of 1819-20, when the whole nation rose up to destroy idols, temples, and the furniture of idolatry, "was no triumph of Christianity—for Christianity had not yet claimed or even approached the Hawaiian islands." The nation had voluntarily cast off the religion of their ancestors, and had not yet adopted—were not even acquainted with—any other system. The American missionaries who arrived in 1820 were well received, and the work of instruction was at once begun. Besides instructing them in Christianity, in less than 40 years they taught the whole Hawaiian people to read and write, to cipher and to sew.

Kamehameha II. and his queen visited England, and after a short residence in this country, both died in London, July, 1824. Prior to the year 1838 the government was a despotism; but in 1810 the king, Kamehameha III., granted a constitution, consisting of king, assembly of nobles, and representative council. This constitution, based on that of Great Britain, has in more recent times been much matured and improved. In 1843 the independence of the Hawaiian kingdom was formally declared by the French and English governments. Kamehameha IV. acceded to the throne in 1854, and, after a brief but useful reign, died in Nov., 1863, and was succeeded by his brother, Kamehameha V. Lunailo was elected in 1873, and on his death, Kalakaua in 1874. The revenue for the years 1874-76 was \$1,008,191; the expenditure, \$919,357—See Miss Bird's *Six Months in the Sandwich Islands* (1875).

SANDWICH ISLANDS (*ante*), so named by capt. Cook, but that name is not found in the constitution and laws of the islands. They are there called the Hawaiian Islands, which is the name used by the people. Their distance from Panama is 4,800 m., from San Francisco 2,100 m., and from Japan 3,400. They are ten in number. The group contains 6,000 sq. miles. The four largest and most important are Hawaii, Maui, Oahu, and Kauai. Kaula and Molokini are little more than barren rocks.—HAWAII, formerly called Owhyhee, is 300 m. in circuit, and twice as large as all the others together. It is in the form of a triangle, is 100 m. long from n. to s., and 80 broad. The interior, a table-land, 8,000 ft. above the sea, is chiefly covered with lava and ashes, but

in some places overgrown with wanti trees or paper-mulberry trees. From this plateau the land gradually slopes toward the sea. There are three mountains, Mauna Kea, Mauna Loa, and Mauna Hualalai, near the edges of this table-land. The higher part of this slope, to about 4 m. from the shore, is covered with dense forests of acacia, which grows very large, and of which the natives make their canoes. The soil on which these trees grow lies on lava, which often appears above it. The tract w. of Byron bay or Waiakae, extending toward the base of the volcano Mauna Kea, is thickly inhabited and well cultivated; but nearly contiguous to it on the s. is a desert of lava extending 40 m. along the shore, without cultivation, and inhabited only by fishermen. The north-eastern coast is bold and steep. Byron bay, on the eastern shore, has a spacious harbor lying s. and n., protected from the n.e. wind by a coral reef half a mile wide, leaving a channel three-quarters of a mile wide and from 3 to 10 fathoms deep. It is the best harbor of the island. In the Kealahue harbor, on the w. coast, capt. Cook was killed. The principal town is Hilo.—MAUI lies n.w. of Hawaii, separated from it by a strait 24 m. wide. It is 48 m. long, 29 broad. It is composed of two masses of rock, surrounded by a narrow tract of low land united by a low and sandy isthmus 9 m. in width. The larger mountain, occupying the e. part, is 10,000 ft. high, and has but little cultivable land; the smaller mountain mass, or peninsula, has a fine tract of level land along the s.w. coast. The harbor of Lahaina, the principal town, nearly in the center of the plain, is formed by two low projecting rocks, 2 m. distant from each other.—KAUAI, 33 m. long, 28 broad, is a mountain mass sloping on all sides toward the sea, where it terminates with a high coast. The valleys are fertile and well cultivated.—OAHU, 46 m. long, 23 broad, has a larger quantity of cultivated land than the other islands, an extensive foreign commerce, and is the most populous of the whole group. A mountain range traverses the island from n.e. to s.w., terminating at Diamond Point, the s.w. cape, in a hill 400 ft. high. This range, with the valleys which intersect it, covers half the surface of the island. Another mountain mass is in the n.w., separated from the other by a plain 20 m. in extent, called the plain of Eva, which is fertile and well-wooded, but not much cultivated. The soil is a deep mold, resting on lava. The plain of Honolulu, extending 10 m. along the s. shore, from 2 to 3 m. in width, has a rich alluvial soil, and is highly cultivated. Honolulu (q.v.) is the capital of the islands and the residence of the king. It has an excellent harbor, which, though small, is deep and perfectly safe. It is formed and protected by a coral reef extending some distance along the shore.—MOLOKAI, extending 40 m. from e. to w. and 7 m. from s. to n., is a mass of rocks, the highest portion rising 5,000 ft. and the sides having deep ravines full of trees. There are level tracts along the shore, many of them fertile.—KAHULAWÉ lies s.w. of the larger peninsula of Maui; is 11 m. long and 8 broad. It is, like the other islands, composed of lava. The soil is thin, and covered with a coarse grass.—LANAI, w. of the smaller peninsula of Maui, separated from that island by a strait 9 or 10 m. wide, is 17 m. long, 9 wide, and is a mass of low volcanic rocks. A large part of it is barren, and there are but few inhabitants.—NIHAU, the most western of the islands, is 20 m. long, 7 broad. The inhabitants make painted and variegated mats, which are used in all the other islands, and the island produces abundance of yams, which are sent to other islands. There is a good harbor on the w. side.—The only mineral obtained in abundance on the islands is salt. A large quantity is taken from a salt lake in the island of Oahu, which is between 2 and 3 m. in circuit. The bottom and shores are incrustated with salt, the water being strongly impregnated, and the crystallization very rapid. There are also artificial vats of clay along the sea-shore, into which the water from the sea is let at high-tide, and large quantities of salt obtained by evaporation. The forests do not contain many trees fit for ship-building. Sandal-wood formerly abounded in some of the mountains, but, having been largely exported to China, it is now scarce. The Hawaiians are supposed to belong to the family of Malay nations. Their complexion is tawny, inclining to olive: they are of middle stature, well formed, with muscular limbs and open countenance. They are expert in swimming, and are good fishermen and horsemen. The Hawaiian nation is believed to have a considerable antiquity. Persons have been appointed from time immemorial to keep the genealogy of their kings unimpaired, and this embraces the names of more than 70 kings. The population in 1778 was estimated by the discoverer at 400,000. When the missionaries arrived, in 1820, they estimated it from 130,000 to 150,000, but since that it has been, from various causes, steadily decreasing, so that in 1872 the official census gave but 56,899. For an account of the Hawaiian kings, see KAMEHAMEHA; and for the present religious condition of the islands, see MISSIONS, FOREIGN.

SANDWORT. See ARENARIA.

SANDY HOOK, a low, narrow, sandy peninsula, running about 6 m. to the n. from Monmouth co., N. J., about 16 m. s. of New York. There is a light-house about $\frac{1}{4}$ of a m. from the n. end.

SANDYS, EDWIN, D.D., 1519-88; b. Lancashire; educated at St. John's college, Cambridge, where he became favorable to the reformation; was junior proctor, 1542; master of Catharine hall, 1547, and vicar of Haversham; prebendary of Peterborough, 1548, and of Carlisle, 1552; vice-chancellor of Cambridge, 1553. Having preached in favor of

lady Jane Grey, was imprisoned in the Tower, from which, after 29 weeks, he escaped and fled to the continent, 1551; returned to England on the day of Elizabeth's coronation; was made bishop of Worcester, 1559; of London, 1570; and archbishop of York, 1576. He was a translator of the Bishop's Bible; and a commissioner to revise the liturgy. As preacher and bishop he was indefatigable and efficient.

SANDYS, Sir Edwin, 1561-1629; educated at Oxford, where he was a pupil of Richard Hooker. He was knighted by James I., who gave him responsible employments. He was associated with Bacon in framing the "remonstrance" of 1604, and was a member and treasurer of the second Virginia company. It was largely due to his efforts that a charter was obtained for the Plymouth colony. His opposition to Charles I. caused him to be arrested in 1621. He wrote *Europe Speculum, or a View on Survey of the State of Religion in the Western part of the World*.

SANDYS, GEORGE, 1577-1644; b. England; went to Oxford in 1589; traveled in the east, 1610-12, and published in 1615 an account of his travels in a work entitled a *Relation of a Journey in Four Books, containing a description of the Turkish Empire, of Egypt, of the Holy Land*, etc. In 1621 he removed to America, succeeding his brother as treasurer to the English colony of Virginia. He was much interested in the welfare of the colony, establishing iron-works and introducing ship-building. The Virginia company broke up in 1624, and he returned to England. He published translations of Ovid's *Metamorphoses*; also poetical versions of the *Psalms*, *Job*, *Ecclesiastes*, etc.

SAN FELÉ, a t. of south Italy, in the province of Potenza, 17 m. n.w. of Potenza. Pop. 10,500.

SAN FELIPE DE ACONCAGUA, a t. of Chili, capital of the department of Aconcagua, 60 m. e.n.e. of Valparaiso. It is regularly built, and has a handsome appearance. In the vicinity are copper mines. Pop. stated at from 12,000 to 13,000.

SAN FELIPE DE JATIVA. See JATIVA.

SAN FERNANDO, a city on the Isla de Leon, in the province of Andalusia, Spain, connected with the main-land by a bridge; pop. about 20,000. The principal industries are the manufacture of leather, salt, and rum. Its suburb, San Carlos, contains the residence of the captain-general.

SAN FILIPPO D'ARGIRO, a t. in e. Sicily, the site of the ancient Agrigum, named in honor of prince Agris; birthplace of Diodorus Siculus. It is on the w. bank of the Traina, one of the head streams of the Giaretta; pop. about 7,000. It is 27 m. n.w. of Catania; has a Saracen castle, and several churches and convents. The chief products are saffron and corn. The ancient city was called Sikelian and had a pop. of 20,000. It was celebrated in the middle ages for the church of St. Philip.

SANFORD, a co. in n.w. Alabama, adjoining Mississippi, drained by branches of the Tombigbee; about 600 sq.m.; pop. '70, 8,893—1563 colored. Surface undulating and soil productive; cotton, sweet potatoes, oats, butter, and pork are the staples. Co. seat, Vernon.

SAN FRANCISCO, the principal sea-port on the western coasts of North America, and the chief city of California, U. S., stands on the w. shore of San Francisco bay, 6 m. s. of the Golden Gate, the outlet leading w., and connecting the bay with the Pacific ocean. Lat. 37° 46' n., long. 122° 23' west. It has a fine deep harbor, well-built streets, handsome shops, gas and water works, and elegant public buildings, among which are the custom-house, mint, city hall, marine hospital, city hospital, theaters, orphan asylums, a convent, etc. There are about 75 churches, 11 daily and 46 other newspapers, numerous schools and charitable institutions, and several fire insurance companies. Of the population attracted by the discovery of gold to San Francisco, a great number are Irish, German, British, French, and Chinese. There are newspapers in English, French, German, Spanish, Italian, and Chinese. The Chinese have a church, Roman Catholic, with a Chinese priest educated at Rome; and a school. Among the manufacturing establishments are flour-mills, saw-mills, woolen factories, and iron foundries. In 1874 4,204 sea-going vessels, with an aggregate burden of 1,553,000 tons, entered the harbor. In 1869 the receipts of precious metals amounted to £9,877,295; but this sum does not nearly represent all the receipts, as much treasure comes by private hands, and passes through no channel by means of which the amounts can be noted by the authorities. The treasure exported in 1876 amounted to near £10,000,000. The other exports were chiefly wheat, barley, wool, quicksilver, hides, furs, flour, gunpowder, and copper-ore. Their value was about £6,263,000. The imports (valued at £3,200,000 in 1876) included sugar, coal, rice, coffee, tea, wines and spirits, iron, cotton, silk, and various manufactured goods. About 50 ocean-steamers run regularly to Japan, Australia, Mexico, Panama, Victoria, and domestic ports in California and Oregon. The Union Pacific railroad, completed in 1870, makes San Francisco an important point as the commercial highway from Europe and the eastern United States to Asia. In 1776 the mission of St. Francis was commenced here by two Spanish monks. In 1825 the mission had under its care 1800 Indians, and possessed 76,000 cattle and 79,000 sheep. In 1834 the property of the mission was secularized, and it rapidly decayed. In 1846 it was taken by the United States, and in 1847 had a population of 450. The discovery of gold in 1848 caused it to

be at first nearly deserted; but soon commenced a rapid growth, which, in spite of several destructive fires, has continued to increase. Pop. '60, 55,626; '70, 149,478; '77, 290,000.

SAN FRANCISCO (*ante*), the capital of San Francisco co., Cal., and the most important city on the Pacific coast of North America, situated in lat. 37° 47' 35" n., long. 122° 24' 15" w., at the n. end of a peninsula 20 m. long and (at this point) 6 m. wide, which separates the bay of San Francisco from the ocean. The city and county, which are consolidated, contain an area of 42 sq. m., and comprise, besides the northern part of the peninsula across to the ocean, Goat island, Alcatraz island, and Mission rock, in the bay, and the Farallones islands, 24 m. off in the ocean. The land upon which the city is built is sandy and unproductive; a portion of it was originally hilly, but has been leveled by art. The development of the city has been quite recent. As far back as 1776, indeed, a Spanish military post was established on its present site, together with a mission of San Franciscan friars for the conversion of the Indians, but it was not till 1835 that a village was laid out under the name of Yerba Buena. In 1847 the name was changed to San Francisco, the number of inhabitants at that date being about 450. Next year the discovery of gold was made in California, and emigrants from all parts of the world were at once attracted there. The growth of the city from that date was rapid. In 1850 the population was 25,000; in 1860, 56,802; in 1870, 149,473 (of whom only about one-half were natives of the U. S.); and in 1880 it was estimated at about 300,000, including 20,000 Chinese. The city was incorporated in 1850, and the city and county consolidated in 1856. In Dec., 1849, a number of buildings were destroyed by fire, and within fourteen months thereafter four other extensive conflagrations devastated the business portion of the city. Earthquakes have been quite frequent, but so slight as to cause little or no damage. In 1851-56, owing to corrupt municipal government and inadequate enforcement of the laws, the citizens, to protect themselves, organized vigilance committees, which summarily dealt with a number of public criminals and reduced the others to subordination. Since then the city has been in the main an orderly one, although in 1877-78 considerable trouble was again apprehended from the unruly members of society led by the popular demagogue, Denis Kearney.—San Francisco is regularly laid out, with wide streets crossing each other at right angles. The business portion is closely built up, but outside of that the houses are frequently quite scattered. Belgian blocks and cobble-stones are used in paving the business streets; wood pavements with asphalt sidewalks are more common elsewhere. The principal thoroughfares are Montgomery, Kearney, and Market streets; all are fashionable promenades and contain the leading retail stores. The wholesale houses are chiefly in Front, Sansome, and Battery sts.; the principal banks and brokers' and insurance offices are in California street. Dupont and Stockton sts., in the southern part of the city, are lined with handsome brick residences. Elsewhere the houses are mainly built of wood, often very lavishly decorated. There are no shade trees, but the yards around the better class of houses make a splendid show of flowers and evergreens—the natural sterility of the soil being overcome by artificial means. The public buildings are not many, though several are remarkably fine specimens of architecture. Such, when completed, will be the new city hall in Yerba Buena park, which is estimated to cost \$4,000,000, and such are now the merchant's exchange on the s. side of California st., the banks of California and Nevada, the mercantile library building, etc. The custom-house and post-office is a plain substantial building in Battery st. The present U. S. branch mint in Commercial st. is even less pretentious in appearance, but a new and magnificent stone structure has been commenced in Mission st., to which the mint will be removed. The Palace hotel is said to be the largest, as it is one of the most magnificent, buildings of the kind in the world. It occupies an area of 275 by 350 ft., is 9 stories high, and has accommodations for 1200 guests. It was erected at a total cost of \$3,250,000. The Baldwin house, although smaller, is hardly inferior in its appointments, and other first-class hotels are the Occidental, the Lick house, and the Cosmopolitan. The custom of living in hotels is very common, not only for single men, but for families. There are 85 churches, of which 14 are Catholic, 5 Jewish, and 66 Protestant, representing 18 different sects. The most important of these are St. Patrick's church and St. Mary's cathedral, both Roman Catholic, the former being the noblest church edifice on the Pacific coast; Grace church (Episcopal), a stately stone building; Trinity church (Episcopal); the Calvary Presbyterian; the First Unitarian, one of the most elegant buildings in the city; and the Jewish synagogue of Sherith Israel, a richly decorated and substantial edifice. San Francisco is the residence of an Episcopal bishop and a Roman Catholic archbishop. One hundred and one periodicals are published in the city as follows: 15 dailies, most of which publish also weekly and tri-weekly editions, 2 semi-weeklies, 42 weeklies, 2 semi-monthlies, and 40 monthlies. Among the educational institutions there are 3 literary colleges, 2 medical colleges, an academy of sciences, and an excellent school of design. The public schools are 69 in number, with a daily attendance of about 21,000 pupils. There are 18 public libraries, the Mercantile, the Mechanics, and the Odd Fellows being the largest. Of the charitable institutions, the principal are the U. S. marine hospital, the new city hospital, the state woman's hospital, and various hospitals and asylums under the control of the religious denominations. The great lack of the city is that of a suitable

public park such as is possessed by every other important town in the union; but a commencement has lately been made in the Golden Gate park (1043 acres) w. of the city, which is now being beautified. There are a few public squares in the city, as Portsmouth, Washington, Union, and Columbia squares, which are tastefully laid out and planted with trees and shrubbery. The principal cemeteries are Lone Mountain and Laurel Hill.—The Chinese portion of the city, "Chinatown," is one of the great curiosities to travelers. Here 20,000 Chinamen are huddled together in quarters which would not accommodate one-fifth that number of Americans, and they have brought with them all the habits and ways of life of the mother-country. They have 2 theaters, joss-houses, opium-sellers, and gambling-houses, all conducted on the Chinese fashion.—Business in the city is remarkably brisk, owing to the energy and pushing qualities of its inhabitants as well as to its favorable location. The manufactures comprise silk and woollen goods, cigars, boots and shoes, iron castings, rolled iron, carriages, flour, glass, sashes, doors, soap, leather, cordage, billiard-tables, wind-mills, willow-ware, etc. The only railroad which terminates in San Francisco itself is the Southern Pacific, although the Central Pacific, the California Pacific, the North Pacific Coast, and the San Francisco and North Pacific all terminate on the bay of San Francisco, and are connected with the city by steam-ferris. The harbor of San Francisco is beyond all comparison the finest on the western coast of North America, and it enjoys in consequence a monopoly of the commerce on the Pacific slope. Forty-three ocean steamers run from this port to China, Japan, Australia, and Panama, and to domestic ports on the northern and southern coasts, besides thirty inland steamers which run to points on the tributaries to the bay. The number of sea-going vessels that arrive in San Francisco is nearly 5,000 annually.

SAN FRANCISCO BAY, in n.w. California, a considerable body of water lying principally between the counties of Contra Costa, Alameda, Santa Clara, San Mateo, and Marin, receiving the drainage of the Sierra Nevada, and the great California valley, which, conducted by the Sacramento and San Joaquin rivers, flows into it through San Pablo bay, with an outlet to the Pacific ocean, at the city of San Francisco, through a channel called the Golden Gate. The channel is 2 m. wide and 5 m. long, with shores which are bold and rocky, nearly 2,000 ft. high on the n., and on the s. shining white sand-hills from 300 to 400 ft. high. In the harbor there is great depth and excellent anchorage, and on the bar at the entrance there is 30 ft. of water at low tide. It contains several islands, Alcatraz, in the middle of the channel 4 m. from the entrance, Angel island, containing 800 acres, the largest one of all, and Yerba Buena, or Goat island. Alcatraz is fortified, and on the s. side of the Golden Gate is Fort point. On the n. San Pablo bay, 10 m. in diameter, receives the waters of Suisun bay (8 m. long and 4 m. wide), through the Carquinez strait, 1 m. wide, with 16 ft. of water at low tide. At the head of San Pablo bay is Napa, or Mare island, containing a U. S. navy yard. Including San Pablo bay, the length is 55 m., width from 3 to 12 m.; at San Francisco 7 m. wide.

SAN FRANCISCO MOUNTAIN, the highest summit in Arizona, 12,500 ft. above the sea, stands alone on the Colorado plateau, from which it rises abruptly 5,000 ft., forming a land-mark seen from afar in all directions. Its base is 10 m. in diameter, and from its summit a hundred volcanoes may be seen.

SAN FRATELLO, a t. of Sicily in the province of Messina, 53 m. w.s.w. from Messina. At the base of the hill on which the town stands is a remarkable cave, discovered in 1859, and containing prodigious quantities of bones of mammals, with which flint implements are mixed. Pop. 7,200.

SANGAMON, a co. in central Illinois, intersected by the Springfield and South-eastern, the Gilman, Clinton and Springfield, the Springfield and Northwestern, the Chicago and Alton, and the Toledo, Wabash and Western railroads; 950 sq.m.; pop. '80, 52,902—45,115 of American birth, 1830 colored. Its surface is level, the greater proportion prairie land; having in the elevated portions extensive deposits of bituminous coal, with an annual product of about 75,000 tons. It is drained by the Sangamon river and its branches; and produces corn, wheat, oats, honey, and dairy products. Live stock is raised, and the manufactures include carriages, saddlery, iron castings, wool, etc. Co. seat, Springfield, the capital of the state.

SANGAREE, a West Indian beverage, consisting of Madeira wine, syrup, water, and nutmeg.

SANGERHAUSEN, a t. of Prussian Saxony, in the government of Mercesburg, and 33 m. w.n.w. of the city of that name. It contains two castles; carries on weaving, tanning, shoe-making, and copper-smelting, and manufactures saltpeter. Pop. '75, 8,474.

SANGIR ISLANDS lie to the n. of Celebes, in 2° to 4° n. lat., are upwards of 50 in number, of various sizes, and nearly all inhabited. Pop. 30,000. The three largest islands, Great Sangir, Sjauw, and Tagolandang, with those which surround each, form as it were separate groups. In the Sangir islands are many mountains, which, except the volcanoes, are clothed to their summits with a rich vegetation. Great Sangir has an area of 273 sq.m., and is divided into four kingdoms. The usual anchorage is on the w.-side, in 3° 28' n. lat., and 125° 44' e. long. Pop. 13,000. In the n.w. is a volcano,

called Abu, or the "Ash mountain," which has frequently caused great devastation. In Mar., 1856, the streams of lava and boiling water carried away the rich plantations, and 2,806 lives were lost.

Sjiau-w lies in 2° 43' n. lat., and 125° 28' e. long., is also mountainous; a volcano, on the n.e. coast, being 6,200 ft. high. Pop. 3,000. The chief town is Uluw.

Tagolandang, in 2° 20' n. lat., and 125° 30' e. long., is populous, and the center of the missionary work which has been carried on successfully in the Sangir islands. A small ship belongs to the station, in which to visit the scattered converts and schools.

In all the islands, the areng (*suguerus* or *borassus gomulus*), the sago, cocoa-nut, and the finest sorts of timber trees abound. Maize, rice, katjang (a species of bean), tobacco, cocoa, and the sugar-cane are cultivated.

The Sangirese belong to the Malay race, are well made and brave, but cunning, lazy, and dirty in their habits. This, and scarcity of pure drinking-water, make them liable to a loathsome skin disease. There are four rajahs in Great Sangir, one in Tagolandang, and one in Sjiau-w. The government is monarchical, somewhat limited by a council.

Toward the end of the 15th c. the Sangirese became Mohammedan; a century later, under the Portuguese, they were brought over to Christianity. These islands, forming now a Netherlands dependency, have several Dutch missionaries, and 24 churches, which are also used as schools. Government supports 8 teachers, the villages 16.

SANG-KOI. See TONQUIN.

SANGRAAL. See GRAAL.

SANGUINA'RIA, a genus of plants of the natural order *papaveraceæ*, having 8 to 12 petals, 2 stigmas, an oblong swollen capsule with two deciduous valves, and a persistent, many-seeded frame. *S. Canadensis*, the BLOOD-ROOT or PUCCOON of North America, has a fleshy root-stalk abounding in red juice, which abounds also in the leaf-stalks; and solitary radical leaves, which are roundish, deeply heart-shaped, and with about seven toothed angles. The flowers are solitary and spring from the root, on short stalks. The whole plant is acrid and narcotic, emetic and purgative in large doses; and in small doses stimulant, diaphoretic, and expectorant. It is much used as a medicine in the United States.—It is supposed to owe its properties to a peculiar alkaloid called *sanguinarine*, which is obtained from it as a white pearly substance. The large white flowers appear early in spring, and are a frequent ornament of flower-borders.

SANGUINE, or MURREY, one of the tinctures of less frequent occurrence in heraldry, denoting blood color, and represented in engraving by lines crossing each other saltire-ways.

SANGUISORBA'CEÆ, or SANGUISOR'BEÆ, according to some botanists a natural order of plants, but more generally regarded as a suborder of ROSACEÆ (q.v.). As a suborder, its distinctive characters are apetalous flowers—the tube of the calyx thickened, indurated, and lined with a disk, generally few stamens, and a solitary carpel, which ripens into a nut inclosed in the calycine tube. About 150 species are known, all of which are herbaceous or half shrubby, some of them spiny.—The leaves of *acena sanguisorba*, a native of Van Diemen's land, are said to be an excellent substitute for tea. Of British species, burnet (q.v.), and lady's mantle (q.v.) are among the best-known.

SANHEDRIM (Gr. *synedrion*), the supreme national tribunal of the Jews, established at the time of the Maccabees, probably under John Hyrcan. It consisted of 71 members, and was presided over by the nasi (prince), at whose side stood the ab-beth-din (father of the tribunal). Its members belonged to the different classes of society: there were priests (*archiereis*); elders, that is, heads of families, men of age and experience (*presbyteroi*); scribes, or doctors of the law (*grammateis*); and others, exalted by eminent learning—the sole condition for admission into this assembly. The presidentship was conferred on the high-priest in preference, if he happened to possess the requisite qualities of eminence; otherwise "he who excels all others in wisdom," was appointed, irrespective of his station. The limits of its jurisdiction are not known with certainty; but there is no doubt that the supreme decision over life and death, the ordeal of a suspected wife, and the like criminal matters, were exclusively in its hands. Besides this, however, the regulation of the sacred times and seasons, and many matters connected with the *cultus* in general, except the sacerdotal part, which was regulated by a special court of priests, were vested in it. It fixed the beginnings of the new moons; intercalated the years, when necessary; watched over the purity of the priestly families, by carefully examining the pedigrees of those priests born out of Palestine, so that none born from a suspicious or ill-famed mother should be admitted to the sacred service; and the like. By degrees the whole internal administration of the commonwealth was vested in this body, and it became necessary to establish minor courts, similarly composed, all over the country, and Jerusalem itself. Thus we hear of two inferior tribunals at Jerusalem, each consisting of 23 men, and others consisting of three men only. These courts of 23 men (lesser synedrion), however, as well as those of the three men, about both of which Josephus is silent, probably represent only smaller or larger committees chosen from the general body. Excluded from the office of judge were those born in adultery; men

born of non Israelitish parents; gamblers; usurers; those who sold fruit grown in the Sabbatical year; and, in single cases, near relatives. All these were also not admitted as witnesses. Two scribes were always present, one registering the condemnatory, the other the exculpatory votes. The mode of procedure was exceedingly complicated; and such was the caution of the court, especially in matters of life and death, that capital punishment was pronounced in the rarest instances only. The nasi had the supreme direction of the court, and convoked it when necessary. He sat at the head, and to his right hand was the seat of the *ab-beth-din*; the rest of the 71 took their places according to their dignity, in front of them, in form of a semicircle, so that they could be seen by both the chief officers. The lictors, or "sheriffs," were always present at the session. The court met on extraordinary occasions in the house of the high-priest; its general place of assembly, however, was a certain hall (*lishet hagazit*), probably situated at the s.e. corner of one of the courts of the temple. With exception of Sabbath and feast days, it met daily. The political troubles forced the sanhedrim (70 B.C.) to change its abode, which was first transferred to certain bazaars (*hannyyoth*) at the foot of the temple mount. After the destruction of the temple and Jerusalem, it finally established itself, after many further emigrations, in Babylon.

We cannot here enter into that most difficult question as to the origin and development of the sanhedrim, and how far it was intended primarily to be a faithful reproduction of the Mosaic assembly of the 70 (Moses himself making 71), supposed to have been re-established by Ezra after the exile; any more than we can examine in this place into the widely different opinions respecting the jurisdiction and competence of the sanhedrim at the time of Christ and the apostles; how far, in fact, it may be said to have existed at all—save for a few matters of smallest importance—curtailed and circumscribed as it was by the Romans, who seem to have recognized only the "high-priest;" and that collateral but most vital question, whether it was the sanhedrim at all from whom emanated those well-known acts recorded in the New Testament. There can be no question as to its utter incompetence to arraign Christ for a "crimen lesse majestatis," i.e., for high treason against the Roman emperor. No less difficult is the explanation of many of the proceedings against the apostles ascribed to this body. The suggestion that the word *synedrium*, as used in the New Testament, stands only for an arbitrarily convoked "lynch-tribunal," deserves more consideration than it has hitherto received.

SANHITA is the name of that portion of the Vedas which contains the mantras or hymns. See VEDA.

SANILAC, a co. in e. Michigan, lying on lake Huron; drained by Black and Cass rivers; 962 sq. m.; pop. '80, 26,341—13,479 of American birth. The surface is rolling and broken, and the soil only moderately fertile; wheat, oats, hay, wool, butter, and maple-sugar are the staples; lumber is the chief article of export. There are several manufactories of furniture and of carriages, and 4 flouring-mills. Co. seat, Lexington.

SANITARY COMMISSION, UNITED STATES, an organization created from among the people of the northern states during the war of the rebellion, which supplemented the medical service of the union army. Its duties and labors comprehended the choice and inspection of camps; the transportation of the wounded from the field of battle and their proper hospital accommodation and treatment; the supply of medical and general stores; the formation of convalescent camps; the organization of relief corps to proceed wherever needed and perform whatever sanitary or other helpful service was required; the special inspection of hospitals by skilled surgeons and physicians; and the establishment of a bureau of vital statistics, whose reports and investigations have added more to the existing knowledge on the subject of the sanitary conditions of warfare than was ever before published. A hospital directory contained the names of 600,000 men who passed through the military hospitals, and successfully answered 70 per cent of all inquiries made after battles, or for missing friends or relatives. Soldiers' homes, established by the commission, afforded food and shelter to as many as 2,000 soldiers per day during the four years of the war. At as many as 600 out of the 700 battles and skirmishes of the war, the commission was represented by its agents and its benefits. More than 4,500,000 meals and 1,000,000 nights' lodgings were supplied by this organization; and \$2,500,000 were collected by it of soldiers' pay. The quantity of stores supplied to the soldiers after the battle of Gettysburg is almost incredible, and the details far too numerous for statement here. The first call for funds by the commission was made June 21, 1861; and up to Mar. 28, 1862, but little more than \$50,000 had been contributed, mostly from Boston, New York, and Philadelphia. In Sept., 1862, its entire receipts had reached the sum of \$158,501. The magnificent gift by the state of California of \$100,000, made in the month last named, secured the commission from failure; and being followed within two weeks by another donation from California of the same amount, incited others to generous giving, and thenceforth there was no lack of money. Early in 1864 a series of "sanitary fairs" was undertaken in the chief cities and towns throughout the north, and these brought enormous sums to the treasury of the sanitary commission.

The following table shows the money contribution to the U. S. Sanitary Commission from all sources, June 27, 1861, to Jan. 1, 1866:

Maine.....	\$24,948 43	Canada.....	\$441 48
New Hampshire.....	21,926 84	Newfoundland.....	150 00
Vermont.....	3,521 17	Italy.....	50 00

After the war the entire collection of records, documents, correspondence, and other papers of the U. S. sanitary commission were deposited in the Astor library, New York; and some years later were formally placed in the possession of that institution, where they remain. The board of direction of the sanitary commission comprised the following gentlemen named by the medical bureau and the secretary of war: rev. Dr. Henry W. Bellows, prof. Alexander D. Bache, prof. Wolcott Gibbs, Dr. Jeffries Wyman, Dr. W. H. Van Buren, Dr. Samuel G. Howe, R. C. Wood, surgeon U. S. A.; G. W. Cullum, U. S. A.; A. E. Shiras, U. S. A. Mr. Fred. Law Olmsted filled the position of general secretary of the commission during the first two years of its history, and to his judgment, sagacity, and administrative ability may be fairly attributed much of its success.

SANITARY SCIENCE, known also under the names of PREVENTIVE MEDICINE, STATE MEDICINE, HYGIENE, and PUBLIC HEALTH, has been variously defined by different writers.* Dr. Mapother's is perhaps as good a definition as any. In the first of his *Lectures on Public Health* he describes this science as "an application of the laws of physiology and general pathology to the maintenance of the health and life of communities, by means of those agencies which are in common and constant use." This department of science received so strong an impulse, about a quarter of a century ago, from the labors of Southwood Smith, Edwin Chadwick, Lyon Playfair, and others, that many persons regard it as of modern origin; and doubtless to a great extent they are right; but on turning back to the records of early history, we almost invariably find evidence that the health of the general population was a subject of legislation. The Mosaic code of laws—the most ancient on record—contains minute directions for the cleanliness of the person, the purification of the dwelling and the camp, the selection of healthy and the avoidance of unwholesome food (pork, for example, which in hot countries is more commonly found to harbor parasites than in temperate climates, and blood, which is the most putrescible part of the animal), the seclusion of persons with contagious disorders, the regulation of sexual intercourse at certain periods, and various other points bearing on the physical well-being of the Jewish nation. The Greeks and Romans, although not, like the Jews, making hygiene a part of their religious duties, were far from neglecting it. "The laws of Lycurgus," says Dr. Gairdner, "are not wanting in very pointed enactments on sanitary matters; and the importance attached by all the Greek republics, and in the Platonic ideal polity, to physical culture, is too well known to require remark. The Roman people, poor and apparently rude as it was in its origin, yet found time amidst its military occupations to construct the *cloaca maxima* as an indestructible and stupendous memorial of its attention to the drainage and sewerage of the city at a very early period of its history. At a later period aqueducts were made to cover miles upon miles of the surrounding plain, and their splendid

* As the state of sanitary science, both in principles and practice, is substantially what it was when this exhaustive account of the subject was written by the late Dr. Day, the article has been allowed to stand without any material alteration.

ruins, still partly used for their original purpose, attest the munificence and the abundance with which the first of sanitary requisites was supplied to the imperial city."—*Public Health in Relation to Air and Water*, 1862, p. 6. Moreover, we know enough of the construction of the private houses and public buildings of the Romans to see that they recognized the necessity for free ventilation and good drainage. When the *archiatri populares*, or state-physicians, were first appointed in the Roman empire, is not certainly known. Their mode of election is described in the Theodosian and Justinian codes. There were ten of them in the largest towns, one to each district or subdivision; seven in towns of the second order, and five in the smaller ones. They collectively formed a college, whose duty it was to attend to the public health, and they may be regarded as the earliest type of our "general medical council." Gradually, however, as Christianity spread, an utter misconception of doctrine led to the neglect of all care of the human body. While the monks and friars devoted themselves to good works, feeding the hungry, clothing the naked, and instituting hospitals, they entertained no idea of the possible prevention of disease. They never attempted to impress upon their followers the importance of drainage, ventilation, pure and abundant water, etc.; but when an epidemic arose it was supposed to be a manifestation of God's special anger, and it would have been impossible to make them understand that it was the natural result of a prolonged disregard of the laws of nature. Those who have read dean Stanley's graphic *Memorials of Thomas à Becket* will be inclined to wonder whether those who adopted such penances as his could ever be free from cutaneous disorders. The state of the towns in England in the 13th c. is so clearly described by Mr. Brewer in his introduction to the *Monumenta Franciscana*, that we should have been glad to have extracted it, if our space had permitted. Those who have not access to the valuable series in which Mr. Brewer's work is included, will find a sufficient quotation from it in Dr. Gairdner's interesting volume on *Air and Water*, pp. 44–47. In another work in the same series—the *Liber Albus*, edited by Mr. Riley—much important information regarding the general sanitary state of London in the medieval times may also be found. In addition to the causes of disease indicated by these writers, such as the absence of drainage, the accumulation of filth, bad ventilation, insufficient and often unwholesome water, inattention to personal cleanliness, etc., must also be noticed the ordinary food in those times. The common vegetables of our own day, excepting the cabbage, were only slowly introduced from the time of Henry VIII. As turnips were not then used as a winter-food for oxen and sheep, these animals were with difficulty kept alive during the season when grass was scanty, and were therefore killed and salted in the beginning of the cold weather; and during several months, game and river-fish were the only kinds of fresh animal food. Macaulay, in his celebrated third chapter on "The State of England in 1685," observes that, at that time, meat, although cheaper than in former times, was still so dear that hundreds of thousands of families scarcely knew the taste of it; that bread such as is now given to the inmates of work-houses was then seldom seen even on the trencher of a yeoman or of a shopkeeper; and that the great majority of the natives lived almost entirely on rye, barley, and oats. Many important facts of a similar nature are also recorded in Freude's *History of England*.

During the 18th c. many important steps were taken for the improvement of the public health. Under a proper system of drainage, ague became eradicated from extensive fenny districts; and with a knowledge of the therapeutic properties of cinchona bark and arsenic, we can cut short the disease when it appears. Scurvy* was all but blotted out of the list of diseases that proved most fatal to our sailors; and vaccination, incomparably the greatest discovery yet made in this department of science, was the crowning achievement of the century.† The first outbreak of cholera in this country in 1832, lamentable as it was in itself, was productive of much benefit in directing the public mind to the all-important subject of the prevention or repression of disease. It was impossible to ignore the fact that, while the poor, dwelling in unventilated and undrained hovels, fell victims to this new and ill-understood disease in thousands, the middle and higher classes were comparatively safe. All investigations into the dwellings and domestic habits of the lowest class of the population revealed a condition of things of which the general public had no conception. A new poor-law was consequently passed in 1834, and a commission was appointed to investigate and report upon its working. The *Report on the Sanitary Condition of the Laboring Population of Great Britain*, published in 1842, and mainly treating of the sanitary state of the poor and of the character of their dwellings, may be regarded, as prof. Gairdner‡ well observes, as "the true starting-point of modern sanitary legislation." A "health of towns commission," which was soon after appointed, gave in two valuable reports in 1844 and 1845; and subsequently a metropolitan sanitary commission published reports in the years 1847 and 1848. These reports will form a lasting memorial of the labor

* We regret to state that during the last few years scurvy is again becoming prevalent in the mercantile service, and occasionally among navvies engaged at places where good food was not easily attainable. In both cases, it may always be traced to neglect of due dietetic precautions.

† And yet, in consequence of vaccination being either neglected or imperfectly performed, no less than 51,093 persons died in Great Britain from small-pox in the ten years, 1856–65. In the year 1864 alone, the deaths were 9,125. On this subject, see sir James Y. Simpson's "Proposal to stamp out Small-pox, etc.," in the *Medical Times and Gazette* for Jan. 4, 1868.

‡ *Public Health in Relation to Air and Water*, p. 17.

of Mr. Chadwick and his able co-operators. Nor, in this rapid glance at the history of sanitary science, can the name of Dr. William Farr be omitted, who—again to quote Dr. Gairdner's words—"found the facts of this science in a state of almost hopeless and aimless confusion, and has not only added immensely to their number and value, but has brought into them light, harmony, order, and, for the first time in the history of the science, a determinate method, and an approach to scientific exactness." By his system of calculating death-rates he has placed an easy and useful method at the service of his professional brethren, while, by the formation of life-tables, he has greatly facilitated the operations of life-assurance.

We now pass on to the consideration of the most important sanitary agents, beginning with Air. Under this head we have to consider (1) the amount of air necessary for the full performance of the respiratory process; (2) the means of ascertaining when air is impure, or, if impure, what substances are mixed with it; (3) the means of purifying contaminated air; and (4) the diseases due to deficiency in the quantity, and alterations in the quality of the air.

(1) The first question can be answered both by calculation and experiment. By calculation, Dr. Parkes finds that 2,082 cubic ft. of air must be supplied per head per hour, so to dilute the products of respiration and transpiration from the sound body, as to keep the air always pure and fresh (see his *Manual of Practical Hygiene*, 1864, p. 65). From numerous experiments in which the outflow of air was measured, and the carbonic acid simultaneously determined, he found that at least 2,000 cubic ft. per hour must be given to keep the carbonic acid at its normal level of .5 or .3 in 1000 volumes, and to remove the *odor humanus* or fetid smell of animal matter. Gen. Morin, in his *Rapport de la Commission sur le Chauffage et la Ventilation des Bâtimens du Palais de Justice*, 1860, gives results in close accordance with those of Parkes, assigning the following as the relative hourly amounts of fresh air (expressed in cubic feet) per head in temperate climates: in barracks, at 1059 by day, and 2,118 by night; in workshops, prisons, and theaters, 2,118; in schools, 1059; and in hospitals, 2,825, increased to 4,236 during the hours of dressing the surgical cases, and 5,650 during epidemics.* In mines, if it is wished to keep up the greatest energies of the men, 6,000 ft. of air per hour must be allowed. It may be incidentally mentioned that a horse requires 2,460 ft. per hour at the least. It is difficult to lay down any rules regarding the amount of fresh air required in sickness. The vitiation of the air by the products of combustion of gas, candles, lamps, etc., must not be overlooked. For every cubic foot of gas that is burned, 1800 cubic ft. of air are required to keep the air pure, unless the gaseous products are carried off in a special channel, such as is now frequently attached to gas-fittings. A pound of oil burned in a lamp may be regarded as equivalent to 10 cubic ft. of gas, so far as the deterioration of the air is concerned. (For these facts we are indebted to Dr. Parkes.)

(2) The composition of pure air is sufficiently described in ATMOSPHERE. The impurities in air may be divided into: (a) suspended matters, (b) gaseous substances, and (c) special impurities. Amongst *suspended matters* are, according to Pasteur and others, numerous and universal germs of organic beings, both animal and vegetable, as of vibriones, bacteria, and monads; pollen, spores of fungi, mycodermis, mucodones, etc. Minute particles of finely comminuted inorganic matter are also often taken up by currents of air, and remain in suspension. These are probably altogether harmless. The works of man more seriously affect the air in a hygienic point of view. Particles of coal and of half-burned carbon (smuts), starch-cells (from bakeries and bread), and, when certain trades are carried on, cotton fibers, hairy particles of wool, of stone, of iron, etc., may, when constantly inhaled, give rise to the production of special diseases of the lungs and stomach. In the air of badly-kept hospital wards, pus-cells and epithelial cells are often to be detected. Most physicians now believe that the specific poisons of small-pox, scarlet fever, and measles, which are derived from the skin and mucous membrane, consist of molecular organic matter, which, although as yet undetected, must pass into the air; and the same remark applies to the so-called germs of typhoid fever (see the article on TYPHUS AND TYPHOID FEVERS) and cholera, which are thrown off by the intestinal mucous membrane, and subsequently become dried and capable of aerial suspension. Amongst *gaseous matters*, which merely pass into the atmosphere either from natural causes or manufactories, are various compounds of carbon, sulphur, chlorine, nitrogen, and phosphorus, with oxygen and hydrogen, which it is unnecessary here to enumerate. Besides the gases formed by the union of the above-named elements, we must notice organic vapor from decomposing animal matters and sewers, which last has been found by Odling to be carbo-ammoniacal. Amongst *special impurities*, those caused by respiration are the most important. An adult man, under ordinary conditions, gives off, in 24 hours, from 12 to 16 cubic ft. of carbonic acid by the lungs, and a certain additional quantity, not determined, by the skin. Watery vapor, ranging from 25 to 40 ounces, also passes off daily from the skin and lungs, together with an undetermined quantity of organic matter, which is partly suspended (as particles of epithelium, etc.), and partly made up of organic vapor. This vapor, when collected and condensed from a large volume of respired air, is found to

* The older observers fixed the necessary quantity of fresh air far too low: Peccet thought 212 ft. sufficient; Arago, 353 ft.; and Dr. Reid, 690 ft. per hour.

be nitrogenous, and has a very fetid smell. Here there is a most powerful source of vitiation, regarding which numerous chemical analyses have been made; for details regarding which we may refer to Parkes, *op. cit.* pp. 70-77; Gairdner, *op. cit.* p. 69; and Mapother's *Lectures on Public Health*, 2d ed., pp. 40-61. There is a condition of the atmosphere to which various observers, and especially Pasteur, have directed attention, which requires a passing remark. It is what may be termed the fermentative condition, and depends upon the universal presence in the air of countless germs of vegetables and infusoria. It is possible that this atmospheric condition may be concerned in some of the zymotic diseases. Dr. Salisbury, an American physician, endeavors to show that the poison of measles is due to a fungus which grows on rotten straw; another American physician, Dr. Flint, "has almost fully demonstrated that the spores of palmella cause ague."—Mapother, *op. cit.*, p. 441, etc. The presence of a *cholera-fungus*, which has been recently proved to exist in the evacuations of all cholera patients, gives, as will be seen from Mr. Simon's report of the Weimar conference,* a hint as to the probable cause of that disease. Bearing on the same subject is the fact, lately noticed by Davaine, that the splenic apoplexy of sheep is owing to the presence of bacteria in the blood, and that sheep, rabbits, and horses can be inoculated by transferring into their circulation the bacteria, which are extremely thin rod-like organisms, varying in length from $\frac{1}{1000}$ to $\frac{1}{2000}$ of an inch. The same observer has just found (as we learn from the "Parisian Medical Intelligence," in the *Lancet* for Jan. 4, 1868) that bacteria are to be found in all carbuncular diseases of any form whatever; that the supervention of these little beings in the spleen, the lungs, and the blood precedes the occurrence of morbid phenomena; and that the carbuncular blood ceases to be contagious as soon as the bacteria have disappeared; and hence he feels justified in regarding them as the cause of carbuncle. Another French observer, M. Poulet, has just detected myriads of infusoria (*monas termo* and others) in the breath exhaled in whooping-cough. If one contagious disease can be proved to be connected with the germs occurring in the air, it is almost a certainty that similar diseases must arise from corresponding causes.

(3) The natural means of purifying the atmosphere are diffusion, oxidation, the action of winds, and the fall of rain. In cases where the air is specially impure, as in sick-rooms where there are contagious cases, the agents commonly known as *disinfectants* (q.v.), or *deodorants*, are employed. Amongst the *solids* of this class are charcoal (see WOOD-CHARCOAL), dried earth, and the carbonates of lime and magnesia. Amongst the *liquids*, those in highest reputation are *Condy's fluid* (consisting of an alkaline permanganate, which at once decomposes ammoniacal compounds, and destroys organic matter rapidly) and carbolic acid: whilst amongst the *gases* or *vapors*—which are the most powerful means of purifying the atmosphere, next to ventilation—may be especially mentioned chlorine, nitrous acid, and sulphurous acid; of these, says Dr. Parkes, the nitrous acid is probably the most powerful, but it is useful to employ all three alternately, or even together. It must be recollected that all these agents are mere auxiliaries to ventilation, the primary importance of which must never be forgotten.

(4) Abundant experience confirms the view which might have been *a priori* inferred from the study of the physiology of respiration (q.v.), that the breathing of impure air must be incompatible with perfect health. The special impurities which are worthy of notice as being causes of disease, or of an impaired state of health, are arranged by Dr. Parkes as follows: (a) Suspended matters; (b) Gaseous matters; (c) Impurities from several substances always co-existing.

(a) *The suspended matters* which are known to occasion disease in various trades are very numerous. Thackrah, in his well-known work on *The Effects of Arts, Trades, and Professions on Health*, published in 1832, gives the following list of workmen who were injuriously affected by the dust of their trades: Corn-millers, maltsters, tea-men, coffee-roasters, snuff-makers, paper-makers, flock-dressers, feather-dressers, shoddy-grinders, weavers of coverlets, weavers of harding, dressers of hair, hatters employed in the bowing department, dressers of colored leather, workers in flax, dressers of hemp, some workers in wood, ware-grinders, masons, colliers, iron-miners, lead-miners, grinders of metals, file-cutters, machine-makers, makers of fire-arms, and button-makers. To this list must be added colliers, who suffer from lung-disease in ill-ventilated mines; potters, especially the class called *flat-pressers*, in whom emphysema is so common that it is known as "the potters' asthma;" the china-scourers, who all, sooner or later, become asthmatical from inhaling the light flint-dust in suspension; pearl button-makers and pin-pointers, who suffer from bronchitis and hemoptysis; the makers of grinding-stones; the makers of Portland cement, etc. In some trades irritant vapors are more or less associated with suspended particles in causing disease. Brass-founders suffer not only from bronchitis and asthma from the inhaled dust, but also a special disease, described by Dr. Greenhow (in the *Proceedings of the Medico-Chirurg. Soc.* vol. 4) as brass-founders' ague, which is apparently produced by the inhalation of the fumes of oxide of zinc; the symptoms being oppression of the chest, with indefinite nervous sensations, followed by shivering, a hot stage, and profuse sweating. Copper-smiths and tin-plate workers are liable to somewhat similar attacks. Plumbers, house-painters, manufacturers of

* Ninth Report of the Medical Officer of the Privy Council (1866), pages 29 and 515.

* It may interest some of our readers to know that by washing the cavity of the mouth with a very weak solution of Condy's fluid, the odor of tobacco is instantly removed.

white-lead, etc., are, as is well known, liable to lead poisoning. The peculiar affection to which workers in mercury and its amalgams, as silverers and water-gilders, are exposed, is described in the article PARALYSIS, under the name of *mercurial tremor*, or *the trembles*. In the various trades in which arsenical compounds are employed, as in making artificial flowers, green paper for walls, etc., preparing arsenical pigments, etc., the well-known symptoms of chronic arsenical poisoning are likely to ensue. On the subject, Dr. Guy has, at the request of government, drawn up an elaborate report.

Passing from inorganic or unorganized matter to organic substances floating in the atmosphere, and giving rise to a large class of important diseases, we may remark that it still remains to be decided in what exact condition this organic matter exists—whether it is in the form of impalpable particles, or moist or dry epithelial or puss cells; “and whether it is always contained in the substances discharged or thrown off from the body (as is certainly the case in small-pox), or is produced by putrefactive changes in these discharges, as is supposed to be the case in cholera and dysentery, is also a matter of doubt. But, from the way in which, in many cases, the organic substance is absorbed by hygroscopic substances, it appears that it is often combined, or at any rate condensed, with the water of the atmosphere.”—Parkes, *op. cit.*, p. 86. This much is known with certainty regarding the specific poisons—viz., that they differ extremely in the readiness with which they are oxidized and rendered harmless. While typhus and oriental plague throw off a poison, which, if there is due ventilation is readily destroyed, the poisons of small-pox and scarlatina spread in defiance of free ventilation, and retain their virulence for weeks or months.

(b) The most important *gaseous matters* in the air likely to produce diseases are *carbonic acid* and *carbonic oxide*. The normal quantity of carbonic acid in the air being regarded as .5 in 1000 volumes, “it produces fatal results when the amount reaches 50 per 1000 volumes; and at an amount much below this, 15 or 20 per 1000, it produces in some persons, at any rate, severe headache.” Dr. de Chaumont, assistant professor of hygiene at Netley, has published a valuable paper in the *Lancet* for Sept., 1866, in which he shows how the amount of air necessary to reduce the carbonic acid of respiration to a given standard could be calculated; and in the *Edinburgh Medical Journal* for May 1867, he has given extended formula for calculating most of the problems connected with ventilation. Amongst the most important of his conclusions are the following: (1) We cannot safely accept a lower standard of purity than .06 per cent of carbonic acid. (2) Uniform diffusion being supposed, we cannot preserve this standard with a less delivery of fresh air than 3,000 cubic ft. per head per hour. (3) We must provide an air space which will admit of the delivery of 3,000 cubic ft. per head, and at the same time preclude the necessity of changing the whole air so often as six times per hour, for which condition a minimum of 1000 cubic ft. is absolutely necessary.* *Carbonic oxide* (q.v.), which is often developed in association with carbonic acid, is far more actively poisonous than carbonic acid. An atmosphere containing $\frac{1}{2}$ per cent killed small birds in three minutes; and when 1 per cent was present they died in half this time (Lethely). For the effect of other gaseous matters, as sulphureted hydrogen, carbureted hydrogen, sulphurous acid gas, hydrochloric acid gas, etc. we must refer to any of the more elaborate works on this subject.

(c) The *impurities from several co-existing agents* next claim attention. In point of fact, these are the impurities with which we have practically almost always to deal, and it is very probable that a knowledge of the actions of two or more isolated noxious agents might lead us to very incorrect conclusions regarding the composite effect that is actually produced. When air is vitiated by respiration, it is popularly believed that the carbonic acid gas is the chief poisonous agent; and that the fatality in such well-known cases as the Black Hole (q.v.) of Calcutta, the prison in which the Austrians were placed after the battle of Austerlitz, the steamer *Londonderry*, etc., is simply due to the action of this gas. The true poisonous agencies in these instances are the organic matter, which is always found in air rendered fetid by the prolonged respiration and cutaneous exhalation of a crowd of human beings, and the deficiency of the oxidation, and the consequent increase of putrescent matter in the body (see Carpenter's *Human Physiology*, 1864, p. 304). Putting aside these extreme cases, which are of rare occurrence, we have abundant evidence in the reports of the Health of Towns commission, and elsewhere, that the continuous inhalation of an atmosphere moderately vitiated from respiration has an injurious effect on the health. The aeration of the blood is imperfectly effected, and the nutrition generally is more or less interfered with. Although impure air has long been vaguely regarded as a cause of phthisis, it is only during the present century that the fact has been placed on unquestionable authority. It may now be regarded as established that not only phthisis but other lung-diseases may have their origin in breathing an atmosphere contaminated by respiration. The subject is one of such vital importance that we shall adduce the very strong evidence of Dr. Parkes, who most distinctly proves that the prevalence of phthisis among our troops is in a direct ratio to the impurity of

* A committee, of which sir T. Watson was president, recently appointed by the poor-law board to consider the question of the amount of cubic space necessary for the sick in work-house infirmaries, report that for ordinary patients 850, for offensive cases 1300, and for fever patients 2,000 cubic feet should be allowed. Although these spaces are greater than we find in most work-houses, it is obvious from the statements in the text that they are not sufficient.

the air in the barracks. "A great amount of phthisis used to prevail," he observes, "in the most varied stations of the army, and in the most beautiful climates: in Gibraltar, Malta, Ionia, Jamaica, Trinidad, Bermuda, etc., in all which places the only common condition was the vitiated atmosphere which our barrack-system everywhere produced. And, as if to clench the argument, there has been of late years a most decided decline in phthisical cases in these stations, while the only circumstance which has notably changed in the time has been the condition of the air. So also the extraordinary amount of consumption which prevails in the men of the royal and merchant navies, and which, in some men-of-war, has amounted to a veritable epidemic, is in all probability attributable to the faulty ventilation."—*Op. cit.*, pp. 91, 92. A considerable amount of evidence in support of this view is afforded by comparative pathology. The extraordinary mortality of phthisis among the inhabitants of the old monkey-house in the zoological gardens was found to be due to overcrowding and bad ventilation; and now, in their present airy residence, the inhabitants are no longer prematurely cut off. The overcrowding to which cows in large towns are subjected leads to the great amount of pulmonary disease among these animals; while horses, which in the worst stables have more free air than cows, rarely suffer. Not only are pulmonary affections induced by the prolonged respiration of air partially vitiated by organic exhalations, but such an atmosphere seems to favor the spread of several well-known specific diseases, as typhus, plague, small-pox, scarlatina, and measles.

Hitherto we have simply considered the effect of breathing an atmosphere vitiated by the exhalations given off by persons in ordinary health; if we now pass to the consideration of the air of a crowded hospital-ward, we shall find the organic matter not only more abundant, but at the same time far more noxious. The convalescence of patients is much retarded by their being kept in such an atmosphere (see CONVALESCENT HOSPITALS). When the air has absorbed a certain amount of organic impurity, its respiration is very liable to give rise to erysipelas and hospital gangrene. *Sewers* and old cess-pools, when opened, give off *sewage-gas* containing carbonic acid, sulphureted hydrogen, sulphide of ammonium, and putrid organic vapor. A case is given in the first volume of the *Health of Towns Report*, which forcibly illustrates this fact. When a privy connected with a school at Clapham was cleaned out, 23 of the children were seized with violent vomiting and purging, headache, great prostration, and convulsive muscular twitchings; and two of them died within 24 hours. Sewer-men are more liable to typhoid and typhus fever than other persons; but night-men and scavengers do not seem liable to any special disease. The effect of diluted sewer-gas from bad drainage on the health of the population at large, is a distinct question, into which we have not space to enter, further than to remark that typhoid and diarrhæa are commonly induced by the escape of this gas through our drains and water-closets into our houses. The effects of the impurities arising from manufactories of various kinds are of course extremely varied; and the subject is so extensive a one that it must be touched upon very briefly. Sulphurous and sulphuric acid are given off from vitriol and copper-smelting works; hydrochloric acid from alkali-works; arsenical fumes and sulphurous acid from copper and lead smelting furnaces; carbonic acid and carbonic oxide from cement-works, etc. Soap and candle manufactories, if not well superintended, yield various gases of a rancid smell, and even that powerful irritant, acrolein. Gas-works in which the wet-lime process of purification is adopted, often evolve sulphureted hydrogen to such a degree as to become a nuisance injurious to health. Manure-works usually evolve more or less disgusting smells according to the basis operated on and the mode of preparation. No bad effect on the health has, so far as we know, been observed in this country from the gases given off by such works, and the exhalations from the manufactories of *poudrette*, which is dry fecal matter, are positively declared, by several of the highest French authorities, to exercise no injurious action either on man or vegetation; but the eminent French hygienist, Parent Duchâtelet, relates two cases in which *poudrette* underwent fermentation on board ship; and in one of these cases the vessel lost half her crew (number not stated); while in the other, all on board (five) suffered from intense headache, pain in the limbs, vomiting, prostration, and (in two cases) diarrhæa. The *air of old graveyards*, when they are disturbed, often gives rise to epidemics of fever; but the effect of the effluvia of comparatively recent putrefying human bodies is much more decided. Numerous cases are recorded of asphyxia and various forms of fever arising from the exhumation and disturbance of bodies. How far the effluvia arising from *slaughter-houses* and *knackeries* are injurious to health is an open question. There is very strong general evidence that the men employed at Montfaucon (where, however, the ventilation is excellent, and no putrid matters are allowed to remain) enjoy good health; and Tardieu, from a late re-examination of the point, confirms the old conclusion, except so far as glands and malignant pustule are concerned. The danger of breathing the *air of marshes* also requires notice. Malaria seems not only to occasion intermittent and remittent fevers, but diarrhæa and pure dysentery. Organic matter to the amount of eight grains has been obtained from 1000 cubic feet of air collected over marshes; and it is worthy of notice that it has just the same chemical characters as the organic matter exhaled from the lungs, turning red with nitrate of silver, yielding ammonia when treated with lime, and blackening sulphuric acid when drawn through it. See Mapother, *op. cit.*, p. 87.

The next point to be considered is the means to be adopted for continually changing the air, so as to keep it in its natural purity. We have already shown that this change must amount to at least 2,000 cubic ft. per head per hour for persons in health; and sometimes double that amount, or more, for sick persons. The general principles of ventilation having been treated in the article on WARMING AND VENTILATION, we shall confine ourselves here to a few supplementary observations. In whatever way the fresh air is supplied there are several essential conditions to be observed, of which the following, as stated by Dr. Parkes, deserve special notice; (1) "The *entering air* must itself be pure. It must be warmed if too cold, and cooled if too warm. (2) Its movement should be imperceptible, otherwise it will cause the sensation of draught, and will chill. The rate at which the movement becomes imperceptible is $1\frac{1}{2}$ ft. per second, or 1.36 m. per hour; 2 and $2\frac{1}{2}$ ft. per second, or 1.4 and 1.7 m. per hour, are imperceptible to some persons; 3 ft. per second, or 2 m. per hour, is perceptible to most; $3\frac{1}{2}$ ft. is perceived by all persons. Any greater speed than this will give the sensation of draught, especially if the entering air be of a different temperature, or moist. (3) It must be well diffused all through the room, so that in every part a movement shall be going on—in other words, the distribution must be perfect. (4) The *outgoing air* must be removed so immediately that there shall be no risk of a person breathing again either his own expired air or that of any other person."—*Op. cit.*, p. 103. The *action of the wind* is a powerful ventilating agent. If it can pass freely through a room with open doors and windows it changes the air to an extent that can be effected in no other way. The most serious objection to winds as ventilating agents by perfilation is the uncertainty of their movement, and the difficulty of its regulation. When the velocity reaches 4 m. it is found unpleasant by most people, and is, therefore, either excluded, or only admitted through small openings, when it fails to become properly distributed. For the various ways in which the perflative power of the wind has been employed in systems of ventilation, we must refer to Ritchie's *Treatise on Ventilation*, 1862; Tomlinson's *Treatise on Warming and Ventilation*; and to the chapter on that subject by Dr. Parkes, who gives a diagram illustrating the mode in which Dr. Arnott has most successfully ventilated the Field Lane ragged schools. In the ventilation of ships the wind is always used, the air being directed between decks and into the hold by means of wind-sails or tubes with cowls turning toward the wind. A description of Dr. Edmond's plan of ventilation, which is now commonly used in emigrant-ships, and is being adopted in the royal navy, is given in a recent article in *The Lancet*, on "The Medical Aspects of the Abyssinian Expedition." "In all cases," says Dr. Parkes, "in which the air of a room—as in a basement story or in the hold of a ship, perhaps—is likely to be *colder* than the external air, and where artificial means of ventilation cannot be employed, the wind should be taken advantage of as motive agent." In artificial ventilation by a fan or screw it is a question which of the two methods should be employed—the method of *extraction*, in which the air is drawn out of a building or room; or the method of *propulsion*, in which air is driven in, so as to force out the air already in the room. Both plans have advocates of authority. The advantages of the method of propulsion are its certainty and the ease with which the amount may be altered. The stream of air can be taken from any direction, and can be washed, cooled, or warmed at pleasure. The fan or wheel commonly used in propulsion is essentially that proposed by Desaguliers in 1734. The following is the way in which it is applied to one of the largest rooms in this country—St. George's hall, at Liverpool. The air is taken from the basement; is washed by being drawn through a thin film of water thrown up by a fountain; is passed (in cold weather) into vessels for the purpose of warming it, in which it can be moistened by a steam-jet, if the difference of the dry and wet bulb be more than five degrees, and is then propelled along the channels which distribute it to the hall. In summer it is cooled in the conduits by the evaporation of water. This system is employed with success in various hospitals, asylums, etc., in France and America; and during the Crimean war Mr. Brunel introduced into the hospital of Renkioi a wheel of Desaguliers' at the entrance of each ward of 50 beds, which was worked by hand, and could throw 1000 cubic ft. of air into the ward every minute.

For information regarding the best means of keeping the air of rooms at the most fitting temperature we must refer to the article WARMING. The degree of artificial warmth that should be given to the air varies according to circumstances. Healthy adults, who are well fed and clothed, usually find any temperature from 50° to 60° comfortable; while children and aged persons require a temperature of 65° to 70° . In hospitals the proper temperature is usually supposed to be about 60° ; but in those diseases in which there is preternatural heat, except possibly in scarlatina, a lower temperature—as from 50° to 45° , or even 40° —is more expedient. In most febrile cases, in the acute stage, cold air moving over the body is very efficacious as a cooling agent.

The next sanitary element to be considered is WATER. The *daily quantity* of water for healthy and sick persons is the first point for consideration. Water is required by healthy persons (1) *for drinking*. A man weighing 10 stone will take on an average from 70 to 90 oz. of water in 24 hours, of which 30 or 40 oz. are taken imperceptibly in the solid food, while the remaining 50 or 60 oz. are taken in a liquid form. But the amount varies extremely. The usual allowance on board ship for both drinking and cooking is 8 pints per adult daily. (2) *For cleansing the person, clothes, and habitations*. Dr. Parkes

estimates 4 gallons per head daily as the smallest amount; and if perfect cleanliness is to be secured, and baths* are taken, at least 16 gallons per head are required. (3) *For sewage* an additional 9 gallons must be added. The amount for a water-closet varies with its construction. At Netley hospital, to which Dr. Parkes is physician, Jennings's closets are used, which require 10 gallons per head daily.

It may be of importance to many of our readers to know that a horse drinks from 8 to 12 gallons daily, and ought to have 3 or 4 more for grooming purposes; a cow or small ox drinks from 6 to 8 gallons; and a sheep or pig from 2 quarts to 1 gallon.

The different sources of water—rain-water, rivers, and springs; the chief impurities in these waters; the methods of detecting them; and the modes of purifying bad water, are so fully described in the article WATER-SUPPLY, that we have scarcely anything to add on these points. The organic matters in different waters used for drinking purposes require, however, a few additional remarks, on account of their extreme importance in a hygienic point of view. To the remarks on this subject in pp. 100-101 of vol. ix., we may add that their amount varies from 0.3 per gallon to as much as 12 or even 30 grains per gallon, the purest waters in this respect being those from granitic, or clay-slate, or chalk districts. The most common organic matter is derived from the vegetable kingdom, and consists of humin and ulmin, and of acids derived from humus; all which substances are non-nitrogenous, although the acids combine readily with ammonia. This form of organic matter is far less dangerous than that which has an animal origin, and contains nitrogen. This organic matter is usually derived from the contents of cess-pools or sewers percolating into springs. Its exact composition is not known. Fecal and biliary matters doubtless contribute to the composition of this matter; and in addition, decomposed flesh, as the refuse of butchers' shops and slaughter-houses—substances from tripe-manufactories and gut-spinners, from size, horn, and isinglass manufactories, etc., often contribute to the organic matter of well and spring water. See Parkes *op. cit.*, p. 12. Most of these substances, in decomposing, produce both nitrous and nitric acid and ammonia; and the nitrites and nitrates thus formed unfortunately not only do not communicate any bad taste or smell to the water, but actually tend in many cases to render it especially palatable. The use of water of this kind is liable to produce diarrhea and choleraic symptoms.

The characters of good drinking-water—as laid down after much discussion by various sanitary congresses—are summed up by Dr. Parkes as follows: "It must be transparent, colorless, without odor, and tasteless; it should be well aerated (as it then appears to be more easily absorbed), cool, and pleasant to drink; it must have no deposit; vegetables should be readily cooked in it; the total dissolved constituents must be within a certain amount, which, with some limitation, may be represented by the following numbers: organic matter should not exceed 1.5 grains per gallon; carbonate of lime, 16 grains; sulphate of lime, 3 grains; carbonate and sulphate of magnesia, 3 grains; chloride of sodium, 10 grains; carbonate of soda, 20 grains; sulphate of soda, 6 grains; and iron, 0.5 of a grain."

For details regarding the mode of examining water with the view of ascertaining its value for drinking purposes, we must refer to any of the leading works on practical and analytical chemistry, and an especial reference may be made to prof. Miller's recent memoir on portable water, and to Dr. Parkes's section on the examination of water. To the substances named in the article on WATER-SUPPLY, as purifying water from organic matter, we may add the following: (1) *Potassium permanganate* of potash, commonly known as Condy's fluid, which decomposes organic matter and ammoniacal compounds by rapid oxidation. A physician who has had long experience on board Australian emigrant-ships informs us that he has often added a small quantity to the water which, when drawn from the casks, was almost undrinkable, with the effect of at once rendering it totally inoffensive. (On this subject, Condy's *Air and Water, their Impurities and Purification*, may be read with advantage.) (2) *Strychnos potatorum*, which is used in India to purify water; the nut being rubbed on the inside of the casks. (3) Certain vegetables containing tannin, as tea,† kino, the laurier rose (in Barbary), and bitter almonds (in Egypt).

The consequences of an insufficient and impure supply of water are deserving of the most serious consideration. The Reports of the Health of Towns Commission (1844 and 1845) contain much information on the first of the subjects; while the Reports of the Medical Officer of the Privy Council abound in facts relating to the second subject. We find that an insufficient supply leads to the person and clothes not being washed at all, or being repeatedly washed in the same water; to water for cooking being repeatedly used; to imperfect cleansing of houses and streets; to the sewers becoming clogged, and the air thus rendered impure. The natural result is—as in the case of a deficiency of pure air—a depressed condition of the general health, with a tendency to skin-diseases, ophthalmia, etc.; while the imperfect cleansing of the sewers favors the spread of typhoid fever and of choleraic diarrhea. We are indebted more perhaps to Mr. Simon's valuable

* A general bath requires about 50 gallons; a shower-bath at least 6 gallons; and a hip-bath from 12 to 18 gallons.

† The water of the Pelho and other rivers in the north of China is so impure and has so offensive a smell during winter, that the Chinese never drink it except as tea, when it seems to lose all its bad effects. It is only by using their "brick-tea" to purify the water of the steppes, that the Tartars render the water drinkable.

reports than to any other source for the knowledge that a continually increasing class of cases is found to be connected with the use of impure water, the principal noxious ingredients being animal organic matter, especially when of fecal origin; vegetable organic matters, when derived from marshes; and some salts, except when in very small quantities, as sulphates of lime and magnesia, chlorides of calcium and magnesium, nitrates and nitrites of ammonia, etc. The *alimentary mucous membrane* is especially liable, he supposes, to be affected by impure water. Thus, dyspepsia, with such symptoms as partial loss of appetite, uneasiness or pain in the pit of the stomach, nausea and constipation, with occasional diarrhœa, may be caused by water containing certain quantities (probably about eight grains each per gallon) of sulphate of lime, chloride of calcium, and the magnesian salts. *Diarrhœa* may be caused by the use of many of the great North American rivers, the Ganges, etc., where much clay is held in suspension. Water contaminated with sewage, and containing suspended animal and especially fecal matter, is a common cause of an outbreak of this affection and even of choleric symptoms. Dissolved animal organic matters doubtless have a similar effect, but it is difficult to distinguish between the actions of these and of suspended organic matters. Among other impurities known to occasion diarrhœa are fetid gases (sulphureted hydrogen), an excess of dissolved mineral matters and nitrate of lime; and on most persons, brackish water acts similarly. The effects which the selenitic well-waters of Paris exert on strangers are well known. There is abundant evidence to show that impure water is one of the principal causes of *dysentery*. The records of our army surgeons abound in illustrative cases. The deleterious effect of the impure water of Calcutta in inducing dysentery has been forcibly pointed out by Dr. Chevers in the *Indian Annals* for 1864.

In addition to the diseases affecting the alimentary mucous membrane of the intestines, there are certain *specific diseases* which result from the use of impure water, as *malarious fevers* of various forms, from the use of the water of marshes; *typhoid fever*, from water contaminated with sewage matters, or the special typhoid poison; *cholera*, from water into which cholera-evaluations have made their way; and possibly *yellow fever*. (The relation of impure water to typhoid fever and cholera will be more fully noticed in a later part of this article.) To the use of water unfit for drinking purposes are also ascribed epidemic boils from the presence of sulphureted hydrogen; disease of the bones, as exostosis, from an excess of carbonate and sulphate of lime; calculi (on, we think, insufficient evidence); goiter, from water derived from limestone and magnesian rocks; and entozoa of various kinds. Dr. Parkes sums up the department of his *Manual* which treats of water in a hygienic point of view with the following practical conclusions: "(1) An endemic of diarrhœa in a community is almost always owing either to impure air, impure water, or bad food. If it affects a number of persons suddenly, it is probably owing to one of the two last causes; and if it extends over many families, almost certainly to water. (2) Diarrhœa or dysentery constantly affecting a community, or returning periodically at certain times of the year, is far more likely to be produced by bad water than by any other cause. (3) A very sudden and localized outbreak of either typhoid fever or cholera is almost certainly owing to the introduction of the poison by water; and the same fact holds good in cases of malarious fever. (4) The presence of lumbrici, guinea-worm, or *bothriocephalus latus*, should always excite suspicion of the drinking and bathing water."—*Op. cit.*, p. 63.

After the two most important factors in relation to health, viz., air and water, *Soil*, and *CLIMATE* occupy a secondary, although by no means unimportant place. As their practical bearing is less direct and universal, we will dismiss them briefly. *Soil* may affect health (1) by its conformation and elevation. Thus, among hills, the healthy spots are inclosed valleys, where the air must stagnate, and ravines. On plains, the most dangerous spots are at the foot of hills which store up water, unless a ravine cuts off the drainage. (2) Vegetation exerts an important influence. If we regard vegetation as divisible into herbage, brushwood, and trees, it may be laid down as a general rule, that herbage is always healthy, and in the tropics, is of great importance in cooling the ground, both by obstructing the sun's rays and by aiding evaporation; that brushwood is almost always bad, but that its removal may cause a temporary increase of malarious disease, on account of the disturbance of the soil; and that trees should seldom be removed, unless they decidedly interfere with the movement of the air, for in cold countries they shelter from cold winds—in hot, they cool the ground—and in both they may afford protection from malarious currents. The present condition of St. Thomas in the West Indies, which is now one of the most pestilential sites we are acquainted with, is mainly due to the insane destruction of its trees. The island of Mauritius, which has lately been visited by one of the most universal and destructive forms of fever ever recorded, has similarly suffered from the same cause. (3) The mechanical structure of the soil is of hygienic importance in various points of view. Thus, *heat* is very differently absorbed by different soils under the same conditions of exposure. Assuming that the sand with a little lime has the maximum power of retaining heat, and that its capacity be represented by 100, then the capacity of clay will range from 76.9 to 66.7; while that of chalk will be 61.8, and that of humus as low as 49. Hence we see the comparative coldness of the latter soils as compared with sand. The capacities of these soils for absorbing and retaining moisture are in the reverse order.

As a general rule, there seems to be the following connection between the geological

characters of a site and its probable healthiness. *Granitic, metamorphic, and trap rocks* are usually healthy; there is generally a slope, so that water runs off readily, the air is dry, vegetation is moderate, and drinking-water generally good. They are, however, supposed to be unhealthy when they have become disintegrated, as at Hong-Kong, into a dark-colored soil. *Clay-slate rocks* are regarded as healthy, for very similar reasons; water, however, is often scarce. Of the varieties of *limestone rocks*, the hard oolite is the best, and the magnesian (which, if possible, should always be rejected as a site) the worst. *Chalk*, when unmixed with clay, forms a very healthy soil; but if it be mixed with clay, it loses its permeability, and is often damp and cold. The air is pure, and the water, though hard, is clear, sparkling, and pleasant. The *sandstones*, if permeable, are healthy; but if, from an admixture or underlying of clay, they lose this property, they are often damp. The water must be carefully examined. The hard millstone grits are very healthy. *Gravels* of any depth are healthy, except water rises through them. Dr. Parkes considers gravel-hillocks as the healthiest of all sites, and the water as being very pure. *Clay, dense marls, and alluvial soils* must be regarded with suspicion. Such soils, and especially the deltas of rivers, should, if possible, be avoided as sites, and if they must be chosen, thorough subsoil draining, careful purification of the water, and elevation of the houses far above the soil, are the measures to be adopted. According to Dr. Forbes Watson, nearly one-third of the whole surface of India is covered by alluvial soil.

CLIMATE.—The most important climatic conditions connected with the air are *temperature, humidity, and movement, weight, and composition of the air*. Under the head of temperature we might enter into the general subject of acclimation; we must, however, confine ourselves to the remark, that Europeans from temperate climates seem to flourish in countries not much hotter than their own, as in some parts of Australia and New Zealand, although it is yet too soon to decide whether the general vigor of the race will improve or diminish. In countries with a yearly mean of 20° Fabr. higher than their home climate, as in many parts of India, the race seems to dwindle, and gives indications of dying out. The endemic diseases of Europeans in the tropics are liver-disease and dysentery, but it is uncertain how far other influences may be at work besides heat in the production of these diseases. Rapid changes of temperature are always dangerous. The sudden check to the free action of the skin caused by a cold wind, is sure to give rise to catarrh, inflammations, and neuralgia. The registrar-general's returns show that when the temperature in London falls from 45° to 27°, the weekly mortality is increased by 400, bronchitis being the disease which mainly causes this increase—an affection which usually does not prove fatal in more than about 40 cases weekly. The fatal influence of extreme cold in depressing the nervous system, and giving rise to a sleep from which there is no awakening, is noticed in the article COLD. According to their humidity, climates are also divided into *moist and dry*. The most agreeable amount of moisture to most persons is when the relative humidity* is between 70 and 80 per cent. In chronic lung diseases, a still moister air is most pleasant, and serves to allay cough. The morbid effects of undue moisture are always associated with rise of temperature. As a general rule, warmth and great humidity are less oppressive than cold and great humidity. There seems to be close relation between the spreading and the checking of certain epidemic diseases and the relative moisture of the atmosphere. The malarious diseases are most intense when the moisture is excessive; while plague and small-pox are checked by a very dry atmosphere. Yellow fever seems unaffected by this atmospheric condition. That the humidity of a climate, irrespective of other climatic relations, is not injurious to life, may be inferred from a comparison between the climates of England and Ireland. The number of persons over 100 years of age is, in proportion to the population, five times as great in Ireland as in England, and the greatest longevity has been observed in Connaught, the wettest of the provinces.† See Mapother, *op. cit.*, p. 134.

The *movement of the air* is another climatic condition of importance, but it must be considered in connection with heat and moisture. A cold wind abstracts the bodily heat in proportion to its velocity; while a hot wind, if dry, increases evaporation, and may thus partly neutralize its own heating power. Variations in atmospheric pressure are of great importance in relation to health. "In ascending mountains," says Dr. Parkes, "there is rarefaction, i.e., lessened pressure of air, lowered temperature, and lessened moisture above 4,000 ft.; greater movement of the air; increased amount of light; greater sun-radiation, if clouds are absent; and the air is freer from germs of infusoria. Owing to the rarefaction of the air and watery vapor, there is greater diathermancy of the air; the soil is rapidly heated, but radiates also fast, hence very great coolness of the ground and of the air close to it at night."—*Op. cit.*, p. 418. The physiological effects of lessened pressure begin to be perceptible at somewhat less than 3,000 ft., at which altitude the mercury falls 3 inches. The pulse is quickened by 15 or 20 beats, and the breathing by 10 or 15 inspirations per minute; there is increased evaporation from the skin and lungs,

* By *relative humidity* we express comparative moisture, complete saturation being assumed to be 100. It is determined by dividing the weight of vapor actually existing in the air (or the absolute humidity), by the weight of vapor which would have been present if the air had been saturated.

† The average annual relative humidity of Ireland is 88, but on many days it attains as high a point as 94.

while the urinary secretion is probably diminished. At an elevation of 6,000 or 7,000 ft., as in the Swiss Alps, the effect of the mountain air shows itself in a marked improvement in digestion, sanguification, and in nervous and muscular vigor. At great heights there is swelling of the superficial vessels, and occasional bleeding of the nose and lungs; and a sensation of weight is felt in the limbs from the lessened pressure on the joints. A residence for some time in a mountain-air is of great value in all anemic affections, from whatever cause they may arise. Neuralgia, gout, and rheumatism are all benefited by high alpine positions (see Weber *On the Climate of the Swiss Alps*, 1864); and scrofula and consumption are almost absent in the true alpine regions, while patients affected with these diseases, if brought to such a climate, rapidly improve. On the other hand, pneumonia, pleurisy, and acute bronchitis are more common in high regions than lower down. The disease formerly known as "mountain asthma" seems, from Weber's observations, to be common pulmonary emphysema combined with or followed by chronic bronchitis.

Food is a subject which has been already considered in the articles DIET and FOOD AND DRINK. There are, however, certain points connected with it which obviously fall within the domain of hygiene; as, for example, (1) the quantity of the different kinds of food required for persons of different sexes and ages, and under varying conditions of life and climate; (2) the determination of the best articles of food in each class, and whether they are in a proper state for use. The first of these subjects is to a considerable degree discussed in the article DIET. The latest and probably the most accurate statements on this subject are those of Pettenkofer and Voit (quoted in Parkes's *Sanitary Report of the Army for 1865*); a strong average man requires, according to these physiologists, 5.22 oz. of dry nitrogenous matters, 3.63 oz. of fat, and 13.3 oz. of carbohydrates. They also find that when the food is sufficient, the daily excretion of carbon from the lungs is 8.92 oz. or 3,902 grains. We may add that an average man, at moderate work, takes in 24 hours from $\frac{2}{3}$ th to $\frac{1}{3}$ th of his own weight in solid and liquid food—viz., from 34 to 46 oz. of so-called solids, as bread, meat, etc.; and from 50 to 80 oz. of water. The ratio of the solid to the liquid food is generally 1 to 2, but may be 1 to 6. Great bodily exercise requires a greater increase of the solid than of the liquid food.

It may be interesting to many readers to know the amount and nature of the daily diet of an English soldier* on home service and the railway navy:

Soldier.	Oz.	Navy.	Oz.
Meat.....	12	Meat.....	13.7
Bread.....	24	Bread.....	28.5
Potatoes.....	16	Potatoes.....	7
Other vegetables.....	8	Other vegetables.....	0.57
Coffee.....	0.23	Butter.....	0.57
Tea.....	0.16	Cheese.....	1.7
Salt.....	0.25	Beer.....	27
Sugar.....	1.33	Coffee.....	0.5
Milk.....	3.25	Cocoa.....	1.1

Deputy-inspector-generals O'Flaherty and Taylor, and assistant-surgeon Spurway, published, in 1867, important articles on the diet of soldiers in the 7th volume of the *Statistical, Sanitary, and Medical Reports for the year 1865*, from which it would appear that, *inter alia*, an addition to the fatty food would be expedient. For information on the *Dietary of Workhouses and Prisons*, we must refer to Dr. E. Smith's admirable report on the former subject, and to Dr. Lankester's paper, "On Prison and Workhouse Dietaries," read before the health department of the social science congress at Belfast—an abstract of which may be found in the *British Medical Journal* for Nov. 2, 1867. The whole subject of prison dietaries requires revision. While in some favored institutions the prisoners live in comparative luxury, in others the dietary scale is far too scanty. The Irish prisons are especially faulty in this respect; the daily expense of the food per head seldom reaching fourpence, and in some jails being only *two*pence! At Waterford jail no food is allowed from 3 P.M. to 8 A.M., and in the Irish jails generally a pint of skim milk constitutes the whole animal diet. It is understood that a commission has been issued to report upon this subject. The proper arrangement of diet for the sick is a matter of great difficulty. In hospitals fixed scales must, as a matter of convenience, be adopted; but almost every special case requires a modification. For further information on special diets the reader is referred to Moleschott's *Physiologie der Nahrungsmittel* (1860); to Dr. Dobell's useful *Manual of Diet and Regimen*; and to Dr. Smith's *Practical Dietary for Families, Schools, and the Laboring Classes*.

The diseases connected with food are so various that we can only notice the most important. Passing over those which arise from excess of food generally, or of one of its classes, with the remark, that a prolonged excess of albuminates gives rise to congestion and enlargement of the liver, and a general state of plethora, while excess of starchy matters may possibly affect the muscular fibers of the heart and voluntary muscles, and certainly often renders the urine saccharine, we proceed to notice the diseases produced by the deficiency of food. The history of epidemic fevers in all ages and countries shows the close relation between famine and fever. The *Irish famine* of 1847-49 is now a matter of history. In those three years, no less than 579,721 cases were treated in the

* We learn from Froude's *History of England* that in the reign of Edward VI. the English soldier's rations during war were, meat, 2 lbs.; bread, 1 lb.; light French wine, 1 pint.

hospitals alone. Fleeing in despair, emigrants carried the germs of disease with them; and the so-called *ship-fever* which followed destroyed its thousands. Its malignity was most appalling. In one vessel 329 out of 349 passengers caught the fever, and 117 died; and the mortality in Liverpool, induced by the contagion of the fever-stricken Irish who landed there, suddenly became the highest ever recorded in any modern town—the death-rate being raised to 70 per 1000. During the last three years, 1865-67, the death-rate of this town was 36, 42, and 30. Dr. Mapother is of opinion that the introduction of the potato as an almost sole article of diet has been productive of much harm, in consequence of the deficiency of that root in nitrogenous matters and in salts of lime and magnesia.* To this source he traces indigestion, consumption, scrofula, rickets, ophthalmia, and chronic rheumatism. The deprivation of starchy food, on the other hand, can be borne for a long time if fat be given; but the simultaneous deprivations of fat and starch soon induces illness, though albuminates be supplied.

With regard to salt meat, it must be recollected that the brine, if it has been used several times, occasionally becomes poisonous. The evidence as to the power of diseased meat when eaten to excite disease, is—if we except the cases in which entozoa are present—very unsatisfactory. We have the evidence of sir Samuel Baker and others that certain African tribes eat without injury meat swarming with maggots. In this country, the flesh of healthy animals, when decomposing, is sometimes eaten with impunity, and sometimes occasions severe gastric intestinal disorders. There is reason, however, to believe that if slightly tainted meat, poultry, or river fish be washed in very dilute solution of Condy's fluid, previous to being cooked, all danger is removed. The occasional occurrence of a poison in sausages and even in pork pies is well known, although its nature is not clearly understood. The fresh flesh of diseased animals assuredly causes injurious effects in many cases, but not in all. In the early stage of acute inflammatory disease, the meat is not altered, and may be eaten with impunity. Whether the epidemic pleuro-pneumonia of cattle renders their flesh unfit for use, is an open question. (See Mapother, *op. cit.*, pp. 217-224, who decidedly condemns its use, and Parkes, *op. cit.*, pp. 161-166, who quotes conflicting evidence.) The discrepancy of evidence is equally great regarding anthrax and malignant pustule. The death of sheep from splenic apoplexy or braxy, and from small-pox, renders their flesh unfit for food; while the flesh of cattle destroyed by foot-and-mouth disease and by typhoid fever has been largely used in France without injury. The detection of the adulterations of the ordinary articles of food is a very important duty in relation to hygiene; on this subject we must refer to Hassall's great work, and to our article Food.

The object of **CLOTHING** is to preserve the proper heat of the body by protecting it both from cold and heat, and thus to prevent the injurious action of sudden changes of temperature upon the skin. The most important materials of clothing are cotton, linen, wool, silk, leather, and india-rubber. *Cotton*, as a material of dress, wears well, does not readily absorb water, and conducts heat much less rapidly than linen, but much more rapidly than wool. From the hardness of its fibers, its surface is slightly rough, and occasionally irritates a very delicate skin. Its main advantages are cheapness and durability. In merino it is mixed with wool in various proportions, and this admixture is far preferable to unmixed cotton. *Linen* is finer in its fibers than cotton, and hence is smoother. It possesses high conducting and bad radiating powers, so that it feels cold to the skin; moreover, it attracts moisture much more than cotton. For these reasons, cottons and thin woollens, are much preferred to linen garments in warm climates. *Silk* forms an excellent underclothing, but from its expense, it can never come into general use. *Wool* is superior both to cotton and linen in being a bad conductor of heat, and a great absorber of water, which penetrates into the fibers and distends them (hygroscopic water), and also lies between them (water of interposition). "This property of hygroscopically absorbing water is," as Dr. Parkes observes, "a most important one. During perspiration, the evaporation from the surface of the body is necessary to reduce the heat which is generated by exercise. When the exercise is finished, the evaporation still goes on, and to such an extent as to chill the frame. When dry woollen clothing is put on after exertion, the vapor from the surface of the body is condensed on the wool, and gives out again the large amount of heat which had become latent when the water was vaporized. Therefore, a woollen covering, from this cause alone, at once feels warm when used during sweating. In the case of cotton and linen, the perspiration passes through them, and evaporates from the external surface without condensation; the loss of heat then continues. These facts make it plain why dry woollen clothes are so useful after exertion. In addition to this, the texture of wool is warmer, from its bad conducting power, and it is less easily penetrated by cold winds."—*Op. cit.*, p. 353. *Leather* is used not only for shoes, boots, and leggins, but, in cold, windy countries, for

* Potatoes contain 74 per cent. of water, 1.5 of albuminates, 0.1 of fat, 23.4 of starch, cellulose, etc. (the carbo-hydrates), and 1 of salts. The chief ingredients of the salts are potash, about 50 per cent.; and phosphoric acid, about 13 per cent. The juice of the potato abounds in salts of organic acids (citric, tartaric, etc.), which on incineration are converted into carbonates—the carbonic acid thus formed amounting to 13.3 per cent. The relative proportion of fat to albuminates in the food which is most easily digested, and at the same time produces the greatest mechanical force, is as 1 to 2; in the potato, it is as 0.1 to 1.5, or as 1 to 15. Again, the starchy matters should be to the nitrogenous as 3 to 1 in the best diet: in the potato, they are as 23.4 to 1.5, or as 14 to 1 nearly. On this subject see the article **MUSCULAR FORCE, ORIGIN OF**.

coats. Leather and sheep-skin coats are in common use in Turkey, Tartary, Persia, the Danubian provinces, and in Canada, where buffalo skins are often used. For persons specially susceptible to cold, and of delicate organization, a chamois leather jacket worn over a flannel waistcoat may be recommended with advantage during the winter months. *India-rubber* clothing must be used with extreme caution. From its being impenetrable to wind, and from its condensing and retaining the perspiration, it is decidedly objectionable; while on the other hand, its protection against rain is a very valuable property. The council of health of the French army have refused to admit waterproof garments among their soldiers; and in this country it has been prohibited among the London postmen.

In relation to protection against heat, we have to consider the color and not the texture of clothing. White is the best color, then gray, yellow, pink, blue, and black. Hence, in hot countries, white or light gray clothing should be preferred.

The shape and weight of all articles of clothing should be such as to allow of the freest action of the limbs, and in no way to interfere by pressure with the processes of respiration, circulation, or digestion. In a complete treatise on hygiene, a discussion on the relative advantages and disadvantages of the various articles of clothing used by both sexes would find a proper place, but our limited space totally precludes us from entering into this subject.

Attention to the STATE OF THE SKIN is of great importance in a hygienic point of view. The perspiration and sebaceous matters which are naturally poured out upon the surface of the body, with an intermingling of particles of detached epidermis, fragments of fibers from the dress, dirt, etc., if not removed, gradually form a crust which soon materially interferes with the due excreting action of the skin. There is little doubt that the daily use of the matutinal *tub*, which less than half a century ago was unheard of, and is now a matter of necessity with most healthy persons who have the means of using it, has contributed materially to harden the system against attacks of colds, rheumatism, etc. When a tub and sponge happen to be unattainable, a wet towel rubbed over the body, followed of course by a dry one, is a good substitute.

EXERCISE is the subject that next claims our consideration, and we shall briefly notice its effects on the different systems of organs. (1) The most important effect of muscular exercise is produced on the *lungs*, the quantities of inspired air and of exhaled carbonic acid being very much increased. Taking the air inspired in a given time in the horizontal position as unity, a man walking 3 m. per hour inspires 3.22; and if carrying 34 lbs., 3.5; a man walking 4 m. per hour inspires 5; and when walking 6 m. per hour, no less than seven. Almost twice as much carbonic acid is exhaled during exercise as during rest. Hence, muscular exercise is necessary for the due removal of the carbon; and it is obvious that in a state of prolonged rest, the carbonaceous food must be diminished, or the carbon will be liable to accumulate in the system; and further, it is clear that, for strong exercise, carbonaceous food should be freely given. (2) The action of the *heart* rapidly increases in force and frequency during exercise. The increase in the number of beats may range from 20 to 30, and is sometimes much more. After exercise, the heart's action is diminished. Excessive exertion may do harm by inducing pulmonary congestion, and even hæmoptysis, palpitation, hypertrophy, valvular disease, and occasionally rupture; while deficient exercise probably tends to induce tuberculous disease of the lung, weakness of the heart's action, and probably dilatation and fatty degeneration. From these facts we learn, that when a person commences any new form of exercise or gymnastics, the heart's action should be watched, and if the pulse rise to 120 or more, the exercise should for the time cease. (3) The *skin* becomes red from increase of blood in the capillaries, and the perspiration is increased, being at least doubled. The bodily heat is kept down by cutaneous evaporation, which reduces the temperature. During exertion, there is very little danger of chill, but the danger becomes great when the exertion is over, because there is then a rapid fall in the heat of the body, while the evaporation of the skin continues. Hence, while the skin may be freely exposed during exercise, it must be covered immediately afterward in order to prevent any feeling of coolness on the surface. (4) The *muscles* grow to a certain limit, but over-exercise of any special group may produce wasting. Care must be taken that the exercise is of such a nature that all the muscles, and not single groups, should be brought into play; and that in early training, long intervals of rest should intervene between the periods of exercise. (5) The effect of exercise on the *mind* is not clearly determined; great bodily activity is often observed in association with full mental activity; but there is a fear that, in our great public schools and universities, boating and cricket are supplanting more useful subjects, and leaving too little time for the due performance of intellectual work. (6) *Digestion* is improved by exercise. The appetite increases, and nitrogenous substances, fats, and salts, especially phosphates and chlorides, are required in greater quantity than in a state of rest. (7) The *change of tissues* is increased by exercise, or, in other words, the excretions give off increased quantities of carbon, nitrogen, water, and salts. The muscles require much rest for their reparation after exercise, and they then absorb and retain water, which seems to enter into their composition. So completely is the water retained in the muscles, that the urine is not increased for some hours. Hence, observes Dr. Parkes, there is an absolute necessity of water for the acting muscles, and the old rule, held by trainers, of only allowing the smallest possible quantity of fluid, must be wrong.

The amount of exercise which should be taken by an adult healthy man is a subject of great importance. Prof. Haughton, in his *New Theory of Muscular Action*, calculates that a laboring man daily exerts a muscular force to a degree which may be expressed by saying, that he would raise to the height of 1 foot from 250 to 350 tons. For persons not obliged to labor, the force expended, including that required for the ordinary avocations of life, should average 150 tons, which is equivalent to walking about 9 m. daily. It is unfortunately impossible to arrange scales of exercise for invalids, women, and children. Prof. Haughton has shown that walking on a level surface is equivalent to raising the $\frac{1}{20}$ th part of the weight of the body through the distance walked. When ascending a height, a man of course raises his whole weight through the height ascended.

Using his formula $\frac{W + W'D}{20 \times 2240}$ (where W is the weight of the person, W' the weight carried, D the distance walked, 20 the coefficient of traction (see FRICTION), and 2240 the number of pounds in a ton), we obtain as a result the number of tons raised 1 foot; and on applying it, we get the following table:

Kind of exercise.	Weight done in tons lifted one foot.
Walking 1 mile.....	17.67
“ 20 miles.....	353.4
“ 1 mile, and carrying 60 lbs.....	24.75
“ 20 miles “.....	495.

Thus, a march of 10 m., with a weight of 60 lbs. (which is about the weight a soldier carries when in marching order, but without blankets and rations), is a moderate day's work. A 20 miles' march with this weight is a very hard day's work. As a continuous effort, prof. Haughton believes that walking 20 m. a day without a load (Sundays excepted) is good work.—For a discussion on the various forms of exercise, as horse exercise, boating, dancing, and gymnastics, we may refer the reader to Mapother, *op. cit.*, pp. 263–268. In connection with the subject of exercise, the reader is referred to the article **MUSCULAR FORCE, ORIGIN OF.**

THE CONSTRUCTION OF HOUSES, especially of dwelling-places for the poor, and public lodging-houses, next claims our notice. There can be no doubt that the frequency and fatality of the epidemics of the middle ages were in a great measure due to unhealthy habitations. The houses were usually closely packed in crowded streets, and were often built for the purpose of defense, at a sacrifice of ventilation, lighting, draining, etc. At the present day, with all our boasted civilization, the dwellings of the poor, both in our large towns and in our country villages, are too often a disgrace to humanity. Any one may readily satisfy himself on this point by reading the various government reports referred to in an early part of this article, the annual reports of the medical officer of the privy council, and the reports which are annually published by many of our officers of health.

An article on the sanitary state of Manchester, which appeared in the *Quarterly Journal of Science* for April, 1867, reveals a condition of the dwellings of the poor which seems almost incredible to those who have not previously studied this important but uninviting subject. In many parts of Ireland, as we learn from Dr. Mapother, the dwelling-places of even the small farmers are hardly fit for a healthy existence. Dr. Tucker of Sligo draws the following picture of “the homely hovel of a small farmer, which may be taken as the prototype of many. It was about 12 ft. wide and 24 ft. long. The domestic circle that dwelt therein consisted of a sick man, his wife, four daughters, one son, three cows, one horse, two calves, two pigs, and poultry—all in one common undivided house, without a partition. Generally the pigs dwelt beneath the beds, the people in them, and the poultry overhead.” On the evils, physical and moral, arising out of such a system it is unnecessary to dwell.

Much has of late years been done in London (by the benevolence of baroness Coutts, Mr. Peabody, alderman Waterlow, and others) and in many other large towns to improve the dwellings of the poor, and to give them, on moderate terms, a far more healthy and commodious house-accommodation than they could otherwise obtain. Many of these improved dwellings seem fever-proof, and the death-rate has been found much lower than in adjacent places. Even without the aid of private benevolence the erection of blocks of improved dwellings for the working-classes has proved remunerative. Five conditions are requisite in order to insure healthy habitations, on whatever scale they may be constructed: (1) A site dry and not malarious, and an aspect which gives light and cheerfulness; (2) a ventilation sufficient to carry off all respiratory contaminations of the air; (3) a system of immediate and perfect sewage removal; (4) a due supply and proper removal of water; and (5) a construction of the house such that perfect dryness of its foundation, walls, and roof is insured. For further information on this important topic, the reader is referred, *inter alia*, to the various works of Mr. Godwin, especially his *Another Blow for Life*; to Mr. Hole's interesting book entitled *The Homes of the Working-classes*; and to Dr. Mapother's *Lectures on Public Health* (2d ed. pp. 297–326).

SEWAGE is sufficiently considered in the special article devoted to that subject (see also SEWAGE EARTH-CLOSET); and we pass on to another subject closely connected with hygiene—viz., the DISPOSAL OF THE DEAD. To see the importance of this subject the

reader must know something of the changes which the body undergoes after death. A body that has been buried gradually breaks up into a large number of comparatively simple compounds, such as carbonic acid, ammonia, sulphureted and carbureted hydrogen, nitrous and nitric acid, and certain more complicated gaseous matters with a very fetid odor, which finally undergo oxidation; while the non-volatile substances usually enter into the soil, and either pass into plants or are carried away by the water percolating the soil. These changes are accelerated by the worms and other low forms of life that usually swarm in decomposing bodies; and the character of the soil materially influences the degree of rapidity of destruction. The bones remain almost unchanged for ages. If a body is burned, decomposition is incomparably more rapid, and different volatile combinations may arise; the mineral salts and a little carbon alone remaining. The question for our consideration is, what is the best method of disposing of our dead, so that the living may suffer the least? Putting aside the visionary schemes for turning the dead to commercial account, there are three methods for consideration—viz., burial in land or in water, or incineration. At present, as Dr. Parkes observes, the question is not an urgent one; but it may become so in a century or two, if the population goes on increasing at the present rate. Even in our own time a great change has taken place, and the objectionable habit of interments in and round churches in towns has been given up, cemeteries in the country being now commonly employed, except in the case of country villages. The air over cemeteries is, however, always contaminated, and water percolating through them is unfit for drinking purposes; and there is a general and very decided opinion that the vicinity of graveyards is unhealthy. The evils are lessened by making the grave as deep as possible, and by placing not more than one body in one grave. Plants should be freely introduced into every cemetery, for the absorption of organic matters and of carbonic acid; and the most rapidly-growing trees and shrubs should be selected, in preference to the slowly-growing cypress and yew. We may add that the superficial space which should be allotted to each grave varies in different countries from 30 to 90 ft., and that the depth should be at least 6 feet. It is required by law that the grave spaces for persons above 12 years of age shall be at least 9 ft. by 4, and those for children under 12 years, 6 ft. by 3. It is likewise required that not less than 4 ft. of earth should be placed over the coffin of an adult, and 3 ft. above that of a child. The time which should elapse before a grave is disturbed for a new tenant varies with the soil and the distance of the body from the surface. Under favorable circumstances, a coffin containing an adult will disappear with its contents in about 10 years; while in a clayey or peaty soil it will remain a century. It is generally assumed that a period of 14 years is sufficient for the decay of an adult, but long before this time all will have disappeared but the skeleton. If the question should in course of time arise between burying in the sea and burning, it will be decided, Dr. Parkes believes, in favor of the former, on the following grounds: "It is true that the impurities in burning can be well diffused into the atmosphere at large, and would not add to it any perceptible impurity. But if the burning is not complete, fetid organic matters are given off, which hang cloud-like in the air, and may be perceptible and even hurtful. As a matter of expense, too, the system of incineration would be greater than the burial at sea. In the burial at sea the body would go at once to support other forms of life more rapidly than in the case of land-burial, and without the danger of evolution of hurtful products." On this subject the reader may further consult the report drawn up by Mr. Chadwick on the state of cemeteries; the report of the general board of health, 1853 (of which Mr. Chadwick and Dr. Southwood Smith were members), on the same subject; Dr. Mapother's 14th lecture "on the burial of the dead;" and a work published by M. Favrot, entitled *Histoire des Inhumations*, 1867.

The reports to which we have just referred contain abundant evidence of the necessity for the universal establishment of mortuaries, or houses for the reception of the dead until the period of the burial. In some parts of Germany, the deposit of the dead in such houses is compulsory; and in many parts of the continent, there are laws rigidly enforcing the burial within a certain number of hours after death.

Before proceeding to consider how far our sanitary regulations have effected a saving of human life, it is expedient to give a brief notice of the chief acts of parliament which have passed, and government reports that have been officially published, bearing on important sanitary subjects. Beginning with 1833, in which the factory children's act was passed; in 1834, the practice of employing climbing boys for sweeping chimneys was abolished; in 1840 and 1841, the act to extend the practice of vaccination was passed; and in 1842, the employment of women and children in mines and collieries was abolished. Then appeared the general local reports on the sanitary condition of the laboring classes, 1842, which constitute, as Dr. A. P. Stewart well observes, a "remarkable series of volumes, for which we were indebted chiefly to Mr. Chadwick, and which, revealing as they did an almost incredible state of matters in our crowded centers of population, were read by multitudes with a strange and eager interest."—*The Medical and Legal Aspects of Sanitary Reform* (1867), p. 5. These Reports of the Health of Towns Commission led to the passing, in rapid succession, of "the acts for promoting the establishment of bath and wash-houses in Great Britain and Ireland, in 1846; the towns improvement act, in 1847; the public health, the nuisances removal, and the city of London sewers acts, in 1848; the metropolitan interments act, in 1850, followed in 1853

by a similar act for the whole of England; the act to encourage the establishment of lodging-houses for the laboring-classes, and the common lodging-houses act, in 1851; the metropolitan water act, in 1852; the smoke nuisance abatement (metropolis) act, and the act to extend and make compulsory the practice of vaccination, in 1853; the merchant shipping act, with its stringent provisions for the preservation of the health of our merchant seamen, in 1854; the diseases prevention, the metropolis local management, the metropolitan buildings, and the nuisances removal amendment acts, in 1855; and the public health act of 1858, which abolished the general board of health, and vested its powers in the privy council. Since then, there have been added to the statute-books the acts for the purification of the Thames, in 1858 and 1866; the act for preventing the adulteration of articles of food and drink, in the same year; the acts (passed in 1860, 1861, and 1864) which included, under the provisions of the factory acts, women and children employed in bleaching and dyeing works, in lace factories, and in the manufacture of earthenware, of lucifer-matches of percussion caps and cartridges, of paper-staining and of fustian cutting; the vaccination amendment act in 1861; the act for the seizure of diseased and unwholesome meat, and the alkali works act, in 1863; the sewage utilization act, in 1855; the laboring-classes' dwelling-houses act, and the sanitary act, in 1866."—Stewart, *op. cit.*, p. 6. The last-named of these acts—the sanitary or public health act of 1866—contains certain clauses with which every one should be acquainted. Its first part is an amendment of the sewage utilization act, 1865, and provides, *inter alia*, that any owner or occupier of premises within the district of a sewer authority shall be entitled, under certain conditions, to cause his drains to empty into the sewer; but if a dwelling-house is without efficient drainage, the sewer authorities may require the owner to make a sufficient drain, emptying into a sewer, provided the latter be not more than 100 ft. distant; and that the sewer authority may provide a supply of water for the use of the inhabitants of the district. The second part is an amendment of the nuisances removal acts—the word "nuisance" being made to include (1) any house or part of house so overcrowded as to be dangerous or prejudicial to the health of its inmates; (2) any factory or workshop not kept cleaned and properly ventilated; (3) any fireplace or furnace not, as far as possible, consuming its own smoke; and any chimney (not belonging to a private house) sending forth black smoke. The rules for the removal of such nuisances are laid down. The nuisance authority, moreover, has power to enforce the cleansing and disinfecting of houses or articles therein likely to retain infection, and to fine those who disregard the injunction; to provide a proper place for disinfecting clothing, bedding, etc., and to effect the disinfection of such articles; to provide carriages for the conveyance of infected persons to hospitals, etc. The 25th clause is so important, and its nature so very little known, that we extract it *verbatim*: "If any person, suffering from any dangerous infectious disorder, shall enter any public conveyance without notifying to the owner or driver thereof that he is so suffering, he shall, on conviction thereof before any justice, be liable to a penalty not exceeding £5, and shall also be ordered by such justice to pay to such owner or driver all the losses and expenses they may suffer in carrying into effect the provisions of the act; and no owner or driver of any public conveyance shall be required to convey any person so suffering until they shall have been first paid a sum sufficient to cover all such losses and expenses." The act further lays it down that places for the reception of the dead may be provided at the public expense, and that any justice may, on the certificate of a legally qualified medical practitioner, order the removal thither of the bodies of those who die of infectious disease,* and gives permission that special places for the performance of *post-mortem* examination may be provided. The third part of the act is headed "miscellaneous." It treats of various points for the better management of lodging-houses, lays a penalty not exceeding £5 on any person with infectious disorder exposing himself, or on any person in charge of such a sufferer causing such exposure; and a penalty not exceeding £20 on persons letting houses, rooms, or part of a house in which infected persons have been lodging, without having such houses, or rooms, and articles therein, disinfected to the satisfaction of a qualified medical practitioner (the keeper of an inn is deemed to let part of a house to any person admitted as a guest into such inn). It is very much to be regretted that most of the provisions of this and other acts bearing on public health are permissive, and not peremptory.

We may note that since 1858 a public health department has been established in the privy council, and that the medical officer of the privy council, Mr. Simon, has, since that date, published an annual report of the proceedings taken under the public health act, 1858. These reports, of which nine have now appeared, are of the highest importance; and we should not omit to mention that the progress of sanitary science has been considerably advanced by the publication of an annual volume (of which seven have now appeared) of statistical, sanitary, and medical army reports, by the establishment of the epidemiological society and the social science congress, and by the publication of their transactions.

It is much to be regretted that the privy council does not more energetically carry

* Liverpool alone, so far as we know, has as yet taken advantage of this clause. The council have erected three mortuaries; and a mortuary chapel for the Roman Catholics has been built partly at the expense of Mr. Hutcheson, a Protestant gentleman, and partly by subscription. (Stewart, *op. cit.*, p. 71.)

out the powers conferred on them by the diseases prevention act, 1855, and the public health act, 1858. Unfortunately, however, it requires some comparatively rare and startling disease, as yellow fever, plague, cholera, or cattle-disease, to stir that august body into activity; while typhus, typhoid, and small-pox may ravage our crowded towns and undrained villages, and carry off their thousands of victims, unless in very extreme cases, to which the public press may have called attention. (Of the half million deaths that occur annually in England, more than 20,000 are due to typhus and typhoid,* while in England and Scotland, more than 5,000 persons annually fall victims to small pox.†) By the sanitary act, 1866, the home secretary is empowered to interfere, if he see fit, on complaint made to him of the default of any local authority. It is sincerely to be hoped that he will unsparingly put forth the power intrusted to him.

Passing from what has, and what has *not*, been done by government, let us consider what are the duties of local authorities, and how they discharge them. On this subject, Dr. Stewart gives us much information in his pamphlet already referred to. To such an extent has non-interference prevailed that, except in London, the appointment of medical officers of health, and even of inspectors of nuisances, is optional. He ascertained that of 570 places under the local government act, 1858, and the public health act, 1848, with populations varying from 214 to 200,000, 50 have no inspectors of nuisances, 153 have each one; while in 347 one man holds the double or treble offices of surveyor, inspector, and collector. In the metropolitan districts, with a population of above 3,000,000, the sanitary force is most unequally divided, for, while 2 subdistricts, with a population of 4,000 and 10,000 respectively, have the services of one inspector, St. Marylebone and St. Pancras, with respective populations of 163,000 and 211,000, have each of them only two.

A few words on the duties, qualifications, and position of the medical officer of health, will find a fitting place here.‡ His duties and qualifications are thus laid down in an instructional minute of the general board of health, dated Dec. 30, 1855: "He will make himself familiar with the general features of the place, with its previous sanitary state, and with its existing provisions for health—viz., the levels, inclinations, soil, wells, and water-springs; with its meteorological peculiarities; with its burial-grounds, slaughter-houses, lodging-houses, etc.; he will see to the general healthiness of his district, inquire into the cleanly and water-proof condition of houses, examine the drinking-water, and observe whether diseased meat or adulterated articles of food are exposed for sale; and will report weekly and annually to the local board." These are but a few of his duties, for the proper performance of which (as the minute goes on to add) special qualifications in science are required. "These lie in pathology, including vital statistics, in chemistry, and in natural philosophy." For these accomplishments, the town of Aberdeen offers 8*s*. 6*d*. a day, or 12 guineas a year, for looking after the health of its 25,000 inhabitants; while Paisley gives £20 for the sanitary superintendence of a population of 48,000. Fifty pounds is a common salary, except in the metropolis; the most liberal salaries are £350 at Birkenhead and Hackney, £400 at St. Marylebone, £500 at Edinburgh and Leeds, £600 at London (proper), while Liverpool has nobly raised the salary to £1000. Surely £500, £600, and £1000 are not too much for Edinburgh, London, and Liverpool to pay, in order to secure the services of such men as Littlejohn, Letheby, and Trench. Dr. Russell, the medical sanitary officer for Glasgow, has £600 a year; and Dr. Gairdner, one of the first of our living hygeists, is retained as consulting officer at £100 a year. Not only is the medical officer's salary dependent on the caprices of the local board, who may dismiss him at pleasure, but, as Dr. Stewart truly observes, "the very efficiency with which he performs his duties may be an unpardonable sin in the eyes of a majority of his masters. His statements of facts may touch the interests of some, his suggestions of remedies may excite the displeasure of others; and if the soundness of his position cannot be assailed by reasoning, passion may suggest—as it has before now suggested—a reduction of salary or a threat of dismissal, as likely to bring the offender to his senses." Not only is this disgraceful form of pressure brought to bear *directly* on the medical officer of health, but *indirectly* on those who have the power of electing or dismissing him. An amusing incident of this nature is mentioned in Dr. Stewart's pamphlet. When Dr. Robinson was appointed officer of health for Leeds, he found that he had to grapple with unparalleled privy abominations, piggeries by hundreds, numerous slaughter-houses, the gigantic smoke-nuisance, and an average death-rate of 30 in 1000. The battle between science and filth was prolonged and terrific, and the piggeries were made the battle-field. The pig-owners, taking alarm at Dr. Robinson's energy, formed themselves into a "pig protection society," summoned ward-meetings, and commenced an active canvass, for the purpose of turning out of the council all who would not pledge themselves to vote for Dr. Robinson's dismissal. The case, after being twice heard before the magistrates, who declared that the pigs were a nuisance, and must be removed, was finally settled on appeal by the recorder, who gave an order, not for the eviction of the pigs, but for the daily removal of the manure, for the due enforcement of which a

* According to Dr. W. Budd, typhoid alone is the cause of from 15,000 to 20,000 deaths in England.

† For data on this subject, see the foot-note to p. 121.

‡ On this subject Dr. Letheby has published an excellent memoir, which will be found in the *Medical Press and Circular* for August 7 and 14, 1867; and Dr. Rumsey's address *On State Medicine in Great Britain and Ireland* (London, 1867), may also be consulted with advantage.

separate inspector would be required for every pig-sty! Under these conditions, is a medical officer of health fairly encouraged to discharge his proper duties?

The next points to which we shall direct attention are the NUMBER OF DEATHS occurring annually in England and Wales, and the CAUSES OF THESE DEATHS; and we shall then proceed to inquire how far the deaths from some of our most fatal diseases might have been prevented by due attention to sanitary measures. We learn from the twenty-eighth annual report of the registrar-general of births, deaths, and marriages in England, which was published in 1867, and gives the results for the year 1865, the following statistical facts, which bear more or less closely on our subject. The population of England, the births, deaths, and excess of births over deaths, are tabulated from the year 1838, when the system of registration came in force; and from this table we extract the numbers for 1838, 1848, 1858, and for 1861-65 inclusive:

Years ending Dec. 31.	Estimated population in middle of year.	Births (exclusive of still-born).	Deaths.	Excess of births.
1838	15,212,256	463,787	312,760	121,027
1848	17,340,492	563,050	399,833	173,226
1858	19,471,391	655,481	449,656	205,825
1861	20,119,314	696,406	425,114	271,292
1862	20,359,117	712,684	436,566	276,118
1863	20,554,137	727,417	473,837	253,580
1864	20,772,308	740,275	453,531	286,744
1865	20,990,916	748,069	490,909	257,160

From these figures, we learn, *inter alia*, that in a quarter of a century the population has added 5,000,000 to its strength, and that there is a steady increase (with occasional exceptions) in the annual number of births and deaths, and in the excess of the former; the number of births having increased during that period 46 per cent, and that of deaths 43 per cent. The following is an abstract of Dr. Farr's letter to the registrar-general on the causes of death in England in 1865: In every 1000 deaths, 381 of the population fell before local diseases, 235 were struck down by zymotic diseases, 182 by constitutional diseases, 160 by developmental diseases, and 36 died violent deaths; the remaining 6 were deaths from causes not ascertained. *Local diseases*—the inflammations and functional diseases of organs—carried off 184,877 persons in England, causing 9 of the 23 deaths per 1000 of the living. It is the deaths from diseases of the vital organs that swell this number so high—22,272 deaths from heart diseases, nearly as many (21,774) from diseases of the digestive organs, more than thrice as many (69,952) from diseases of the respiratory organs so essential to life, and a number nearly as large as this last (60,264) from diseases of the nervous system. The number of deaths in England ascribed to bronchitis has rapidly increased: it was but 21,528 in 1856, had advanced to 32,346 in 1860, and in 1865 reached 36,428. Softening of the brain is another disease that has increased rapidly of late years, and in 1865 was fatal to 1551 males and 627 females: these deaths would formerly have been classed under paralysis and other heads. The deaths from diseases of the nervous system include 26,722 from convulsions, occurring chiefly in children. Among the rarer deaths from local diseases, 5 are referred to fright, 3 to grief, and 43 to melancholy. The second most fatal class of diseases—the *zymotic* (epidemic and contagious)—is swelled chiefly by fevers and by diarrheal disease. It swept from life in England 113,948 persons in 1865, the majority of them young children under 5 years of age. The deaths by cholera in England in 1865 were 1291; by diarrhea, 23,531. The deaths by fever—typhus, typhoid, and typhina*—which were 13,012 in the year 1860, rose to 23,034 in 1865, and five-tenths of them were registered among four-tenths of the population. The deaths from scarlatina were 17,700, and from diphtheria, 4,145. The deaths attributed to syphilis rose to 1647; 437 persons died from intemperance, and 612 from *delirium tremens*; 74 from privation; 19 from hydrophobia; 4 from glanders, for horses as well as dogs communicate some of their diseases to men. Worms are put down as the cause of death in 153 cases, one of which is ascribed to *trichina spiralis*. The third class of deaths is from *constitutional diseases*, diathetic or tubercular, which were fatal to 88,501 persons in 1865. These diseases have this in common with the zymotic, that they are diffusive; and human tubercle is, even when introduced by inoculation, capable of inducing tubercular deposits in the organs of animals. The prevalence of phthisis in the armies of Europe is considered to be probably due in part to the inhalation of expectorated tubercular matter, dried, broken up into dust, and floating in the air of close barracks. Dr. Farr remarks that to test this may be difficult, but the

* In the National Returns, all cases of fever are set down as typhus, which is thus made to include pure typhus, with blood-spots (*petechie*) on the skin, which is exceedingly fatal (more than 20 per cent of the cases in the London fever hospital proving fatal), is generated in crowded populations, and is very infectious; *typhoid* or *typhoid fever*, which is endemic, is characterized by an eruption of rose-red spots on the skin, and by ulceration of Peyer's glands, and is usually generated by the intestinal evacuations of typhoid patients, which should therefore always be submitted to the action of disinfectant agents (its mortality in the London fever hospital is rather less than 20 per cent); and, lastly, *typhina*, which is commonly known as *relapsing* or *famine fever* (it is epidemic and infectious in times of scarcity and famine, and is comparatively harmless, the deaths amounting to only 3½ per cent). For the introduction of the terms *typhus* and *typhina*, we are indebted to Mr. Farr (see his 24th Annual Report of Births, Deaths, and Marriages in England, 1863, p. 214).

origin and propagation of the most fatal of all human diseases deserves full investigation. The inquiry should also extend to cancer and the other constitutional diseases, among which should perhaps be included diabetes. Among the deaths from constitutional diseases may be noted gout, as increasing every year. Gout is five times as common in men as in women, and is very rarely fatal under 35 years of age. To it, 361 deaths were attributed in 1865. Unlike gout, dropsy is most fatal to women; and the substitution of dropsy in women for gout in men after the age of 45 is worthy the attention of pathologists. Cancer is more than twice as fatal to women as it is to men. The mortality by all constitutional diseases is rather less than it was in the decade 1850-59; and this is partly due to the decrease of the number of deaths referred to phthisis; still these deaths reached 53,734 in 1865, the greater part of them occurring in adults; and more than half the deaths of young women between 20 and 25 were caused by phthisis. The fourth class of diseases—the *developmental*—were fatal to 77,806 persons in England in 1865: 8,791 infants born alive died from being premature; and other 22,435 died of debility before they were a year old. Besides 1333 deaths by puerperal fever, and 2,490 ascribed to child-birth, 490 women died of specific diseases complicated by parturition. The deaths by ordinary diseases of the 560,000 *encrente* women, constantly existing in the population of England, could not be entirely distinguished from the deaths of other women of the same age; of course they were subject to the same diseases as others, but probably the class of mothers belongs to what, in a certain sense, the insurance offices call select lives. The list of developmental diseases closes with the deaths of 28,709 persons from old age, 154 of the men and 402 of the women being of the age of 95 and upward. Thus we reach the last class of deaths—the 17,374 persons who were destroyed by *violent deaths*; 15,232 by accident or negligence, 443 under circumstances bringing the case under the legal denomination of homicide, 1392 by suicide, 6 on the scaffold, and the remaining 301 not classed. These are the several ways in which 490,909 persons died in England in 1865.

Now let us see how many of the above diseases are more or less preventable, and how far we have already been successful in diminishing them. There are parts of England in which, for each 1000 persons living, there die annually only 15;* while there are other parts that, of each 1000 persons, 30 or more† die annually. The 15 and the 30 are said to be the respective death-rates of these places. The average London death-rate is 25; and the most common death-rate in country districts and small towns through all England and Wales is 20. The registrar-general's return, published in Jan., 1868, showing the annual rate of mortality in the large towns of the United Kingdom for the year 1867, enables a comparison to be made of the death-rates in the last three years—1865 being the first year of the publication of these results. Thus the average annual rate of mortality per 1000 persons living in the great cities in each of the years 1865, 1866, and 1867 respectively, was as follows: Birmingham, which is one of the healthiest sites in the kingdom, 25, 24, and 24; the density of population (persons to an acre) in 1867 was 44. Hull, 27, 24, and 25; density, 30. Bristol, 24, 25, and 23; density, 35. Edinburgh, 28, 27, and 27; density, 40. Dublin, 26, 28, and 27; density, 33. Salford, 29, 29, and 29; density, 22. Glasgow, 33, 30, and 29; density, 87. Manchester, 33, 32, and 31; density, 81. Leeds, 31, 33, and 27; density, 11. Liverpool, 36, 42, and 30; density, 96. The annual mortality in Sheffield, in each of the years 1866 and 1867, was 28 and 25, density, 10. In Newcastle-on-Tyne the annual mortality in 1866 and 1867 respectively was 32 and 31. The results for London in each of the three years 1865-67 respectively were, annual mortality per 1000 of population, 25, 26, and 23; density, 40. In comparing the rate of mortality in one town with that of another, it should be borne in mind that of the English towns, Bristol, Leeds, and Liverpool have each a medical health officer. Birmingham, Hull, Salford, Manchester, Sheffield, and Newcastle-on-Tyne have no medical health officer; but most of these towns, however, have benefited from the efficacy of hygienic measures. It is obvious that if, by sanitary precautions, we could reduce all the death-rates to 15, or even to 20, an enormous saving of human life would result‡. In the year 1865 Mr. Simon suggested that the time was come for attempting to ascertain the amount of benefit to the public health that had been derived from the works of sanitary improvement—especially of drainage and water-supply—that had been already completed, and he was authorized to institute the inquiry, with the assistance of Dr. Buchanan as an inspector. The result of the inquiry, which relates to 24 towns,§ with an aggregate population of

* In an article on "Public Health," in the *Quarterly Journal of Science* for Jan., 1868, it is stated that at Sandown, in the Isle of Wight, which is thoroughly drained and well supplied with pure water, the death-rate for the last five years has been only 11 in 1000. As a contrast, we may take the village of Child's Hill, in the parish of Hendon, in which there is no efficient drainage, and where the open cesspools connected with the privies often overflow into the ditches and discharge their contents into the river Brent. Here, out of an entire population of 1000, there were 70 deaths in 1867, mainly from epidemic typhoid.

† We have already mentioned that the death-rate at Liverpool not very long ago reached 70; see also the preceding note.

‡ As in the year 1865, the population of England was 20,990,946, while the deaths were 490,909; the general death-rate for that year is 23.4. If this rate could have been reduced to 15, the number of lives thus saved in that year would have amounted to 176,324!

§ Twenty-five towns were visited, but we have omitted Ottery St. Mary, because it seems to have yielded no information.

more than 600,000 persons, is now published, and we shall give a brief abstract of the results which have been obtained. The numerical results are given in the accompanying table, page 131, where A shows at each place in the list what difference there has been, since sanitary works were established, in the *general death-rate* in 10,000 of the population, this number being taken instead of 1000 to obtain more accurate numerical results. B gives the general death-rates of A, *minus* the inconstant influence which has been exerted by the chief infantile epidemics; and similarly E gives the means of eliminating from A the influence of the cholera epidemics of 1848-49, 1854, and 1866. The columns C to G inclusive are for comparing the quantities of particular kinds of deaths caused in each of the places in the two compared periods. Such "special death-rates," used with caution, yield the most useful of all conclusions as to changes wrought in the public health.

From the table, which is fraught with the most valuable information, in the most condensed form, we learn that, omitting the influence of cholera, there has been a diminution in the death-rate in all but five cases, where the rate has been stationary. In four of the towns—viz., Cardiff, Newport (Mon.), Macclesfield, and Croydon—the reduction amounted to 24, 23, 20, and 18½ per cent. With regard to the *contagious diseases, small-pox*, which is capable of being rooted out by an efficient system of vaccination, is not noticed here, and *typhus fever* has scarcely occurred in the towns selected for inquiry. The time has hardly come for estimating the effect of works of sewerage and water-supply upon measles, scarlatina, and whooping-cough, inasmuch as epidemics of these diseases may revolve in long periods. *Measles* and *whooping-cough* seem, however, to have slightly declined. *Typhoid* has very much diminished with the ample supply of good water, and the purification of the atmosphere from decomposing organic matter, by the abolition of cess-pools, by draining, etc. In Salisbury, Stratford, Croydon, and Merthyr the annual death-rate from typhoid has diminished 75, 67, 63, and 60 per cent respectively; and in all the towns except three there was more or less diminution. In these exceptional cases it was found that sewage gases were, by a defect of the outfall arrangement, forced into the houses.* *Diarrhea* appears to have been reduced by purification of air and water. Removal of subsoil water has not affected it. While in three towns the death-rate from this disease has been diminished 50 per cent or more, in Ashby it has increased 100, and in Rugby 200 per cent. These anomalous results are ascribed to the prevalence of the disease in the respective work-houses. *Cholera epidemics* appear, says Dr. Buchanan, to have been rendered practically harmless in the towns examined, as may be seen by the comparison of the death-rates per 10,000 in the three last epidemics:

	1848-49.	1854.	1866.
Merthyr.....	267	84	20
Cardiff.....	208	66	15½
Alnwick.....	205
Salisbury.....	180	14½	..
Newport.....	112	1½	12
Bryn-mawr.....	100

Pulmonary phthisis has diminished in certain of the towns, and the diminution seems due to the drying of the soil, which has in most cases accompanied the laying of main sewers; and the greater the influence of the sewerage in drying the subsoil is, so much the greater is the diminution of the death-rate from this disease. At Salisbury it is 49 per cent of its former rate; at Ely, 47; at Rugby, 43; at Banbury, 41; and at Worthing, 36. Failure to reduce consumption is most observable either where the soil already contained little water, or where—the town water passing by the surface or in superficial drains—the deep drainage consisted of impervious pipes, laid down in compact channels, so that no extensive drainage of water could occur either through or alongside of them. It does not seem that the sewerage of towns, by the removal of excreta and house-slops, has acted to reduce the amount of their death-rate by consumption. *Diseases of the lungs* other than consumption have undergone no regular reduction. Dr. Buchanan concludes this most valuable report with the observation that the progress made by the inhabitants of most of the towns in decency, cleanliness, self-respect, and morality was at the least as striking as the improvement in their health, measured by the mortality returns.

In various articles on special disorders, as scurvy, small-pox, and typhoid fever, we have pointed out how completely they are under the control of sanitary or dietetic measures. In his excellent chapter "On the Prevention of Diseases in the Army," Dr. Parkes gives the following list of diseases, with the methods to be adopted for their prevention—viz.: (1) *Specific Diseases*—paroxysmal fevers, yellow fever, cholera, typhus exanthematicus, bubo plague, typhoid fever, relapsing fever, bilious remittent fever, eruptive fevers, erysipelas, hospital gangrene; and (2) *Non-specific Diseases*—dysentery and

* Worthing is the town in which the increase of fever is greatest, and this need not excite surprise when we learn that on the side of the water-tower of the town is a shed containing the engine which performs the double duty of distributing the water to the houses and the sewage to the land. To enable this to be effected there are two wells within 50 feet of one another, sunk in a porous soil, one for the reception of the sewage and the other for the drinking-water. Moreover, the water-well is in bad condition, and the water-supply is neither constant nor sufficiently abundant. See the article "Seaside Drainage—Worthing," in *The Medical Press and Circular*, Dec. 4, 1867. No arrangement for the propagation of typhoid could have been more ingeniously devised!

TABLE ILLUSTRATING THE IMPROVEMENTS OF PUBLIC HEALTH WHICH RESULT FROM PROPER WORKS OF DRAINAGE AND WATER SUPPLY.

diarrhea, liver disease, insolation, phthisis, scurvy, military ophthalmia (gray granulations on the palpebral conjunctiva), and venereal diseases.*

It is the miasmatic diseases which form the first order of the class of zymotic diseases, which seem most under our control. We have shown in a previous page that recent researches tend to show that various of these diseases owe their origin to fungi. We shall conclude this imperfect sketch of the history, progress, and results of sanitary science with a history of the recently discovered *cholera-fungus*, and with a notice of the other recent scientific investigations regarding the nature and prevention of this disease (which may be regarded as a supplement to the article CHOLERA). At the international congress held at Weimar in 1867, the cholera-fungus was the great center of interest. The subject had been investigated by professors Hallier and De Bary, two of the leading German mycologists, and the latter drew up a report, the following abstract of which is given by Mr. Simon†: "Both observers find in cholera evacuations, and in the intestinal mucus of the dead body, definite organic structures, zoogloea, consisting of excessively fine granules, clustered more or less densely in the interspaces of a jelly, which more or less abundantly surrounds them. The granules divide and subdivide themselves, to form beaded threads, which interlace, in immense numbers, into felted masses in the mucus. The further development of these organisms has yet to be determined. Dr. Thomé, by sowing them, has got, after some time, larger, round, cell-like bodies, which rapidly multiplied, and also abundant filamentous fungi (*cylindro-tenium*), on which grew cylindrical spores, capable of developing again to filaments. Views as to the mutual relations of these cells, filaments, and spores, are for various reasons to be expressed only with reserve; and the study of them is so immensely difficult, that definite results cannot at once be expected. The significance of these fungi would be greatly increased if they should be shown to exist in the blood as well as in the bowels of the sick; but this, though from some inquiries it seems probable, must at present be deemed questionable." It has been since ascertained that this fungus requires a high temperature (86° to 112° F.) for its fructification, and therefore cannot be of European origin. "The doctrine of the cholera-fungus," says Mr. Simon—"the alleged discovery that the specific zymosis of cholera, the bowel-fermentation in respect of which it is contagious, has essentially associated with it, and perhaps as its immediate cause, a definite multiplying organic form—is not only of the utmost philosophical interest, but, should it be substantiated, may also, hereafter, be found capable of very important practical application. For, as one reflects on the doctrine in all its bearings, specially, as one considers prof. Hallier's conjecture (based on botanical considerations), that perhaps the *cylindro-tenium* is originally a blight of rice, something like a clue is for the first time suggested for investigations, which may hereafter conduce to the prevention of cholera in its eastern centers of origination. But for us in Europe, meanwhile, the doctrine may be absolutely sterile of results. In its broad signification, indeed, the discovery would not be a surprise to pathologists. The possibility has for some years past been recognized, that perhaps every fermentatory or putrefactive change of organic material has with it, and possibly as its cause, a characteristic molecular living thing; and however sure it may have become, that the choleraic zymosis answers to that possibility, it remains yet untried whether disinfection (which, after all, is but a doubtful resource) can deal better with the process on that basis, than on the purely chemical basis which has hitherto been the ground of our proceedings."

"It cannot," adds the same high authority, "be too distinctly understood that the person who contracts cholera in this country is *ipso facto* demonstrated, with almost absolute certainty to have been exposed to excremental pollution; that what gave him cholera was (mediately or immediately) cholera-contagium, discharged from another's bowels; that, in short, the diffusion of cholera among us depends entirely upon the numberless filthy facilities which are let exist, and specially in our larger towns, for the fouling of earth, and air, and water, and thus, secondarily, for the infection of man, with whatever contagion may be contained in the miscellaneous outflowings of the population."

"Cholera, ravaging here at long intervals, is not nature's only retribution for our neglect in such matters as are in question. Typhoid fever and much endemic diarrhea are, as I have often reported, incessant witnesses to the same deleterious influence; typhoid fever, which annually kills some 15,000 to 20,000 of our population, and diar-

* In connection with diseases or affections which may be totally or in a very great measure prevented, is short-sightedness. Dr. Cohn, of Breslau, has examined the eyes of 10,000 school-children, out of which number 1730, or 17.1 per cent, were found to be short-sighted. No village-children were affected until they had been at least half a year at school. Dr. Cohn attributes the evil, in a great measure, to the bad construction of the school-benches, which force the children to read with their books close to their eyes, and with their heads inclining downward.

† A much fuller abstract (by Dr. Buchanan) of prof. Hallier's recent researches into the natural history of the cholera contagion, as contained in his pamphlet entitled, *Der Cholera-Contagion; Botanische Untersuchungen, Aertzen und Naturforscher mitgetheilt*, 1867, is given in pp. 512-515 of the appendix to Mr. Simon's ninth report, to which that able pathologist has added a most instructive note on the earlier microscopic observations that had been instituted, especially by our own countryman, on the cholera evacuations. On the subject of cholera the reader should also consult Dr. Parkes's *Sanitary Report (Army Medical Department) for 1865* (published in 1867), in which he discusses the recent additions to our knowledge of (1) The specific cause of cholera—the cholera-fungus; (2) The spread of cholera by intercourse; (3) Its communication by the so-called premonitory diarrhea; (4) Its spread by the agency of water; (5) and its prevention by disinfecting the discharges by means of carbolic acid, sulphate of iron, and salts of zinc.

rhea, which kills many thousands besides. The mere quantity of this wasted life is horrible to contemplate, and the mode in which the waste is caused is surely nothing less than shameful. It is to be hoped that, as the education of the country advances, this sort of thing will come to an end; that so much preventable death will not always be accepted as a fate; that, for a population to be thus poisoned by its own excrement, will some day be deemed ignominious and intolerable."

In conclusion we may remark, that Mr. Simon's ninth report for 1866 (published in 1867) is one of the most valuable contributions to the literature of cholera that has ever been presented to the profession. The history of this disease in England in 1866 is first given. This is followed by a series of scientific investigations on the following points: 1. Examination of the degrees of success attained by different methods of *treatment* of cholera at Guy's, St. Bartholomew's, the London, and St. Thomas's hospitals. 2. Study of the successive *chemical changes* undergone by the body in cholera. 3. Similar study, chiefly microscopical, of the successive *anatomical changes* of the affected body. 4. Collection of facts as to the non-coincidence of local epidemics of cholera with such conditions of the local ground-water as are indicated by a foul state of the surface-wells. The results of these studies are given in the appendix. Unfortunately, the practical result of these inquiries is, that in cases of developed cholera "our utmost power is but perhaps some very little ability of palliation, and in the treatment of incipient cholera competent physicians are not agreed that even here their art has much efficiency." In contrast with the powerlessness of curative medicine, the power of preventing it is about the happiest possession of science. The evidence of Dr. Buchanan and others clearly shows that cholera may be prevented by due attention to sanitary works, which provide for the prompt and complete removal of fecal impurities, and the plentiful supply of water which cannot have been exposed to this form of contamination. In addition to the works quoted in this article, we may refer those of our readers who wish to study this subject more fully, to the French treatises on hygiene by Becquerel, Levy, Tardieu, Vernois, and others. There is, however, no work on the subject in any language equal to that of Dr. Parkes, from which we should not have ventured to borrow so freely if we had not had the author's kind permission.

SANITARY SURVEY, a survey made by a health officer or a sanitary commission for the purpose of determining the sanitary conditions of a locality, both natural and artificial, or either, with a view of ascertaining the proper remedies, if any are required. When a city or a district has been, or is, affected by an epidemic or an epidemic disease several important questions may be settled by a survey by a civil engineer combined with an inspection. See **SANITARY SCIENCE**, **HEALTH** (*ante*), **HEALTH**, **MUNICIPAL BOARDS OF**, and **HYGIENE**.

SAN JACINTO, a co. in s.e. Texas; bounded on the n.e. by the Trinity river; drained by the branches of the San Jacinto river; about 500 sq.m.; pop. '80, 6,186—3,331 colored. The surface is rolling. The soil is fertile. The principal productions are corn and cattle. Co. seat, Cold Spring.

SAN JACINTO, BATTLE OF, near San Jacinto bay, Texas, April 21, 1836, between the Texan troops, 700 in number, under gen. Houston, and about 1500 Mexicans, under Santa Anna. Harrisburg, then the capital, was burned by the Mexicans on the night of the 18th. Houston was marching on a parallel line with the Mexicans with a view to get control of the ferry over the San Jacinto. Santa Anna, endeavoring to cut off Houston's retreat, came up to the bay about the same time with him. The opposing forces took up positions about one mile apart, and Houston, relying on his knowledge of the ground, resolved to fight. After some preliminary skirmishing on the 20th, the battle took place on the 21st. It was hardly more than a sharp charge by the Texans, who rushed on with the cry "Remember the Alamo." Santa Anna fled, but was afterward captured. He was released on parole on condition to do his best to insure the recognition of Texan independence. The Texan loss was only 8 killed and 25 wounded.

SANJAK, a Turkish word signifying "a standard," is employed to denote a subdivision of an *eyalet* (q.v.), because the ruler of such a subdivision, called *sanjak-beg*, is entitled to carry in war a standard of one horse-tail. The sanjak is frequently called a *lia*, and its ruler a *mirmiran*.

SANJAK SHERIF. See **FLAG OF THE PROPHET**.

SAN JOAQUIN', a river of California, rises in the Sierra Nevada, and runs first s.w. to its junction with the outlet of lake Tulare, thence n.w. to its junction with the Sacramento river, 50 m. from the bay of San Francisco. It receives numerous branches from both the coast range of mountains and the Sierra Nevada. Entire length, 350 m., for only a small portion of which it is navigable for large vessels.

SAN JOAQUIN', a co. in central California; drained by the San Joaquin river and by the Calaveras and other of its branches; traversed by the Central Pacific, the Stockton and Visalia, and the Stockton and Copperopolis railroads; 1,452 sq.m.; pop. '80, 24,354—17,187 of American birth, 1,984 Chinese. The surface is not rugged, though the county lies between the Coast and Sierra Nevada ranges; there is much marsh land in the n.w. Co. seat, Stockton.

SANJO SANÉYOSHI, the present premier of Japan, b. in Kioto, 1836, of one of the most illustrious families in the Kuge, or court nobility. For sympathizing too strongly with the attempts to restore the mikado to his ancient power he and six other nobles were banished from Kioto, 1863, to Chōshiu and deprived of their honors and titles by the Tycoon's ministers resident in Kioto. These six nobles were restored to honor and office after the palace revolution and *coup d'état* of Jan. 3, 1868, and Sanjo Sanéyoshi was made an active member of the new government. In 1871, by a decree of the mikado, he was made *dai jō dai jin* (the great minister of the great government) or premier, and still (July, 1880,) holds this supreme office, the highest to which a subject in Japan can attain. He, with Iwakura and the other *dai jin*, form the triumvirate that represents the conservative force of the imperial court, as modifying the active tendencies of the departmental ministers. The office of *dai jō dai jin* is of very ancient foundation, antedating probably the 6th century.

SAN JOSÉ, the seat of justice of Santa Clara co., Cal., on the Southern Pacific railroad, and the terminus of the San José branch of the Central Pacific; on the Gaudaloupe river, 48 m. s.e. of San Francisco bay; pop. '80, 12,567. The city is situated on a plateau between, and extending beyond, the Gaudaloupe and Coyote rivers, which are 1½ m. apart. The climate is dry and even. It has wide and regular streets; is lighted with gas; supplied with water from artesian wells, and is noted for its fine gardens. The principal public buildings are the court-house, state normal school, jail, and two markets. It has three parks of 2, 8, and 10 acres, and there is one of 400 acres, 7 m. distant in Penitencia cañon, containing mineral springs and wild and picturesque scenery, a magnificent avenue, which cost \$30,000, and bordered by rows of trees, leads to it. It contains the college of Notre Dame for girls, a large opera house, a library association, a business college, churches, and numerous manufactories. It was settled by Spaniards about 1800, was ceded to the United States, and the first legislature of California was held there in 1849-50. Slight earthquake shocks are sometimes felt.

SAN JOSÉ, or **SAN JOSE DEL INTERIOR**, the capital of Costa Rica, Central America, on the river Carthago, and 15 m. w.n.w. of the remains of the town of that name, which was formerly the capital of the country. It stands on a table-land 4,500 feet above sea-level, contains a number of important institutions (including a university), and carries on an active trade. Its port is Punta Arenas, on the gulf of Nicoyas, 60 m. west. In 1873-74, 139 vessels, of 136,301 tons, entered, and 134 vessels, of 136,180 tons, cleared Punta Arenas. Pop. of San José, 25,000.

SAN JUAN, a co. in n.e. Washington territory, comprising the islands of San Juan, Orcas, Lopez, Blakely, Decatur, Shaw, Waldron, Henry, Spiedan, Stuart, and Sucia, with a few islets, all in Puget sound, between Vancouver island and the main-land; about 200 sq.m.; San Juan and Orcas islands about 60 sq.m. each; Lopez 30. These islands previous to the San Juan boundary dispute (q.v.) were part of Whatcom co., but in 1873 were made into a new county. They are rugged and heavily wooded, but there is some prairie land. Coal and limestone are found. Co. seat, Friday Harbor.

SAN JUAN BOUNDARY QUESTION arose under the treaty of June 15, 1846, between the United States and Great Britain in regard to the Oregon boundary, which was made by the treaty the 49th parallel as a line to "the middle of the channel which separates the continent from Vancouver island, and thence southerly through the middle of said channel and of Fuca straits, to the Pacific ocean." Afterward a difference of opinion arose between the two countries as to what "channel" was meant; the United States maintaining that it was the canal de Haro, and Great Britain that it was Rosario strait, so that it remained unsettled to which government Washington sound and the islands in it belonged. An amicable arrangement was effected in 1859, by which the two governments jointly occupied the island, the United States having a garrison in the s. and Great Britain in the north. The treaty of Washington (1871), art. 34, referred the controversy to the emperor of Germany, who decided for the United States in 1872. The British garrison left in November.

SAN JUAN DE LA FRONTERA, a t. of the Argentine republic, the capital of a province of the same name in the extreme w. of the republic. The town, 660 m. n.w. from Buenos Ayres, stands on the right bank of a river, also called San Juan de la Frontera, which rises in the Andes, and falls into the large salt lake of Guanacache. The province is as yet only very partially settled, but exports considerable quantities of fruits and wine. The chief seat of trade is this town, which has a pop. of 20,000, almost one-third of that of the whole province.

SAN JUAN DE POR TO RICO. See **PUERTO RICO**.

SAN JUAN RIVER, a river of Nicaragua the sole outlet of lake Nicaragua. After leaving the s.e. end of the lake, it flows in a s.e. course for 120 m. and empties into the Atlantic. Its delta is large and there are three channels, the Taura, San Juan, and Colorado. The last is the only one easily navigable, but lies within the limits of Costa Rica. The town of San Juan del Norte, or Greytown, lies near the San Juan channel, but its harbor has in large part been filled with sand and is now difficult of access. The river has a number of branches of which the San Carlos and Sarapiquí are the largest.

There are five sets of rapids rendering navigation impossible. The San Juan is part of the proposed Nicaragua route for the interoceanic canal and has several times been surveyed with a view to its use for that purpose.

S'ANKARA, or S'ANKARĀCHĀRYA, i.e., the *āchārya*, or spiritual teacher, S'ankara, is the name of one of the most renowned theologians of India. His date, as is the case with most celebrities of that country, is unknown. Tradition places him about 200 B.C., but H. H. Wilson assigns him, with more probability, to the 8th or 9th c. after Christ. With regard to his place of birth and to his caste, most accounts agree in making him a native of Kerala or Malabar, and a member of the caste of the Nambūri Brahmans. In Malabar, he is said to have divided the four original castes into seventy-two, or eighteen subdivisions each. All accounts represent him as having led an erratic life, and engaged in successful controversies with other sects. In the course of his career, he founded the sects of the *Das'nāmī-Dan'dīns* (see S'ĀIVAS). Toward the close of his life, he repaired to Cashmere; and finally to Kēdārnāth, in the Himalayas, where he died at the early age of 32. His principal works, which are of considerable merit, and exercised a great influence on the religious history of India, are his commentary on the *Vedānta* (q.v.) Sūtras, and his commentaries on the *Bhaga vadgītā* and the principal *Upanishads* (q.v.). His learning and personal eminence were so great that he was looked upon as an incarnation of the god S'iva, and was fabled to have worked several astounding miracles. One of these was his animating the dead body of a king Amara, in order to become temporarily the husband of the latter's widow, so as to be able to argue with the wife of a Brahman mandana upon the topic of sensual enjoyments—the only topic on which he had remained ignorant, as he had always led the life of a brahmachārin, or bachelor student. A number of works are current in the S. of India relating to his life; among these, the *S'ankara-dig-vijaya*, or the conquest of the world by S'ankara, composed by *Anandagiri*, one of his disciples, is the most important.—See H. H. Wilson, *A Sketch of the Religious Sects of the Hindus*; works, vol. i. (edited by Dr. R. Rost, 1862), pp. 197, ff.; and Cavell Venkata Ramaswami, *Biographical Sketches of Deccan Poets* (Bombay, 1847).

SANKHYA (from the Sanskrit *sankhyā*, synthetic reasoning) is the name of one of the three great systems of orthodox Hindu philosophy. See SANSKRIT LITERATURE. It consists of two divisions—the Sāṅkhya, properly so called, and the Yoga (q.v.); and like the other systems (see MĪMĀṂSĀ and NYĀYA), it professes to teach the means by which eternal beatitude, or the complete and perpetual exemption from every sort of ill, may be attained. This means is the discriminative acquaintance with *tattva*, or the true principles of all existence, and such principles are, according to the Sāṅkhya system, the following twenty-five: (1), *Prakṛ'iti* or *Pradhāna*, substance or nature; it is the universal and material cause; eternal, undiscete, inferable from its effects; productive, but unproduced. Its first production is (2) *Mahat* (lit. the great), or *Buddhi* (lit. intellect), or the intellectual principle, which appertains to individual beings. From it devolves (3) *Ahaṅkāra* (lit. the assertion of "I"), the function of which consists in referring the objects of the world in one's-self. It produces (4-8) five *tanmātrā*, or subtle elements, which themselves are productive of the five gross elements (see 20-24). *Ahaṅkāra* further produces (9-13) five instruments of sensation—viz., the eye, the ear, the nose, the tongue, and the skin; (14-18), five instruments of action—viz., the organ of speech, the hands, the feet, the excretory termination of the intestines, and the organ of generation; lastly (19), *manas*, or the organ of volition and imagination. The five subtle elements (see 4-8) produce (20-24) the five gross elements—viz., *ākāśa*, space or ether, which has the property of audibleness, is the vehicle of sound, and is derived from the *sonorous tanmātrā*; air, which has the properties of audibleness and tangibility, is sensible to hearing and touch, and is derived from the *aërial tanmātrā*; fire, which has the properties of audibleness, tangibility, and color, is sensible of hearing, touch, and sight, and is derived from the *igneous tanmātrā*; water, which has the properties of audibleness, tangibility, color, and savor, is sensible to hearing, touch, sight, and taste, and is derived from the *aqueous tanmātrā*; lastly, earth, which unites the properties of audibleness, tangibility, color, savor, and odor, is sensible to hearing, touch, sight, taste, and smell, and is derived from the *terrene tanmātrā*. The 25th principle is *prāṇa*, or soul. It is neither produced nor productive; it is multitudinous, individual, sensitive, eternal, unalterable, and immaterial. The union of soul and nature takes place for the contemplation of nature, and for abstraction from it, "as the halt and the blind join for conveyance and for guidance, the one bearing and directed, the other borne and directing." From their union, creation is effected. The soul's wish is fruition or liberation. In order to become fit for fruition, the soul is in the first place invested with a *linga-s'arīra*, or *sūkshma-s'arīra*, a subtle body, which is composed of *buddhi* (2), *ahaṅkāra* (3), the five *tanmātrās* (4-8), and the eleven instruments of sensation, action, and volition (9-19). This subtle body is affected by sentiments, but being too subtle to be capable of enjoyment, it becomes invested with a grosser body, which is composed of the five gross elements (20-24), or, according to some, of four, excluding *ākāśa*, or, according to others, of one alone—viz., earth. The grosser body, propagated by generation, perishes; the subtle frame, however, transmigrates through successive bodies, "as a mimic shifts his disguises to represent various characters." Some assume, besides, that between these

two there is intermediately a corporeal frame, composed of the five elements, but tenuous, or refined, the so-called *anukūḥāna s'arira*.

Creation, resulting from the union of *prakṛiti* (i) and *puruṣa* (25), is *material*, or consisting of souls invested with gross bodies, and *intellectual*, or consisting of the affections of intellect, its sentiments or faculties. *Material creation* comprises eight orders of superior beings—gods, demi-gods, and demons; five of inferior beings—quadrupeds, birds, reptiles, fishes, and insects; besides vegetable and inorganic substances; and man, who forms a class apart. This material creation is again distributed into three classes: 1. that of *sattva*, or goodness, comprising the higher gods, with virtue prevailing in it, but transient; that of *tamas*, or darkness, where foulness or passion predominates; it comprises demons and inferior beings; and between these, that of *rajas*, or impurity (lit. colored condition), the human world, where passion together with misery prevails. Throughout these worlds, soul experiences pain, arising from death and transmigration, until it is finally liberated from its union with person. *Intellectual creation* comprises those affections which obstruct, disable, content, or perfect, the understanding; these amount to fifty. *Obstructions* of intellect are error, conceit, passion, hatred, fear, severally subdivided into 62 species. *Disability* of intellect arises from defect or injury of organs, such as deafness, blindness, etc., and from the contraries of the two next classes; making a total of 28 species. *Content* is either internal or external—the one fourfold, the other fivefold. Internal content concerns nature, proximate cause, time, and luck; external content relates to abstinence from enjoyment upon temporal motives—viz., aversion to the trouble of acquisition, or to that of preservation, and reluctance to incur loss consequent on use, or evil attending on fruition, or offense of hurting objects by the enjoyment of them. The *perfecting* of intellect comprises eight species; it is direct, as preventing the three kinds of pain; or indirect, such as reasoning, oral instruction, amicable intercourse, etc.

Besides the 25 principles, the Sāṅkhya also teaches that nature has three essential *gun'as*, or qualities—viz., *sattva*, the quality of goodness or purity; *rajas* (lit. coloredness), the quality of passion; and *tamas*, the quality of sin or darkness; and it classifies accordingly material and intellectual creation. Thus, four properties of intellect partake of goodness or purity—viz., virtue, knowledge, dispassionateness, and power; and four, the reverse of the former, partake of sin or darkness—viz., sin, error, incontinency, and powerlessness. It is worthy of notice that by power the Sāṅkhya understands eight faculties—viz., that of shrinking into a minute form, to which everything is pervious; of enlarging to a gigantic body; of assuming extreme levity; of possessing unlimited reach of organs; of irresistible will; dominion over all beings, animate or inanimate; the faculty of changing the course of nature; and the ability to accomplish everything desired. The knowledge of the principles, and hence the true doctrine, is, according to the Sāṅkhya, obtained by three kinds of evidence—viz., perception, inference, and right affirmation, which some understood to mean the revelation of the Veda and authoritative tradition.

It will be seen from the foregoing summary that the Sāṅkhya proper does not teach the existence of a supreme Being, by whom nature and soul were created, and by whom the world is ruled. It was therefore accused by its opponents of being atheistical, or as denying the existence of a creator; and it is the special object of the *Yoga* system to remove this reproach, by asserting his existence, and defining his essence (see *YOGA*). The truth however, is, that the Sāṅkhya proper merely maintains that there is no proof for the existence of a supreme Being; and the passages quoted by the opponents to show that the founder of the Sāṅkhya *denied* *Iśvara*, or a supreme God, are quite compatible with the view that he confined his teaching to those *tattvas* or principles which, in his opinion, were capable of demonstration. Nor is it at all probable that the founder of the orthodox *Yoga* would have propounded his system as supplementary to that of the Sāṅkhya proper, had there been that incompatible antagonism between them which must separate an atheistical from a theistical philosophy. The Sāṅkhya system underwent a mythological development in the *Purāṇas* (q.v.), in the most important of which it is followed as the basis of their cosmogony. Thus, *Prakṛiti*, or nature, is identified by them with *Māyā*, or the energy of Brahṁā; and the *Matsya-Purāṇa* affirms that *Buddhi*, or *Mahat*, the intellectual principle, through the three qualities, goodness, passion, and sin, "being one form, becomes the three gods, Brahṁā, Viṣṇu, and Śiva." The most important development, however, of the Sāṅkhya is that by the Buddhistic doctrine, which is mainly based on it. The Sāṅkhya system is probably the oldest of the Hindu systems of philosophy; for its chief principles are, with more or less detail, already contained in the chief Upanishads (see *VEDA*); but whether the form in which it has come down to us, and in which it is now spoken of as *the* Sāṅkhya, is also older than that in which the other systems are preserved, is a question as yet not solved by Sanskrit philology. That this form, however, is not the oldest one is borne out, for instance, by the differences which exist between the Sāṅkhya doctrine of the Upanishads and the doctrine propounded in the first book of the institutes of Manu on the one side, and the doctrine of the actual Sāṅkhya on the other.

The reputed founder of the actual Sāṅkhya is *Kapila* (lit. *twining*), who is asserted to have been a son of Brahṁā, or, as others prefer, an incarnation of Viṣṇu. He taught his system in *Sūtras* (q.v.), which, distributed in six lectures, bear the name of *Sāṅkhya-*

Pravachana. The oldest commentary on this work is that by *Aniruddha*; another, is that by *Vijñānabhikṣu*. The best summary of the Sāṅkhya doctrine is given by I's'wara Kr'ishn'a, in his *Saṅkhya-Karika*, edited by H. H. Wilson, with a translation of the text by H. T. Colebrooke, and a translation of the commentary of Gaud'apāda by himself (Oxford, 1837). For the various theories concerning the word Sāṅkhya, and the founder of the system Kapila, and for the literature relating to it, see the elaborate and excellent preface by Fitzedward Hall to his edition of the *Saṅkhya-Pravachana*, with the commentary of Vijñāna-bhikṣu, in the *Bibliotheca Indica* (Calcutta, 1856); and see also his valuable *Contribution toward an Index to the Bibliography of the Indian Philosophical Systems* (Calcutta, 1859). Amongst essays on the Sāṅkhya philosophy, the most reliable still remains that by H. T. Colebrooke, reprinted from the *Transactions* of the Royal Asiatic society, in his *Miscellaneous Essays* (London, 1837), vol. i. p. 227, ff.

SANKEY, IRA DAVID, b. Penn., 1840; was engaged in business at New Castle, Penn., 1855-71; afterward became associated with Dwight L. Moody in revival work at Chicago; in Great Britain, where they were instrumental in producing great religious awakenings in Edinburgh, Glasgow, Dublin, London, and other cities, 1873-75; and since then in various principal cities in the United States. In these labors Mr. Sankey has had special charge of the devotional singing in which he is eminently efficient.

SAN LUCAR DE BARRAMEDA, a sea-port of Andalusia, in the modern province of Cadiz, and 18 m. n. of the port of that name, stands on a sandy, undulating tract on the left bank of the Guadalquivir, and at the mouth of that river. It is a dull, decaying place, and is notable chiefly as the mart whence inferior and adulterated vintages are exported to England as sherries. Pop. 16,000.

SAN LUIS, a province in central Argentine Republic; bounded on the n. by Rioja, on the e. by Cordova and Rio Colorado, on the s. by Rio Colorado, and on the w. by Mendoza and San Juan; drained by the Rio Quinto; about 20,000 sq.m.; pop. about 55,000. The surface is even in the s. with good pasture land; mountainous in the north. The soil is fertile. The principal productions are fruits, wines, and cattle. Gold, copper, and salt are found. Hides, skins, and wool are exported. Capital, San Luis.

SAN LUIS DE LA PUNTA, the chief t. of the province of San Luis in the Argentine Republic, is situated 445 m. w.n.w. from Buenos Ayres, on a river which falls into the large salt lake of Bevodero. San Luis de la Punta has some trade in horses, hides, and furs. Pop. above 5,000.

SAN LUIS OBISPO, a co. in s.w. California, bounded by the Coast range on the e., the Pacific on the w., and the Santa Maria on the s.; drained also by the Salinas river; about 3,000 sq.m.; pop. '80, 9,142-7,179 of American birth. The surface is mountainous but in great part fertile; wheat, corn, barley, hay, and dairy products are the staples. Gold, silver, and coal are found. Co. seat, San Luis Obispo.

SAN LUIS POTOSI', a state in e. Mexico, bounded on the n.e. by Nuevo Leon, on the e. by Tamaulipas and Vera Cruz, on the s. by Queretaro and Guanajuato, and on the w. by Zacatecas; drained by the Tampico and Santander rivers; about 27,500 sq.m.; pop. about 525,000. The surface except in the s.e. is mountainous or hilly. The plains are fertile, and there is much good pasture land among the mountains. There are valuable copper mines. The principal productions are corn, barley, wheat, and cattle. There are manufactures of leather, metal wares, cottons, woolens, etc. Capital, San Luis Potosi'.

SAN LU'IS POTOSI', a considerable t. of Mexico, capital of the state of the same name, stands near the source of the river Tampico, and 200 m. w. of the port of that name on the Mexican gulf. It stands on a plateau 6,350 ft. above sea level, is well built, containing many handsome edifices, chiefly ecclesiastical, and is surrounded by gardens. Its markets are well supplied, and it carries on a considerable trade with the neighboring states. Shoes, hats, and hardware are the chief manufactures, and woven fabrics and liquors are imported from Tampico. Pop. 33,600.

SAN MARCO IN LA'MIS, a t. of s. Italy, in the province of Foggia, 18 m. n.n.e. of Foggia. It has some trade in corn, wine, oil, and silk. Pop. above 15,000.

SAN MARINO, or **MARINO**, one of the most ancient and most limited republican states of Europe, consists of a craggy mountain 2,200 ft. in height, situated amidst the lesser ranges of the Apennines, and encircled by provinces formerly belonging to the Pontifical States. It possesses a total area of 21 m., and comprises a t. of the same name, and several villages in the adjacent territory. The climate is healthy, but, owing to its exposure, high winds and frequent rains prevail. The town of Marino is built on a slope of the mountain; it is accessible only by one road, and is protected by walls and towers; it contains several squares and streets, rudely paved, and various public buildings, including seven churches, a town-hall, a theater, the governor's palace, convents, museums, and hospitals. The inhabitants, who numbered, in 1874, 7,816, are noted for their hospitality, sobriety, industry, and general morality. They are sensitively jealous of their rights, and cling with tenacity to their territorial and legislative independence. Their chief trade is in agricultural produce and cattle.

The early history of the republic is very obscure. During the mediæval wars of Italy,

Marino had its pigmy feuds and factions, which seem to have been none the less envenomed from the pettiness of the arena in which they were enacted. In 1740 the democratic form of government was securely guaranteed against further assault. The rights of this miniature state were scrupulously respected by Napoleon during his Italian campaign. The government, designated the sovereign grand council (*generale consiglio principe*), is composed of 60 members, of whom one third are nobles. From this number are selected the smaller "council of twelve" (two-thirds from the town and the rest from the country), who, with the assistance of a jurisconsult, decide in questions of the 2d and 3d instance. The representatives of the state are termed captains-regent (*capitani reggenti*). They are chosen, the one from the party of the nobles, the other from the bourgeoisie. They each hold office only for six months. The army, or rather the militia of the republic, numbers 950 men.

SAN MARTÍN, JOSÉ DE, 1778-1850; b. Yapeyú; received a military education in Spain, served at Baylen as col. in the Spanish army. He organized the Argentine forces in the war of independence in South America, and was commander in chief, 1814, of the expedition to upper Peru against the viceroy of Lima. He raised an army in the province of Cuyo, and crossing the Chilian Andes defeated Osorio in the battle of Chacabuco 1817. He was offered the presidency of Chili, but declined it; and meeting the Spaniards again at Maypu defeated them, and secured Chilian independence. In 1820 accompanied by Bernard O'Higgins, president of Chili, he made a triumphal entrance into Lima, and in 1821 declared Peru independent and himself protector. In 1822, compelled to resign his office, he retired to private life, residing in England, France, and the Netherlands.

SAN MATEO, a co. in w. California, having the bay of San Francisco on the n., the Pacific ocean on the w.; 300 sq.m.; pop. '80, 8,669—5,135 of American birth, 637 colored. It is intersected by the Southern Pacific railroad. Its surface is hilly, rising into mountains 3,000 ft. high covered with forests of oak and redwood, the latter used largely for building purposes. The climate is warm and mild. Its towns have as residents many merchants of San Francisco who reside in the country. The soil is very fertile, producing vegetables of remarkable size, dairy products, and grain. It contains valuable mineral springs; and has manufactures of flour, leather, and lumber. Co. seat, Redwood City.

SAN MATEO, a t. of Venezuela, South America, in the department of Cumana, and 50 m. s.s.w. of the town of that name. Pop. 7,000.

SAN MIGUEL, a co. in e. New Mexico, adjoining Texas; drained by the Rio Pecos and Canadian rivers; about 10,800 sq.m.; pop. '70, 16,058. The surface is mountainous in the n.w., but productive elsewhere; wheat, corn, hay, wool, and dairy products are the staples; cattle-grazing is extensively carried on. There are several flouring and saw mills. Co. seat, Las Vegas.

SAN MIGUEL, a t. of Central America, in San Salvador, and about 80 m. e. of the city of that name. It is said to be the chief trading town in Central America. At its annual fair of La Paz, 15,000 strangers assemble, and business to the amount of \$2,000,000 is transacted. About five m. w. of San Miguel is a volcano, 6,680 ft. high, which was in a state of eruption in 1848, and again in 1855. Ordinary pop. 10,000.

SAN MIGUEL, EVARISTE, Duc de, 1780-1862; b. Gijon, Spain. In 1808 he joined in the movement against the French, became a lieut.col. in the army, and later a delegate to the cortes. In 1820 he joined in Riego's expedition to Andalusia. He was exiled 1821, but recalled the following year and made minister of foreign affairs. After the French intervention of 1823 he was again exiled, but returned to Spain in 1834 and again became a member of the cortes. In 1854 he was president of the Madrid junta, and later minister of war and field-marshal.

SAN MINIA'TO, a city of central Italy, province of Florence, and 21 m. w.s.w. of the city of that name. San Miniato is a fine old episcopal city, adorned with many monuments, and is famous in the history of the Florentine republic. Pop. 2,785.

SANNAZARO, JACORO, a distinguished Italian poet of Spanish descent, was b. at Naples July 28, 1458. Love for a young lady called Carmosina Bonifacia, whom he has celebrated under the names of Harmosine and Filli, was what developed his poetical faculty. The lady being insensible to his passion, he sought to forget her in travel. It was during his absence that he composed the *Arcadia*, a medley of prose and verse, of which Tiraboschi, the historian of Italian literature, thus speaks: "The elegance of the style, the propriety and the choiceness of the expressions, the descriptions, the imagery—everything, in fact, is fresh and original." The work was greatly admired, and in the course of a century went through 60 editions. It has given its author the reputation of being an Italian classic. Sannazaro, after his return to Italy; was invited to the Neapolitan court, and composed some comedies for the amusement of the royal family, of which only one has been preserved. He died at Naples in 1530 or 1532. His other productions are *Sonetti e Canzoni*, *Ecloga VI.* (reckoned by some his most perfect performance); *Elegiarum Libri III.*; *De Morte Christi ad Mortales Lamentatio*; and *De Partu Virginis, Libri III.*, mostly written in Latin verse. Sannazaro's life has been written by Crisipo and J. A. Volpi. See also Tiraboschi's *Storia della Letterat. Ital. VII. Part iii.*

SAN NICAN DRO GARGANICO, a t. of southern Italy, in the province of Foggia, 26 m. n. of the city of Foggia. Pop. 8,186. It is situated on mount Gargano, and is one of the most populous towns among those mountains. The lands belonging to it are very fertile, and great herds of cattle and sheep are reared there. It trades in grain, wool, and wine.

SAN NICOLAS, or **SAN NICOLÃO**, one of the Cape Verd islands (q.v.), and residence of the bishop of the group.

SAN PATRICIO, a co. in s. Texas, on the gulf of Mexico, n. of Corpus Christi bay, drained by the Nueces and the Aransas rivers; about 565 sq.m.; pop. '80, 1010—749 of American birth. The surface is level and heavily timbered. The soil is fertile. The principal production is live stock. Co. seat, San Patricio.

SAN PETE, a co. in e. Utah, adjoining Colorado; drained by Green, San Pete, and White rivers; about 6,800 sq.m.; pop. '70, 6,786—3,890 of American birth. The surface is traversed in the w. by the Wahsatch mountains, it consists in the e. of large valleys, and is heavily timbered. The soil in the e. and along the San Pete river is fertile. The principal productions are corn, wheat, oats, wool, and cattle. Co. seat, Manti.

SAN REMO, a city of northern Italy, province of Porto Maurizio, 27 m. e.n.e. of Nice. It is built on the slope of a rising ground on the shores of the Mediterranean. Its fine cathedral, the Santuario della Guardia, and the Santuario dell' Assunta are worthy of notice, the last having four handsome pillars of alabaster. The palace of the marquis Borrea d'Olmo contains a fine picture gallery. There is a seminary for priests, besides a college and many schools. Its little harbor carries on a brisk trade in oils and lemons. Nine foreign consuls reside in the town. San Remo is an ancient city, and obscure in its origin. In 1170 it was self-governed, and made an alliance with the Genoese against the Pisans. One of its bishops afterward sold it to Genoa. "San Remo is perhaps the mildest situation on all the Riviera. Here palms, lemon, and orange trees grow with the greatest luxuriance, and the fruit of the date palm almost attains maturity."—Murray's *Handbook*. In recent years it has begun to be resorted to by English visitors, and several new and excellent hotels have been erected. Pop. 9,017.

SAN ROQUE, a t. of Spain, in the modern province of Cadiz, on the bay of Gibraltar, and 8 m. n.n.w. of the town of that name. The salubrity of the climate, and the cheapness of living, have attracted hither many foreign families, especially English. Pop. about 7,000.

SAN SABA, a co. in w. Texas, bounded e. and n. by the Colorado, and drained by the San Saba river; 980 sq.m.; pop. in '80, 5,325. The surface is hilly and covered with large forests: the soil is partially fertile. The main productions are wheat, sweet potatoes, honey, wool, molasses, cattle, and swine. It contains sulphur springs. Co. seat, San Saba.

SAN SALVADOR, the smallest, though the second in point of population, of the Central American republics (see AMERICA), consists of a strip of territory stretching along between Honduras and the Pacific, and bounded on the w. by Guatemala, and on the e. by Fonseca bay, which separates it from Nicaragua. It averages 180 m. in length, by about 40 in breadth, and contains an area of 7,230 English sq.m., with a pop. (according to the most recent estimate) of 600,000, or 83 to the sq. mile. The northern frontier is formed by a portion of the great Cordillera chain, and parallel to this range, and between it and the Pacific sea-board, runs another range of mountains along the whole length of the country, breaking it up into an inland valley, and a long, low, rich belt along the coast. This central range is highly volcanic in character, and has 16 volcanic peaks, ranging in height from 7,386 to 4,000 ft. high. San Salvador possesses numerous lakes, the largest of which is Guija, about 90 m. in circumference, and abounding in fish. The greater portion of the interior valley, and the alluvial strip lying along the coast, are of extreme fertility, and agriculture is extensively and successfully practiced, to the almost total exclusion of pastoral pursuits. The principal agricultural products are indigo, sugar, and maize, cotton also being successfully cultivated in the districts around La Libertad and the bay of Jiquilisco. The coast from Acajutla (30 m. from the western frontier) to La Libertad is known as the *Costa del Balsamo*, or Balsam coast, as in the woods of this district is produced the famous balsam known as "balsam of Peru," in such quantities that from 17,600 to 22,000 lbs. av. are annually exported. The mineral wealth of San Salvador is not great, but rich veins of silver are found at Tabancó in the n.e., and mines of iron in the w. near Santa Ana. San Salvador has considerable export trade in indigo (which is known in trade as "indigo of Guatemala," and is reckoned the finest of all) and sugar, as well as turpentine, cocoa, cotton, and spices. The annual value of exports amounts to about \$3,200,000, and that of imports to \$2,000,000. The revenue is between \$2,000,000 and \$3,000,000, the expenditure being a little less. The debt in 1875 was \$4,360,000.

The climate of San Salvador is salubrious, and the temperature is lower than might be expected from the low latitude and general want of elevation of the country.

The bulk of the population is composed of Indians and mixed races, there being about 300,000 of the former, and about 190,000 of the latter. There are about 9,000 whites (of Spanish origin), and 1000 negroes. The Indians are of the Aztec race, speak

the Spanish language, and profess the Roman Catholic religion (the one established by statute) but retain many of their old heathen rites, and live in a certain degree apart from the rest of the population. They have the rights of citizens, but generally exercise them under the advice of the government. The government is carried on by a president, vice-president, and two ministers, one for foreign affairs and finance, and the other for internal business and war. The legislature consists of two chambers, an upper one of 12 senators, and a lower of 24 representatives. Education is well provided for, every village of 50 inhabitants being bound by law to support a school, and there is a university in the capital, San Salvador (q.v.), which is well endowed by the state. The standing army is 1,000 men.

San Salvador, originally called *Cuscatlan*, "the land of riches," is said to have been, previous to the immigration of Europeans, the best peopled and most civilized country in America. It was conquered after a long and obstinate contest by Pedro de Alvarado, a lieut. of Cortes, and under the Spanish rule was one of the most flourishing portions of the Guatemalan kingdom. In 1821 it threw off the yoke and joined the Mexican confederation, from which, however, it seceded in 1823. The several trials since made of a union among the Central American states have ended in the dissolution of all political connection; and San Salvador is now an independent republic. In 1863 war broke out between San Salvador and Guatemala, in which Honduras joined the former, and Nicaragua the latter. The result was the defeat of San Salvador, and the expulsion of the president from the country. The government has taken active measures toward developing the resources of the country.

SAN SALVADOR, the capital of the republic of San Salvador, was founded in 1589, and supplanted an older town which had been built in 1528 by a brother of Pedro de Alvarado. It was the capital of the Union of Central America from 1823 till 1839. In 1854 it was a fine, well-built city, adorned with numerous splendid buildings, and containing a pop. of more than 30,000, but on the night of April 16 it was completely destroyed by an earthquake, and about 100 lives lost. In Jan., 1855, it again became the seat of government, and its pop. is now above 20,000. The trade, which equally suffered, is gradually assuming its former flourishing condition, and is carried on mostly through the port of La Libertad, which is about five miles distant.

SAN SALVADOR, or **BANZA**, the former being the Portuguese, and the latter the native name—a t. of Africa, the capital of Congo (q.v.). It is 120 m. s.e. by e. from the mouth of the estuary of the river Congo, in a mountainous district near the source of the river Lelunda. Pop. 20,000.

SAN SALVADOR or **CAT ISLAND**. See **BAHAMAS**, *ante*.

SANSANDING, a large t. in the n.w. of Africa, in Bambarra, about 20 m. n.e. of Segou, on the left bank of the Niger, here called the Joliba. A considerable trade in salt, beads, coral, gold-dust, and cotton cloth is here carried on. Pop. from 10,000 to 11,000.

SANSĀRA, or **SANSKĀRA** (lit. completing, perfecting), is the name of the ten essential rites or ceremonies of the Hindus of the first three castes. They are the ceremonies to be performed at the conception of a child; on vitality in the fetus, in the fourth, sixth, or eighth month of pregnancy; and at the time of his birth, before dividing the naval string; the ceremony of naming the child on the tenth, eleventh, or hundred and first day; the ceremony of carrying the child out to see the moon on the third lunar day of the third light fortnight, or to see the sun in the third or fourth month; of feeding him in the sixth or eighth month (or at other stated periods); the ceremony of tonsure in the second or third year; of investiture with the string in the fifth, eighth, or sixteenth year—when he is handed to a *guru* to become a religious student; and the ceremony of marriage, after he has completed his studies, and is fit to perform the sacrifices ordained by his sacred writings.

SANSULOTTES, i.e., "without breeches," was the name given in scorn, at the beginning of the French revolution, by the court party to the democratic "proletaires" of Paris. The latter accepted this superfine reproach with sardonic pride, and the term soon became the distinctive appellation of a "good patriot," more especially as such a one often made a point of showing his contempt for the rich by neglecting his apparel, and cultivating rough and cynical manners. As the noblesse prided itself on an illustrious pedigree, so the genuine child of the revolution boasted that he was come of a long line of—noteeless sansculottes; that his

"Ancient but ignoble blood
Had crept through scoundrels ever since the flood."

Toward the close of the convention, the name, connected as it had been with all the sanguinary excesses of the period, naturally fell into bad odor, and soon after totally disappeared; nor do the French appear to wish that its memory should be preserved, for they have not given it a place in their encyclopedias.

SAN SEBASTIAN, a rising sea-port city in the n. of Spain, capital of the Basque province of Guipuscoa, 381 m. n.n.e. of Madrid by the North of Spain railway. It is built on a peninsula, at the southern base of a conical hill, called Mont Orgullo, 400 ft. high,

commanding a most striking view, and crowned with a castle strong enough to have obtained for itself the name of the Gibraltar of the n. of Spain. Since its almost total destruction during the Peninsular war, the town has been rebuilt on a regular rectangular plan. The streets are narrow, and are bordered by high houses, and having curtained balconies in front. On the e. of the town is a confined gulf, formed by the embouchure of the Urumea; and on the w. is a magnificent roadstead, protected against enemy and tempest by the isle of Santa Clara and a series of rocks, which offer to vessels only a narrow and dangerous pass. The roadstead is bordered by a beautiful shore, which, on account of its suitability as a watering-place, attracts visitors from all parts of the country. The town communicates with the mainland by a narrow tongue of land, and by a bridge leading across the Urumea, and connecting San Sebastian on the peninsula with the railway station on the mainland. By means of the North of Spain railway, which was inaugurated by the king of Spain, Aug. 15, 1864, the town is placed in direct communication with Madrid and Paris. Commerce increases. Near 200 vessels, of about 50,000 tons, yearly enter and clear the port; annual value of imports £430,000, and of exports £73,000. The exports consist principally of wool, flour, wine, cutlery, fire-arms, copper ore, and lead; the imports are salted fish, sugar, silk and cotton and linen goods, cocoa, machinery, coffee, timber, and iron wares. In 1863, coal, coke, wagons, rails, etc., for the new railway, were imported from Great Britain, France, and Belgium to the value of £538,706. Pop. estimated at 15,900.

San Sebastian has suffered from numerous sieges in the wars between France and Spain. It was captured by the duke of Wellington in 1813, when the dispossessed French garrison set it on fire.

SAN SEVERINO, a city of central Italy, province of Macerata, 15 m. w.s.w. of the city of that name. It is well-built, and has handsome palaces, the finest of which are the Palazzo Comunale, and that of the bishop. The neighborhood produces exquisite wine, oil, and fruit, and cattle are reared on the pasture grounds. Pop. 4,700.

SAN SEVERO, a city of southern Italy, province of Foggia, with 15,500 inhabitants, stands in a delightful and fertile open country, producing abundance of grain, tobacco, and wine, and affording rich pasturage. It was once remarkable for the industry and activity of its population. In 1799, it was taken, and nearly destroyed by the French. The cholera committed fearful ravages here in 1865.

SANSKRIT', or **SANSKRIT'** (from the Sanskrit *sam*=Gr. *syn*, "with, together," and *kr'ita*, "done," with an epenthetic *s*, imparting greater emphasis to the sense of the compound; hence, "thoroughly done, finished, accomplished") is the name of the ancient language of the Hindus; in which their whole sacred literature, and by far the greatest amount of their numerous ritual, legal, poetical, and scientific works, are written. Sanskrit belongs to that stock of languages commonly called the Indo-European, or Indo-Germanic, which includes the Indian, the Medo-Persian, the Græco-Latin, the Germanic, the Lithuanian-Slavonian, and the Gallo-Celtic families. It is therefore intimately allied to the ancient and modern languages comprised in each of these families, itself being the parent of the *Prākṛit* (q.v.) dialects, the *Pāli* (q.v.), and the languages spoken in the n. of India. Compared with the ancient languages kindred with it, Sanskrit has come down to us in a state of preservation and development so much superior to theirs that it must be looked upon as the principal means which enables us to understand the affinity, and in general the linguistic laws which pervade the structure of these languages. The essay of Franz Bopp, *Ueber das Conjugations system der Sanskrit Sprache*, dated May 16, 1816, began a new era in the study of language. See PHILOL. OG. BOPP.

There are two great periods into which the history of the Sanskrit language may be conveniently divided: the first embracing the language as contained in the Vedic hymns (see VEDA); and the second, that represented by the so-called classical Sanskrit, in which the epic works, the law codes, and the later literature are written. Between the two there is a transition period of the language, to which the Brāhman'a and ritual portion of the Vedas, and the Upanishads, may be assigned. In the language of the Vedic hymns, the grammar is less developed and much less settled than in the classical Sanskrit; it contains, moreover, many forms which at the second period became obsolete, or altogether disappeared from use; the structure of its sentences, too, is simpler, though it is more elliptical than in classical poetry. Another main difference between the two periods lies in the sense of its words. Though this is the same in many words of the Vedic hymns and the classical literature, still there are numerous words, which, though the same in form at both periods, have a sense which differs according as it belongs to the one or the other class of writings. The difficulty thus presented by the Vedic hymns is in a great measure removed by the commentators who explain the meanings of the Vedic words, and, in doing so, follow tradition, which, considering the peculiarities of Hindu history, and also internal evidence, is in all probability immemorial, and therefore the safest if not the only guide in the understanding of the oldest Vedic works. That their explanations may have become unsafe in some instances, would be but natural; but it is certain that these instances are the rare exceptions; and it is likewise certain that when modern Sanskritists—and several of these only imperfectly acquainted with Sanskrit grammar—have attempted to supersede those traditional meanings by inter-

pretations which they suppose better suited to the context, or to some assumed etymology of their own, their rendering may better adapt the Vedic to the classical vocabulary, but is sure to falsify that understanding which the Hindu mind had of its oldest and most sacred works, and on which its further historical development is based. In the transition period of the Brāhman'a and ritual portion of the Vedas and the Upanishads, grammar and vocabulary offer similar difficulties to those of the Vedic hymns; but though for this reason the aid of the commentaries is likewise indispensable, they are much less numerous; and in those works of this extended period, which probably were composed at the classical epoch, the difference between the two is even inconsiderable. In comparing Sanskrit with other kindred languages, it is therefore necessary not to lose sight of these periods of the language, and of the peculiarities inherent in them.

SANSKRIT LITERATURE. The most natural, and, at the same time, the most scientific distribution of Sanskrit literature would be that according to the dates at which its writings were composed. The actual condition of Sanskrit philology, however, renders such a course impossible; for, with the exception of very few works, no date whatever is known to which they could be safely assigned. (See INDIA—*Religion*; VEDA.) In spite, therefore, of an apparent plausibility with which some authors have propounded a regular literary chronology of Sanskrit works, even with figures or dates appended to them, the general reader will do well to look upon all such dates as imaginary, and to rest satisfied with the hope that perhaps future results of Sanskrit philology may afford a more satisfactory settlement of this vexed question of Sanskrit chronology. Under these circumstances, the only possible arrangement of Sanskrit literature is that suggested by their contents, irrespectively of the time at which they were composed, but, under each head, in that order which, within large margins, may be suggestive of consecutiveness.

1. *Religious Literature.*—It comprises, in the first place, the Vedas, and the mystical, philosophical, and ritual works connected with them (see VEDA and UPANISHAD); and secondly, the Purān'as (q.v.) and Tantras (q.v.), besides prayer-books and smaller works, and treatises of less importance relating to the modern worship, based on the two latter classes of works.

2. *Law Literature.*—It is comprised under the name of *Dharmasāstra* (from *dharma*, law—religious and civil—and *sāstra*, book), and its origin is traceable to the ritual Sūtras relating to the Vedas. A complete *Dharmasāstra* consists of three portions: the first treating of *Āchāra*, or "established rules of conduct," comprising such matters as education, marriage, the funeral rites, the duties of a king, etc.; the second treating of *Vyavahāra*, or judicature, including law, private and criminal, and under the former, for instance, the law of inheritance and adoption; the third, on *Prāyaschitta*, or penance, treating, besides this subject, also of impurity, the duties of a devotee, transmigration, and final beatitude. The chief extant representatives of this class are the codes of Manu (q.v.) and Yājñavalkya (q.v.). Less complete than the latter—for it does not contain the Vyavahāra portion—is the code of Parāśara (q.v.); but it deserves special mention, as the modern Hindus consider it to have been especially composed for the requirements of the Kaliyuga, or the present mundane age, and as it is cited, therefore, as *the* authority, for instance, on the question, and in favor, of the remarriage of Hindu widows. For practical purposes, especially those concerning Vyavahāra, the chief actual authorities are the commentaries on Manu, *Yājñavalkya*, and similar works, and the digests which have grown up from them. Among the former, the *Mitāksharā* (q.v.) by Vijnānes'wara, occupies the principal rank; and amongst the latter, the *Chūnāmūlī*, *Vīramitrodaya*, *Vyavahāra-mayūkha*, *Smṛtichandrikā*, and *Vyavahāra-Mādhurīya*, which generally defer to the authority of the *Mitāksharā*; and, besides these, the *Dāyabhūga* of Jimūtavāhana, which, like the *Dāyatattva* of Raghunandana, differs from it on several important questions, for instance, on that relating to the hereditary rights of women. (See MITĀKSHARĀ.) As on the Vyavahāra, there are numerous smaller treatises on the *Āchāra* and *Prāyaschitta*.

3. *Poetical Literature.*—(a.) The two great epic poems. See RĀMĀYAN'A and MAHĀBHĀRATA.

(b.) *The Modern Epic Poems.*—Their subject-matter is entirely borrowed from the two great epic poems and other legendary works; and their only merit consists in the art bestowed by their authors on the versification, and all that relates to the æsthetical canon of Hindu poets, which, in some respects, may meet with the approbation of western critics, but, in others, would require in the European reader a total abnegation of his ideas of poetical beauty, in order to make these poems acceptable to him. Minute descriptiveness, elaborateness of diction, and an abundance of figures of speech, are some of the characteristics of these poems, among which those of Kālidāsa approach nearest our standard of poetical worth. One of them, the *Bhāttikāvya*, which relates to the history of Rāma, was purposely composed for illustrating rules of grammar and formations of words of special interest. In another, the *Rāghava-Pāṇḍarīya*, the ambiguity of the diction is so studied that the poem may be interpreted as relating to the history of Rāma, or other descendants of Dasāratha (see RĀMĀYAN'A), or to that of the descendants of Pāṇ'du (see MAHĀBHĀRATA). The following are the *Mahā-kāvya*, or great poems of this class; the *Raghuvans'a* and *Kumārāsambhava*, by Kālidāsa (q.v.);

the *Nalodaya*, also ascribed, though probably wrongly, to the same poet; the *Bhāt'ikāya*, or the poem by Bhāt'i; the *Sis upalabdhā*, by Māgha, hence also called the *Māgha-kāya*; the *Naishadīyacharita*, by Sriharsha; the *Kavātārjunīya*, by Bhāravi; and the *Rāghava-Pāṇ'd acīya*, by Kavi-rāja (i.e., the prince of poets), as the author calls himself.

(c.) *Lyric and Erotic Poetry*.—Several works of this class are more of a descriptive character, and would differ therefore from what in European poetry might be included under this head. The principal works belonging to it are the following: the *Ritūsan-hāra*, or a description of the seasons, attributed to Kālidāsa (q.v.); the *Meghadūta*, or the cloud-messenger, also supposed to have been written by Kālidāsa—a poem in which a demigod, separated by fate from his wife, is imagined to make a cloud the messenger to her of his woes, and incidentally, as it were, describes his course over a large tract of India; the *Amarāśatuka*, or hundred stanzas of Amaru, on amatory feelings and scenes, the natural sense of which commentators have twisted also into one of a mystical character, so as to make them appear less objectionable, especially as they were supposed by some to have been composed by the celebrated theologian Sankara, when he had animated the dead body of King Amaru (see SANKARA); these stanzas have an epigrammatic character, and share in this respect the style of the first *Sataka*, or hundred verses on love, by Bhartrihari; the *Bhāmīniribhāsa*, by Jagannātha Paṇ'ditarāja, in four books, the second of which is connected with amatory subjects, while the third is a beautiful elegy on the death of the poet's wife; the *Gītāgovinda*, by Jayadeva, who probably lived in the 12th c., which, in ten sections, describes the amours of Kṛishn'a with the cow-herdesses, his separation from his wife Rādhā, and his ultimate reconciliation with her, and which, like the *Amarāśatuka*, has also been explained in a mystical sense, Kṛishn'a then being represented as the soul which, for a time, becomes estranged from the supreme soul, its original source, but finally returns to it. This poem differs from those mentioned before in being intended for singing and for representation at a festival held in honor of Vishn'u; it combines the lyric and the melo-dramatic character.

(d.) *Didactic Poetry*.—A portion of this class of poetry may be included under the former head, since even such works as the *Amarāśatuka*, and the erotic stanzas of *Bhartrihari*, have much of the sententious character; another is contained in the episodes of the *Mahābhārata*, and another forms a considerable portion of the books of fables. The chief special representatives of this class are, "the three *Satakas*," or hundred stanzas on love, good and wise conduct, and renunciation of worldly desires, by *Bhartrihari*. Similar pieces of poetry are the hundred stanzas of *Chāṇakya*, and some stanzas in the anthology of *Sārngadhara*, called the *Sārngadharapaddhati*. Others have been collected in various modern anthologies, such as the *Nītisankalana* and the *Kavītan-rītikāpa*. For the poem *Bhagavadgītā*, see under YOGA.

(e.) *Dramas*.—The plays of the Hindus are not numerous; they were only acted on special occasions, and the subject of the plot is with predilection borrowed from the legendary literature of ancient India. Hindu dramatists have little regard for unity of time, place, and action; and with the exception of Kālidāsa, they must be considered as inferior in poetical worth to the renowned dramatic writers of ancient Greece and of modern Europe. Besides the reasons to be sought for in the religious, mystical, and metaphysical tendencies of the Hindu mind, a free development of the Hindu drama was probably also impeded by the heavy and artificial canon which weighed upon Hindu dramaturgy, and which, ascribed to sacred sources, and looked upon as a law not to be transgressed by any dramatic poet, did not allow much scope for poetical imagination, and would keep down any free movement upon which it might have ventured. The various kinds of dramatic performances, the number of their acts, the characters of the plays, the conduct of the plot, the sentiments to be represented, and even the modes of diction—all these were strictly regulated; so much so, that in spite of the differences which must exist between different authors and plays, there is still a kind of uniformity which pervades the whole Hindu drama, and must strike any one unacquainted with this elaborate dramatical canon. It must suffice here to mention a few of its peculiarities. All dramatic composition is divided, according to it, into two great classes—the *rūpaka*, or performance, and the *uparūpaka*, or the minor *rūpaka*; the former containing ten species, from the *nāṭaka*, or the play, *par excellence*, which represents exalted personages, down to the *prahasana*, or farcical comedy; and the latter with 18 species. Neither class contains the species "tragedy"—which is incompatible with a belief in fate, one of the main features of the Hindu mind. Every drama opens with a prelude in the form of a dialogue between the stage-manager and one of his company, in which the name of the author and of his work, and such prior events as the spectators should know, are brought before the audience. The first part of this prelude is a prayer invoking the benediction of some deity in favor of the assembly. The piece thus being opened, is then carried on in the usual manner; but so long as the same act lasts, the stage is never left empty, but the entrance of a new personage is always announced by a special person. The piece closes as it began, with a benediction. The principal characters of the play are the hero (*nāyaka*) and the heroine (*nāyikā*). The former is either *lūlita*, gay, thoughtless, and good-humored; or *sānta*, gentle and virtuous; or *dhiro-datta*, high-spirited, but temperate and firm; or *udatta*, ardent and ambitious; but as each of these categories is again subdivided, they become multiplied to 144 kinds.

Equal minuteness is displayed in specifying the classes of the heroines. The hero had his antagonist in the *pratinidhika*, or counter-hero; and each of these may have his officers, ministers, and friends. The heroine, on her part, has always a confidential companion, who is often her foster-sister. The subordinate characters are described as being eunuchs, mutes, dwarfs, foresters or barbarians. Two characters, however, deserve special notice, as being peculiar to the Hindu stage—the *ritu* and the *vidūshaka*. The *ritu* may be the companion of a man or woman; he is generally on familiar, yet dependent terms, with his associate, and though somewhat like the parasite of the Greek comedy, yet not rendered contemptible; if a female, she is courtesan. The *vidūshaka* is the humble companion of a prince or a man of rank; he is always lively, sometimes witty, and, according to the definition of his attributes, he is to excite mirth by being ridiculous in person, age, and attire. He is, curiously enough, always a Brāhman. The plays have eight, or, according to some, nine *rasa*, or characteristic flavors: these *rasas* are love, mirth, tenderness, fierceness, heroism, terror, disgust, wonder, and tranquillity; and they again consist of conditions with numerous divisions and subdivisions. The manner according to which the form of speech is regulated, is another peculiarity of the Hindu drama. Only the hero and the principal personages speak Sanskrit, but women—with rare exceptions—and the inferior personages speak Prakṛit, the various, higher or inferior, idioms of that language being adapted to their higher or inferior character. See PRAKṚIT. The oldest known Sanskrit drama is the *Mṛichekhakatī*, or “the Clay Cart,” by king Sūdraka, which, in the opinion of H. H. Wilson—who translated it in his *Select Specimens of the Theater of the Hindus*—was written in the 1st c. B.C. Of other dramas may here be mentioned *Abhijnānaśakuntalā* (see ŚAKUNTALĀ) and *Vikramorvasī*, by Kālidāsa (q.v.), to whom also the drama *Mālikaṁguvātra* is attributed; *Mālatīmādhava*, *Mahavīracharita*, and *Uttararāmacharita*, by Bhavabhūti; *Ratnavali*, by Śrīharsha; *Mudrā rā kṣasa*, by Viśākhaḍatta; *Hanuman takti*, fabled to have been composed by the monkey Hanumat (q.v.); and *Anarghar ghara*, by Murāri. A drama of a peculiar nature is the *Prabodhachandrodaya*, by Kṛishṇanīśa, who in the opinion of Goldstücker, expressed in the preface to his translation of this drama, lived at the end of the 12th century. Its leading personages are all of a transcendental kind; such as the supreme spirit, faith in Vishnu, volition, organ of imagination, opinion, devotion, quietude, friendship, etc., on the one side; and error, egotism, hypocrisy, love, voluptuousness, anger, avariciousness, etc., on the other; and its object is to represent the victory of the former over the latter. The general dullness of the play is relieved by a number of sectarian worshippers, who appear on the scene, each eulogizing the truth of his own religion, and ridiculing that of his antagonist. That this drama, which would baffle the patience of a European audience, was acted “before king Kirtivarman, who, with his whole assembly, was very eager to see it,” the poet relates in the prelude to it. An imitation of this drama is the *Chaitanyachandrodaya*, by Kavikarṇāpura. For the translation of several of these dramas, and an account of others, see H. H. Wilson's *Select Specimens of the Theater of the Hindus* (2 vols., London, 1835).

(f.) *Fables and Narratives*.—Fables, as such, occur, and are referred to, as early as in the great epic poems; but the oldest collection of fables is the *Panchatantra* (q.v.); and after it, the *Hitopadeśa* (q.v.). These works are considered by the Hindus to belong to the class called *nītiśāstra*, or works on conduct and polity, since the morals drawn from the fables, and expressed in sententious verses, with which they are interwoven, are the object for which these collections were made. A different class of writings are the ghost-stories, merely composed for amusement, such as the *Tejūlapancharīnśati*, or the 25 tales of the vampire; and the *Sukasaptatī*, or the 70 tales of the parrot; and the *Sinhāsāmadātrīnśati*, or the 32 tales of the statues on the throne of Vikramāditya. A work of a higher order is the *Vṛīhatkathā*, “the Grand Tale,” or *Kathāsārītsāgara*, “the Ocean for the Rivers of Tales,” by Somadeva of Cashmere. Among narratives of the romance class, the most celebrated are the *Dasakumāracharita*, or the “Adventures of the Ten Princes,” by Daṇḍin, who lived about the middle of the 11th c., edited, with an elaborate preface, by H. H. Wilson; *Kudambartī*, by Vānabhata; and the *Vasavadattā*, by Subandhu, a critical account of which work is given by Fitzedward Hall, in the preface to his edition of it (Calcutta, 1859).

(g.) *Chronicles*.—Historical works, in the European sense of the word, do not exist in Sanskrit literature. The same causes which have clouded all Hindu chronology, and even, at recent periods of Hindu history, have transformed historical facts into myths, seem to have rendered the Hindu mind indifferent to the research and the recording of historical truth. The only approach to historical works is found in some chronicles, though these, also, are not devoid of fictitious narratives. The most renowned among them is the *Rājataranginī* (q.v.), or the Chronicle of Cashmere, by Kālhana. A modern work of a similar kind, but of much smaller extent, is the *Kṣhīrāsānśārīchārī*, or the chronicle of a series of royal families who reigned in Bengal. It was composed in the middle of the last century.

4. *Scientific Literature*.—(a.) *Philosophy*. See the articles SĀNKHYA, YOGA, NYĀYA, VAISĒSHIKA, MĪMĀNSĀ, VEDĀNTA.

(b.) *Grammar*.—That a scientific study of grammar was cultivated at a very early period of Hindu literature is borne out by the testimony of the oldest glossator on the Vedas, YĀSKA (q.v.). The oldest extant work, however, on Sanskrit grammar is pos-

terior to the work of Yāska; it is the grammar of Pān'ini (q.v.), which was criticized by Kātyāyana (q.v.) in the *Vārttikas*, these, again, being commented on and criticized by Patanjali in the *Mahābhāṣya*. (See PĀN'INI, where some of the principal later works connected with his system are mentioned.) That the *Pratīśākhya*s (see VEDA) did not precede the grammar of Pān'ini, has been shown by Goldstücker in his *P'rinipi, his Position in Sanskrit Literature*, etc. Of authors of grammars, not following the technical system of Pān'ini, the principal are Hemachandra, a Jaina (q.v.) writer, and Vopadeva, who probably lived about six centuries ago, and is especially esteemed in Bengal.

(c.) *Lexicography*.—It consists of glossaries of words and *dhātus*—a term which may be vaguely rendered by "roots," or "radicals," though it does not imply to the Hindu grammarian the idea of a linguistic element—and of commentaries on these glossaries. The oldest known glossary of Vedic words—nouns and verbs—is the *Niruktā* (q.v.) of Yāska. Renowned glossaries of classical words are the *Amarakosha*, by Amarasinha, who is probably not later than the 3d c. after Christ; the *Athadhānaratnamālā*, by Halāyudha; the *Āimākosha*, by Hemachandra; and the *Viśvapradīkā*, by Mahes'wara. (For other works of this class, see Wilson's *Sanskrit-English Dictionary*, preface to 1st ed. 1819; and Colebrooke's *Miscellaneous Essays*, vol. i, p. 50, ff.) The glossaries of *dhātus* are called *Dhātupāṭhas*. The oldest was probably composed by Pān'ini himself, and is the groundwork of the existing works of this name, though the latter contain numerous additions of later forms. The chief commentary on the *Dhātupāṭha* is that by the celebrated Mādhavāchārya (q.v.).

(d.) *Prosody*.—Sanskrit prosody admits three sorts of meter: one governed by the number of syllables, and which is mostly uniform, or monoschematic, in profane poetry, but not so in various passages of the Vedas; the other regulated by feet equivalent to two long syllables, or to four short; and the third regulated by the proportion of syllabic instants, without noticing the number of feet. Some *Sūtras* (q.v.) connected with the Vedas contain rules on the Vedic meters; but the principal work on Vedic as well as profane prosody is the *Chhandah'sāstra*, by Pingala, which has been commented on by various writers, the most conspicuous of whom is Halāyudhabhaṭṭa. A short treatise on prosody, which only exhibits the most common sorts of meter, the *Srutabodha*, is attributed, but probably wrongly, to Kālidāsa (q.v.).

(e.) *Art of Poetry*.—It is treated in works on dramaturgy, and works on the poetical art in general. The oldest work on the dramatic art is the *Sūtra* of Bharata; a later one is the *Dasārūpa* by Dhanañjaya. Some of the principal works of the latter category are the *Kāvya-prasā*, by Mamurata, the *Kīrtyārasa*, by Daṇḍin, and the *Sāhitya-darpana*, by Viśwanātha Kavirāja. Several other works of this class are especially concerned in the explanation of figures of speech.

(f.) *Works on Music*.—In general, they treat of notes, musical scales, melodies, the art of singing, and musical instruments; and some of them also of the art of dancing and performing. The melodies, or *Rāgas*, are represented as deities, who have wives, the *Rāginīs*. Their number is uniform in the different works, and it is probable that the passages in dramas and other poetical works intended for singing were written to suit these fixed melodies, and not that the melodies were composed after the poet had performed his task. The principal works of this kind are the *Saṅgītaratnākara*, by Śārṅgadeva, the *Saṅgīta-darpana*, by Dāmodara, and the *Saṅgīta-dāmodara*, by S'ubhankara. Special treatises relate to the melodies alone.

(g.) *Amatory Art*.—Works treating of this art purport methodically to explain and to classify all that relates to love, and they refer for many of their statements to the oldest authorities. The chief work on the subject is the *Kāma-Sūtra* of Vātsyāyana.

(h.) *Astronomy and Arithmetic*.—The calendars connected with the Vedas are the earliest evidence of Hindu proficiency in astronomy; they presuppose a knowledge of a solar year of 365 days, and their date is assumed by Colebrooke to belong to the 13th c. B.C., while others would place them a few centuries later. The scientific works of later Hindu astronomers are professedly based on five ancient systems, or Siddhāntas, called the Pauliśa, Romaka, Vāsiṣṭha, Saura, and Paitāmaha-Siddhānta; and the earliest renowned author among these astronomers is Aryabhaṭṭa, who, according to Colebrooke's calculation, did not live later than the 5th c. after Christ. From the quotations by Brahmagupta, it appears that Aryabhaṭṭa "affirmed a diurnal revolution of the earth on its axis, that he possessed the true theory of the causes of lunar and solar eclipses, and that he noticed the motion of the solstitial and equinoctial points, but restricted it to a regular oscillation, of which he assigned the limit and the period." See, for further detail, Colebrooke's *Algebra*, etc. (Lond. 1817, p. 38). His principal work, the *Āryabhaṭṭa-sūtra*, is at present only known from the quotations of Brahmagupta, Bhaṭṭotpala, and others; but his other works, the *Dasagītikā* and *Aryabhaṭṭa-ṭīkā*, are extant. Varāhamihira, the next important astronomical writer, a native of Ujjayini, lived about the beginning of the 6th c. after Christ. His compilation of the five Siddhāntas, the *Panchasiddhāntikā*, is not yet recovered; but several of his astrological treatises, and the scholia on them by Bhaṭṭotpala or Utpala are preserved, and his *Br̥hatsaṃhitā* has been recently edited by Dr. H. Kern (Calc., 1865). Another great astronomical authority is Brahmagupta, who appears to have written toward the close of the sixth, or the beginning of the following century; his work bears the title of *Brahmasiddhānta*, and it was followed up by Bhāskara, who in the middle of the 12th c., composed a celebrated work, the

Siddhāntas'iroman'i, translated by Lancelot Wilkinson (Calc., 1861). The *Sāryasiddhānta* has been edited by Fitzedward Hall (Calc., 1859); and two translations of it are due, one to E. Burgess, in the *Journal of the American oriental society*, accompanied with notes by Whitney (New Haven, 1860); another to Bāpūdeva S'āstri (Calc. 1861); but whether this Siddhānta is the Saura, one of the five original Siddhāntas above mentioned, or a later work bearing a similar title, is matter of doubt. That Hindu astronomy is largely indebted for its progress to the kindred sciences of western nations may be inferred from the occurrence in Sanskrit of terms which are of Arabic and Greek origin. Thus, the terms *hōra*, *dreshkān'a*, *līpta*, *kendra*, etc., are easily traced to the Greek *hōra*, *dekano*, *lepta*, *keutron*, etc.—That works on Hindu astronomy contain more or fewer chapters or passages which no longer concern astronomy, but belong to the sphere of astrology, can be no matter of surprise, considering the intimate connection in which, in India, religion and superstition stand to every branch of human knowledge, and much more especially to one concerning the heavenly bodies. There are, moreover, numerous works which are purely astrological, merely treating of nativities and the influence of the planets on certain periods of the day or month, and the occurrences that would take place at them. Among celebrated writers on algebra, it must here suffice to name Varāhamihira and Bhāskara. See Colebrooke's *Algebra*, as quoted above.

(c.) *Medicine*.—The origin of Hindu medicine is referred to the god Brahman, from whom the Ayurveda, or "the science of long life," was obtained by Daksha, who communicated it in his turn to the As'vins. Some time after this, mankind, in consequence of their wickedness, becoming afflicted with numerous diseases, the Munis, or saints, met in the Himalaya mountains to search for a remedy. A long list of these saints is given by *Charaka*, one of the greatest medical writers, and it is so far of interest as it contains several names known in Hindu history, and which thus may be probably connected with the early study of Hindu medicine. The two greatest medical authorities the works of whom are still extant are *Charaka* and *Sus'ruta* (q.v.). Both treat of the duties of physicians and their pupils, of anatomy and physiology; hygeology; materia medica, pharmacy, and preparations of medicine; surgery; the diagnosis, prognosis, and treatment of a considerable number of diseases; midwifery, toxicology, etc. Several chapters in them are devoted to omens and portents, as well as to the evil influence of planets and demons on the human body. *Charaka*, who is older than *Sus'ruta*, contains more mythological detail than the latter. Of the authorities quoted by *Charaka*, *Atreya* seems still preserved in a work, the *Atreyasamhitā*, which is far less scientific and complete than either the work of *Charaka*, or *Sus'ruta*, and therefore appears to have preceded them.—See also T. A. Wise, *Commentary on the Hindu System of Medicine* (London, 1860).

(j.) *Architecture*.—Treatises on architecture, sculpture, etc., are collectively called *Silpaśāstra*. There appear to have been 32, or, according to some, 64 standard treatises on these arts, but of these only a few are probably still in existence. The most important of them is the *Mānasāra*, which consists of 58 chapters, each of which is devoted to a particular topic—such as measures used in architecture; the different sites to be selected for building temples and houses; the mode of determining the different points of the compass; the several sorts of villages, towns, and cities, with directions for building them; the different parts of an edifice, its ornaments, pedestals, bases, pillars, etc.; the various sorts of temples; the construction of porticoes, gates, palaces, etc.; the construction of images, and cars in which the gods are carried in procession, together with the ceremonies attending the consecration of images; the mode of determining the propitious moment for commencing to lay the foundation of an edifice, etc. See, for further detail, Rām Rāz, *Essay on the Architecture of the Hindus* (London, 1834).

For a more copious supply of titles of books on the subjects mentioned, the reader may consult Gildemeister, *Bibliotheca Sanskrita*, Bonn (1847), and the printed catalogues of the library of the India office, of the Sanskrit MSS. of the Bodleian library at Oxford, and of the Sanskrit MSS. of the royal library at Berlin.

SANSON, NICOLAS, 1600-67; b. Abbeville, France; educated at the Amiens Jesuit college. In 1616 he made a map of ancient Gaul. He engaged in business, but with little success, and in 1627 visited Paris, where he attracted the notice of Louis XIII., and became his instructor in geography. By him he was made engineer of Picardy, and later, geographer to the king and counselor of state. His maps were not remarkable for accuracy, but he has the honor of being the creator of French geography.

SANTA ANNA, a co. in n.w. New Mexico, having the territorial line of Arizona for its w. boundary; 7,000 sq.m.; pop. '70, 2,599—2,587 of American birth. It is drained by the Rio Grande, the Rio de Chaco, the Rio Puerco, and other streams. Its surface is mountainous, a range of mountains occupying the e. portion, the Sierra de Chusa the s.w. The rainfall is very slight, and the farming lands require irrigation, but are very fertile, and produce wheat and corn. The country is adapted to raising cattle and sheep, particularly the valley of the Rio Grande, where large quantities of wool are produced. Co. seat, Jemez.

SANTA ANNA, or ANA, a t. of Central America, in the state of San Salvador, and 32 m. n.w. by w. from the town of San Salvador. Pop. about 10,000.

SANTA ANNA, DON ANTONIO LOPEZ DE, ex-President of Mexico, was born in Jalapa, in 1798. While a mere youth he entered the Spanish army, and became lieut.col. in 1821. When Mexico determined to throw off the Spanish yoke, Santa Anna greatly distinguished himself at the head of the Mexican troops. The Spanish royalists were expelled from Vera Cruz, and he was elected governor of the city and province. Iturbide had established an imperial rule over Mexico (q.v.), but his tyranny having worked his downfall, Santa Anna proclaimed in 1822 a Mexican republic, which was recognized by every foreign state except Spain. He was incessantly engaged in quelling the civil wars kindled by the aristocratic and democratic factions. In 1829 he engaged and put to flight a division of Spanish troops which invaded Mexico by way of Tampico, with the view of again bringing Mexico under Spanish rule. The separation of Texas (q.v.) from the Mexican union was vigorously but unavailingly opposed by Santa Anna. In 1837 differences arose with France, and a division of French troops landed at Vera Cruz. They were gallantly engaged by Santa Anna, who drove a portion of them into the sea at the point of the bayonet. In this action he received a bullet in the leg, which rendered the amputation of the limb necessary. In 1838 the French took Vera Cruz, and obtained the settlement of their differences. In 1847 war having been declared by Mexico against the United States, Santa Anna took the command of the Mexican forces. He offered a gallant but ineffectual resistance to the troops of generals Scott and Taylor. The city of Mexico having been stormed and taken by the Americans under gen. Scott, the war was at an end, and Santa Anna retired from Mexico. During 30 years he had disputed the direction of affairs with Bustamante, Herrera, Cevallos, and other chiefs of parties, being at one time dictator, and at another disgraced and an exile. In 1853 Mexico, torn by civil dissensions, and falling into anarchy, again recalled Santa Anna. He declared himself president for life, and a civil war was the immediate result. In 1855 he was driven from the country. During the government of Juarez, 1858-63, Santa Anna was looked up to as their chief and future ruler by an influential party in Mexico. On the establishment of a hereditary monarchy under Maximilian of Austria as emperor, Santa Anna returned to Mexico, having first signed an act of adhesion to the empire. He soon, however, began to intrigue for his own return to power, issuing addresses to the people as emperor, and was ordered to leave the country. After some residence in the United States, Santa Anna planned an expedition against Juarez; but ere a landing at Vera Cruz had been effected, Santa Anna, with his secretary, was taken prisoner. He was condemned to death, but pardoned by Juarez, on condition of his leaving Mexico. He afterward resided on Staten Island, N. Y., where he spent his time cock-fighting and playing at three-card monte. On the death of Juarez in 1875 he returned to Mexico, where he died in 1876. He was regarded by his countrymen as their ablest general, and he was more successful than any other Mexican ruler in quelling the miserable civil wars, though he sometimes showed unjustifiable cruelty. He was also accused of being greedy of wealth, and unscrupulous in the means of obtaining it. He received the grand cross of Charles III. of Spain, and the grand cross of the red eagle of Prussia.

SANTA BARBARA, a co. in s.w. California, having the Pacific ocean on the s. and w., the Guaymas river on the n., comprising several islands on the coast; about 2,800 sq.m.; pop. '80, 9,522—8,124 of American birth, 378 colored. It is drained by the Santa Clara and Santa Inez rivers. Its surface is crossed in the e. by the Sierra San Rafael and the Sierra Santa Inez; in the w. it is less hilly; throughout its entire extent the low land and river banks are fertile, producing grain, potatoes, dairy products, oranges, and all tropical fruits, and grapes which are made into wine and raisins. The climate is warm and mild, and the rainfall is slight from May to November. Orchards of mulberry trees have been planted, and large numbers of cattle are raised. Its mineral products are asphaltum, largely exported, salt, petroleum, sulphur, copper, and iron. Gold is found. Co. seat, Santa Barbara.

SANTA BARBARA, a t. in s. California, 90 m. n.w. of Los Angeles, 260 m. s. of San Francisco; pop. '70, 4,255. It contains an old mission cathedral, and is the seat of Santa Barbara and Franciscan colleges and St. Vincent's institute. It has 7 churches, a public school, a bank, 5 newspapers, a circulating library, masonic and odd fellows' lodges, and a patrons of husbandry society. It has several extensive vineyards and hot springs, and on account of its soft and salubrious climate is much frequented by consumptive invalids from the eastern states. Live stock is raised in large numbers, and the exportation of wool is important. It has flour and lumber mills.

SANTA CATHARINA, a province in Brazil, bounded e. by the Atlantic, and on the other three sides by the provinces of Paraná and Rio Grande de Sul; 18,924 sq.m.; pop. 159,802. Except on the coast, which is low, the surface is mountainous, traversed by the Serra Catharina on the w., and well watered. On account of the mildness of the climate, fertility of the soil, and beauty of the scenery, it is called "the paradise of Brazil." The principal productions are rice, manioc, millet, sugar, coffee, and cochineal. Beds of bituminous coal have been found. The chief towns are Desterro, São Francisco, and Laguna. There are prosperous German colonies in the province. Off the coast, separated by a strait, is the fortified island of Santa Catharina, 30 m. long, 8 broad, forming the fine bay of the same name.

SANTA CLARA, a co. in w. Cal., bordered on the n. by San Francisco bay, and crossed by the Southern Pacific, and the San José branch of the Central Pacific railroads; drained by the Gaudaloupe river, Coyote creek, and other streams; 1332 sq.m.; pop. '80, 35,039, partly Chinese. The beautiful and fertile valley of Santa Clara, which is 20 m. wide, forms the greater part of the county, and lies between the coast and Santa Clara mountains, the highest point of which is mount Hamilton, 4,449 ft. high. The valley is furnished with water from nearly 1000 artesian wells; the climate is uniform, and there is abundance of good fruit. The principal productions are lumber, grain, hay, wine, cattle, wool, and hops. It contains asphaltum, copper, petroleum, mineral and hot springs, and the New Almaden and Gaudaloupe quicksilver mines, the richest in the world, which yielded in 1875, 31,106,200 lbs. It has manufactories of tanned and curried leather, carriages, wagons, machinery, paper, saddlery, harness, tin, copper, and sheet-iron ware, flour, planing, and saw-mills, and establishments for smelting quicksilver. Co. seat, San José.

SANTA CLAUS. See **NICHOLAS, SAINT.**

SANTA CRUZ, a co. in w. Cal., bounded by the Pacific ocean and Monterey bay on the w., on the e. by Santa Cruz mountains, and on the s. by Pajaro river; crossed by the Santa Cruz railroad, and drained by the San Lorenzo and Sequel rivers; 432 sq.m.; pop. '80, 12,801. The surface is mountainous and heavily wooded with oak, pine, and redwood trees of large growth, the redwood often attaining the size of 15 ft. in diameter. The soil in the valleys is fertile, and large crops are raised. The main productions are grain, potatoes, wine, butter, and cattle. It contains copper, limestone, petroleum, gold, and sand that is used in making glass. It has good water-power, and there are manufactories of gunpowder, barrels, lime, saddlery and harness, engines and boilers, tin, copper, and sheet-iron ware, tanned and curried leather, flour, planing and saw-mills. Sardines and other fish are abundant in the bay. Co. seat, Santa Cruz.

SANTA CRUZ (Teneriffe), the capital of the Canary islands (q.v.), and the chief seaport of the group, stands on the n.e. side of the island of Teneriffe. Its port, the safest in Canaria, has recently been extended and improved by the construction of two moles, with a united length of about 5,400 ft., which inclose a large space of water, affording excellent anchorage in from two to nine fathoms. When completed, these works will be of inestimable value, in a commercial point of view, to the island. The streets of Santa Cruz are broad, the houses whitewashed and flat-roofed, and several of the public buildings striking in appearance. The town is defended by several forts and redoubts. Formerly large quantities of wine of excellent quality were grown in Teneriffe, and shipped for export at Santa Cruz; now, however, the principal article of export from this, and also from the other islands, is cochineal. Coals from England, together with manufactured goods, hardware, and furniture are imported. Of the imports at Santa Cruz, more than a third come from England, and the annual imports amount to about £160,000. Pop. 13,228.

SANTA CRUZ. See **VIRGIN ISLANDS.**

SANTA CRUZ DE LA PALMA, the capital of Palma, one of the Canary islands (q.v.). It stands on the e. coast of Palma, on a spacious bay from 7 to 10 fathoms deep. Pop. about 5,000, employed partly in manufactures of silks and hosiery.

SANTA FÉ, a prov. in the Argentine republic, on the w. bank of the Rio Parana', separating it from Entre Rios; bounded by Buenos Ayres, Cordova, Corrientes, and Santiago; 27,500 sq.m.; pop. 89,117. It is divided into the departments of Santa Fé, San José, San Geronimo, and Rosario. It is drained by the Rio Solado and the Tercero. In the s. are level plains rising into hills in the n., and diversified by salt lakes. Much of the country is occupied by extensive forests; in the cultivated portions, wheat, maize, tobacco, wax, honey, and tropical fruits are produced. Agriculture and stock-raising are the chief pursuits. The chief town is Rosario. Capital, Santa Fé.

SANTA FÉ, a co. in n. central New Mexico; drained by the Rio Grande and its branches, and the Pecos; about 1900 sq.m.; pop. '70, 9,699—9,383 of American birth. The surface is mountainous, and heavily wooded. The soil is fertile in the Rio Grande valley, but on the high table-lands sterile and uncultivated. The principal productions are wheat, corn, wool, and cattle. Gold, iron, and coal are found. Co. seat, Santa Fé.

SANTA FÉ, a t. of the Argentine republic, on the right bank of the Salado, a large branch of the Parana, 250 m. n.w. by n. from Buenos Ayres. Pop. 15,000.

SANTA FÉ, city and capital of the territory of New Mexico, U.S., built among the Rocky mountains, on a plain 7,047 ft. above the sea. It is an old Spanish Mexican town, and contains 4 Roman Catholic churches, a Presbyterian mission church, and the government buildings. It has an active overland trade with St. Louis. Pop. in '70, 4,765.

SANTA FÉ (*ante*), capital of New Mexico and of Santa Fé co., is on both sides of Santa Fé creek, which flows into the Rio Grande, 275 m. w. of Denver; pop. '75, about 6,009, mostly of Spanish and Mexican origin. It is the center of trade with the surrounding country. The climate is very equable and healthy. The town is irregular, the streets are unpaved, narrow, and crooked. The houses are generally built of *adobes*

or sun-dried bricks, and are of one story. The principal business houses are on three sides of a public square or plaza of two acres; and on the fourth is the old palace of one story, now containing the governor's residence, a legislative hall, and court-room. In the center of the town is a beautiful park. Santa Fé contains a court-house, 2 national banks, a jail, 2 newspapers, 5 churches, and a convent. It is a Roman Catholic archbishop's see. Silver and copper are found near the city. When it was first visited by the Spaniards in 1542, it was an Indian settlement, and has been the capital of New Mexico since 1642. In 1680 it was taken and burned by the Indians, and the whites were driven away. In 1694 the Spaniards returned and recaptured it. In 1837 the Indians made another assault, but were conquered by Manuel Armijo. The United States troops took possession in 1846, under gen. S. W. Kearney, who found there 20 American traders and trappers. The territorial government was established in 1851. In 1862 the rebel troops under gen. Sibley occupied the city, but were defeated by the Union forces under col. Slough and compelled to evacuate it.

SANTALA'CEÆ, a natural order of exogenous plants, mostly trees and shrubs. The leaves are undivided, sometimes minute. The perianth is superior, 4 to 5 cleft. The stamens are 4 or 5, opposite the segments of the perianth, and inserted into their bases. The ovary is one-celled, with one to four ovules. The fruit is one-seeded, nut-like, or drupaceous.—There are about 110 known species, natives of various parts of the world, the European and most of the North American species being obscure weeds, while the trees of the order occur chiefly in the East Indies, New Holland, and the South Sea islands. Sandal-wood (q.v.) is the produce of plants of this order. The leaves of *osyris Nepalensis* are used for tea. Some species are used in medicine in their native countries. *Fusanus acuminatus* is the quandang nut of New Holland. Its taste and qualities resemble those of sweet almonds, as do also those of the seed of the *Cercantesia tomentosa* of Peru. *Pyralaria oleifera*, the buffalo tree or oil-nut, has a large seed, from which, in the southern states of America, oil is obtained.

SANTALINE, or **SANTALIC ACID**, the coloring matter of *ptercarpus santalinus*, or red sandal-wood, is readily obtained by digesting the rasped wood in alcohol, and then precipitating the santaline by the free addition of water. It is little used in this country as a dye-stuff, but it is employed in India both in dyeing silk and cotton. It is in consequence of the santaline contained in it that red sandal-wood is retained in the *pharmacopœia* as a coloring agent for tinctures, etc.

SANTA MARGARITA, a t. of Sicily, 42 m. n.w. of Girgenti. Pop. 7,000.

SANTA MARGHERITA DI BELI'CE, a city of Sicily, in the province of Girgenti, with 7,500 inhabitants. From the lands belonging to it, grain, wine, and oil are exported. Woven goods and hats are manufactured for export.

SANTA MARGHERITA DI RAPALLO, a pleasant t. in the province of Genoa, situated on the sea-coast about 3 m. from Rapallo. The Genoese coral fishery is carried on principally by feluccas fitted out here, and manned by the bold seafaring population. Pop. 71, of Santa Margherita di Rapallo (also called Santa Margherita Ligure), 4,750.

SANTA MARIA, a city in s. Spain, in the province of Cadiz; on the bay of Cadiz, 6 m. n.e. of the city of that name, near the mouth of the Gaudalete river; pop. 19,247. It is 7 m. by rail from Jerez, and receives its wine for exportation. Its manufactures include brandy, liquors, leather, soap, oil, hats, wax, etc.

SANTA MARIA DI CAPUA-VETERE, a city of s. Italy, in the province of Caserta, with about 16,800 inhabitants. It is not handsome but new, and its population increases every year. The neighboring soil is very fertile, and produces abundance of grain, fruits, oil, and excellent wines. Its manufactures consist of cloth and other woven materials and hals.

SANTA MARTA, a t. of the United States of Colombia, the capital of a province, on a bay of the Caribbean sea, 400 m. e.n.e. from Panama. There is a good harbor, defended by a castle and several batteries. Pop. 8,000.

SANTA MAURA, or **LEUCA'DIA** (anc. also *Leucadia* and *Leucas*, so called from its white cliffs, one of the Ionian islands, off the w. coast of the ancient Greek province of Acarnania, from which it is now separated by a passage about a mile wide, although it was in early times connected with the main-land by an isthmus. The canal across the isthmus, which converted the peninsula into an island, is said to have been cut by the Corinthians. Santa Maura is about 22 m. long, and has a breadth ranging from 6 to 9 miles. Area about 180 sq.m.; pop. 20,147. Its surface is very uneven. It is traversed by a range of hills from north to south, which end at the southern extremity in the high white cliffs called by the Italian sailors of the Levant cape Ducato (a corruption of *Leucates*), but better known under the name of "Sappho's Leap."

SANTANDER, a state in the United States of Colombia; bounded on the n.e. by Venezuela, and on the w. by the Magdalena river; about 16,000 sq.m.; pop. 425,427. Capital, Socorro.

SANTANDER, a prov. of Old Castile, Spain, lying on the bay of Biscay, and adjoining the provinces of Biscay, Burgos, Palencia, Leon, and Asturias; 2,132 sq.m.; pop. 70,241,581. The surface is hilly, being on the n. slope of the Cantabrian moun-

ains, but there are many fertile valleys. There are mines of lead, iron, and copper, and quarries of marble and building stone. The people are extensively engaged in fishery. The chief towns are Santander, Santona, Santulana, and Laredo.

SANTANDER, an important and thriving sea-port of Spain, in the modern province of the same name, stands on a magnificent bay, an inlet of the bay of Biscay, about equally distant from Oviedo on the w., and San Sebastian on the east. The bay on which the town is placed is from 2 to 3 m. wide, and about 4 m. long, and is accessible to the largest vessels at all times of the tide. The situation of the town, on a headland protected by a hill, is picturesque; among its edifices few are either interesting from their appearance, or important from their character. Of its former convents one now serves as a theater; another as a cigar-factory, giving employment to about 1000 people. Numerous new houses, and handsome warehouses, and commercial establishments of various kinds have been erected recently. The fine harbor of Santander, with a commodious entrance, is accessible at all tides, and unobstructed by a bar. Several important improvements have recently taken place here. The half of the province of Santander may be said to be impregnated with iron, copper, zinc, and other ores; though, hitherto the timidity of native capitalists has rendered the quantity extracted comparatively small. In one year, 12,625 tons of iron and copper ores, together with a quantity of quick-silver and cobalt, were shipped from the port of Santander to Great Britain alone, and mostly to Newport and Swansea. Wheat is an important element in the trade of Santander. The annual exports amount to about £1,563,600; and of that sum the exports of wheat and flour alone amount to the value of £1,400,000. The imports—the chief articles of which are sugar from Cuba; textile fabrics from England, France, Belgium, and Germany; and salted codfish from Norway—amount to about £1,800,000. A railway runs s. from Santander to Venta de Banos on the Great North of Spain railway; and in the middle portion of it, from Barcena to Reynosa, a distance of 21 m., there are 22 tunnels. Pop. 31,000. Area of province, 2,111 sq. m.; pop. '70, 241,581.

SANTAREM, an interesting old t. and river-port of Portugal, on the right bank of the Tagus, 46 m. n.e. of Lisbon by railway. It carries on an active trade in the products of the fertile vicinity with Lisbon, with which there is steam-communication by river as well as by rail. Pop. about 8,000.

SANTA ROSA, a co. in w. Florida, bordering on Alabama, with the gulf of Mexico on the s., and Escambia river on the w., and drained by Yellow and Blackwater rivers; 1440 sq. m.; pop. in '80, 6,645. The surface is level and mostly covered with forests of pine; the soil is poor. The island of Santa Rosa, in the gulf of Mexico, is a part of the county, and is situated at the entrance of Pensacola harbor, which is defended by fort Pickens, which stands on the western extremity of the island. Lumber is the chief export. The main productions are Indian corn, rice, molasses, cattle, and swine. Co. seat, Milton.

SANTEE, a river of South Carolina, which rises in the Blue Ridge, in North Carolina, by two principal branches, the Congaree and Wateree, and flowing s.e. empties into the Atlantic ocean. Lat. 33° 6'. It is navigable 150 m. to Camden, and is bordered, in its lower course, by rice-swamps and pitch-pine forests.

SANTERRE, ANTOINE JOSEPH, a French revolutionist, who for some time exercised an influence quite disproportioned to his feeble abilities, was b. at Paris, Mar. 16, 1752. He followed the trade of a brewer in the faubourg Saint-Antoine, and his wealth, probity, and generosity toward his *employés* gave him an immense influence in the district. On the establishment of the national guard in 1789 he received the command of a battalion, and took part in the storming of the bastille. During the year 1792 the Jacobin agitators of the faubourgs often met in the brewery of Santerre, and it was there that the *émeute* of June 20 was preconcerted, on which occasion Santerre, along with Saint-Huruge, marched at the head of the mob who invaded the *assemblée nationale*, and turned out the Girondists. He also played a conspicuous part on Aug. 10, when he was invested with the dignity of gen. commanding of the national guard. In October he was named field-marshal (*maréchal de camp*), and in April, 1793, he got the "authorities" to let him off scot-free for a debt of some 50,000 livres, which he owed the exchequer in the shape of taxes on the beer manufactured by him—the minister of finance arguing that, inasmuch as Santerre's beer was drunk for the most part by "patriots" (not always careful to pay their score), it ought not to be subjected to "duty." But greater things were yet in store for the privileged brewer. On July 30 he was appointed a gen. of division in the French army, and wishing to do something to justify this strictly military office, he marched at the head of 20,000 men against the Vendéan royalists, but was miserably beaten, and in consequence recalled. Shortly after, he was arrested and imprisoned, and only obtained his liberty after the death of Robespierre. He then withdrew into private life; but his fortunes and his popularity alike declined, and in 1800 we find him begging money and employment from Bonaparte. The latter, who saw clearly enough that Santerre was intrinsically an incapable fool, declined to employ him, but restored him to his military rank. Santerre died Feb. 6, 1809. Owing to the calumnies of royalist writers, Santerre commonly figures as one of the ferocious monsters of the revolution. There is positively no evidence, however,

for such an opinion. Though he was hugely fond of "brave words," and menaced his opponents with all the bellicose grandiloquence of a French revolutionist, he was nearly as soft in the heart as in the head. Some witty contemporary made the following epitaph on him:

Ci-gît le général Santerre,
Qu'il eût de Mars que la bière.

SANTIAGO, the largest of the Cape Verd islands (q.v.).

SANTIAGO, a province in central Chili; bounded on the e. by the Argentine republic, on the w. by the Pacific; drained by the Mapu river; 7,800 sq.m.; pop. about 375,000. The surface is mountainous, intersected by the Andes. The soil in the lowlands is fertile. Many cattle are raised, and agriculture is more advanced than in any other part of South America. Silver and copper mines are worked. Capital, Santiago.

SANTIAGO, or **SANTIAGO DEL ESTERO**, a province in the central part of the Argentine republic; bounded on the n. by Tucuman, on the e. by El Gran Chaco, on the s. by Cordova, and on the w. by Catamarca; drained by the Salado, Dulce, and other streams; about 35,000 sq.m.; pop. '69, 132,763. The surface is mountainous in the w. level in the east. There are many lakes and large forests. The climate is warm, but healthful. The soil is fertile. The principal productions are corn, wheat, and sugar. Much of the soil is pasture land. There are manufactures of woollens and laces. Capital, Santiago.

SANTIAGO DE CHILI, capital of the republic of Chili, and of a province of the same name, an archbishop's see, and the seat of the supreme government, stands at the western base of the Andes, 1800 ft. above sea-level, and 90 m. e.s.e. of Valparaiso. It was founded in 1541 by Pedro de Valdivia, but it has only recently acquired importance. Its climate is delightful; the plain on which it stands is extensive, and fertile in vines, figs, melons, and other fruits, and the scenery, looking toward the range of the Andes, is of the grandest description. The valley or plain of Santiago is sprinkled with tasteful villas and well-cultivated farms. The city is arranged in squares, and the houses are generally low, and are built around a court or garden, which is intended as a place of refuge during the earthquakes that frequently occur here. But of late years it has become the fashion, in spite of the earthquakes, to build costly houses of two, three, and even four stories, with a façade toward the street. The Alameda, shaded with poplars, and cooled by two streams of running water, is a pleasant promenade. The mint, a portion of which serves as one of the president's palaces, and as offices for the ministers, is the handsomest of the public buildings, many of which, however, are beautiful structures. The university comprises the five faculties of philosophy, mathematics and physical sciences, medicine, law, and theology. There are important educational institutions (including a normal school), and a library and museum. On the west side of the great square, which is adorned with a fine fountain, is the cathedral. On Dec. 8, 1863, one of its churches, that of La Compania, was destroyed by fire during service, and 2,000 out of the 3,000 of the congregation—the victims being mostly women—met a dreadful death. Gold, silver, and lead are exported, and the imports are chiefly manufactured goods, wines, and spirits. The chief trade is with Valparaiso by the Valparaiso and Santiago railway, opened in 1863. Pop. '75, 148,264. Area of province, 9,000 sq.m.; pop. '75, 362,712.

SANTIAGO DE COMPOSTELLA, an important and once famous city of Spain, formerly the capital of Galicia, and, from the number of pilgrims by whom it was annually visited, the Mecca of Spain, is extremely picturesque in appearance, from its hill-girt situation on an irregular uneven site, 40 m. s. of Corunna. The cathedral, occupying the site of a former edifice of the same nature, was founded in 1082, and its buildings, comprising a cloister, the archbishop's palace, etc., cover more than 3½ acres. The great square is a spacious area, and occasionally used as a bull arena. In front of the town-house is an equestrian statue of Sant Jago (St. James the elder, the patron saint of the city and of Spain), whose body, according to a monkish legend, was discovered near this by a hermit—a star miraculously pointing out the spot, whence the name Compostella (*campus stellæ*, "field of a star"). It was removed to Santiago in 829. The bones of the saint are believed by the people to be built into the foundations of the cathedral. A desolate appearance is imparted to the town from the number of tenantless and ruined nunneries and convents which it contains. Leather is manufactured, and the making and carving of small silver graven images employ a number of silversmiths. Pop. about 30,000.

SANTIAGO DE CUBA, formerly the capital of the island of Cuba, and now the chief t. of the eastern department of the island, stands on a bay on the s. coast at the mouth of a stream of the same name. It is hemmed in by mountains, and is reputed the most unhealthy place in the island. Its harbor is deep, well protected, and fortified. It communicates by railway and telegraph with the other towns of the island. As a seat of commerce it takes rank after Havana and Matanzas. Pop. 45,000.

SANTILLANA, MARQUIS DE. See MENDOZA.

SANTO DOMINGO. See **DOMINGO, SAN** or **SANTO**; **DOMINICAN REPUBLIC**; **HAYTI**; *ante*.

SANTONINE ($C_{20}H_{18}O_6$) is a vegetable principle possessing slightly acid properties, obtained from the seeds and flower-heads of several species of *artemisia*. The British Pharmacopœia gives *santonina*, "the unexpanded flower-heads of an undetermined species of *artemisia*," imported from Russia, as its source. It is one of the most efficacious of the class of medicines known as anthelmintics or vermifuges, the most obstinate cases of ascarides and lumbrici almost always yielding to its prolonged use. Pure santonine may be given in powder combined with scammony or rhubarb, the dose being from half a grain to two grains, according to the age of the child. The French prescribe it in the form of lozenges made with white sugar and mucilage; they are readily obtained in this country, and usually act satisfactorily. Küchenmeister, one of the highest authorities on the subject of intestinal worms, prefers the use of santonate of soda, which he obtains by digesting an alcoholic solution of santonine with carbonate of soda, evaporating and crystallizing. The dose is from two to eight grains mixed with sugar. Two very peculiar symptoms occur after the administration of santonine. The urine often acquires a reddish tint, which may give rise to an unfounded suspicion of the presence of blood in that fluid; and under its influence, vision becomes remarkably affected for a few hours, every object appearing either yellow or green to the patient. No satisfactory explanation of the latter phenomenon has yet been given.

SANTORIN. See **Thera**.

SANTOS, one of the chief ports of the province of São Paulo (q.v.) in Brazil, 34 m. s.s.e. of the city of São Paulo, of which it is the port. It stands on the northern side of the island of Engua Guacu, and commands a fine bay. Sugar, coffee, and other products of the interior are transported to Santos by troops of mules; and salt, flour, and other imported goods find their way back by the same means. It is stated that 200,000 mules arrive here laden during the year. 160,000 sacks of coffee are exported annually. Pop. stated at 8,000.

SAN VICENTI. See **SAN SALVADOR**.

SÃO FRANCISCO, a large river of Brazil, rises, as the Paraopeba, in the province of Minas Geraes, in lat. about $20^{\circ} 40'$ s.; long. $43^{\circ} 25'$ west. It flows n., n.e., and e., and in its lower course it separates the provinces of Bahia and Sergipe from Pernambuco and Alagoas. Its first considerable affluent is the Rio das Velhas, which joins it from the right in lat. $17^{\circ} 45'$ south. Above the junction of the Velhas, at Pirapora, where the river is 1782 ft. broad, and 1700 ft. above sea level, there is a fall of 17 feet. From the mouth of the Velhas (1665 ft. above sea level) to the falls of Paulo Affonzo the river is navigable for 920 m.; and from these falls to the mouth of the river, a distance of about 140 m., it is navigable for larger vessels and steamers. Its entire length is 1652 m., and its breadth at its mouth is 3,486 feet.

SAÔNE, a river of France, an affluent of the Rhone (q.v.), rises in the dep. of Vosges, at Vioncnil, in the Faucelles mountains, at the height of 1476 ft. above sea level, and flows s. past Gray, Châlons, and Maçon to its confluence with the Rhone at Lyons. Entire length, 312 m., of which 170 m. are navigable.

SAONE-ET-LOIRE, a dep. of France, bounded on the e. by the dep. of Jura and the river Saône, and on the w. by the dep. of Nièvre and the river Loire. Area, 3,300 sq.m.; pop. '76, 614,309. The country consists for the most part of vast and fertile plains, separated by rich vine-clad hills. The fertility is greatest in the vicinity of the two main streams. Horses of a small but vigorous breed are reared; the excellent and abundant pasturage supports numerous herds. The wines, of which 15,400,000 gallons are made annually, are well known as *vins de Mâcon*. Agriculture, iron-mining, and manufactures of cotton fabrics, leather, pottery, fire-arms, etc., are all actively carried on. The dep. was formed in 1790 out of four districts of the ancient province of Burgundy—Maconnais, Charollais, Chalonnais, and L'Autunois. It now forms five arrondissements, of which Mâcon is the capital.

SAONE. HAUTE, a dep. in the n.e. of France, bounded on the n. by the dep. of Vosges, and on the e. by that of Haut-Rhin. Area, 2,050 sq.m.; pop. '76, 304,052. About one-half of the entire area is in cultivable land, and more than a fourth part, comprising the n. and n.e. districts, is covered with forest clad mountains. In the s. and s.w. are fertile plains, bounded by hills, covered with vines or timber. The climate of this rich champagne district, with its bulwark of mountains against the n. and n.e. winds, is remarkably mild and healthy. Sheep, including some flocks of the merino breed, and cattle are reared in large numbers. Fruits are largely cultivated; and 6,600,000 gallons of wine and 220,000 gallons of brandy are made annually. The arrondissements are Gray, Lure, and Vesoul, and Vesoul is the capital.

SÃO PAULO, a southern maritime province of Brazil, bounded on the n. by the province of Minas Geraes. Area, 169,050 sq.m.; pop. '72, 837,354. Its coast-line—part of which in the n.e. is high and rocky, though the rest is low—is about 400 m. in length. Sugar, coffee, rice, millet, and tobacco are staple crops; horses, cattle, and swine are reared for ex-

port; and among the minerals are the precious metals and gems. There are several commodious harbors, and the capital is São Paulo.

SÃO PAULO, a city of Brazil, capital of the province of the same name, stands on an uneven elevation between two small streams, tributaries of the Tiete, 220 m. w.s.w. of Rio de Janeiro. There is an academy of laws, attended by about 500 legal students. The general appearance of the town is picturesque, and the vicinity and suburbs are beautiful. Pop. stated at 22,032.

SÃO PEDRO DO RIO GRANDE. See RIO GRANDE DO SUL.

SAP, the fluid which circulates in plants, and is as indispensable to vegetable life as the blood to animal life. Entering by the roots of the plant (see ENDOSMOSE), it ascends through the cells and vessels of the stem, proceeding to the surface of the leaves and utmost extremities of the system, and having been exposed, chiefly in the leaves, to the influences of air and light, returns through the bark, a portion ultimately reaching the root and being excreted there, while another portion probably enters again into circulation with the new fluid entering from the soil. See CIRCULATION OF SAP. Sap in its most simple state, the ascending or crude sap, consists chiefly of water, mucilage, and sugar; the elaborated sap varies much more in its properties in different plants, forming the peculiar juices of the plants. The elaborated sap always contains much less water than the ascending sap. Plants seem to derive their supply of sap not only from the soil by their roots, but also from the atmosphere by the stomata (q.v.) of their bark and leaves; and some, especially succulent plants, are capable of existing and increasing in size although entirely severed from the soil. The ascending sap appears to find its way through the whole wood of the stem in ligneous plants, but chiefly through the alburnum or sap-wood. The elaborated sap has been named Latex (q.v.).—The ascent of the sap is one of the most wonderful phenomena of spring, and seems to depend not so much on the state of the weather, for it begins in the depth of winter, as on the plant having had its sufficient period of repose, and being therefore constrained by its very nature to renewed activity.

SAP, in military engineering, is a narrow ditch or trench, by which approach is made from the foremost parallel toward the glacis or covert-way of a besieged place. The sap is usually made by four sappers, the leading man of whom rolls a large gabion before him, and excavates as he progresses, filling smaller gabions with the earth dug out, and erecting them on one or both sides to form a parapet. The other sappers widen and deepen the sap, throwing more earth on to the parapet. A sap is considered to advance in average ground about eight ft. per hour. From the nearness of the enemy's works, running a sap is an extremely dangerous operation. When possible, therefore, it is carried on at night; in any case, the sappers are relieved at least every hour. When a sap is enlarged to the dimensions of a trench, it bears that name.

SAPAJO, a name sometimes applied to all that division of American monkeys which have a prehensile tail, and sometimes limited to those of them which are of a slender form, as the genera *ateles* (q.v.), *cebus* (q.v.), etc.

SAPAJO (*ante*), the name of a group of South American monkeys including the ordinary sapajoes (*ateles*, q.v.) and other sapajoes, as the weeper or *cebus* (q.v.). See also SPIDER MONKEY, *ante*. All the sapajoes are exceedingly active, but the fore-hands are not as well developed as in the old-world monkeys. The thumb is longer, but more on a line with the other fingers; facial angle about 60°. They feed chiefly on fruits and insects. One of the most common species is the weeper above mentioned. Humboldt describes another species, *cebus albifrons*, about the same size as the weeper, with a grayish-blue face, and a grayish-olive body. It was found in the forests near the cataracts of the Orinoco river. They are often kept as playthings by the Indians. Humboldt saw one catch a pig every morning and ride him about on the savanna while he was feeding. The horned sapajo has a singular tuft of hair on the forehead in the form of a crescent, or a waterman's cap, having the appearance of two horns when viewed in front. It is a native of French Guiana. *Cebus monachus*, the large-headed sapajo of the English, has the head covered with short whitish hairs, as if shorn. The sides of the face, breast, and belly are of a yellowish-white; fore-arms, hinder extremities, and tail black; back mottled with black and light brown. The genus *saguinus* includes the following species: *S. sciureus*, *S. personatus*, *S. lugens*, *S. amictus*, *S. torquatus*, *S. motch*, *S. melanocher*, and *S. infulatus*. *S. sciureus* is the *simia sciuræ* of Linnæus; *callithrix sciureus* of Geoffroy; *saguinaimiri*, *saimiré* of the French, *saimiré* of the natives of the Orinoco, and *titi* of Humboldt. It is about the size of a common gray squirrel, being about ten inches in length without the tail, which measures from a foot to fourteen inches. The body is greenish yellow above, gray on the thighs and arms, and white on the belly. Feet, legs, and fore-arms reddish chestnut; muzzle dark; the rest of the face and the ears flesh-colored; tail black at the tip, covered with hair, and not prehensile, but, when the animal is at rest, wound round the body. It is said to sleep in the sitting posture with its head hanging between its fore-legs. In both extremities the nails of the thumbs are broad, but those of the fingers are more claw-like. There is considerable variation in the classification of this group of monkeys.

SAPAN WOOD; SAPPAN WOOD, or BUKKUM WOOD, the wood of *Cesalpinia Sappan* (see *CESALPINIA*), an East Indian tree, about 40 ft. high, with twice pinnate leaves, and racemes of yellow flowers. The wood is much used as a dye-wood, yielding a good red color, which, however, is not easily fixed. It is a very considerable article of export from Singapore and other parts of that region both to Calcutta and to Europe.

SAPINDA CEE, a natural order of exogenous plants, consisting of trees and twining shrubs furnished with tendrils, and a few herbaceous climbers. Their leaves are often marked with lines or pellucid dots. The flowers are in racemes or racemose panicles, hermaphrodite or unisexual. The calyx is 4 to 5-partite, or consists of 4 to 5 sepals. The petals are 4 to 5, occasionally wanting, hypogynous, usually having an appendage in the inside. The stamens are usually 8 to 10; often inserted into the disk, which is fleshy, and sometimes glandular. The ovary is generally 3-celled, the cells containing one or few ovules. The fruit is fleshy, or *samaroid*, or capsular. The order contains about 380 known species, natives of warm climates, especially of South America and India; none of them natives of Europe, although the horse-chestnut (q. v.) is now as well known in many parts of it as most of its native trees.—The timber of some species is valuable, particularly that of *pterocylon utile* and *hippobroma alatum*, natives of the cape of Good Hope, the former known there by the name of *nieshout*, and the latter of *pardepis*. Some are used in medicine as astringents. Narcotic and poisonous properties are very generally developed—also, a saponaceous principle, especially in the genus *sapindus* (see *SOAP BERRY*). Yet guarana bread (q. v.) is made from the seeds of a species of this order; the leaves of another (*cardiospermum halicacabum*) are used as a boiled vegetable in the Moluccas; and the fruits of some species are excellent.

SAPODILLA PLUM, the name given in the West Indies to the fruit of *achras sapota* and other species of *achras*, a genus of the natural order *sapotaceæ*. The seeds are aperient and diuretic, but an overdose is dangerous. The pulp of the fruit is subacid and sweet, and is much esteemed for the dessert in the West Indies. The fruit of *achras mammosa* is called MARMALADE. The NASEBERRY, also of the West Indies, belongs to this genus.

SAPONIFICATION. See OILS AND FATS, and SOAP-MAKING.

SAPONINE ($C_{24}H_{40}O_{14}$) is a vegetable principle contained in various plants, including the *saponaria officinalis*, or soap-wort, the *polygala senega*, several varieties of *lychnis*, the fruit of the horse-chestnut, etc. It is readily extracted from the root of soap-wort by means of boiling alcohol, which, as it cools, deposits the saponine as an amorphous sediment. It derives its name from its behavior with water, in which it is soluble in all proportions, yielding an opalescent fluid which froths when shaken, like a solution of soap, if even $\frac{1}{1000}$ part of saponine be present. Its solution, or an infusion of soap-wort, is sometimes employed in place of a solution of an alkaline soap, for cleansing the finer varieties of wool from grease.

SAPOTA CEE, a natural order of exogenous plants, consisting of trees and shrubs, often abounding in milky juice. The leaves are leathery, entire, and without stipules. The flowers are axillary; the calyx regular, persistent, generally with five divisions; the corolla monopetalous, hypogynous, deciduous, regular, its segments usually equal in number to those of the calyx, rarely twice or thrice as many. The stamens are inserted on the corolla, fertile ones generally as many as the segments of the calyx, and generally with alternate sterile ones. There is no disk. The ovary is superior, with several cells, each cell with one ovule. The fruit is fleshy; the seeds nut-like; sometimes cohering; the testa bony and shining, with a very long, opaque, and softer scar on the inner face.—There are considerably more than 200 known species, chiefly natives of the tropics, and the remainder of sub-tropical countries. One of the most recently discovered species is also already one of the most important, *isonandra gutta*, which produces gutta percha (q. v.).—The fruits of some are pleasant, as the sapodilla (q. v.), and other species of the genus *achras*, the STAR APPLE, and other species of *chrysophyllum* (q. v.), different species of *minussops*; *imbricaria malabarica* and *I. maxima*, various species of *lucuma*, etc. The genus *bassia* (q. v.) contains species valuable for the oils which they yield. The seeds of *minussops clengi* also yield oil abundantly.

SAPPER, the name given to a private soldier in the corps of royal engineers.—The name of the corps was formerly royal sappers and miners.—The pay of the sapper is £20 10s. 7½d. a year, with extra pay when at work; the number of such men for 1877–78 was 2,952. Only men of good character, already adepts in a mechanical trade, are eligible for this service, which is very popular, as an intelligent sapper frequently passes into some situation in civil life for which his practical military training specially fits him. Many sappers are excellent surveyors, photographers, and draughtsmen.

SAPPHIRE, a gem excelled in value by no precious stone except diamond, and regarded as a variety of corundum (q. v.), highly transparent and brilliant. It is sometimes colorless, and the colorless kind, called *white sapphire*, is sometimes sold as diamond. It more frequently exhibits exquisite color, generally a bright red or a beautiful blue; more rarely gray, white, or green. The red variety is the oriental ruby (q. v.) of lapidaries; the blue is that commonly called sapphire, and which has received this name from ancient times. It is found crystallized, usually in six-sided prisms, terminated by

six-sided pyramids; and is sometimes found imbedded in gneiss; but it more frequently occurs in alluvial soils. It occurs at Bilin in Bohemia, and Expailly in Auvergne, but more abundantly in some parts of the east. Ceylon is famous both for its rubies and its sapphires, the latter being the more abundant. They occur with garnets and other minerals, in a stratum of water-worn pebbles firmly imbedded in clay, in which there are occasional lumps of granite and gneiss. But nothing has yet been done to seek for them in their original situation in the mountain rocks. A piece of sapphire, which was dug out of the alluvium within a few miles of Ratnapoora in 1853, was valued at upward of £4,000. The sapphire was one of the stones in the breastplate of the Jewish high-priest. Among the Greeks it was sacred to Jupiter.—The name *girasol sapphire* is given to a beautiful variety with a pinkish or bluish opalescence, and a peculiar play of light. The *chatoyant sapphire* has more pearly reflections. The *asteria sapphire* has in the midst of it a star of six bright rays, resulting from its crystalline structure.

SAPPHIRE (*ante*). The chemical formula of sapphire is Al_2O_3 with the addition of a minute quantity of chromic oxide, the amount of which determines the color. Common corundum contains other oxides which destroy the beauty of the stone. It is found in various parts of the world; in the granite of Siberia, in granular limestone in New Jersey, and in the ripidolite of North Carolina. The finest rubies are found in Barmah and Siam, and the finest blue sapphires in Ceylon. A barbel blue sapphire, a fine gem, but weighing only 6 carats, once brought, at a public sale in Paris, \$350. The ordinary price of blue sapphires is the square of the weight in carats multiplied by \$2.50. If the above had not been a rare specimen its price would have been about \$90. The ruby, or red sapphire, is, however, the most precious variety. A ruby of over 20 carats is commonly called a carbuncle, and the finest tint, the one most prized, is what is known as *pigeon's blood*. In Burmah, when a very fine stone is found, a procession of elephants carrying dignitaries, and soldiers is sent to meet it, and one of the titles of the king is *lord of the rubies*. The topaz or yellow sapphire was the second stone in the breastplate of Aaron. A perfectly pure crystal of corundum, without any color, but transparent, is called a white sapphire, and is so beautiful a gem that it has been mistaken for a diamond. The emerald corundum is one of the rarest gems. Some specimens have been found in Montana. Deville and Caron formed small crystals of sapphire by the action of boric acid on fluoride of aluminium at a white heat, adding variable quantities of fluoride of chromium to impart the various colors. Gaudin formed them by decomposing potash alum with charcoal at a very high heat.

SAPPHIRE D'EAU, or IOLITE, a mineral, called also *dichroite* and *Cordierite*, one of the anhydrous silicates of alumina; crystalline form, six or twelve-sided rhombic or hexagonal prisms, but often found in an amorphous condition. The color is of various shades of blue—deeper in the axial direction; yellowish-gray transversely; transparent to translucent, having much the appearance of glass. Hardness, 7 to 7.5; specific gravity, 2.6 to 2.7. The following is an analysis by Stromeyer of a specimen from Bodenmais, Bavaria: Silica, 48.35; alumina, 31.71; magnesia, 10.6; protoxide of manganese, 0.33; protoxide of iron, 8.32; water, 0.59 = 99.46. A specimen from Haddam, Conn., gave: Silica, 49.62; alumina, 28.72; magnesia, 8.64; protoxide of manganese, 1.51; protoxide of iron, 11.58; lime, 0.23 = 100.3. A specimen from Unity, Me., according to Jackson, gave: Silica, 48.15; alumina, 32.5; magnesia, 10.14; protoxide of manganese, 0.28; protoxide of iron, 7.92; water, 0.5 = 99.49. Iolite fuses slowly on the edges in the blow-pipe flame to a blue transparent glass; with borax it forms a clear bead. When in fine powder it is partially dissolved in concentrated mineral acids. It occurs at Bodenmais in perfect crystals $1\frac{1}{2}$ in. thick, and this variety has been called *pelion*, from its smoky appearance. It occurs in quartz at Ujordlersöak in Greenland; in granite at cape de Gata, Spain; at Arendal in Norway; and at Tunaberg in Sweden. In Ceylon there is a transparent variety occurring in small, rolled masses of an intense blue color, which is particularly the *sapphire d'eau* of the jewelers. Iolite occurs at Haddam, Conn., associated with garnet and anthrophyllite in gneiss, and in various other parts of Connecticut and Massachusetts, and at Richmond, N. H., in talcose rock. Iolite is sometimes used as an ornamental stone, and, when cut, has a very fine play of colors, which vary, as above stated, when viewed in different directions. The word *iolite* means *iolet stone*. It is called *dichroite* from its dichroism (q. v.), and *Cordierite* after the geologist, M. Cordier. Iolite becomes soon altered on exposure to air and moisture. The change may be caused by simple hydration, as in *fahnlite*, or the removal of part of the protoxide bases by carbonic acid, or by the action of water containing alkaline carbonates, forming *pinite* and mica. There are several other altered forms, as *gigantolite*, *apastolite*, *praseolite*, *acessite*, *pyrrargillite*, *liebenervite*, *iberite*, and *Huronite*, the latter from Canada, near lake Huron, considered analogous to *fahnlite* by T. Sterry Hunt.

SAPPHO, along with Alceus, the chief representative of the Æolian school of lyric poetry, was b. either at Mitylene or at Eresos in Lesbos. She was only six years old when she lost her father Scamandronymus. She was contemporary with Alceus, Stesichorus, and Pittacus, with the first of whom she lived in friendly intercourse, as is seen in the surviving lyrics of both. All that we know of her is contained in an obscure reference in the Parian marble, and in one of the epistles of Ovid, to her having fled from Mitylene to some place of refuge in Sicily, between 604 and 592. Her famous

plunge into the sea from the Leucadian rock, on finding her love for Phaon unrequited, seems to be an invention of later times. At Mitylene she is supposed to have been the center of a literary coterie, all of them females, and most of them pupils of her own in the art of poetry. Her moral character has been the subject of controversy in modern times; the most recent disputants being the late col. Mure and the well-known F. G. Welcker of Bonn, who, in the *Rheinisches Museum* (1857-58), appeared, the former, for the prosecution, and the latter for the defense. To whatever opinion on this subject we may incline, there is no doubt of her high lyrical genius, which was the admiration of antiquity from Solon downward, and which, as still surviving in her matchless ode to Aphrodite, enhances our regret that, of the nine books of her poems, we only possess fragments. The best text is that contained in Bergk's *Poete Lyrici Graeci* (1854); the best separate edition is Neue's (1827).

SAPPORO. The capital of that division of Japan called the Hokkaidō (circuit of the Northern sea), including Yezo, the Kurile islands, etc. The city is laid out after the general manner of an American town, and is situated on a fertile plain in the valley of the Ishikari river, 10 m. from the sea of Japan; pop. 10,000. The broad streets cross each other at right angles in the direction of the cardinal points, but the buildings are mostly in Japanese style, which is unsurpassed for good taste and economy both in convenience and construction. The government buildings are in American style, the capital being a somewhat imposing structure, surmounted by a dome-like cupola. Its lat. is 43° 3' n., long. 141° 22' e. from Greenwich. Water for factory-power, irrigation, and drinking is furnished by the Toyohira, a mountain stream which flows through the city. The Ishikari river is 11 m. from the city. The character of the vegetation is like that of Virginia. Under the superintendence of American engineers and scientific men, model farms, saw-mills, steam factories, improved roads and mining machinery, canning establishments, etc., have been introduced, and railways on the American model of construction and rolling stock are now in progress with a view of bringing to shipment the produce of the immense areas of coal fields, whose possible output is estimated to equal that of the present yield of Great Britain, continued for 1000 years. Distance from Hakodate, 150 miles.

SAPUCAIA NUT, the seed of *lecynthis ollaria*, a lofty tree, which is plentiful in the forests of the n. of Brazil, and belongs to the natural order *lecynthidaceae*. The fruit is urn-shaped, as large as a child's head, and opens by a lid which falls off. Each fruit contains a number of seeds or nuts, as in the case of the allied Brazil nut. The flavor is finer than that of the Brazil nut, although, hitherto, the sapucaia nut is much less common in our shops. Its form is oval, somewhat pointed at both ends, which are slightly bent in opposite directions. Monkeys are very fond of the sapucaia nut, and are sometimes caught in consequence of thrusting the hand into a capsule, and not being able to withdraw it when filled with a nut, while they obstinately keep hold of the expected prize.

SA'RABANDE, originally a slow dance, said to be of Saracenic origin; and hence a short piece of music, of deliberate character, and with a peculiar rhythm, in $\frac{3}{4}$ time, the accent being placed on the second crotchet of each measure. The sarabande is of frequent occurrence among the *suites* or series of short pieces written by Handel, Sebastian Bach, and others of the old masters, for the harpsichord or clavicord.

SARACENIC ARCHITECTURE. See ARABIAN ARCHITECTURE.

SARACENS, a name variously employed by mediæval writers to designate the Moham-medans of Syria and Palestine, the Arabs generally, or the Arab-Berber races of northern Africa, who conquered Spain and Sicily and invaded France. At a later date it was employed as a synonym for all infidel nations against which crusades were preached, and was thus applied to the Seljuks of Iconium, the Turks, and even to the pagan Prussians. The true derivation of the word was long a puzzle to philologists; Du Cange deduced it from Sarah, the wife of Abraham, an opinion coincided in by the mediæval Christian authors; Houtinger (*Biblio. Orient.*), from the Arab. *saraca*, to steal; Forster (*Journey*), from *sahra*, a desert; while others strove to see its origin in the Hebrew *sarak*, poor; but the opinion which has been most generally supported, and prevails at the present time, is, that the word was originally *Sharkeyn** (Arab. "eastern people"), corrupted by the Greeks into *Sarakenoi*, from which the Romans derived their word *Saraceni*. The epithet Sarakenoi was applied by the Greek writers (from the 1st c. of the Christian era) to some tribes of Bedouin Arabs in eastern Arabia, though they do not agree among themselves as to the particular tribe so denominated. Pliny and Ammianus place the Saracens in Arabia Petraea and Mesopotamia, on the common frontier of the Roman and Persian empires; and the description of them by the latter, a most painstaking and accurate historian, coincides, in every important particular, with what is known at the present day of the Bedouin tribes of those regions.

SARACEN'S HEAD, a not unfrequent bearing in heraldry. It is represented as the head of an old man, with a savage countenance.

* *Sharkeyn*, or *Sharakyoun*, "eastern people," is thus opposed to *Magharibé*, or *Maghribé*, "western people," the self-styled appellation of the inhabitants of *Maghrib* ("the west") or *Morocco*.

SARAGOSSA, or **ZARAGOZA**, a city of Spain, the capital of a province of the same name, and formerly of the kingdom of Aragon. It stands on the Ebro, here a muddy stream, which divides the city into two parts, and is crossed by a noble stone bridge, built in 1437. The city has an imposing appearance from a distance, being adorned with numerous slender towers and spires; but the traveler, on entering it, finds it full of narrow winding lanes, instead of streets, although the houses—which are built of brick—are of most solid structure, and many of them are the palaces of a nobility who have now ceased to reside here. These buildings, rich in finely carved decorations and magnificent cornices, are now mostly inhabited by agriculturists of a rude class; their spacious courts converted into farm-yards, and filled with dung-heaps. Everything about the city indicates decay and poverty. Saragossa was the Celtiberian *Sidduba*, but received the new name of *Cæsarea Augusta* in 25 B.C., of which the present name is a corruption. It was a place of importance under the Romans, but there are few remains of the Roman city. Saragossa was one of the first cities of Spain in which Paganism was generally renounced and Christianity adopted; it afterward became rich in relics, to which miraculous powers were ascribed. Saragossa was taken by the Moors in the 8th c., and recovered from them in 1118, after a siege of five years, during which great part of the inhabitants died of hunger. It was taken by the French in 1809, after a siege of eight months, and one of the most heroic defenses recorded in the history of modern warfare. See **PALAFOX**. Saragossa has a university, founded in 1474. It has two cathedrals, both interesting as specimens of architecture; but the older is in a simple and severe style; the modern one—that of *Nuestra Señora del Pilar*—is very ornate. The latter cathedral boasts of a pillar on which the Virgin descended from heaven, 40 A.D.—an event so strongly attested, that Diego de Astorga, primate of Spain, on Aug. 17, 1720, excommunicated all who even questioned it. Pilgrims flock from all neighboring parts of Spain to this pillar and the image of the Virgin, which came down from heaven. Saragossa suffered grievously at the hands of the French in 1809, and lost most of its treasures of art. It has a considerable trade in agricultural produce, mostly carried on by the Ebro; and manufactures of silks, woolens, and leather. Pop. about 63,500.

SARAGOSSA, MAID OF. See **AGUSTINA**.

SARANSK', a t. of European Russia, in the province of Penza, and 80 m. n. from Penza, at the confluence of the Saranga and Insara, feeders of the Sura. Pop. '67, 14,284.

SARASWATĪ is, in Hindu mythology, the name of the wife, or the female energy, of the god Brahma, the first of the Hindu trimūrti or triad. She is also the goddess of speech and eloquence, the patroness of music and the arts, and the inventress of the Sanskrit language and the Devanāgarī letters. She was induced to bestow these benefits on the human race by the sage *Bharata*, who, through his penance, caused her to descend from heaven, and to divulge her inventions. Hence she is also called *Blārātī*. She was very white, hence another of her names, *Mahās'wetā*, or *Mahās'uklā* (from *mahat*, great, and *ś'weta* or *ś'ukla*, white).—Saraswatī is also the classical name of the river now called *Sarsooty*, which rises in the mountains bounding the n.e. part of Delhi, whence it runs in a south-westerly direction, and is lost in the sands of the great desert in the country of the Bhatti. According to the *Hitop*, the river only disappears in this place, and continuing its course underground, joins the Ganges and Jumna at Allahabad.

SARATOGA, a co. in e. New York, bounded on the e. by Hudson river, on the s. by the Mohawk; drained also by the Sacondoga river; traversed by the Champlain canal, the Adirondack, and the Rensselaer and Saratoga railroads; about 840 sq.m.; pop. '80, 53,135—47,597 of American birth. The surface is hilly, mountainous in the n., and heavily timbered. The soil is fertile. The principal productions are corn, rye, hay, and oats. Saratoga Springs is the most important place in this co. Co. seat, Ballston.

SARATOGA, BATTLE OF, was fought at a critical period of the American revolution. Gen. Burgoyne, having captured fort Ticonderoga in July, 1777, was pursuing gen. Schuyler in his retreat from fort Edward, intending to force his way to the navigable waters of the Hudson. Gen. Gates on taking command of the American forces had forthwith moved his army back to Stillwater. Sept. 14 Burgoyne crossed the Hudson, and took position on the heights overlooking the American camp. On the 19th he advanced his right wing upon the Americans. He was promptly resisted by gen. Arnold with Morgan's sharp-shooting riflemen. A severe encounter ensued and continued for many hours, till night compelled a cessation. The Americans retired having lost 300 men. The British lost 500 men, but held the field. Both armies rested in their fortified camps, neither being anxious for a general battle. Oct. 7, Burgoyne, having vainly waited for promised re-enforcements from the British forces near New York, renewed the contest, leading forth his best battalions with the grenadiers and artillery. His left wing was opposed by the Americans under gen. Poor; Arnold also, with impetuous daring, led his men into a hand-to-hand combat. The batteries were repeatedly taken and retaken, till the British, by their own captured artillery, were driven from the field. Gen. Morgan was equally victorious over Burgoyne's right wing, whose valiant leader, gen. Fraser, was mortally wounded. The whole British army became demoralized,

and Burgoyne began a retreat. The exultant Americans closely followed, drove out the Hessians, and took a portion of his camp. Gen. Arnold was severely wounded leading this last charge. Night again closed the contest, and before morning Burgoyne had retreated, and was soon entrenched in his first fortified camp. Here, however, he could not remain. The Americans had captured his supplies, and closed every avenue for retreat. Not daring to risk another battle, and despairing of the expected succor, short of provisions and hourly expecting an attack from the Americans, flushed with their recent success, he proposed an armistice to arrange the terms of capitulation. Gen. Gates demanded unconditional surrender. This Burgoyne refused, and terms more favorable to the British were concluded Oct. 15. Burgoyne surrendered nearly 6,000 prisoners of war, forty pieces of brass artillery, several thousand stand of small arms, and great stores of ammunition. The report of this battle electrified the country, quieted all fears of other incursions from Canada, and rallied the waning confidence and enthusiasm of the people. To commemorate this auspicious event, it is proposed to build a grander monument than that on Bunker Hill; and toward the estimated cost of nearly half a million the sum of \$50,000 has been appropriated by the state of New York.

SARATOGA SPRINGS, one of the chief watering-places in the United States, is in New York, 32 m. n. of Albany. It contains 28 mineral springs, some chalybeate; some containing iodine, with salts of soda and magnesia; and all highly charged with carbonic acid. They are prescribed in diseases of the liver, chronic dyspepsia, etc. In the village are 32 hotels, some of immense magnitude; and during each season there are from 30,000 to 45,000 visitors. Pop. in '70, 7,516.

SARATOGA SPRINGS (*ante*), in Saratoga co., N. Y., on the Rensselaer and Saratoga, and the Adirondack railroads, on a plateau about 10 m. w. of the Hudson. It has hotel accommodations for nearly 20,000 persons. On the principal street, Broadway, running n. and s. several miles are the principal hotels; and beyond are lines of handsome villas. Lake avenue and Circular street contain many handsome residences. Opposite the principal hotels is Congress park. Four miles from the village is Saratoga lake, reached by the Boulevard, a drive 100 ft. wide, and lined with trees. Six of the 28 mineral springs of Saratoga are spouting springs. All the springs are charged with carbonic acid gas, and variously impregnated with magnesia, sulphur, and iron; some are chalybeate. The waters are valuable for chronic dyspepsia, diseases of the skin and liver, and affections of the bowels. Some are cathartic, some tonic. The best known springs are the Congress, extensively used as a mild cathartic, and exported to all parts of the world; the Hathorn, a favorite cathartic, discovered in 1838; the Pavilion, much used for biliousness; the High Rock, the Columbian, the Geyser Spouting Spring, and the Washington. Saratoga is the resort of crowds of invalids and pleasure-seekers, and for number of visitors is second to no other American summer resort. The mineral waters of Saratoga were used by the Indians. The first framed house there was built by gen. Philip Schuyler in 1734. The large hotels have been built since 1815. The English under Peter Schuyler defeated the French under De Monteth here in 1693.

SARATOV, a government in the s.e. of Russia, is bounded on the e. by the river Volga, and on the n. by the governments of Penza and Simbirsk. Area, 32,500 sq.m.; pop. '70, 1,751,268. Its dimensions were much larger prior to 1850, when a considerable portion of it—the portion to the *east* of the Volga—was taken to form a part of the government of Samara (q.v.), erected in that year. One-third of the area is pasture-land, $\frac{1}{4}$ is under crop, $\frac{1}{4}$ in wood, and $\frac{1}{4}$ waste land. The chief rivers are the Volga and the Medwiedtza. A number of German colonists settled here in 1765-75, and distinguished themselves by their persevering industry and by diligent cultivation of the soil. Their descendants have become an important section of the population. Cattle-breeding is carried on extensively; fishing is of considerable importance.

SARATOV, a city of Russia, capital of the government of the same name, on the right bank of the Volga, 460 m. s.e. of Moscow. Though its houses are generally built of timber, the town has a rich and picturesque appearance. Its 16 churches are ornamented with numerous towers and cupolas; and its broad streets, from the character of the houses and of the elegant equipages that roll through them, have quite a European appearance. It manufactures pottery, bricks, tobacco, silk, hosiery, etc. Pop. '70, 85,220.

SARAWAK, a kingdom on the n.w. coast of Borneo, is bounded s. and w. by Sambas, e. by Brunai, and n. by the bight of Datu. The coast stretches from the w. of cape Datu, in lat. 2° n. and long. 109° 55' e., to the e. of the river Samerahan, in long. 111° 3' e., a distance of nearly 70 miles. Area, 3,000 sq. miles. Pop. 50,000. The Sarawak is the most important river; it has two navigable mouths, the one entering the bight of Datu in lat. 1° 42' 30" n., and long. 110° 20' 30" e.; the other, a few miles further to the east. Other considerable rivers are the Rejang (navigable for 120 m. for vessels of more than 1000 tons), the Lündu, Samerahan, and Sadang. A chain of mountains, 3,000 ft. in height, rises in Sarawak, and, with increasing elevation, tends toward the n.; while others are detached, as the Samerahans, and the steep, densely-wooded Lündu. Sandstone and granite are the prevailing rocks; porphyries, basalt, and quartzose schists also occurring. In some parts the soil is clayey; in others, it is a rich mold. With the exception of some cultivated spots, the surface is covered with forests, which abound with wild swine,

harts, and a variety of monkeys. There is excellent coal near the river Sadang. Antimony ore, which can be both easily worked and shipped, is obtainable in any quantity; copper and gold have been found, and iron ore is plentiful at Lündu. Fine timber trees, as iron-wood, ebony, sandal-wood, teak, and other sorts peculiarly adapted for shipbuilding, grow on the lands near the mouths of the rivers. Overtopping them all is the tall camphor tree (*dryobalanops aromatica*), from which, by incision, the valuable camphor-oil is obtained; or by felling and splitting the wood, the crystallized camphor, which is prized above that produced in any other part of Asia.

The climate is not considered unhealthy. Much rain falls from September to March, and the thermometer usually indicates about 83° F. Edible nests, wax, and aromatic woods are collected by the Dyaks for the Singapore market, and the plains are well adapted for the growth of rice and sago. In 1862 two cargoes of choice timber for shipbuilding were sent to the royal dockyards of Great Britain, and more attention is now being paid to that natural source of wealth. In 1871 the exports, the chief articles of which were gutta-percha, sago flour, antimony ore, and edible birds' nests, amounted to £280,000; and the imports, chiefly gray and colored shirtings, tobacco, brass-ware, opium, rice, and cocoa-nut oil, amounted to £315,000. The exportation of antimony and sale of opium are monopolized by the government, and with a small head-tax, form the chief revenue.

The original inhabitants are Dyaks, divided into some 20 tribes, and speaking different dialects; they are, for savages, mild, industrious, and honest. Malays live on the coast, and the mines are worked by Chinese. From 1841 to 1868 Sarawak was governed by sir James Brooke (q.v.), as an independent rajah appointed by the sultan of Borneo, in return for distinguished services in putting down rebellion and restoring order; and even on the testimony of the Dutch, who view with extreme jealousy the increased influence of the British on that coast, his rule has done much to promote the civilization and prosperity of his people.

The seat of government is the town of Sarawak, formerly called Kútjing, near the mouth of the river, which is navigable for large ships. Mission-stations and schools have been erected, and the population has increased to 25,000. Trade, which has multiplied tenfold since sir J. Brooke was appointed rajah, is principally carried on with Singapore.

SARCINA (Lat. a package), or **SARCINULA**, a genus of minute plants of very low organization, sometimes reckoned among *algæ*, and sometimes among *fungi*. A number of forms or species are known. The first discovered, called *S. ventriculi*, was originally observed by Goodsir in matters vomited from the human stomach. It is of a roundish quadrangular form, about $\frac{1}{160}$ to $\frac{1}{120}$ of a line in diameter; the individuals generally grouped in cubes of 4, 16, or 64 in the cube, separated by rectangular striæ. Although the most common seat of sarcinæ is the human stomach, they have likewise been detected in the stomach of the tortoise, the rabbit, the dog, the ape, and in the cæcum of the fowl; in the urine, in a considerable number of cases; in the lungs; in the fæces and intestinal canal; in the fluid of the ventricles of the brain; in cholera stools; in the fluid of hydrocele; in the bones; and Dr. Lowe has noticed its existence in stagnant water. It appears from the measurements of Welcher that the sarcinæ occurring in urine are about half the size of those occurring in the stomach, and the aggregations of sarcina cells are also smaller.

The occurrence of the sarcina in the urine, the fluid of the ventricles of the brain, etc., is probably a *post-mortem* phenomenon of little diagnostic or pathological importance. Its appearance in vomited fluids is, however, characteristic of a peculiar and important form of dyspepsia. The vomited matter in these cases has a faint acid smell, like that of fermenting wort, and is obviously in a state of fermentation. After standing a few hours it becomes covered with a thick, brownish, yeast-like froth, and deposits a brown flaky sediment. On examining the froth and the deposit under the microscope sarcinæ are found in great abundance, together with the torule characteristic of yeast (q.v.). The fluid is always acid, if sarcinæ are present. The amount of vomited matter is always large, and sometimes enormous. It is usually ejected in the morning, after a night spent awake from a sense of heat, gurgling, and distention in the epigastric region; and its discharge gives almost immediate relief. Dr. Budd, one of the highest authorities in diseases of the stomach, believes that the disease consists, primarily and essentially, in some organic change, which prevents that organ from completely emptying itself, and which causes a secretion from its coats, capable, when mixed with food, of undergoing or exciting a process of fermentation; and that the development of the sarcinæ bears to this process, or to some stage of it, the same relation which the development of torule bears to simple alcoholic fermentation. The well-known power of sulphurous acid in checking the fermentative process induced prof. Jenner to try the effect of sulphite of soda—a salt which readily yields its sulphurous acid—in this disease; and experience has fully confirmed the accuracy of Jenner's induction; for this salt, administered soon after a meal, or when the fermenting process is commencing, in doses varying from 10 grains to a dram, dissolved in water, is the most effectual remedy at present known for relieving this disorder. The hyposulphite of soda, in somewhat larger doses, has a similar action.

SARCINE (Gr. *sarr*, gen. *sarcos*, flesh) is the name now given to a nitrogenous substance ($C_{10}H_4N_4O_2$) which has been obtained from the muscular tissue of the horse, ox, and hare; and from various glandular organs, as the liver and the spleen of the ox, the thymus gland of the calf; and the human liver in cases of acute atrophy of that organ, in which case it is associated with xanthine ($C_{10}H_4N_4O_4$), a substance differing from it only by two atoms of oxygen. It is identical with the substance formerly known as hypoxanthine.

SARCOLEMMA is the term applied to the delicate sheath which invests each primary muscular fiber. See **MUSCLE**.

SARCOMA is a somewhat vague term used by Abernethy and many subsequent surgical writers to designate a fleshy or firm morbid tumor. The term sarcoma is comparatively rarely met with in recent works on surgery.

SARCOMA (*ante*). The large group of tumors now classed together under the name of sarcomata or sarcomas includes many which were until recently known by a variety of other names and grouped in other divisions, and the term sarcoma, which now has a definite meaning, was formerly applied to many soft growths. Many hard sarcomas have been classed as scirrhus or hard cancer, but several tumors formerly known as fibro-plastic, fibro-muscular, fibro-nuclear, malignant fibroid, and mycoid, have been placed among the sarcomas. See **TUMOR**.

SARCOPHAGI. See **CANNIBALISM**.

SARCOPHAGUS (Gr. flesh-eater), any stone receptacle for a dead body. The name originated in the property assigned to a species of stone found at Assos in Troas, and used in early times, of consuming the whole body, with the exception of the teeth, within the space of 40 days. The oldest known sarcophagi are those of Egypt, some of which are contemporary with the pyramids. The earliest of these are of a square or oblong form, and either plain or ornamented with lotus leaves; the latter are of the form of swathed mummies and bear inscriptions. The Phœnician and Persian kings were also buried in sarcophagi. The Roman sarcophagi of the earlier republican period were plain. Sarcophagi were occasionally used in the later republic, although burning had become the more general mode of disposing of the dead. The use of stone chests for the interment of distinguished persons has not been altogether discontinued in modern times.

SARDANAPALUS. See **ASSYRIA**.

SARDE, or **SARDA**, a variety of quartz, differing from carnelian only in its very deep red color, blood-red by transmitted light. It is rare, and brings a much higher price than common carnelian. The name is probably from Sardis. The sarde was one of the stones of the breastplate of the Jewish high-priest. There were also two in the ephod. The **SARDONYX** is an onyx (q. v.) containing layers of sarde.

SARDÉS, or **SARDIS**, anciently a city of Asia Minor, the capital of Lydia, was situated in a fertile plain between the northern base of mount Tmolus and the river Hermus, about 60 m. e.n.e. of Smyrna. Through its *agora*, or market-place, flowed the Pactolus, a tributary of the Hermus. The city is first mentioned by Æschylus. It was taken by the Cimmerians in the reign of king Ardys (680-631 B.C.). In the reign of Cræsus, the last Lydian king, Sardés attained its highest prosperity. It became the residence of the Persian satraps after the overthrow of the Lydian monarchy. The Athenians burned it 503 B.C., and it afterward passed under the Romans, and was the seat of a separate provincial government. It is one of the seven churches mentioned in the book of Revelation.—*Sart*, the modern Sardis, is a poor village, worthy of mention only for the ruins of the ancient city to be seen in the vicinity. Of these the chief are those of a stadium, of a theater, and of the Acropolis.

SARDINE, *Clupea sardina*, a fish of the same genus with the herring and pilchard, smaller than the pilchard; abundant in the Mediterranean, and found also in the Atlantic ocean, although not so far n. as the British shores. It is much esteemed for its flavor, and sardines preserved in oil are exported in large quantities from some of the Mediterranean ports. But the "sardines" of the west coast of France, which are largely imported into Britain, are generally not true sardines, but young sprats—the *garvies* of the firth of Forth—and sometimes young herring.

Sardines appear in shoals on the coasts of the Mediterranean at particular seasons, as herrings and pilchards on those of Britain. The sardine fishery on the coast of Provence is chiefly in the months of May, June, and July; but the fishery for sprats, which are cured as sardines, and sold under that name on the coast of Bretagne and elsewhere in the west of France, takes place in the winter months. The quantity of both kinds cured is so great as to amount in value to 3,000,000 or 4,000,000 francs annually, about £120,000 to £160,000. They are exported to the most distant parts of the world, cured with oil in tin boxes, forming a much esteemed delicacy, and at the same time a most wholesome article of food. To cure them in this way they are first carefully washed in the sea, then sprinkled with fine salt, and after a few hours the head, gills, etc., are removed; they are then washed again, and spread out on willow branches or wire-work exposed to the sun and wind if the weather is dry, but in damp and rainy weather to a current of air under cover. They are next put into boiling oil,

in which they remain for a short time, and when they are taken out the oil is drained away from them as much as possible, and they are put into the tin boxes of which the shape and appearance are so familiar to every one. The boxes being filled with sardines are filled up with oil, the lid is soldered on, and they are placed for a short time in boiling water or exposed to hot steam. The boxes which have leaked or have burst in boiling are rejected, and those which remain sound are now ready for the market.

In the south of France sardines are sometimes cured in red wine, and those so cured are called *sardines anchoisées*, or anchovied sardines.

In 1875 the "Cornish sardine company" was formed at Falmouth for the purpose of preserving pilchards in oil after the manner above described. The result is a delicacy hardly to be distinguished from French sardines. The company is thriving; and thus, it is to be hoped, tons of hitherto waste food will be utilized.

Several species of small *clupeide* much resembling the sardine are found in different parts of the world, and are used in the same way as the sardine of the Mediterranean. One species frequents the southern and eastern coast of Ceylon in such vast shoals that 400,000 have been taken at a single haul of the nets in a little bay; and when the shoal approached the shore the broken water became as smooth as if a sheet of ice had been floating below the surface.

SARDINIA, ISLAND OF, the largest, after Sicily, of the islands of the Mediterranean, lies directly s. of Corsica, from which it is separated by the strait of Bonifacio, a channel only 7 m. wide in its narrowest part. Sardinia is situated about half-way between central Italy and Africa, and between southern Italy and Spain. Its length is 166 m.; greatest breadth, 90 m.; and area, 9,361 sq. miles. The country is mostly mountainous, some of the peaks of the central chain having an elevation of 6,300 feet; The Limbara range, in the n.w., is granite, the diagonal chain paleozoic, and the central range of the tertiary calcareous formation; many of the peaks, especially within the semicircle formed by the Limbara range, are extinct volcanoes. The coasts are generally steep and rugged. A few islands lie off the coast, and all, of any considerable size and importance, are situated at the corners; off the n.e. corner are the Maddalena group, consisting of Maddalena, Caprera, and five or six minute islets; off the n.w. corner is Asinara; and off the s.w. corner are San Pietro and San Antioco. The island is well supplied with streams, but none of them have a long course, and only one is partially navigable.

Soil and Climate.—Between the mountain ranges are several wide valleys of remarkable beauty and fertility. There are also several large sandy or stony districts (*macchie*); of almost irremediable sterility. The mountain sides are partly rocky and barren, partly clad with woods, and partly fitted for pasture. The climate is mild, the temperature ranging from 34° to 90°; but in the low lands, which are largely of a marshy character, and in the neighborhood of the littoral lakes, a deadly malaria (*intemperie*) prevails, especially in autumn. The inhabitants of those districts, who can afford to do so, migrate annually during the unhealthy season; and those who are compelled to remain never leave their houses till an hour after sunrise, and carefully return before sunset, taking all precautions to prevent the entrance of the poisonous gas by door or window. The inhaling of the miasma by a stranger is considered among the inhabitants to be as deadly as a dose of strong poison.

Products.—Wheat, barley, maize, oranges, and other fruits are produced in abundance, and are esteemed for their excellent quality. The vine is extensively cultivated, but from carelessness in the process, the wine is not so good as might naturally be expected. The olive-grounds are extensive, and the produce excellent. Tobacco (of inferior quality), cotton, linseed, flax, hemp, saffron, and madder are also produced. The woods which clothe the mountain sides are chiefly composed of cork, chestnut, oak, pine, and other timber trees, which form a considerable item in the export trade. Many mountain-slopes have, however, been much deteriorated in fertility by the excessive cutting down of timber.

The bullock is the favorite animal for draught, but horses are also used; and a small species of pony, which in ancient times was much esteemed by the Roman matrons, is still found. The sheep are of ordinary quality, and the swine are said to be among the best in Europe. Few cows are kept, and cheese is obtained almost wholly from sheep's and goat's milk. Wild boars and deer are not uncommon, and the moufflon (q.v.) is found in the Alpine woods. Foxes, rabbits, hares, and martens are so abundant that a large export trade in their skins is carried on. The fisheries are important.

Manufactures are insignificant, being mostly the result of home industry; but the royal manufactories of gunpowder, salt, and tobacco are of considerable importance. Sardinia is rich in minerals, but these, like its other resources, are as yet little developed; silver, mercury, granite, gypsum, marble, labaster, amethyst, and other precious stones are found; and lead, iron, and copper are in considerable abundance. Gold, bismuth, and antimony are said to exist.

Inhabitants.—The inhabitants bear a considerable resemblance to the Greeks, and speak a barbarous dialect, composed chiefly of Spanish, Arabic, and Italian; they are ignorant and bigoted, having been subjected to misgovernment and oppression from their emancipation from Roman rule till 1836, when feudal tenure was abolished, and the enormous power of the clergy somewhat reduced. They are generally stupid and indolent, clothe themselves in sheep-skins, and invariably profess the Catholic religion.

The custom of the *Vendetta* is frequently practiced, though not to the same extent as in Corsica.

History.—Sardinia, at first called by the Greeks *Ichnusa* and *Sandaliotis* (from its resemblance to a human foot-print), and afterward *Sardo* by the Romans, was colonized at a very early period. The first really historical event is its conquest, about 480 B.C., by the Carthaginians, who, during their occupation, rendered the island a celebrated corn-producing country. They were forced to abandon it to the Romans (238 B.C.), who gradually subdued the rebellious natives, and made it a province of the republic; but on three several occasions formidable outbreaks required the presence of a consul with a large army to restore the authority of Rome. From this time it was held as a subject province, and on account of its value as the "granary of Rome," was carefully protected from invasion. It fell into the hands of the Vandals and other barbarians, and was recovered by the eastern empire in 534 A.D., but was finally separated from the Roman empire by the Saracens. They were driven out in their turn by the Pisans, one of whose deputy-governors, being supported by the Genoese, obtained the erection of Sardinia into a kingdom (1154) by Frederick I. The popes, who had long claimed a right of suzerainty over the island, gave it, in 1296, to James II. of Aragon; and it continued in the possession of Spain till 1708, when it was taken possession of by the British, and by the peace of Utrecht (1713) it was yielded to Austria. In 1730 Austria gave it to the duke of Savoy in exchange for Sicily, and it has since that time formed apart of the dominions of the house of Savoy. When Sardinia came to the house of Savoy, two-thirds of it belonged to barons of Spanish descent, and the most of the remainder to the clergy, who also levied a tithe on the whole produce, and for a century afterward it was shamefully neglected by the government. However, in 1836 and 1837, patrimonial rights and compulsory labor were abolished; and in 1838 and 1847 the peasants were freed from the rest of the vexatious imposts with which they were burdened. In 1847 the vice-royalty was abolished, and Sardinia incorporated with the Sardinian kingdom (q.v.). It is at present divided into two provinces or *capos*—Cagliari in the s., containing 5,236 English sq.m., with a pop. of (1871) 393,208; and Sassari in the n., containing 4,125 English sq.m., with a pop. of (1871) 243,452. Cagliari is the capital.

SARDINIA, KINGDOM or, a former kingdom of Italy, and the nucleus of the present *Kingdom of Italy*, included the duchies of Savoy and Genoa, and parts of those of Montferrat and Milan, the principality of Piedmont, the county of Nice, and the islands of Sardinia and Caprera, amounting in all to 19,564 English sq.m. of continental territory, with a pop. of (1857) 4,590,260, and 9,205 of insular territory, with a pop. of 577,282; total area, 28,769 English sq.m., pop. 5,167,542. In 1859 it was increased by the addition of the Austrian portion of the Milanese, and diminished by the cession in 1860 of Savoy and Nice to France, the change in the continental territory being shown by the following figures: area, 21,099 English sq.m.; pop., 6,530,232; the insular territory remaining unaltered. The various districts above mentioned differ greatly from each other in physical configuration and climate, and the more important of these are treated in separate articles. See also ITALY. The Roman Catholic religion was established by law in Mar., 1848; but monastic orders, with the exception of those which are also benevolent institutions, were suppressed May 28, 1855. In 1859 the army amounted to 76,172 men, and the fleet to 29 ships (none of them men-of-war), with 436 guns; the revenue (1858), which was mostly derived from customs, duties, and direct taxation, to £5,799,301; and the expenditure to £5,949,902—a want of equilibrium in the finances which had long existed, and which caused the establishment, since 1819, of a gradually increasing national debt, that amounted (1858) to £27,080,810. The annual import trade amounted (1857) to a declared value of £19,123,054, and the exports to £14,605,043.

The kingdom of Sardinia was originated by a treaty (Aug. 24, 1720) between Austria and the duke of Savoy (q.v.), by which the latter agreed to surrender Sicily to the former on condition of receiving in exchange the island of Sardinia, and the erection of his states into a kingdom. In 1730 *Victor-Amadeus I.*, the last duke of Savoy and first king of Sardinia, resigned the throne to his son, *Charles-Emmanuel I.* (1730-73); but repenting his resolution, and attempting to resume the government, he was put in prison, where he died in 1732. His son, by joining with France and Spain against Austria, obtained (1735) the territories of Tortona and Novara, to which were further added (1743), during the war of the Austrian succession, the county of Anghiera and the territories of Vigevano and Pavia. He was the author of the code known as the *Corpus Carolinum*. His successor, *Victor-Amadeus II.* (1773-96), acceded to the European coalition against France, and was deprived in consequence of Savoy and Nice in 1792; but sustained by England and the pope, he raised an army, and maintained himself in his kingdom till 1796, when Bonaparte forced him formally to relinquish the territories he had lost. His son, *Charles-Emmanuel II.* (1796-1802), was at first an ally of France; but the directory, in 1798, compelled him to surrender all his continental possessions, which were then incorporated with France; and it was not till the first peace of Paris (May 30, 1814) that the house of Savoy regained its territories. The congress of Vienna (Dec., 1814) annexed to Sardinia the ancient republic of Genoa, and the second peace of Paris (1815) restored a small portion of Savoy, which France still possessed, and gave

the king a protectorate over the small principality of Monaco. Long before this time Charles-Emmanuel had abdicated, and his brother, *Victor-Emmanuel I.* (1802-21), succeeded to his rights, and made his entry into Turin, May 20, 1814. His return restored the ancient misgovernment; and similar political changes in the other Italian states revived the societies of the "Carbonari" (q.v.) and other similar secret associations, whose aims were supported by a portion of the nobility and army, and by the heir-presumptive to the throne, Charles-Albert, prince of Savoy-Carignan. The insurrection of the army on Mar. 9-10, 1821, brought on a general revolution. But the king having abdicated in favor of his brother, *Charles-Felix* (1821-31), and the Austrians having come to the rescue, the insurrection was put down. Under the protection of an Austrian army of occupation till 1823, Charles-Felix re-established absolute power, recalled the Jesuits, persecuted the Protestants, and took various other measures for rooting out all opposition. On his death the elder line of Savoy became extinct, and the succession fell to the cadet branch of Savoy-Carignan (see SAVOY, HOUSE OF), whose rights had been recognized by the congress of Vienna, and *Charles-Albert* (q.v.) (1831-49) ascended the throne. The liberals were gratified with some slight reforms, but the power of the clergy was untouched, and the conspiracy of Nov. 30, 1833, at Turin, and the mad inroad of Mazzini, at the head of a small band of German, Polish, and Italian refugees, in Feb., 1834, only disturbed the country, and confirmed the government in its despotic policy. The interior administration was, however, carried on with more energy than under the two previous reigns, through the conclusion of treaties with France, Britain, Turkey, the Low Countries, Denmark, Austria, and the Hanse towns, etc.; the construction of roads, bridges, and railways was vigorously prosecuted, and agriculture and other industries were encouraged. In 1842 the king commenced a gradual but progressive liberal policy, promulgated a limited act of amnesty to political offenders, relaxed the severity of censorship, reformed judicial administration and prison discipline, and abolished the feudal system in Sardinia. The kingdom participated in the agitations of 1846 and 1847, which affected the whole peninsula, but was wholly exempt from insurrections and conspiracies, the people contenting themselves with expressing their views and wishes in petitions and demonstrations displaying entire confidence in the government. On Feb. 8, 1848, the king announced a new and extremely liberal constitution, which was proclaimed some weeks afterward; a liberal law of election was decreed, the first Sardinian parliament convoked for April 17, and the act of amnesty declared general. In the midst of these changes the revolution broke out, and Charles-Albert, who was saluted with the title of "the sword of Italy," put himself at the head of the movement, and declared war against Austria. (See ITALY, RADETSKY, etc.) On the day after the fatal rout of Novara (Mar. 13, 1849), Charles-Albert abdicated, and was succeeded by his son, Victor-Emmanuel (q.v.), who, in alliance with France, declared war against Austria in 1859; and by Mar., 1861, was in possession of the whole of Italy, except Venetia and Rome, and exchanged the title king of Sardinia for that of king of Italy. Venetia was added to the kingdom in 1866, and the papal states in 1870, when the union of Italy was complete.

SARDONIC SMILE is a term applied by the older medical writers to a convulsive affection of the muscles of the face, somewhat resembling laughter. It may occur in tetanus or lock-jaw, and other convulsive affections, or may result from the action of certain vegetable poisons, such as the *ranunculus sceleratus*, or celery-leaved crowfoot. The name is derived from a species of *ranunculus* that grows in Sardinia, termed *herba sardonica* or *sardou*.

SARDOU, VICTORIEN, b. Paris, 1831; studied medicine, and wrote many articles for newspapers and reviews. In 1854 his first comedy, *La Taverne des Étudiants*, was a complete failure. He fell into extreme poverty, and in 1857 was nursed through a dangerous fever by Mlle. de Brécourt, the lady who afterward became his wife, and by whom he was introduced to Mlle. Déjazet, proprietor of the *Théâtre Déjazet*. For this theater he wrote pieces, of which *Monsieur Garat* and *Les Près-Saint-Gervais* were most successful. He at once rose in fame and fortune, and has since produced a very large number of comedies and *vaudevilles*; and one tragedy, *La Haine*, 1874. Among the most popular of his works are *Nos Intimes*, 1861; *La Perle Noire*, 1862; *Les Pommes du Voisin*, 1864; *Le Roi Carotte*, 1872; and *Dora*, 1877. *L'Oncle Sam*, 1873, purported to be a satire, but is in reality a libel, on American society. Sardou was elected to the French academy 1877, has acquired a large estate, and has the decoration of the legion of honor.

SARGASUM—SARGASSO SEA. See GULF-WEED.

SARGENT, EPES, 1814-1880; b. Mass.; educated at Boston Latin school, and spent two or three years at Harvard college. On leaving college he devoted himself to literature in New York and Boston, and was connected with the editorial staffs of many periodicals. He was a frequent contributor to the *Knickerbocker Magazine*, and to the early volumes of the *Atlantic Monthly*. He assisted S. G. Goodrich in preparing his geography and some of his Peter Parley books. He wrote, in 1836, *The Bride of Genoa*, a play, produced with success at the Tremont theater, Boston. In 1837 he wrote for Miss Ellen Tree the tragedy *Voluseo*, which was produced with success in Boston, New York, and Washington, and in 1850 in England. He wrote two other plays, a comedy, *Change Makes Change*, and a tragedy, *The Priestess*; also the lives of several of the

English poets prefixed to editions of their works. Some of his songs obtained popular currency, and a series of school reading-books, edited by him, was very popular. His *Cyclopædia of Poetry* appeared posthumously in 1881.

SARGENT, HENRY, 1770-1845; b. Gloucester, Mass.; son of Daniel, and brother of Lucius Manlius; educated at Dunmer academy, went to London and entered the studio of sir Benjamin West. Returning to this country he became adj.gen. of the state of Massachusetts, and aid to gov. Brooks and gov. Strong. He was a member of the academy of arts and sciences, and inventor of an elevated railway. One of the best productions of his brush, "The Landing of the Pilgrims," valued at \$3,000, was presented by him to the Pilgrim society of Plymouth, and is still preserved in Pilgrim hall; other interesting works are "The Dinner Party" and "Christ's Entrance into Jerusalem."

SARGENT, JOHN OSBORNE, b. Mass., 1810; graduated at the Boston Latin school, and at Harvard college in 1830; practiced law in Boston; was a member of the legislature 1835-36; connected with the Boston *Atlas* 1835-36; associate editor of the New York *Courier and Inquirer* 1837-41; practiced law in New York 1838-48; took charge of the *Battery*, a whig campaign paper at Washington; founded in 1849, with A. C. Bullitt, the *Republic*. He has translated several books from the German, published some legal and political pamphlets, and a lecture on *Improvements in Naval Warfare*, with a biographical sketch of John Ericsson; assisted S. G. Goodrich in several of the Peter Parley books and some of his school histories.

SARGENT, LUCIUS MANLIUS, 1786-1867; b. Boston; studied law, but did not practice. He had considerable influence as a writer and lecturer upon temperance. He was the author of *Temperance Tales*, which passed through more than 100 editions; *Life of Samuel Dexter*, 1858; and *Dealings with the Dead, by a Section of the Old School*, 1856.

SARGENT, NATHAN, 1794-1875; b. Putney, Vt.; studied law and commenced practice at Cahawba, Alabama, and was appointed county and probate judge 1816. He removed to Buffalo, N. Y., and resided there 1826-30. In the latter year he began the publication, in Philadelphia, of a newspaper in the interest of the whig party, and subsequently wrote letters from Washington to the *United States Gazette*, over the signature of *Oliver Oldschool*. He was at one time president of the Washington reform school, and was sergeant-at-arms of the U. S. house of representatives 1849-51. He was register of the treasury 1851-53, commissioner of customs; 1851-71. He wrote *Life of Henry Clay*, 1844; and *Public Men and Events*, 2 vols., 1875.

SARGENT, PAUL DUDLEY, 1745-1823; b. Gloucester, Mass.; son of col. Epes. He was col. in the patriot army during the revolution, commanding a regiment when Boston was besieged by the British. He fought in the battle of Bunker hill; was wounded; promoted to brig. gen. 1776. He participated in the engagements at Harlem, Trenton, Princeton, and White Plains; and was appointed judge of the court of common pleas, Hancock, Maine, soon after the war, holding the office many years.

SARGENT, WINTHROP, 1753-1820; b. Mass.; joined the American army in 1775, and became navy agent at Gloucester in 1776. He served through the war in the artillery, attaining the rank of maj. In 1786 he was appointed surveyor of the North-west territory, in 1787 its secretary, and 1793-1801 was its governor. He was adj.gen. of St. Clair's forces in the expedition against the Indians in 1791, and of Wayne's forces in the campaign of 1794-95. He wrote *Boston, a Poem*, 1803.

SARGENT, WINTHROP, 1825-70; b. Philadelphia; graduated at the university of Pennsylvania and the Harvard law school. He settled in New York, where he practiced law. Among his works are *Loyalist Poetry of the Revolution*, 1857-60; *History of an Expedition Against Fort Duquesne*; and *a Life of André*, 1861.

SARI, the capital of the province of Mazanderan, Persia, is situated on the banks of a small stream, the Tejend, 18 m. s. of the Caspian sea. It is a modern town, built near the ruins of a very ancient one, and contains a pop. of about 25,000, who carry on a small trade in the produce of the province with Russia, through the Caspian ports, and with the interior of Persia. It stands in the midst of fine orange gardens adorned with beautiful cypresses. It used to be distinguished by a tower 100 ft. high and 30 in diameter, without a staircase, and built of brick and mortar. The great causeway of shah Abbas the great without which the forests of Mazanderan would be impenetrable, runs through Sari.—See *History of Persia* by C. Markham (1874).

SARK, one of the Channel islands. See JERSEY—THE CHANNEL ISLANDS.

SARMA TIANS. The root *arm* in this word is in all probability the same as *arb*, so that it has been conjectured the name Sarmatians has the same ethnological meaning as *Serbi* and *Serri*. The oldest Greek form of the word (and the only one found in Herodotus) is *Sauromata*. The region occupied by the Sarmatians embraced (according to Ptolemy, our chief authority) a portion both of Europe and Asia.—1. The *European Sarmatians* are found as far w. as the Vistula; as far n. as the Venedicus Sinus (gulf of Riga?), or even further; as far e. as the Crimea and the Don; and as far s. as Dacia. Roughly speaking, their territory corresponded to modern Esthonia, Lithuania, western Russia, and parts of Poland and Galicia. The principal, or at least the best-known

nations among the European Sarmatians, were the Peucini and Bastarnæ, about the mouths of the Danube, and in Moldavia and Bessarabia; the Jazyges and Roxolani, probably in Kherson, Tauris, and Ekaterinoslav; the Venedi and Gythones, about Riga, Memel, and Elbing; and the Avari, at the sources of the Vistula.—2. The *Asiatic Sarmatians* are found as far w. as the Tanais (Don), as far e. as the Caspian, as far s. as the Euxine and Caucasus, and as far n. as the water-shed between the rivers that fall into the White sea and the Black, but we have no distinct knowledge of their territorial possessions. North of the Don, in the region now occupied by the Don Cossacks, dwelt the *Perierbidi*; s.e. of it, about Astrakhan, the Jaxamatæ. Beyond the Perierbidi lay the Astei, the "horse-eating" (*Hippophagi*) Sarmatæ, the "Royal" and Hyperborean Sarmatæ, and many others, besides a multitude of nations in the region of the northern Caucasus. The question naturally arises: What were these Sarmatians? The vast extent of territory over which they spread, and the manifest inclusion under the name Sarmatians of different races, as, for example, Goths, Finns, Lithuanians, Circassians, Scythians, and Slaves, prove that the term was loosely used by Ptolemy and his contemporaries, just like the older Herodotean term Scythia, and is not strictly ethnological; yet Dr. Latham's view (see Smith's *Dictionary of Greek and Roman Geography*, arts. Sarmatia and Scythia), that it designated on the whole Slavic races, and in particular the north eastern portion of the great Slavic family, may be regarded as tolerably certain. The Sarmatians figure prominently among the barbarians who vexed the northeastern frontiers of the Roman empire.

SARMIENTO, DOMINGO FAUSTINO, b. Buenos Ayres, 1811; a teacher at San Luis in 1826; opposed Rosas and was exiled to Chili in 1831; returned and established a school for girls at San Juan in 1836; edited a literary paper; went to Chili in 1840, where he interested himself in education. In 1845 he was sent by the Chilean government to visit the educational institutions of Europe and the United States. In 1851 he returned to the Argentine republic, became col. in the army, minister of the interior, governor of the province of San Juan, and minister of public instruction; was minister plenipotentiary to the United States 1864-68, when he was chosen president of the Argentine republic. The country was very prosperous under his administration, commerce being encouraged, railways and telegraphs constructed, schools established, and a national observatory founded. His important works are: *Manual de la Historia de los Pueblos Antiguos*; *Arji Popôis ó la Capital de los Estados Confederados*; *Viajes por Europa, Africa i América*; *Vida de Abram Lincoln*.

SARNIA, or **PORT SARNIA**, a city in s.w. Ontario, Dominion of Canada, opposite Port Huron, at the mouth of St. Clair river; pop. 71, 2,929. It is in Lambton co., 61 m. w. of London, on the Great Western and Grand Trunk railways. It is connected with Port Huron by a steam ferry. It contains Point Edward, formerly Port Sarnia, at the Canada terminus of the Grand Trunk railway opposite Fort Gratiot in Michigan, with which place it is connected by transfer ferry boats, which convey the railway cars across the river. It has 5 churches, public schools, 2 branch banks, a telegraph office, and 2 newspapers. Its trade is important, and its commerce both by rail and steamer is increasing in consequence. It has manufactures of ale and beer, lumber, iron castings, machinery, wooden-ware, woollens, leather, etc.

SARNO, a city of southern Italy, in the province of Salerno, on the river of the same name, 13 m. n.w. of Salerno. It is a well-built town, with a very handsome cathedral containing some good paintings, and has a seminary for priests, a hospital, several paper manufactories, and foundries. Its environs are famous for the produce of very fine silk. In the center of the town there are springs of sulphureous and chalybeate waters. Among the buildings worthy of notice is the ancient castle of the Barberini family. Pop. 10,933.

In the plain near Sarno, Teias king of the Goths, in a desperate battle with the Greeks, commanded by Narses, in 553, was vanquished and slain, and the reign of the Goths in Italy brought to a close.

SAROS, a co. in n. Hungary, drained by the Topla, Tarcza, and other rivers; intersected in the n. by the Carpathian mountains; about 1400 sq. m.; pop. 70, 175,292. The surface is uneven, and broken by ridges of the Carpathians. The soil along the river valleys is fertile. The principal productions are grain, flax, hemp, oats, and fruit. There are salt and iron mines. Opals and other precious stones are found. Capital, Eperies.

SARPI, PIETRO, better known by his monastic appellation, **FRA PAOLO**, or brother Paul, was b. at Venice in the year 1552; became an early proficient in mathematics as well as in general literature, resolved to embrace the monastic life, and in his 20th year took the vows in the religious order of the Servites (q.v.). Soon afterward he was appointed by the duke of Mantua to a professorship of theology in that city; but he held it only for a short time; and returning to his order, of which he was elected provincial in his 27th year, he continued to pursue in private his studies in languages, in mathematics, in astronomy, and in all the other branches of natural philosophy, including the medical and physiological sciences, in which he attained to great proficiency, being by some writers regarded (although, as it would seem, without sufficient grounds) as entitled to at least a share in the glory of the discovery of the circulation of the blood. The freedom of some of his opinions led to his being charged at Rome with heterodox views, and although

held free from actual heresy, his opinions became an object of suspicion; and in the dispute between the republic of Venice and Paul V. (q.v.) on the subject of clerical immunities, Sarpi justified these suspicions by the energy with which he threw himself into the anti-papal party. On being summoned to Rome to account for his conduct, he refused to obey, and was accordingly excommunicated as being contumacious. The zeal of Sarpi's opposition to Rome drew upon him the hostility of the partisans of the Roman claim; and an attempt was even made upon his life by a band of assassins, whom the ardor of party-spirit at the time did not hesitate, although upon mere presumption, to represent as emissaries of the Jesuits. Fra Paolo himself openly professed to share this suspicion, and believing his life in danger, confined himself thenceforward within the inclosure of his monastery. It was in this retirement that he composed his celebrated *History of the Council of Trent*, which has long been the subject of controversy and criticism. It was published in London by Antonio de Dominis, the ex-bishop of Spalatro, who had recently conformed to Protestantism, at first under the pseudonym of *Pietro Scare Polano*, an anagram of the real name of the author, *Paolo Sarpi Veneto*; and it almost immediately rose into popularity with the adversaries of Rome as well in England as throughout the continent. It is by no means a simple history of the proceedings of the council, but rather a controversial narrative of the discussions, in which the writer freely enters into the merits of the doctrines under discussion, and in many cases displays a strong anti-Catholic bias. His judgment of the motives and of the conduct of the members of the council, especially of the representatives of the pope and his partisans in the assembly, is uniformly hostile, and has been accepted by Protestants as a strong testimony against Rome from a member of the Roman church. It must be confessed, however, that whatever judgment we may form of Sarpi's credibility on his own merits, it is idle to look upon him in the light of a member of the church of Rome. It is plain, from numberless declarations in his work, and from remains of his correspondence published after his death, that his opinions were strongly biased, not merely with an anti-Roman, but even with rationalistic leanings; and Ranke does not hesitate to declare that his unsupported statements cannot be accepted with security, when there is question of a damaging narrative of some intrigue of the legates in the council, or some cabal of the Italian bishops in the interest of Roman views. A voluminous counter-history of the council of Trent was written by the Roman Jesuit (afterward cardinal) Pallavicino, which follows him into the details as well of the history as of the controversy. It would be out of place here to enter into any comparison of these rival histories of the council. The history of Sarpi has been translated into most of the European languages. The French translation is by the celebrated Courayer, and is enriched with copious vindictory and critical annotations. Sarpi lived in the full vigor of intellect to the age of 71, and died of a neglected cold, which led to a protracted illness, in the year 1623. His life as an ecclesiastic was without reproach; and his long-tried zeal in the cause of the republic had made him the idol of his fellow-citizens. He was honored accordingly by the republic with a public funeral. His *History of the Council of Trent* has been reprinted in numberless editions; and his collected works were published at Verona in 8 vols. 4to, 1761-68, and again in Naples, in 24 vols. 8vo, in 1790.

SARPY, a co. in e. Nebraska, separated from Iowa by the Missouri river, bounded on the s. by the Platte; drained by the Papillion and Elkhorn rivers; traversed by the Union Pacific railroad; about 260 sq.m.; pop. '80, 4,481—3,603 of American birth. The surface is rolling prairie or woodland. The soil is extremely fertile. The principal productions are corn, wheat, and oats. Co. seat, Papillion.

SARRACENIA, or **SIDE-SADDLE FLOWER**, a genus of very singular marsh plants, natives of North America. *S. purpurea* is common from Hudson's bay to Carolina; the other species are confined to the southern states. They are herbaceous perennial plants, with radical leaves and scapes, which bear one or more large flowers. The leaves are of very remarkable structure, the stalk being hollow and urn-shaped, and the blade of the leaf articulated at its apex, and fitting like a lid. It is from the form of the leaves that the name side-saddle flower is derived.—The genus is the type of the small natural order *sarracenaceae*, the only other genus of which has been discovered in Guyana. The order is closely allied to *papaveraceae*.

SARREGUEMINES (Ger. SAARGEMÜND), formerly a frontier t. in the n. of France, but since the war of 1870-71 in the possession of Germany, is in the province of Alsace-Lorraine, 41 m. e. of Metz. It is famous for its pottery; hempen fabrics and velvets are also made. Pop., '75, 8,471.

SARSAPARILLA, or **SARSA**. This much-employed medicine is the produce of several species of *smilax* (q.v.), although the species yielding the different kinds brought to the market have not yet been fully ascertained. Among them, the three principal are believed to be *S. officinalis*, *S. medica*, and *S. papyracea*; twining shrubs, with prickly angular stems; the first with large ovate-oblong, acute, heart-shaped, leathery leaves; the second with shortly acuminate smooth leaves; the lower ones heart-shaped, the upper ones approaching to ovate; the third with membranous, oval-oblong, obtuse leaves. These shrubs are natives of warm parts of America; *S. officinalis* and *S. papyracea* being found in South America, and *S. medica* on the Mexican Andes. Some botanists regard them as mere varieties of one species.

The part of the plant used in medicine is the dried root, of which the following are the characters, as given in the British Pharmacopœia: "Roots not thicker than a goose-quill, generally many feet in length, reddish-brown, covered with rootlets, and folded in bundles about eighteen inches long, scentless; taste mucilaginous, feebly bitterish, faintly acrid." Sarsaparilla has been analyzed by various chemists, and appears to consist of volatile oil, most of which is expelled during the process of drying, of a white crystallizable neutral substance named *smilacin*, whose composition is represented by the formula $C_{16}H_{12}O_5$, an acrid bitter resin, lignin, starch, and mucilage. Sarsaparilla is one of the class of medicines called diaphoretics. The British Pharmacopœia contains three preparations of this drug—viz., the decoction, the compound decoction (containing sarsaparilla, saffraas chips, guaiac wood-turnings, liquorice root, and meze-reon), and the liquid extract. The cases in which they are serviceable are those of chronic rheumatism, secondary syphilitic affections, chronic skin diseases, etc. To be of any service, sarsaparilla must be taken in considerable doses. The compound decoction, formerly known as the *decoction of sweet woods*, is the best preparation, and should be taken in doses of four or six ounces three times a day.

The root of *S. aspera*, a native of the s. of Europe, is used as a substitute for sarsaparilla, although of inferior quality, and is called Italian sarsaparilla.

The root of *hemidesmus indicus*, a climbing shrub of the natural order *asclepiaceæ*, is used in India as a substitute for sarsaparilla, and is therefore called Indian sarsaparilla. The plant is common in all parts of India. The root has a peculiar aromatic odor and bitter taste. In consequence of the high price charged for genuine sarsaparilla, the root of *hemidesmus indicus* or *Indian sarsaparilla* has been introduced into the British Pharmacopœia. The following are its characters: "Yellowish brown, cylindrical, tortuous, furrowed, and with annular cracks, having a fragrant odor and a very agreeable flavor. The only official preparation is the syrup; but in India, where this root is highly esteemed as a diaphoretic and tonic, and is extensively used as a substitute for sarsaparilla, an infusion prepared by infusing two ounces of the root in a pint of boiling water, is generally employed, the dose being from two to four ounces three times a day. The syrup is chiefly used, in consequence of its pleasant flavor, as a vehicle for more active medicines.

In Germany, the roots of *Carex arenaria*, *C. disticha*, and *C. hirta* (see CAREX), are occasionally used as a substitute for sarsaparilla, under the name of German sarsaparilla.

SARFIELD, PATRICK, Earl of Lucan, 1645-93; b. Ireland; entered the army and served under Monmouth, but was in the victorious army when the latter was defeated at Sedgewick. He was a Roman Catholic and at the revolution was a member of parliament. He supported king James's effort to retain the crown, and fought at the battle of Boyne. William III. was forced by him to raise the siege of Limerick in 1700. In 1791 he commanded the reserve at Aughrim, and after a gallant defense of Limerick obtained fair terms of surrender and entered the French service. Here he distinguished himself at the battles of Steenkirke (1692), and Landen (1693). He was killed in the last-named battle.

SARTAIN, JOHN, b. London, 1808; became an engraver, and in 1830 emigrated to Philadelphia. He is noted chiefly as having introduced here the art of mezz-tint engraving, and as the designer of the Washington and Lafayette monument in Philadelphia. He was proprietor and editor of two magazines, and author of *Poetical and Prose Illustrations of Celebrated American Painters*, 1852.

SARTHE, an inland dep. of France, n. of the Loire. Area, 2,390 sq. m.; pop. 76, 446,330. It is a country of plains, traversed by low hills and by undulations clothed with vines, of large picturesque forests, and of pleasant valleys. The soil is fertile, productive in grain and in clover; hemp is cultivated, and hempen fabrics largely manufactured. The wine produced is of a mediocre quality. The climate is healthy and temperate. Clover-seeds are exported to England and Holland, and swine and cattle are reared in large numbers for the Paris and other markets. Sarthe is divided into the four departments of Mans, La Flèche, Mamers, and St. Calais. The capital is Le Mans. See MANS, LE.

SARTI, GIUSEPPE, one of the most skillful and learned musical composers of the 18th c., was born at Faenza in the Papal States in 1729. He studied under padre Martini at Bologna; and in 1752 produced his first opera, *Il Re Pastore*, which was performed at Faenza with great success. He held for a time the office of *hof kapellmeister* at Copenhagen, but returned to Italy in 1765. In 1770, and the following years, he composed his principal operas, including *Le Gelosie Villane* *Giulio Sabino*, the latter of which was enthusiastically received throughout Italy, and is highly praised by Dr. Burney. In 1779 he became *maestro di cappella* of the Duomo at Milan, and gave himself to the composition of church music. In 1784 he went to St. Petersburg as music director to the court of the empress Catherine, by whom he was treated with great liberality, and raised to the highest rank of nobility. He died at Berlin in 1802, on his way to Italy. His operas are thirty in number; but the composition by which he is now most known is his beautiful sacred terzett, *Annibals Lara Me*. Sarti was the musical instructor of Cherubini (q.v.)

SARTO, ANDREA DEL, one of the most famous painters of the Florentine school, was b. at Florence in 1488. According to later writers the family name was Vannucchi, and

Andrea only received the name of *del Sarto* (the Tailor) from the occupation of his father; but this statement is probably erroneous. Sarto was a pupil of Piero di Cosimo, but formed his style mainly through study of the works of Masaccio, Domenico Ghirlandajo, and Buonarroti. These artists inspired him with a love of fresco-painting, in which he achieved great distinction. During 1509-1514 he executed a series of representations from the life of St. Filippo Benizzi, in the porch of the Annunziata at Florence; and in these the characteristics of his genius—dignity of composition, purity of form, freshness of color, and grace of expression—are seen at their best. In 1514 he commenced a series of frescoes from the life of John the Baptist, which were not finished, however, till 12 years afterward. The finest works, of what may be called his middle period, are the “Madonna di San Francesco,” and the “Contending Theologians,” both in the Florentine galleries. In 1518 Francis I. invited Sarto to Paris, where he painted, among other things, the picture of “Charity” in the Louvre; but at the solicitations of his wife, he returned to Florence, where he died in 1530. To the later years of his life, which were neither happy nor honorable, belong his “Piety,” his most celebrated fresco the “Madonna del Sacco” (in the Annunziata at Florence), the “Madonna with Saints” (in the Berlin museum), and the “Sacrifice of Abraham” (in the Dresden gallery). His largest fresco is the “Lord’s Supper,” in what was formerly the abbey of San Salvi, near Florence.—See Remmont’s *Andrea del Sarto* (Leip. 1835).

SARUM, OLD, an extinct city and borough of England, was situated on a hill 2 m. to the n. of Salisbury, in Wiltshire. It dated from the time of the Romans, by whom it was known as *Sorbiodonum*, and remained an important town under the Saxons. A Witenagemôte was held at Old Sarum in 960; and here William the conqueror assembled all the barons of his kingdom in 1086. It was the seat of a bishop from the reign of William the conqueror till 1220, when the cathedral was removed to New Sarum, now Salisbury (q.v.), and was followed by most of the inhabitants. In Henry VII.’s time it was almost wholly deserted, and has so continued till the present time. Some traces of walls and ramparts, and of its cathedral and castle, are still seen. Though without a single house or inhabitant, two members represented it in parliament, till, like many other rotten boroughs, it was disfranchised by the reform bill of 1832. William Pitt, earl of Chatham, first sat in parliament for Old Sarum in 1735.

SARVĀSTIVĀDAS, or SARVĀSTIVĀDINS (lit., those who maintain the reality of all existence), is the name of one of the four divisions of the *Vāibhāshika* system of Buddhism: its reputed founder was *Rāhula*, the son of the Buddha S’akkyammi.—See C. F. Koepfen, *Die Religion des Buddha* (Berlin, 1857); and W. Wassiljew, *Der Buddhismus, seine Dogmen, Geschichte und Literatur* (St. Petersburg, 1860).

SARZANA, a city of northern Italy, in the province of Genoa, 8 m. e. of Spezia. Its cathedral, built in 1200, is very rich in paintings and marbles. There is also an ancient fortress built by the Pisans in 1262. It is the birthplace of pope Nicholas V. Pop. ’71, 5,396.

Sarzana is a very ancient city, founded 176 B.C. The adjacent city of Luni having been sacked and destroyed by the Vandals and by the Normans, its inhabitants abandoned it, and took refuge in Sarzana, to which place they removed the episcopal see in 1204. There are still remains of the amphitheater at Luni.

SASH, in the British army, is a military distinction worn on duty or parade by officers and non-commissioned officers. For the former, it is of crimson silk; for the latter, of crimson cotton. By officers it is worn over the left shoulder, and by non-commissioned officers it is worn over the right shoulder. There are no sashes in cavalry regiments.

SASH. The frames in which the glass of windows is inserted are called window-sashes. Common windows are usually made with an upper and lower sash, contrived so that, by means of cords or chains, pulleys, and balance-weights, they slide up and down in a wooden case.

SASIN. See ANTELOPE.

SASINE. (See INFERTMENT.) The ceremony was as follows: the attorney of the party giving the right produced his warrant of title, and gave it to the bailie or representative of the other party, who gave it to the notary to be explained by the latter to witnesses, and then the first party delivered earth and ground, that is, part of the very soil, to the other in presence of the witnesses. The notary then drew up an instrument reciting what had been thus done, and which was signed by the notary and two witnesses. In England, *seisin* never had so narrow and technical a meaning as it had in Scotland.

SASKATCHAWAN, a large, important, and only recently explored river of British North America, draws its waters from the Rocky mountains, and is formed by two head-waters called the south branch or Bow river, and the north branch. The south branch issues from a lake about 4 m. long, fed by a glacier descending from a magnificent *mer de glace*, and by a group of springs in the vicinity. A few yards n. of this group of springs is another group, from which the north branch takes its rise. The height above the sea is 6,347 ft.; the lat., 51° 40' n.; the long., 117° 30' west. The south branch flows s.e. to its junction with the Belly river in long. 111° 40' w., then

n.e. to its junction with the north branch in long. 105° west. Fed mainly from the same glacier that feeds the south branch, the north branch flows n. past Mt. Murchison, 15,789 ft. above sea-level, and one of the highest peaks of the Rocky mountains, n. through Kutanie plain, a fine prairie abounding in game, and then flows in a general eastern direction to its confluence with the south branch. From long. 105° w., the river flows e., and falls into lake Winnipeg. Length of main river, 200 m.; of north branch, over 550 miles. From its mouth it is navigable (on the north branch) about two-thirds of its entire length. It flows through a country rich in coal and iron, with a healthy climate, and comprising almost boundless plains suited to the cultivation of grain. At the sources of the Saskatchewan, there are several easily practicable routes across the Rocky mountains, especially the Vermilion pass.—*Journal of the Geographical Society for 1860*; earl of Southesk's *Saskatchewan* (1875). See NELSON RIVER.

SASSAFRAS, *Sassafras*, a genus of trees or shrubs of the natural order *lauraceæ*, having dioecious flowers, a 6-parted membranous perianth, 9 stamens, a succulent fruit placed on the thick fleshy apex of the fruit-stalk, and surrounded by the unchanged perianth. The sassafras tree (*S. officinale*) of North America, found from Canada to Florida, a mere bush in the n., but a tree of 50 ft. in the s., has deciduous leaves, yellow flowers which appear before the leaves, and small dark-blue fruit. The wood is soft, light, coarse in fiber, dirty-white and reddish brown, with a strong but agreeable smell, resembling that of fennel, and an aromatic, rather pungent and sweetish taste. The wood of the root possesses these properties in a higher degree than that of the stem, and the thick spongy bark of the root most of all. The wood is brought to market in the form of chips, but the bark of the root is preferred for medicinal use, is a powerful stimulant, sudorific, and diuretic, and is employed in cutaneous diseases, gout, rheumatism, and syphilis, generally in combination with other medicines. It contains a volatile oil, *oil of sassafras*, which is often used instead. An agreeable beverage is made in North America by infusion of sassafras bark or sassafras wood; and a similar beverage was once very commonly sold at daybreak in the streets of London under the name of *saloop*. A few saloop-venders are still to be seen plying their vocation. The leaves of sassafras contain so much mucilage that they are used for thickening soup.—Another species of sassafras (*S. parthenorhylon*), possessing similar properties, is found in Sumatra.

SASSAFRAS NUTS. See PITCHURM BEANS.

SASSANIDÆ, the dynasty which succeeded that of the Arsacideæ on the throne of Persia (q.v.), derived its name from Sassan, the grandfather of the newly elected monarch ARDISHIR. The reign of the Sassanidæ is remarkable in the history of Persia, not for the extent of their sway, or the luxury and magnificence of their court, though in these respects they could vie with the Achæmenidæ at the epoch of their greatest power and splendor, but for the intense energy which they succeeded in infusing into the people at large. A comparatively small army of Greeks might and did successfully strive against the immense hordes of a Xerxes and a Darius; but the veterans of Rome could gain no permanent laurels in a conflict with an equal force of Persians under the Sassanidæ. Ardishir made the desert of Khiva and the Tigris his boundaries, and resigned the throne to his son, SHAHPUR I. (SAPOR) (240–273 A.D.), who subdued Armenia, took Algezira (258) and Nisibis, totally routed the Romans at Edessa, taking prisoner the emperor Valerian and the relics of his army, and overrunning Syria, Capadocia, and other portions of western Asia. This monarch paid as much attention to the prosperity of his subjects and the encouragement of the fine arts as he did to the extension of his power; but his enlightened plans were not carried out by his immediate successors.—NAIRI (NARES) (294–303) retook Armenia, and signally defeated the Romans under Galerius; but fortune deserted him in the following year (297).—His grandson, SHAHPUR II. (310–331), surnamed POSTHUMUS, an infant, succeeded, and Persia, during his minority, was much harassed by the Arabs, Romans, and Tartars; but Shahpur had no sooner taken in his hands the reins of government than in return he ravaged Yemen, punished the Tartars, and took the sole revenge at that time in his power against the Romans, by commencing a dreadful persecution of the Christians in his dominions. A regular war speedily followed; the army of Constantius was routed at Singarah, and he was compelled to sue for peace. But the war continued; Constantius's successor, Julian, was defeated, and lost his life (363) near Ctesiphon, and the Romans were glad to conclude the humiliating peace of Dura. Armenia, Iberia, and the other Caucasian principalities were then reduced by Shahpur. The wholesome terror thus infused into the Romans effectually restrained them from aggressions for many years.—Among his successors were BAHARAM V. (420–448), surnamed GOUR, who recommenced hostilities with the Romans, the result being a partition of Armenia and a truce for 100 years; and KOBAD (COBADES or CABADES) (488–498, 502–531), a wise and able monarch, who, on the Romans refusing any longer to pay the stipulated tribute, declared war against them, and defeated them in every engagement, concluding peace (505) on receiving 11,000 lbs. of gold. A second war, which commenced in 521, was from beginning to end in favor of the Persians, though the Romans at that time possessed a staff of generals unsurpassed at any previous epoch of their history. The war continued for some time after the accession of KHRSD I. (q.v.) (531–579), and was continued at intervals till nearly the conclusion of the century, when another great Persian

conqueror, KHUSRU II. (q.v.) (591-628), ascended the throne; but the details of his annihilation of the Roman power in Asia, and the resistless march of Heraclius (q.v.), who again cooped up the Persians within the Tigris, and inflicted upon the Sassanids a blow from which they never recovered, will be found under these names.—After four years of petty civil war, which wore out the remaining strength of the nation, YESDIGERD III. (632-651) was raised to the throne. The Arabs, who had already twice attacked Persia without success, made a third attempt in 639, and routed Yesdigerd's army at Kudseah (Cadesia) with immense loss. Yesdigerd made another energetic attempt to rescue his kingdom; but the great battle of Nahavend, in which more than 100,000 Persians are said to have been slain, extinguished all hope of success; and the unfortunate monarch became a fugitive and a wanderer in northern Khorassan till 651, when he was treacherously murdered.—Thus perished the dynasty which had pulled down the Romans from their proud pre-eminence among nations by the hands of a horde of robber fanatics, under whose barbarous rule the extensive commercial prosperity and refined civilization which had been so carefully fostered for four centuries, were utterly swept away, leaving only such traces as ruined aqueducts, choked-up canals, and the still magnificent remains of almost forgotten cities.

SASSARI, a province of Italy, in n. Sardinia, bounded e., n., and w. by the Mediterranean, and on the s. by Cagliari; drained by the Posada, Tirso, Coghinis, and other rivers; about 4,000 sq. m.; pop. '72, 243,452. The surface is mountainous. The principal productions are wheat, barley, and dairy products. Capital, Sassari.

SASSARI, a city in the n.w. of the island of Sardinia, the chief t. of the province of the same name, 8 m. from the shore of the gulf of Asinara. It is a handsome and important archiepiscopal city, and has a vast cathedral, with many sculptures, one of which is by Canova; a university, founded in 1776; a college; and a rich library, with the MSS. of the Azuni. Sassari is a very busy town, and trades especially in grain, wine, fruits, wood, olive oil, and tobacco. Its harbor, Torres, is 10 m. n.w. of Sassari; it is narrow and shallow, and does not admit large vessels. Pop. '72, 32,674.

SATA LIAH, another name of Adalia (q.v.).

SATAN. See DEVIL.

SÁTARÁ, generally spelled *Sattara*, a collectorate in the southern division of the province of Bombay, British India, is bounded on the n. by the state of Poona, and on the w. by the lofty ridge of the western Ghats. Area, 5,371 sq. m.; pop. '72, 1,052,853. SÁTARÁ, the capital, from which the state derives its name, one of the most salubrious and pleasant stations in the Deccan, 133 m. s.e. of Bombay. Pop. '72, 24,484.

SATELLITES (Lat. *satellites*, an attendant) are certain celestial bodies which attend upon and revolve round some of the planets, as these latter revolve round the sun; and hence scientific men frequently apply to them the generic term, "secondary planets." The earth, Mars, Jupiter, Saturn, Uranus, and Neptune each possesses one or more of these attendants. The eclipses, inequalities, inclinations, and reciprocal attractions of the satellites have been carefully noted from time to time, and the theory of their motions, at least of the most prominent of them, has been found to coincide with that of the moon. The satellites of Jupiter are invested with additional interest, from their eclipses having been the means of directing Römer to his great discovery of the successive propagation and velocity of light. On careful investigation, he found that the eclipses regularly happened 16' 26" earlier when the planet was in opposition (i.e., nearest the earth), than when it was in conjunction (i.e., furthest from the earth), a phenomenon which could only be accounted for by the supposition that light requires 16' 26" to pass over a distance equal to the diameter of the earth's orbit.

SATIN, a fabric in which so much of the weft is brought uppermost in the weaving as to give a more lustrous and unbroken surface to the cloth than is seen when the warp and weft cross each other more frequently; this will be better understood by reference to the figure than by any verbal description. A are the warp threads, of which only every tenth one is raised to allow the shuttle to pass, but they are all raised in regular succession, so that the weaving is quite uniform throughout; B are the weft threads; and C is the selvedge, which is formed on each side of the piece of stuff by the regular method of plain-weaving, that is, by raising every other warp thread for the passage of the weft. The term satin is very rarely applied to any other than silk

fabrics, woven as described; but there are woolen, linen, and cotton satins known in the markets.

SATIN-BIRD. See BOWER-BIRD.

SATINET, an inferior satin, woven much thinner than the ordinary kind. The term is also occasionally applied to a variety of cloth woven with cotton warp and woolen weft.

SATIN-WOOD, a beautiful ornamental wood obtained from both the West and East Indies. The former is the better kind, and is supposed to be the produce of a moderate-sized tree, *ferolia Guianensis*, and probably other species, as there are several varieties of the wood. That from the East Indies is less white in color, and is produced by *chloroxylon swietenia*. Both are much used by cabinet-makers, and for marquetry, etc. The logs are usually only 6 or 7 in. square.

Chloroxylon swietenia is a tree of the natural order *cedrelaceæ*, growing on the mountains of the Circars in India, and in Ceylon. Sir James E. Tennent says that "in point of size and durability, it is by far the first of the timber-trees of Ceylon. The richly-colored and feathery logs are used for cabinet-work, and the more ordinary for building purposes, every house in the eastern province being floored and timbered with satin-wood."—Tennent's *Ceylon*.

SATIRE (Lat. *sâtîra*; older form, *sâtûra*), the name given by the Romans to a species of poetry of which they may be considered the inventors. The word *satûra* (from the root *sat*, enough) is strictly and originally an adjective, meaning "full" or "filled"; but afterward it came to possess also a substantive signification, and denoted a dish filled with a medley of ingredients, like the *pot-pourri* (q.v.) of the French, or the *olla podrida* (q.v.) of the Spaniards. Hence, in its figurative application to a branch of literature, it throws a light on the primary character of that literature. The oldest Roman satire was a medley of scenic or dramatic improvisations expressed in varying meters (Livy, lib. 7, cap. 2), like the Fescennine verses (q.v.); but the sharp banter and rude jocularity of these unwritten effusions bore little resemblance, either in form or spirit, to the earnest and acrimonious criticism that formed the essential characteristic of the later satire. The earliest—so far as we know—who wrote *satûre*, were Ennius (q.v.) and Pacuvius; but the metrical miscellanies of these authors were little more than serious and prosaic descriptions, or didactic homilies and dialogues. Lucilius (b. 148, d. 103 B.C.) is universally admitted to be the first who handled men and manners in that peculiar style which has ever since been recognized as the satirical; and the particular glory of Lucilius, in a literary point of view, consists in this, that he was the creator of a special kind of poetry, which in all subsequent ages has been the terror and aversion of fools and knaves. The serious and even saturnine gravity of the Roman mind must have readily disposed it to a censorious view of public and private vices. After the death of Lucilius satire, as well as other forms of literature, languished, nor do we meet with any satirist of note till the age of Horace (q.v.), whose writings are as a glass in which we behold mirrored the tastes and habits of the Augustan age. His satire, though sharp enough at times, is in the main humorous and playful. It is different when we come to Juvenal (q.v.)—a century later, when satire became a *sæva indignatio*, a savage on-laught on the tremendous vices of the capital. Persius (q.v.), who lived in the generation before Juvenal, is every way inferior, in force of genius, to the latter. After Juvenal we have no professed satirist, but several writers, prose and poetic, in whom the satiric element is found, of whom Martial, the epigrammatist, is perhaps the most notable.

During the middle ages the satirical element showed itself abundantly in the general literature of France, Italy, Germany, England, and Scotland. Men who have a claim to the character of satirists, *par excellence*, are Ulrich von Hutten, one of the authors of the *Epistolæ Obscurorum Virorum* (q.v.), Erasmus (q.v.), Rabelais (q.v.), sir David Lindsay (q.v.), George Buchanan (q.v.). In all of these writers, priests are the special objects of attack; their vices, their greed, their folly, their ignorance, are lashed with a fierce rage. But it was in France that satire as a formal literary imitation of antiquity first appeared in modern times. Vauquelin (q.v.) may be considered the true founder of modern French satire. The satirical verses of Mottin, of Sigogne, and of Berthelot, of Mathurin Régnier, *L'Espadon Satirique* of Fourquereux, and *Le Pierreuse Satirique*, attributed to Théophile Viaud, are very impure in expression, and remind us that at this time a satire was understood to be an obscene work—the 17th c. scholars supposing that the name had something to do with Satyr, and that the style ought to be conformed to what might be thought appropriate to the lascivious deities of ancient Greece! During the 17th and 18th centuries, both England and France produced professed satirists of the first order of merit, who have not been surpassed by the best either of their predecessors or successors. The names of Dryden (q.v.), Butler (q.v.), Pope (q.v.), and Churchill (q.v.) on this side of the channel, of Boileau (q.v.) and Voltaire (q.v.) on the other, are too well known to require more than mention. Dr. Edward Young (q.v.) and Dr. Johnson (q.v.) have also made a name for themselves in this branch of literature. It may be noticed, however, as a distinguishing characteristic of Dryden, Boileau, Young, Pope, Churchill, and Johnson, and as a mark of the difference of the times in which they lived from those of the satirists of the reformation, that it is no longer the church that is assailed, but society, political opponents, literary rivals, etc.; the war is carried on, not so much against bad morals in the clergy as against the common vices of men in general, or is

even the expression of partisan hatreds. Swift (q.v.) and Arbuthnot (q.v.) are perhaps as great satirists as any of those we have mentioned.

Satire in the shape of political squibs, lampoons, etc., is very abundant in the 17th and 18th centuries. Butler's *Hudibras* is simply one long lampoon against the Puritans; most of the playwrights of the restoration were royalist satirists—unscrupulous and indecent partisans. Dryden himself was but *facile princeps* of the herd. Andrew Marvell (q.v.) is the most famous name on the side of liberty. The *Beggars' Opera* of the poet Gay is a piece of very fine political satire. Gifford (q.v.) and Wolcot (q.v.), better known as Peter Pindar, also deserve mention in a historical point of view, though their intrinsic merits are small. Incomparably superior to all their contemporaries, and among the first order of satirists, are Robert Burns (q.v.) and Cowper (q.v.).—Meanwhile, in France, since Voltaire, no great name has appeared, except, perhaps, that of Béranger (q.v.), though the spirit of satire has pervaded most of the current literature, more particularly political literature, of which one of the latest expressions is the pamphlet published in 1865 by M. Rogeard against the system of government pursued by Napoleon III., and entitled *Les Propos de Labricius*. In Germany the most conspicuous modern names are those of Hagedorn, Rabener, Sturz, Stolberg (q.v.), Kästner, Wieland (q.v.), Tieck (q.v.), and Goethe (q.v.), but none of these have adhered very strictly to the classic models of satire. Of 19th c. satirists in England, the best names are Byron (q.v.), the brothers Smith (q.v.), and Hood (q.v.) in poetry; and Hook (q.v.), Jerrold (q.v.), Thackeray (q.v.), and Carlyle (q.v.) in prose. To these may be added the name of the author of the *Bigelow Papers*, James Russell Lowell.—See Sellar's *Roman Poets of the Republic* (Edinb. 1863); Browne's *History of Roman Classical Literature* (Lond. 1853); Thomson's *History of Roman Literature* (forming a volume of the *Encyclopædia Metropolitana*); Mommsen's *History of Rome*; Niebuhr's *Lectures on Roman History*; M. Viollet le Duc, article "Satire" in the *Dictionnaire de la Conversation*; and James Hannay's *Satire and Satirists*.

SA TRAP, in the ancient Persian monarchy, was the governor of a province, whose power—so long as he enjoyed the favor of the king—was almost absolute. He levied taxes at his pleasure, and could ape the tyranny of his great master without let or hindrance. When the monarchy of Cyrus began to decline, some of the satraps threw off their slight allegiance, and founded independent kingdoms or sultanates of their own, the most famous of which in ancient times was the Mithridatic kingdom of Pontus. See PONTUS and MITHRIDATES.

SATSUMA, a province in the s. of Japan, on the island of Kiushiu; pop. 1,200,000. The ancient possessions of the hereditary lords of Satsuma extended over a large part of Kiushiu, but from the 16th c. their fief was greatly restricted. They were humbled by Taiko, and again by Iyeyasu. In 1609 they conquered and occupied the Loo Choo islands. Always restive and jealous of the Yedo usurpation, they were the first to rise against it in the restoration of 1868, since which time, having handed over their power to the mikado, their lands have formed the Kagoshima *ken* or prefecture, after the name of their chief city, at which Xavier first landed in 1549, and which in 1863 was bombarded by a British fleet, in revenge for the killing of a British subject near Yedo, by men in the procession of Shimadzu Saburo. An indemnity of £100,000 was paid the British. In 1877 about 30,000 rebels, mostly from Satsuma, actuated by the idea that Japan was dishonored by not going to war with Corea, and that the mikado's ministers in Tokio were ruining the country by extravagance and oppression, rose in arms against the imperial government. To suppress this rebellion cost the nation 20,000 lives and £50,000,000. The surface of Satsuma is mountainous, and the soil not very good; but manufactures and commerce flourish, and the mines are rich. Satsuma faience has long been noted for the richness of its gilding and painted decoration. The white clay was first discovered in 1624, and the characteristic decoration in gold and bright colors began about 1690. Nearly all the matchless ceramic triumphs of Satsuma have been the work of Corean captives or their descendants.

SATTERTHWAITE, THOMAS EDWARD, b. N. Y., 1843; graduated at Yale, 1864; and at the college of physicians and surgeons, New York, 1867. He was surgeon in the Franco-Prussian war, has distinguished himself as a microscopist and pathologist, and has published many papers on medical subjects. His treatise on *The Structure and Development of Connective Substances* received the alumni prize of the college of physicians and surgeons in 1876.

SATURDAY, the seventh and last day of the week, receives its name from the Latin *dies Saturni* (Saturn's day). It is the Jewish Sabbath; and it is held by many that the application of that name to the Lord's day (Sunday) is incorrect. In the breviary of the Roman Catholic church, Saturday is still called *Dies Sabbati*.

SAT URN, an ancient Italian divinity, who presided over agriculture. His name, from the same root as *satum* (*sero*, to sow), indicates what was probably one of the earliest personifications in the Italian religion, Saturn being the god who blessed the labors of the sower. His identification with the Greek KRONOS by the latter Greece-myth-mongers is a peculiarly infelicitous blunder, and has led to more than ordinary confusion. The two have absolutely nothing in common except their antiquity. The Greek *Demeter* (Ceres), it has been observed, approaches far more closely to the Italian conception of the

character of Saturn. The process of amalgamation in the cases of Kronos and Saturn is visible enough. First, there is the Greek myth. Kronos, son of Uranos (heaven) and Gæa (earth), is there the youngest of the Titans. He married Rhea, by whom he had several children, all of whom he devoured at birth except the last, Zeus (Jupiter), whom his mother saved by a stratagem. The motive of Kronos for this horrible conduct was his hope of frustrating a prophecy which declared that his children would one day deprive him of his sovereignty, as he had done in the case of his father Uranos; but fate is stronger even than the gods, and when Zeus had grown up, he began a great war against Kronos and the Titans, which lasted for ten years, and ended in the complete discomfiture of the latter, who were hurled down to Tartarus, and there imprisoned. So ran the common myth. But other myths added, that after his banishment from heaven, Kronos fled to Italy, where he was received hospitably by Janus, who shared his sovereignty with him. At this point the Greek myth coalesced with the Italian. Saturn, the old homely deity of the Latin husbandmen, was transformed into a divine king, who ruled the happy aborigines of the Italian peninsula with paternal mildness and beneficence, taught them agriculture and the usages of a simple and innocent civilization, and softened the primitive roughness of their manners. Hence the whole land received from him the name of *Saturnia*, or "land of plenty." His reign was that "golden age," of which later poets sang as the ideal of earthly happiness, and in memory of which the famous *Saturnalia* (q. v.) were thought to have been instituted. At the foot of the Capitoline, where the fugitive god had formed his first settlement, there stood in historical times a temple dedicated to his worship. Ancient artists represented him as an old man, with long, straight hair, the back of his head covered, his feet swathed in woollen ribbons, a pruning-knife or sickle-shaped harp in his hand. Other attributes, as the scythe, serpent, wings, etc., are of later invention.

SATURN (PLANETS, ante). The mean distance of Saturn from the sun is 872,137,000 m., but the greatest and least distances differ nearly 49,000,000 m., being 920,973,000 and 823,301,000 miles. The eccentricity of his orbit is 1.055396, and he completes a circuit around the sun in a period of 29 years 167.2 days. While the volume of Saturn is 700 times that of the earth his mass is only about 90 times as much; his density being less than that of any other planet or planetoid. Taking the earth's density as unity, Saturn's is 0.13. Compared to the density of water, that of Saturn is as 73 to 100. His mean diameter is about 70,000 m., with a polar compression of about $\frac{1}{16}$, so that the polar diameter is about 63,500, and the equatorial about 73,500 miles. The rings of Saturn are his most remarkable characteristics. The breadth of the system of rings from the outside of the larger to the inside of the smaller is about 29,900 m., and the diameter of the outer ring is 167,000 miles. Three rings are usually counted, as with ordinary telescopic power they present that appearance, but increased power together with calculations made upon the effects of light make it probable that each of these three rings is subdivided into numerous others. Inside of the system of bright rings, there is a dark ring having a breadth of 87,000 miles, or more than the diameter of the earth. It was discovered by the elder Bond of Harvard university. This is also probably a multiple ring, and the inner diameter is about 90,000 m., leaving a space of about 10,000 m. between the innermost dark ring and the surface of the planet. In regard to the subdivision of the rings, recent investigations have made it probable that they are composed of numerous small satellites mingled with vaporous matter traveling in planes. The bright rings of Saturn were discovered by the Dutch astronomer Huygens in 1659. He had already discovered one of the satellites with a telescope of his own construction, having a focal length of 10 feet. The instrument with which he discovered the ring had a focal length of 23 feet, and was much the largest telescope ever constructed up to that time. The appearance of two luminous bodies on either side of the planet at various times had been observed by Galileo, but his telescope did not permit him to make out what the phenomena were. Huygens ascertained that the luminous appearances were caused by the reflection of the sun on two parts of the rings. From a calculation made from the position of the rings and the planet's revolution, he predicted the return of the luminous appearances in 1671, a prediction which was verified. The late prof. Peirce of Harvard came to the conclusion that the major planets must be still in a state of intense heat. Sir W. Herschel, Bond, Airy, and others also observed that changes of figure took place, consisting of bulgings out of regions corresponding to our temperate zones, with depressions at the poles and equator, or elevation of one polar region with depression of the other. This is accounted for by supposing the existence of great and dense cloud masses in the atmosphere of the planet.

SATURNALIA, an ancient Italian festival, instituted, according to the common belief of the ancients, in memory of the happy reign of Saturn (q. v.). Discarding all mythical explanations of the institution of the Saturnalia as simply incredible, and not worth the trouble of refutation, we may rationally conjecture that the Saturnalia was a rural festival of the old Italian husbandmen, commemorative of the ingathering of the harvest, and therefore of immemorial antiquity. It is not, we conceive, to be doubted for a moment that the untrammelled jollities of the Saturnalia were familiar to the farmers of Latium long before their homely national god, who blessed the labors of seed-time with abundant fruit, had been decorated with incongruous Hellenic honors, and transformed into a

skyeey Titan. Later ages may have introduced novel elements into the Saturnalia befitting the hybrid myth of king Saturn, but originally no thoughtful investigator can doubt that the cessation from toil, and the wild self-abandoning mirth that marked the feast, were expressive of the laboring man's delight that the work of the year was over, and not an artificial enthusiasm for a "golden age" that never had been. The great feature of the Saturnalia, as we know the festival in historical times, was the temporary dissolution of the ordinary conditions of ancient society. The distinctions of rank disappeared or were reversed. Slaves were permitted to wear the *pileus*, or badge of freedom, and sat down to banquets in their master's clothes, while the latter waited on them at table. Crowds of people filled the streets, and roamed about the city in a peculiar dress, shouting *Io Saturnalia*; sacrifices were offered with uncovered head; friends sent presents to each other; all business was suspended; the law courts were closed; school-boys got a holiday; and no war could be begun. During the republic the Saturnalia proper occupied only one day—Dec. 19 (xvi. Kal. Jan.). The reformation of the calendar by Julius Cæsar caused the festival to fall on the 17th (xvi. Kal. Jan.), a change which produced much confusion, in consequence of which the emperor Augustus ordained that the Saturnalia should embrace the whole three days, Dec. 17, 18, and 19. Subsequently the number was extended to five, and even seven, though even in the times before the empire, it would appear that the amusements often lasted for several days. But while the whole week was regarded in a general sense as devoted to the Saturnalia, three distinct festivals were really celebrated—the Saturnalia proper; the *Opalia*, in honor of *Ops*, the wife of Saturn, and the goddess of field-labor (from *opus*, a work; and the *Sigillaria*, in which *sigilla*, or little earthenware figures, were exposed for sale, and purchased as children's toys. The modern Italian carnival (q.v.) would seem to be only the old pagan Saturnalia baptized into Christianity.

SATURNIAN VERSE, the name given by the Romans to that species of verse in which their oldest poetical compositions, and more particularly the oldest national poetry, were composed. In the usage of the later poets and grammarians the phrase has two different significations. It is applied in a general way to denote the rude and unfixed measures of the ancient Latin ballad and song, and perhaps derived its name from being originally employed by the Latin husbandmen in their harvest-songs in honor of the god Saturn (q.v.). In this sense it simply means *old-fashioned*, and is not intended to determine the character of the meter. It is also applied to the measure used by Nævius, and a common opinion, sanctioned by the great name of Bentley, is that it was a Greek meter introduced by him into Italy. But though the Saturnian verse is found among the measures employed by Archilochus, scholars generally incline to the opinion that this is an accidental coincidence, that the measure of Nævius is of Italian (Hermann even thinks of Etruscan) origin, and that it merely improved on the older ballad-meter—the primitive Saturnian verse. It continued in use down to the time of Ennius (q.v.), who introduced the hexameter (q.v.). According to Hermann, the basis of the verse is contained in the following *schemata*:

— — — — — | — — — — —

which, as Macaulay happily points out, corresponds exactly to the nursery rhyme,

The queen was in her pálor | éating bréad and hóney,

and is frequently found in the Spanish poem of the *Cid*, the *Nibelungen Lied*, and almost all specimens of early poetry; but in the treatment of it a wide and arbitrary freedom was taken by the old Roman poets, as is proved by the still extant fragments of Nævius, Livius Andronicus, Ennius, and of the old inscriptionary tables which the *triumphators* set up in the capitol, in remembrance of their glorious achievements.—See *History of Roman Literature*, by Thompson, Arnold, Newman, etc. (*Encyclopædia Metropolitana*, 1852); Browne's *History of Classical Roman Literature* (1853); Niebuhr's *History of Rome*; Preface to Macaulay's *Lays of Ancient Rome*; and Sellar's *Roman Poets of the Republic* (1863).

SATYRIASIS (see SATYRS) is the insanity, or the ungovernable sway of the lowest instincts and propensities, by which man becomes an animal in its savage and excited state. The ancients were acquainted with this loathsome form of alienation, in which man is the sport of foul and dangerous instincts, and recognizes no law or hindrance to the promptings of hunger, thirst, or lust. It still appears at puberty and in dotage, but is more rarely met with; and its disappearance may be hailed as significant of the predominance of the higher sentiments, or of the subjection of propensities to law, decency, and decorum.—Mason Good, *Study of Medicine*, vol. v. p. 124; Sauvages, vol. ii. p. 214.

SATYRS, in Greek mythology, were a race of woodland deities, first mentioned by Hesiod, who designates them—"the race of worthless satyrs unfit for work." Subsequently they figure in great numbers in the train of Dionysus (Bacchus)—their leader being that model of tipsy revelers, the never-sober Silenus! In appearance they were at once grotesque and repulsive, like all old woodland demons. They are described as robust in frame, with broad snub noses, large pointed ears like those of animals (whence they are sometimes called *theres*, "wild beasts"), bristly and shaggy hair, rough skin, little horny knobs on their foreheads, and small tails. The satyrs are of course sensual

in their inclinations, and ravishers of the woodland nymphs, fond of music, dancing, wine, and of the deep slumbers that follow a debauch. The Roman poets identified them with the *fauni* of their own mythology, and gave them larger horns and those goats' feet with which they are so often represented. Ancient sculpture was fond of the satyr as a "subject"—one of the most famous specimens of ancient art being the "Satyr" of Praxiteles (q.v.).

SAUCES are preparations of various condiments, used for the purpose of giving piquancy and flavor to various kinds of food, chiefly animal. Sauces have been in use from the earliest times of culinary art. The ancients prided themselves much upon them, and used them almost wholly with fish. Sauces were used by the Greeks, but seem to have arrived at the summit of their reputation in the time of the Roman empire, when that called *garum*, made from a fish called *garon* by the Greeks, probably the anchovy, was considered one of the greatest luxuries of the table. Besides the *garum*, many other sauces were made of the tummy and other fishes. In modern times we have sauces in great variety: there are those ready prepared, as Harvey's, Worcestershire, Yorkshire Relish, etc., the basis of which is ketchup (q.v.), which of itself is one of the most extensively known sauces; and there are a large number prepared, when wanted, by the cook, to suit every kind of dish sent to the table. These usually consist of rich gravies, thickened with flour or other materials, and flavored with some suitable condiment. One of the reproaches of British cookery is the extensive use of a sauce called melted butter, which is usually little better than bill-stickers' paste, and which at the best is a little flour, water, and butter warmed together, and well mixed; and it is the habit to serve this to almost every kind of dish needing a sauce, whether animal or vegetable.

SAUCISSON, or **SAUSAGE**, is a fascine of more than the usual length; but the principal application of the term is to the apparatus for firing a military mine. This consists of a long bag or pipe of linen, cloth, or leather, from 1 in. to 1½ in. in diameter, and charged with gunpowder. One end is laid in the mine to be exploded; the other is conducted through the galleries to a place where the engineers can fire it in safety. The electric spark is now preferred to the saucisson. See **BLASTING**.

SAUERKRAUT, a preparation of the common white cabbage, well known and in extensive use in Germany and the n. of Europe, where it supplies during the winter the place of fresh vegetables. The cabbages are gathered when they have formed firm white hearts; and these, sliced into thin shreds, are placed in a succession of thin layers in a cask, each layer being sprinkled with fine salt, to which some add juniper berries, cumin seed, caraway seeds, or other condiment. A board is then placed on the top, with a heavy weight, so as to press the whole down firmly, but gently. After a time, fermentation begins; and when a sour smell arises from the cask, it must be removed into a cool place, and kept for use. It is generally eaten boiled, in the same way as fresh cabbage.

SAUGERTIES, a village in s.e. New York, on the w. bank of the Hudson river, 100 m. above New York, in Saugerties township; pop. '75 (township), 10,951. It is pleasantly situated at the mouth of Esopus creek, connected with Tivoli on the Hudson River railroad by a steam ferry. It has 7 churches, a newspaper, 2 national banks, public schools, and is the seat of the Saugerties institute. It contains extensive strata of limestone, which is quarried and used for building purposes. Large quantities of fruit are shipped from this place. The leading industries are the manufacture of iron, paper, quick-lime, cement, brick, etc.

SAUGOR, a t. of India, the chief town of a district in the central provinces, is situated in a hilly tract on the Bees, or Bes, a feeder of the Jumna, in lat. 23° 50' n., and long. 78° 49' east. Sagor is the seat of a military cantonment and of a collegiate school. The elevation is so considerable that the climate is moderately cool; but the cantonment is unhappily in a swampy and unhealthy situation. Pop. '72 of town, 45,655; of dist., 527,725.

SAUK, a co. in s.w. central Wisconsin, bounded on the n.e., s., and s.e. by the Wisconsin river, drained by the Baraboo river, traversed by the Milwaukee and St. Paul, and the Madison division of the Chicago and Northwestern railroads; about 820 sq.m.; pop. '80, 28,729—21,474 of American birth. The surface is moderately hilly and heavily wooded. The soil is fertile. The principal productions are corn, hops, hay, oats, wheat, and live stock. Co. seat, Baraboo.

SAUL, the first king of Israel, was the son of Kish, a wealthy chief of the tribe of Benjamin. The circumstances that marked his election to the royal dignity are familiar to all the readers of Scripture, and need not be repeated here (see **JEW**, **SAMUEL**). Gigantic in stature, noble in mien, and imperious in character, he appeared admirably fitted to accomplish the task of consolidating the dislocated tribes of Israel. His earlier achievements augmented hopefully for his future. The deliverance of the men of Jabesh Gilead; above all, his victories over the Philistines, the Moabites, Ammonites, Edomites, and Amalekites, were unmistakable proofs of his vigorous military capacity, but gradually there showed itself in the nature of the man a wild perversity—"an evil spirit of God," as it is called—culminating in paroxysms of insane rage, which led him to commit such frightful deeds as the massacre of the priests of Nob. Samuel, who had

retired from the "court" of Saul, and had secretly anointed David as king, did not cease to "mourn" for the wayward monarch; but nothing availed to stay his downward career, not even the noble virtues of his son Jonathan; and at last he fell in a disastrous and bloody battle with the Philistines on Mount Gilboa.

SAULCY, LOUIS FÉLICIEUX JOSEPH CAIGNART DE, b. Lille, France, 1807; educated at the Paris polytechnic school, and entered the artillery service. In 1836 he was awarded the numismatic prize of the French institute, having before that obtained a high reputation as an antiquary. He was made conservator of the museum of artillery at Paris. He devoted himself especially to oriental numismatics and antiquities; made extensive explorations in Palestine, and claimed to have discovered the ruins of Sodom. He has written many works on special antiquarian topics, is a member of a large number of societies, and a commander of the legion of honor.

SAULT SAINTE MARIE, or **SAULT DE SAINTE MARIE**, the co. seat of Chippewa co., Mich., on St. Mary's strait and the ship canal between lakes Superior and Huron; pop. '80, 4,227. It has churches, hotels, etc. Its inhabitants, who are mainly French Canadians and Indians, live by hunting and fishing. See **SAINT MARY'S STRAIT**.

SAUMAREZ, JAMES, Baron de, a celebrated naval hero, was descended from an old French family, which had long been settled in Guernsey, and was born there Mar. 11, 1757. He entered the navy as midshipman at the age of 13, and served in the American war (1774-82), receiving for his gallantry at the attack of Charleston (1775) the grade of lieutenant; but he was recalled before the end of this war, and placed under sir Hyde Parker. He did good service in the action off the Dogger Bank (Aug., 1781), and was rewarded with promotion to the rank of commander, being soon afterward placed under the orders of admiral Kempenfeldt on the Jamaica station. At the great fight between Rodney and De Grasse (April 12, 1782), Saumarez commanded the *Russell*, a line-of-battle ship, and gained much distinction by his coolness and intrepidity throughout. For his gallant capture of the French frigate *La Reunion*, with one inferior in size and equipment, he received the honor of knighthood; and in command of the *Orient*, a seventy-four, he served under lord Bridport at the battle of l'Orient, June 23, 1795. He also took a prominent part in the battle off cape St. Vincent (Feb. 14, 1797), and was second in command at the battle of the Nile, in which he was severely wounded. In 1801 he became a baronet, and vice-admiral of the blue; and in the same year fought his greatest action off Cadiz (July 12), defeating a French-Spanish fleet of 10 line-of-battle ships and 4 frigates, with a squadron less than half their strength, and causing to the enemy a loss of 3,000 men and three ships. This contest, than which, according to admiral Nelson, "a greater was never fought," gained for Saumarez the order of the bath, the freedom of the city of London, and the thanks of parliament. In the Russian war he commanded the Baltic fleet, and took or destroyed two large Russian flotillas (July, 1809). In 1814 he became admiral, vice-admiral of Great Britain in 1821, was created a peer in 1831, and died at Guernsey, Oct. 9, 1833. His life has been written by sir John Ross (*Memoirs of Admiral Lord de Saumarez*, 2 vols., 1833).

SAUMUR, a t. of France, on the left bank of the Loire, in the department of Maine-et-Loire, 23 m. s.e. of Angers by railway. Bridges connect the town with a suburb on the right bank of the river. The river-side is lined with handsome quays, and there are good bridges and agreeable promenades. There is a great cavalry school, in which riding-masters for the army are trained. The hôtel de ville and the castle are prominent buildings. Rosaries of coco-nut shells and articles in enamel are manufactured. The trade of Saumur is in spirits, wines, hemp, and linen. Pop. '72, 11,028.

Saumur, formerly the capital of the province of Samurois, was a stronghold of the Protestants during the reign of Henry IV., at which time it contained 25,000 inhabitants. Its prosperity was annihilated by the revocation of the edict of Nantes, and its population was reduced to a fourth. Perhaps the most striking event in the history of the town was its brilliant capture by Laroche-Jaquelin and the Vendéans, June 10, 1793. In this action the victors, with but a slight loss, captured 60 cannon, 10,000 muskets, and 11,000 republicans.

SAUNDERS, a co. in e. Nebraska, bounded on the n. and e. by the Platte river; drained by Saline, Cottonwood, and other creeks; traversed by the Omaha and Republican Valley railroad; about 775 sq. m.; pop. '80, 15,809—10,726 of American birth. The surface is level, with little timber. The soil is fertile. The principal productions are corn, wheat, oats, and hay. Co. seat, Wahoo.

SAUNDERS, EPHRAIM DOD, DD., 1809-72; b. N. J.; graduate of Yale college, 1831; studied theology at Princeton, and was settled over a Presbyterian church in Virginia for many years. After residing for a short time in Pottstown, Penn., and making the tour of Europe, he returned to Pennsylvania and founded the Saunders institute at West Philadelphia in 1857. In 1870 he founded the Presbyterian hospital of Philadelphia, by the presentation of the buildings and grounds of the institute, and raising \$100,000 additional by subscription; the new institution to be for a memorial to his son Courtland, author of *A New System of Latin Paradigms, with a Synopsis of Declensions*, 1860, who fell at Antietam fighting in the union army, 1862, aged 21.

SAUNDERS, FREDERICK, b. London, 1807; commenced the publishing business in New York, 1836; was for a time assistant editor of the *Evening Post*; assistant librarian of the Astor library 1859-76, when he was appointed librarian, and still holds the position. Among his published writings, *Salad for the Solitary* and *Salad for the Social* have been especially popular, and have been printed in London as well as in New York.

SAUNDERS, PRINCE, 1775-1839; a negro, b. Thetford, Vt. Having obtained a competent education he taught school in Colechester, Conn. and afterward in Boston. In 1807 he went to Hayti, and soon afterward was sent to England by Henri Christophe, president of the republic, to obtain books, teachers, and school apparatus. After this Saunders returned to the United States, studied divinity, and ministered acceptably to a church in Philadelphia. He was also a lawyer, and revisiting Hayti he was appointed attorney-general, in which capacity he framed the criminal code of the republic, as useful for the Haytiens as the code Napoleon was for the French. He published the *Haytien Papers* and several smaller works; and died in Hayti in 1839.

SAUNDERSON, NICHOLAS, LL.D., a distinguished English scholar, was b. at Thurlston in Yorkshire, in 1682. He became blind from small-pox at the age of twelve months, but received a good education, including instruction in the classics, which was orally communicated. His strong predilection for mathematics becoming known to his friends, attempts were made with success to instruct him in arithmetic, geometry, and algebra, by means of ingenious mechanical contrivances which it is not necessary to describe. In 1707 he came to Christ's college, Oxford, as a teacher, and there delivered a series of lectures on the Newtonian philosophy, including (strange to say) a discussion of Newton's theory of optics. Four years afterward he succeeded Whiston as Lucasian professor, and died April 19, 1739. A valuable and elaborate treatise on algebra, from his pen, was published in 1740 (2 vols. 8vo), and another on fluxions, including a commentary on some parts of Newton's *Principia*, in 1756. The mental process by which he was enabled to understand the rules of perspective, the projections of the sphere, and some of the more recondite propositions of solid geometry, seems to have been peculiar to himself, and was almost wholly unintelligible to others.

His sense of feeling was extremely acute; and he is said even to have been able to distinguish, by this sense alone, true Roman medals from counterfeits. He could judge fairly of the size of a room and of his position in it by the sound of his own footsteps, and could tell, in some inexplicable manner, when light clouds were passing across the sun's disk.

SAURIA, in the systems of Cuvier and other recent naturalists, an order of reptiles (q.v.), having an elongated body, covered with scales or with bony plates; a more or less elongated tail; four limbs, or sometimes only two apparent, the rudimentary hind-limbs being concealed beneath the skin; the mouth always furnished with teeth; the ribs movable, rising and falling in respiration; the young issuing from the egg in a form similar to that of the mature animal.—To this order belong crocodiles, alligators, etc.; chameleons, geckos, iguanas, agamas, varans, teguixins, lizards, skinks, etc., numerous families, some of which contain many genera and species. Crocodiles and their allies, being covered with bony plates instead of overlapping scales, are by some naturalists removed from among the saurians, and a place nearer to the chelonians is assigned to them. In their general form and structure, however, they correspond with auriens, and have no resemblance to chelonians. The recent sauria are far excelled in size and in variety of strange forms by the fossil sauria as the *plesiosaurus*, *ichthyosaurus*, etc.

SAURIN, JACQUES, a celebrated French Protestant preacher, was b. at Nîmes, Jan. 6, 1677, studied at Geneva, and was chosen minister of a Walloon church in London in 1701. But the climate of England did not agree with his delicate health; and in 1705 he settled at the Hague, where his extraordinary gift of pulpit oratory was prodigiously admired, but not by his clerical brethren, who enviously assailed him with the accusation of heresy. The ground of their charge was that Saurin had attributed falsehood to God. Commenting in a thesis on the conduct of Samuel (1 Sam. chap. xvi.) when about to proceed to Bethlehem to anoint David, Saurin had pointed out that God certainly induced the prophet to adopt such measures and such language as could not but lead king Saul to believe what was not true. He argued, however, that the "will of God" can never command what is criminal or wrong, and that this deception—this falsehood, as men would call it—was quite innocent and permissible. Saurin's logic is not perhaps quite faultless, but he at least deserves credit for not denying the existence of a moral difficulty. The dispute was carried to the synod of Hague, and Saurin was subjected to a series of petty persecutions that shortened his days. He died at the Hague in 1730. As a preacher, Saurin has often been compared with Bossuet, whom he rivals in force, if not in grace and subtlety of religious sentiment. His chief productions are: *Sermons sur divers Textes de l'Écriture Sainte* (La Haye, 1708-25); *Nouveau Sermons sur la Passion* (Potterdam, 1732); *Discours sur les Événements les plus mémorables du V. et du N. T.* (Amst. 1720-28); *Abregé de la Théologie et de la Morale Chrétiennes en Forme de Catéchisme* (Amst. 1722); and *État du Christianisme en France* (La Haye, 1725).

SAUROID FISHES, a name sometimes employed to designate fishes which approach in their structure to saurian reptiles. Of recent sauroid fishes examples are found in

bony pikes (q.v.) and sturgeons (q.v.). Fossil sauroid fishes are numerous, some of them of very large size. The teeth of *megaleichthys* are nearly 4 in. in length, far exceeding those of any existing fish, and bony plates of the same fish have been found 5 in. in diameter.

SAUROPSIDA, a division of vertebrata established by prof. Huxley to include the birds and reptiles, which he with others considers to have so many affinities as only to be separated by class distinctions. The common anatomical characteristics in this division are the absence of gills, the possession of an amnion and allantois, the articulation of the skull with the vertebral column by a single occipital condyle, the composition of each branch of the lower jaw of several pieces, the articulation of the lower jaw with the skull by the intervention of a bone called the *os quadratum* or four-sided bone, and the possession of nucleated red blood corpuscles. See VERTEBRATA.

SAURY PIKE, *Scombercor*, a genus of fishes of the order *pharyngognathi* and family *scomberosidae*, having the body greatly elongated, and covered with minute scales; the head also much elongated, and the jaws produced into a long sharp beak, as in the garfish (q.v.); from which, however, the present genus differs in the division of the dorsal and anal fins into finlets, as in mackerels. One species (*S. saurus*) is common on the British coasts. It is about 15 in. long, the back dark-blue, the under parts white; the fins dusky-brown. It approaches the coast, and enters firths in shoals, which are pursued by larger fishes, porpoises, etc.; and in order to escape from these, the saury pike often leaps out of the water, or rushes along the surface, for a distance of 100 ft. scarcely dipping or seeming to touch the water. Hence the name SKITTER, which it very commonly receives on the British coasts. Vast shoals sometimes enter bays, so that they may be taken by handfuls, and great numbers are sometimes found among the sludge at the ebbing of the tide, in the upper parts of the firth of Forth and elsewhere. The flesh of the saury pike is palatable.

SAUSAGE, a well-known preparation of the flesh of various animals for culinary purposes. It is made by chopping the raw meat very fine, adding salt and other flavoring materials, and often bread-crumbs also, the whole forming a pasty mass. This is pressed into portions of the intestines of the animal, previously thoroughly cleaned and properly prepared. Usually, a considerable length of the intestine is filled and divided into separate sausages, by constricting it with pieces of string, at short intervals. The sausages of Lucania were very celebrated among the Romans. They were made of fresh pork, and bacon chopped fine, with nuts of the stone-pine, and flavored with cummin-seed, pepper, bay-leaves, various pot-herbs, and the sauce called garum. Italy is still celebrated for its Bologna sausages, and with many people the smoked sausages of Germany are highly prized; but except when quite fresh, sausages cannot be recommended as wholesome food.

SAUSAGE-POISON. It is well known that sausages made or kept under certain unknown conditions are occasionally highly poisonous; and in Germany, where sausages form a staple article of diet, fatal cases of sausage-poisoning are by no means rare. The symptoms are slow in appearing, three or four days sometimes elapsing before they manifest themselves. The poison may be described as of the narcotico-irritant character, and is very dangerous. Dr. Taylor, in his *Medical Jurisprudence*, records the cases of three persons who died from the effects of liver-sausages which had been made from an apparently healthy pig, slaughtered only the week before. The inspection threw no light on the cause of death. This case differs from those commonly occurring in Germany in this respect, that here the sausages were fresh, while the sausages which have proved poisonous in Germany had always been made a long time. Dr. Kerner, a German physician, who has specially studied this subject, believes that the poison is an acid formed in consequence of a modified process of putrefaction; others regard it as an empyreumatic oil.

SAUSSURE, HORACE BENEDICT DE, a celebrated Swiss physicist and geologist, was b. at Conches, near Geneva, Feb. 17, 1740. His education was attended to with such success that, in 1762, young Saussure obtained the chair of physics and philosophy in the university of Geneva. In 1768 he commenced the famous series of journeys which were fraught with such important consequences to science and to his own reputation; and during the course of which he visited the Jura and Vosges mountains, those of Germany, England, Italy, Switzerland, Sicily, and the adjacent isles; the extinct craters of Auvergne, etc.; and traversed the Alps no less than 14 times, crossing them by 8 different routes. He was the first "traveler" who ever ascended to the summit of Mont Blanc; he camped for 17 days on the Col du Géant, and finished his Alpine achievements by the ascent of Monte Rosa in 1789. During this extensive course of travel, he made numerous observations on the minerals, physical features, botany, and meteorology of the mountain ranges he visited; and these observations were found, after having undergone a searching examination, to be as correct and valuable as they were numerous. In short, they put the science of geology for the first time on a basis of fact. The work in which they are found is entitled *Voyages dans les Alpes*, etc. (Neuf-châtel, Geneva, Paris, 1779-96, 4 vols.), and is much admired for its accurate and splendid descriptions of Alpine scenery. His observations were not made without con-

siderable preliminary labor, for he found it necessary to improve his thermometer, hygrometer, eudiometer, electrometer, anemometer, and to invent other two instruments—viz., the cyanometer and diaphanometer, before his investigations, which were conducted with much care and candor, produced satisfactory results. In 1786 Saussure resigned his chair; and in 1798 was appointed professor of natural history in the central school of the *département of Lemán* (formed on the annexation of Geneva to France); but four years afterward, he was struck with paralysis, and after a long period of suffering, died at Geneva, Jan. 22, 1799. Besides the great work above mentioned, he wrote numerous others, the chief of which are: *Observations sur l'écorce des Feuilles et des Pétales* (1762); *De Præcipuis Errorum nostrorum Causis, ex Mentis Facultatibus Oriundis* (1762); *De Electricitate* (1766); *De Aqua* (1771); *Sur l'hygrométrie* (1783), which, according to Cuvier, is one of the most important contributions to science in the 18th c.; and in which Saussure set forth his discovery of the dilatation in bulk, and diminution in specific gravity, of air charged with moisture. His "Description of the Alps," a portion of his great work, was published separately in 1834, at Geneva and Paris.

SAUTRĀNTIKA is the name of the second of the four great schools or systems of Buddhism, the three others being called *Vaibhāshika*, *Mādhyamika*, and *Yōgichāra*. They recognize the authority of the *Sātrās* (q.v.), but reject that of the *Abhidharma*.—See C. F. Koeppen, *Die Religion des Buddha* (Berlin, 1857); and W. Wassiljew, *Der Buddhismus, seine Dogmen, Geschichte und Literatur* (St. Petersburg, 1869).

SAVAGE, JAMES, LL.D., 1784-1873; b. Boston; graduated at Harvard, and was admitted to the bar. He was a member of the state executive council, of the constitutional convention of 1820, and of both branches of the legislature. He was a learned antiquarian, and president of the Massachusetts historical society. Among his publications are an edition of John Winthrop's *History of New England*, and a valuable *Genealogical Dictionary of the First Settlers of New England*.

SAVAGE, RICHARD, an English poet, was b. in London, Jan. 16, 1696-97. He was the fruit of an illicit intercourse between lord Rivers and the countess of Macclesfield, which resulted in the divorce of the lady, and the declared illegitimacy of her offspring. Lord Rivers, though permitting his name to be given to the child, seems not to have concerned himself further with him at all; and at the hands of his mother he met with only the grossest neglect. To the interference of her mother, lady Mason, he was indebted for his education, received at the grammar school of St. Albans. Afterward, he was apprenticed to a shoemaker in Holborn, but an accident revealing to him the secret of his birth, he quitted this obscure handicraft. Repeatedly and in vain he appealed to the tender sympathies of his mother, who declined even to see him, and withheld all acknowledgement and assistance. Failing other means of subsistence, he turned his attention to literature, and at an early age produced several comedies, which met with but little success. Somewhat more fortunate was his tragedy of *Sir Thomas Overbury*, which though indifferently received on the stage, with the author himself as actor of the leading part, obtained in print some approval, and put a little money in his purse. In 1727 he killed a man in a drunken tavern brawl—an offense for which he was tried, and sentenced to death. A pardon was, however, obtained for him on the intercession of the countess of Hertford with the queen, and the details of his story becoming widely known, a strong feeling arose in his favor. Though his mother continued inexorable, and would, it was thought, have been well pleased to be rid of him by the hands of the hangman, certain of her relations interested themselves in him, and he was received into the household of lord Tyrconnel, who allowed him £200 a year, and otherwise treated him with considerate generosity. His poem, *The Wanderer*, was now published; its success was great, and for a time the career of Savage was prosperous, and even brilliant. But it did not very long remain so. The inveterate irregularity of his habits involved him in difficulties with lord Tyrconnel, and they parted with mutual recriminations. After this, he sunk irretrievably. Though he failed in an attempt to obtain the post of poet-laureate, a poem which he wrote to commemorate her birthday so pleased the queen, that along with "a permission to write annually on the same subject," she conferred on him a pension of £50 a year. This sum, which might have been to him the basis of a modest subsistence, it was his regular habit to dissipate in a week's debauchery, passing the rest of the year in what disreputable fashion he could. On the failure of his pension by the death of the queen, a subscription was set on foot, mainly through the influence of Pope, with the view of sending him to live quietly at Swansea in Wales. Thither, accordingly, he retired; but happening to visit Bristol, where he lived in the reckless manner habitual to him, he was arrested for a debt of £8, and died in prison there, on July 31, 1743.

The poetry of Savage, though a few vigorous lines of it continue to be remembered, is scarcely such as of itself would have sufficed for a permanent reputation. His most powerful and finished piece is *The Bastard*, in which, when he had finally broken with the relations of his mother, he held her up to public execration. Such celebrity as still attends his name he owes, however, almost entirely to the masterly life of him by Dr. Johnson, who, in the time of his own early struggles, was thrown much into his society.

SAVAGES, or **WILD MEN**, in heraldry, are of frequent occurrence as supporters. They are represented naked, and also, particularly in the later heraldry, are usually wreathed about the head and the middle with laurel, and often furnished with a club in the exterior hand. Savages are especially prevalent in the heraldry of Scotland. In more than one of the Douglas seals of the first half of the 15th c., the shield is borne in one hand by a single savage, who acts as sole supporter.

SAVANNAH, a river which forms the boundary between Georgia and South Carolina, rises in the Alleghenies, on the south-western border of North Carolina, and flows s.e. to the Atlantic. Its length is 300 m., navigable to Augusta.

SAVANNAH, a city and port of Georgia, on the right bank of the Savannah river, 18 m. from its mouth, 90 m. s.w. of Charleston, lat. 32° 5' n., long. 81° 5' w. It is built on a sandy plain, 40 ft. above the river, with broad streets shaded by beautiful trees. Its chief edifices are the custom-house, city exchange, court-house, state arsenal, theater, St. Andrew's hall, Oglethorpe hall, market, hospitals, and asylums. In 1874 the exports valued \$50,500,000, consisting of cotton, rice, lumber, etc. The cotton exported in 1875 was 610,903 bales. Vessels of upward of 14 ft. draught discharge and load 3 m. below the harbor. Savannah is surrounded by marshes and islands, and on the river side is defended by forts Pulaski and Jackson. It was founded in 1733 by the English general, Oglethorpe. In 1776, a British fleet, attempting to take the town, was repulsed after a severe action; but it was taken in 1778, and held in 1789 against the combined French and American forces. In the war of secession, after many unsuccessful attacks by sea, it was taken by gen. Sherman in Feb., 1865. The population in 1870 was 28,235.

SAVANNAH (*ante*), co. seat of Chatham co., Georgia, terminal station of the Central, the Atlantic and Gulf, and the Savannah and Charleston railroads; pop. '80, 30,761, about 4,000 less than Atlanta. The city is noted for its beautiful streets and the large number of small parks (about 25). Forsyth place, in the center of the town, is a very pleasant resort, filled with tropical and semi-tropical trees and flowers. The climate is delightful in winter but generally considered unhealthy in summer. The harbor is excellent, and the Savannah river is navigable as far as Augusta. As a cotton port it is inferior to New Orleans only, having maintained the position held before the war much better than Charleston; about 850,000 bales are shipped annually. Other important exports are rice and lumber. There are a large cotton mill, foundries, planing and flouring mills; but, on the whole, the manufactures are not very important. The great warehouses are on a street below the bluff, known as the Bay. Among the public buildings are the custom house, court house, city exchange, St. Andrew's hall, Chatham academy, and the Masonic hall where, in 1861, the ordinance of secession was passed. In Forsyth park is a confederate monument; and in Johnson square an obelisk to the memory of gen. Greene and count Pulaski, the corner-stone of which was laid by Lafayette in 1825. The Pulaski monument in Monterey square is 55 ft. high, of marble, surmounted by a statue of Liberty, and is considered one of the finest works of the kind in this country. Bonaventure cemetery, near the city, is unique in its long avenues of live-oaks, draped with the gray southern moss. The city has good police and fire departments, 3 hospitals, medical school, 32 churches, a public library, historical society, 5 banks, 2 daily and 4 weekly papers, gas and water works, and an excellent school system. It has had two great fires, one in 1796 (damage \$1,000,000), the other in 1820 (loss \$4,000,000). Savannah was invested by Sherman in Dec. 10, 1864; on the 13th fort McAllister was taken; and a few days later Hardee, the confederate general, evacuated the city, which was occupied by the union forces Dec. 21, 1864.

SAVANNAS (Span. *savana* or *sabana*), the name given by the early Spanish settlers to the great plains or prairies (q.v.) of the North American continent.

SAVARY, ANNE JEAN MARIE RENÉ, Duc de Rovigo, a French gen. and diplomatist, was b. at Mareq, in Ardennes, April 26, 1774, entered the army as a volunteer in 1790, and served with distinction in the army of the Rhine. In 1797 he accompanied Desaix to Egypt as *chef d'escadron*, and remained under his command as long as that general lived. After the battle of Marengo (1800), Napoleon made him his aid-de-camp and for several years employed him only in political affairs, for which he showed an admirable capacity. In 1803, he was made gen. of brigade; in 1804, as commandant of the troops stationed at Vincennes, he presided at the execution of the duc d'Enghien, an event which he is believed to have unduly hastened; and in the Prusso-Russian Austrian wars of 1806-08, he acquired high military reputation, his victory at Ostrolenka (Feb. 16, 1807) being really a brilliant achievement. Created duke of Rovigo in the beginning of the following year, he was sent to Spain by the emperor, and negotiated the perfidious arrangement by which the Spanish king and his son were kidnapped. In 1810, he replaced Fouché as minister of police. After the fall of Napoleon, to whom he had always been passionately, and, we may add, unscrupulously devoted, he wished to accompany him to St. Helena; but he was confined by the British government at Malta for seven months, when he succeeded in making his escape, and getting on board a ship, was landed at Smyrna. After experiencing several vicissitudes, he returned to Paris in 1818, and was reinstated in his titles and honors. In 1823 he removed to Rome;

but at the close of 1831, he was appointed commander-in-chief of the army of Africa, and during his brief administration of affairs in Algeria, exhibited a splendid energy and generalship. But ill-health forced him to withdraw to France in Mar. 1833, and on June 2d following, he died at Paris. Savary's *Mémoires* (Par. 8 vols. 1828) are among the most curious and instructive documents relating to the period of the empire.

SAVE, a river of the s. of Austria, and an important affluent of the Danube, is formed by two upper waters, which rise in the extreme n.w. of Carniola, and unite at Radmannsdorf 1560 ft. above sea-level. The river then flows s.e. through Carniola, passing Laibach (at which point it becomes navigable), and forming in part the boundary between Carniola and Styria, after which it enters and traverses Croatia; and at its confluence with the Unna, first touches the Turkish dominions, the northern boundary of which it continues to form throughout the remainder of its course to its junction with the Danube at Belgrade. Estimated length, 400 miles. Its principal affluents are the Laibach (200 m. long), Kulpa, Unna, Bosna, and Drina.

SAV'ELOY, a kind of sausage common in the London shops; it only differs from pork sausages in being made of young *salted* pork, highly seasoned, and having a little saltpeter added to give the contents a red color.

SAVIGLIANO, a fortified t. of n. Italy, province of Cuneo, 9 m. e. of Saluzzo. It is situated on the Maira and the Grana, and is a handsome and clean town. Cloth and silk are extensively manufactured, and the country in the vicinity is productive in wines and grain. Cattle are reared in great numbers, and silk-worms are bred largely. Pop. of town '71, 9,544: of commune, 16,150.

SAVIGNY, FRIEDRICH KARL VON, an illustrious writer on Roman jurisprudence, descended from a French Calvinistic family, that had emigrated to Germany in 1622, to avoid religious persecution, was born at Frankfort on Feb. 21, 1779. He studied at Marburg, and took his degree in 1800, after which he commenced a series of lectures on juridical subjects, which were attended by a numerous auditory. Struck, in his exposition of the digest, with the divergence existing between the text and the commentaries on the theory of possession, he composed in 1803 his masterly treatise, *Das Recht des Besitzes*, in which the Roman law is disengaged from the extraneous elements introduced into it by Germanic law, common usage, and the misapprehensions of commentators. Its merit was quickly recognized, and Savigny received the most advantageous offers from different universities, which, however, he declined, in order to prosecute researches in the libraries of France and Germany, with a view to a historical development of the glosses of commentators. He was assisted in this laborious undertaking by his pupil, Jakob Grimm, and his young wife, a daughter of the poet Clem. Brentano, and Bettina von Arnim. Appointed professor of law at Landshut in 1808, he was called, two years afterward, to Berlin, on the reorganization of the university, and there he continued to lecture with unbroken success for a period of 32 years, in the course of which he filled various important offices in the university and the state, and died Oct. 25, 1861, at the age of 82. Savigny is the virtual founder of the new historical school of writers upon jurisprudence, although it is but fair to admit that Hugo and Schlosser had preceded him in the same direction. The essential idea of this school is, that "law" or "right" is not an abstract and absolute rule, manifesting itself under the same forms in all countries, but that it is one of the forces of society, with which it changes, according to fixed laws of development that are beyond the caprices of the day. This idea, when worked out historically, has produced the most important and original results, and may even be said without exaggeration to have regenerated the science of jurisprudence. Savigny's principal writings are: *Vom Berufe unserer Zeit für Gesetzgebung und Rechtswissenschaft* (Heidelb. 1815); *Geschichte des Römischen Rechts im Mittelalter* (6 vols. Heidelb. 1826-31); *System des heutigen Römischen Rechts* (8 vols., Berl. 1840-48); *Das Obligationenrecht* (1851-53), and *Vermischte Schriften* (5 vols. Berl. 1850), a collection of essays which had originally appeared in the *Zeitschrift für Historische Rechtswissenschaft*, and elsewhere.

SAVILLE, Sir HENRY, 1549-1621; b. Yorkshire; entered Brasenose college, Oxford, and Merton college 1561; fellow of the university and voluntary lecturer on mathematics; proctor 1575-76. Subsequently he visited many places on the continent collecting MSS., and on his return was appointed Greek and mathematical tutor to queen Elizabeth 1578; provost of Eton 1596; knighted by James I. 1604; warden of Merton college 1585-1621. He founded at Oxford the Savilian professorships of geometry and astronomy 1619, and gave liberally to the institution besides the gift of his valuable library. He was the author of a translation of *The end of Nero and Beginning of Galba, four Books of the Histories of Cornelius Tacitus*; and *The Life of Agricola, with Notes*, Oxford, 1581.

SAVILLE or **SAVILE**, GEORGE, 1630-95; b. England; created marquis of Halifax in 1682. He was a confidential adviser of Charles II., who made him lord privy-seal. James II. dismissed him for his opposition to the repeal of the habeas-corpus and test acts. James appointed him a commissioner to treat with William of Orange, whom he supported on the meeting of parliament. He was at once made speaker of the house of lords, and William, soon after his accession, made him lord privy-seal. He soon

joined the opposition, and for a time affiliated with the Jacobites. He was the head of the so-called party of "trimmers."

SA VINE. *Juniperus sabina*, (see **JUNIPER**), a low, much-branched, and very widely-spreading shrub, with very small, imbricated, evergreen leaves, which grows on mountains in the s. of Europe and the east. It bears small black berries, covered with a pale blue bloom. Its foliage has a strong, fetid, aromatic, penetrating odor, particularly when rubbed. Its exhalations cause headache. The part of the plant used in medicine is the tops of the branches, collected in spring, and dried. Their odor is strong, peculiar, and unpleasant, and their taste acrid, bitter, resinous, and disagreeable. The therapeutic proprieties of savine are due to the volatile oil which it contains. Two pounds of the tops yield about five ounces of this oil, which is limpid and nearly colorless, having the odor of the plant, and a hot acrid taste. Its composition is $C_{10}H_8$, being isomeric with oil of turpentine.

Savine exerts a stimulating effect on the uterine organs, and is employed with much benefit in cases of amenorrhœa and chlorosis, depending upon want of tone in those parts. It is best given in the form of the oil, one or two minims of which may be prescribed in a pill, to be taken twice a day. This drug is often employed by the lower classes for the purpose of procuring abortion; but it ought to be generally known that if it is given in a sufficiently large dose to produce the desired effect, the life of the mother is placed in the greatest possible peril. If a poisonous dose has been given for this or any other object, emetics should first be employed to remove any of the drug that may remain in the stomach, after which opiates and demulcents should be prescribed, and a general cooling and lowering treatment adopted. Savine in the form of ointment is much used as an external application, with the view of keeping up the discharge from a blistered surface. The ointment cannot, however, be kept long without losing its properties.

SAVINGS-BANKS. The application of the banking-system to the middle and humbler classes of society was commenced by individual exertions long before the legislature took cognizance of the matter. In 1799 the rev. J. Smith, rector of Wendover in Bucks, as a means of inducing habits of prudence and frugality among his parishioners, offered, with two other inhabitants, to receive weekly any sum not less than twopence; and if the amount were not touched before the next following Christmas, to add one-third to it as a bonus or encouragement. In 1810 the rev. H. Duncan established a parish bank friendly society at Rathwell (Scotland), more resembling a modern savings-bank. A minute account of its organization and mode of operation drew so much attention to it that by the year 1817 there were 78 establishments resembling it in the United Kingdom.

The first savings-banks acts were passed in 1817, one for England and Wales, and one for Ireland. A fund, called the fund for the banks for savings, was opened with the national debt commissioners; and into this fund were to be placed all savings-banks deposits as soon as they reached £50. On these sums the national debt commissioners gave £4 11s. 3d. per cent interest (3d. per cent per diem). The managers of the savings-banks in most cases allowed the depositors $\frac{1}{4}$ per cent, the difference being applied to the working expenses.

This, the fundamental statute on the subject, has been modified and extended in many ways since. In 1824, as it was found that the benefits of the savings-banks system were reaped by persons for whom it was not intended, an act was passed declaring that the deposits in the first year should not exceed £50; that those in subsequent years should not exceed £30; that no interest would be allowed on any excess beyond £200; and that no person would be allowed to make deposits at more than one savings-bank. In 1828 an act was passed to give greater security to the depositors. The rules drawn up by the trustees and managers of all savings-banks were to be submitted to a barrister appointed by the national debt commissioners, and without his approval no savings-bank could commence or continue operations. The justices of the peace had also a veto in the matter; and the clerk of the peace was to keep a certified copy of the approved rules and regulations. The trustees were to receive £3, 16s. 0 $\frac{1}{4}$ d. per cent interest (2 $\frac{1}{4}$ d. per cent per diem), and were to pay the depositors not exceeding £3 8s. 5 $\frac{1}{4}$ d. interest (2 $\frac{1}{4}$ d. per cent per diem). No depositor was to deposit more than £150; but compound interest might accumulate until the total reached £200. Friendly societies and charitable institutions were, however, permitted to invest to the amount of £300.

In 1833 an act was passed to enable savings-banks to manage the granting of small deferred annuities, to be paid for by weekly, monthly, quarterly, or yearly installments. In 1835 another act extended the operation of the statutes of 1828 and 1833 to Scotland, and enabled existing savings-banks to conform to the stipulations without a necessity for reorganization.

In 1844 a new act made extensive changes in the savings-banks system, the chief items of which may thus be summarized: Interest allowed by the commissioners to trustees to be reduced to £3 5s. 0d. per cent, and to depositors to £3, 0s. 10d. per cent (2d. per diem); every depositor's book to be sent once a year to his savings-bank for examination; the extent of the liability of trustees, managers, actuaries, and cashiers

exactly defined; arrangements for making deposits in trust for other persons; annuities under the act of 1833 not to exceed £30 for any one person, but separate annuities to that amount may be granted to a husband and wife; deposits made by a married woman may be returned to her, unless the husband give notice to the contrary; rules laid down concerning the inheritance of the deposits of intestate and illegitimate persons; payments to the relations of intestate depositors to be made to the next of kin according to the law of Scotland, if in that country. An act passed in 1848 placed a limit on the liability of trustees of savings-banks in Ireland. In 1853 an act placed the maximum and minimum of savings-banks annuities at £30 and £4 respectively; and allowed a husband and wife to purchase a joint annuity, although one of them may have already had an annuity of the full amount. Another act in 1860 authorized the national debt commissioners to invest the moneys received by them from savings-banks in any kind of stock, debenture, or other security that has received parliamentary sanction; and required them to make an annual return to parliament of all such transactions. The act of 1861, establishing post-office savings-banks, contained provisions for the transfer of deposits from the one kind of savings-banks to the other. By another statute passed in 1863 the arrangements for deposits in the name of a minor are defined; the order of proceedings is settled whereby any savings bank may be wound up and closed, and the claims of the depositors transferred to the post-office savings-banks. Two more recent statutes will be noticed in the concluding paragraphs of this article.

From time to time, as the above-named statutes came into operation, the national debt commissioners have laid down rules for giving them practical effect, and the registrar of savings-banks has exercised the necessary supervision. The rules on the important subject of savings-banks annuities may be thus briefly noticed: The nominee's age must not be under 15; no annuity below £4, and the aggregate of annuities to any one person not to exceed £30; by purchasing two half annuities instead of a whole one, the annuitant may receive his money in four quarterly sums; on the death of the annuitant, a sum equal to one-fourth part of the annuity will be paid to his or her next representative, if claimed within two years; if the purchaser of an annuity is unable to continue his installment of payments, he may either receive back the whole of his money without interest, or may have an immediate or deferred annuity equivalent in amount to the moneys which he has paid; if the purchaser of a deferred life-annuity die before the annuity becomes due, the whole amount of his payments, but without interest, is paid to his family; an annuity is not transferable, except by a bankrupt to his creditors, from whom it will be purchased by the national debt commissioners at its proper value.

These institutions have wrought vast benefit, by inducing habits of economy among the working classes. Let us compare two years thirty years apart, 1833 and 1863. On Nov. 20, 1833, there were 484 savings-banks, holding balances belonging to 475,155 depositors; the sum in hand was £15,715,111, giving an average of more than £33 due and belonging to each depositor; these totals applied to England, Wales, and Ireland, but did not include Scotland. On Nov. 20, 1863, there were savings-banks in the United Kingdom holding balances belonging to 1,555,089 individual depositors, charitable institutions, and friendly societies; the sum in hand (including interest) was £43,278,656, giving an average of about £28 due and belonging to each depositor. The charitable institutions and friendly societies which had accounts open with savings banks were so large a number as 28,334, having deposits of about £100 each on an average. About 800,000 depositors had accounts open of less than £5 each. There were 6,627 savings-banks annuities then in force, for an aggregate sum of £135,748 per annum; in other words, the annuities were more than £20 each on an average.

Just before the new post-office savings-banks came into operation, there were 1,609,103 depositors in the old savings-banks; this number increased to 1,887,510 by Mar. 31, 1864—showing that the new system has been a positive benefit to the old. In subsequent years, many of the old, or trustee, banks arranged for a transfer to the postmaster-general. The report issued in 1872 tells us of 1,404,078 accounts open with the old banks, on which was due to depositors the aggregate sum of £38,820,453; the rate of interest averaging £2 19s. 5d. per cent. The different sections of the United Kingdom had contributed to the aggregate amount in the following proportions in 1878:

England and Wales.....	£35,324,689
Scotland.....	6,178,534
Ireland.....	2,219,596
Channel islands.....	533,069
	<hr/>
	£44,255,890

It would appear that the post-office savings-banks are suitable for smaller deposits than the others judging from the sums deposited since the two systems have been in operation together. That the changes have been in the increase of the post-office banks, rather than in the decline of the trustee banks, is satisfactorily shown by a comparison of the deposits in each in 1864 with those in 1874:

Post-office banks.....	£4,993,124	£23,157,469	£18,164,345
Trustee banks.....	35,145,567	41,505,949	6,360,382
	£40,138,391	£64,663,418	£24,524,727

a total increase of £24,524,727 in ten years.

POST-OFFICE SAVINGS-BANKS.—Mr. Sikes, of the Huddersfield banking company, in a paper read before the congress on social science, held at Bradford in 1859, advocated the establishment of savings-banks in connection with the money-order department of the general post-office. The subject had more or less occupied the attention of public men since 1806, when Mr. Whitbread made a proposition relating to it; but Mr. Sikes's plan was so clear and detailed that the postmaster-general took the matter up. An act of parliament was obtained in 1861. The postmaster-general is to act in concurrence with the treasury and the national debt commissioners. Deposits not less than one shilling in amount may be made at any of the money-order offices, or at such offices as the postmaster-general may appoint. Each depositor is provided with a deposit-book; each deposit is entered in this book, and is attested by the receiving-officer, and by the dated stamp of his office. The amount received is reported on the same day to the postmaster-general. An acknowledgment of each deposit is transmitted to the depositor, and this is to be conclusive evidence of his claim to repayment with interest. The depositor is entitled to repayment of the whole or any part of the deposit, on making a demand in a prescribed form at *any* of the offices (not necessarily the one at which he made his deposits) within ten days at furthest after sending in the demand. The names of the depositors, and the amounts paid in and returned, are not to be disclosed, except to the officials immediately concerned. All the moneys are paid into and received back from the national debt office, on the authority of the postmaster-general. Interest at 2½ per cent is allowed on all deposits as soon as they amount to £1, but none on fractional parts of £1. Facilities are supplied by means of certificates for transferring deposit accounts from ordinary savings-banks to post-office savings-banks, or *vice versa*. All expenses are refunded to the post-office out of the deposit fund; and if there should be any deficiency, the consolidated fund is to bear it. A detailed account of the proceedings is to be presented annually to parliament. The maximum sum deposited by any one person in one year is limited to £30. The deposit-book, in which the name, address, and occupation of the depositor are written, contains minute printed directions for his guidance. The book contains a pocket, in which the receipts from the postmaster-general may be kept. The depositor pays nothing for the book, and nothing for postage for letters to and from the postmaster-general.

This new system has proved remarkably convenient and successful. Operations commenced on Sept. 16, 1861; from which time till the end of 1875 the total amount deposited, with interest, amounted to £81,397,000, and the sum withdrawn to £56,210,000. At the end of 1875 the number of post-office savings-banks in the United Kingdom was 5,260, and the amount of deposits for that year was £8,783,852, making an average of £2 16s. 1d. for each of 3,192,433 deposits by 1,777,103 depositors. The number of withdrawals was 1,112,637, amounting to £7,325,560; average of each withdrawal, £6 11s. 8d. The interest amounted to £571,584, and the charges of management to £122,325, being 9s. 8½d. per cent on the capital. The total amount at the credit of depositors at the end of the year was £26,222,485. The average amount at the credit of each depositor in the United Kingdom was £14 3s. 5½d., English depositors having slightly over this, Scotch £9, and Irish £17. The average of depositors to population was 1 to 18, thus distributed: England, 1 to 14; Scotland, 1 to 69; Ireland, 1 to 89. Large numbers of provident and charitable societies, etc., deposit their funds in the post-office savings-banks.

MILITARY AND NAVAL SAVINGS-BANKS.—In 1842 an act was passed for establishing military savings-banks in connection with the regimental pay departments. Another act was passed in 1859, affording greater facilities to the frugal soldier. The proceedings of these banks in the first four years present the following figures:

	Deposits in Year.	Withdrawals in Year.
1859.....	£70,736	£64,497
1860.....	163,491	116,393
1861.....	167,136	149,090
1862.....	152,203	164,775

The figures have fluctuated through causes not stated in the parliamentary returns, being about the same in 1871 as in 1861, after being much lower in some of the intervening years, and much higher in 1866. The number of accounts open in the latest years was about 14,500, including those of many army charitable funds.

Concerning seamen's savings-banks, they mainly depend for their provisions on an act passed in 1856, which recognized the shipping-offices for seamen as branch savings-banks; and authorized the board of trade to lay down rules with respect to the persons entitled to become depositors, the making and withdrawal of deposits, etc. The operations of the seamen's savings-banks are far less extensive in amount than those of the military savings-banks. Recent years have exhibited about £17,000 or £18,000 deposits

each year; but as the withdrawals are always less in amount, the total investment is steadily growing, and with it the total interest receivable.

A few changes have been made by the legislature, not so much in the arrangements between the depositors and the savings-banks generally, as in the relation borne by the latter toward the national exchequer. An act was passed in 1866 (29 Vict. c. 5), authorizing the investment of a stated amount of savings-banks money in terminable annuities. It applied alike to trustee savings-banks and to post-office savings-banks; and was supplemented by another act in 1869 (32 and 33 Vict. c. 59). The two statutes together have swept off a number of earlier acts of parliament, and have facilitated the investment of a portion of the savings-funds in annuities which will terminate at various dates before 1885.

AMERICAN SAVINGS-BANKS.—In a recent report, the secretary of the United States treasury states the total deposits in United States savings-banks at £175,625,000, owned by 2,300,000 depositors, but owing to insufficient security the injury inflicted by the losses sustained is greater than in commercial ventures, and he proposes a scheme for converting deposits into 4 per cent bonds of the United States.

SAVINGS-BANKS (*ante*). While in England no laws were passed affecting the organization of savings-banks until 1817, in Boston, Mass., one was incorporated Dec. 13, 1816, and began business in the following spring. In 1818 this was followed by the incorporation of savings-banks in Salem, Mass., and Baltimore; and one in Philadelphia in 1819. In the latter year they appeared in Hartford, Conn.; Newport and Providence, R. I.; Bristol, R. I.; and Portland, Me. The following statement for 1876, of the first nine savings-banks incorporated in the United States, includes the names of all those above indicated, excepting that of Portland, which failed in 1838, and of Bristol, R. I., which never organized:

NAME.	Opening.	Open Accounts.	Due Depositors.	Surplus.
Philadelphia Savings Fund Society, Penn.	1816	44,790	\$11,290,127	\$1,079,428
Boston Provident Savings Institution, Mass.	1817	31,883	14,761,081	797,178
Savings-Bank of Baltimore, Md.	1818	32,429	12,512,209	1,250,000
Salem Savings-Bank, Mass.	1818	16,004	6,000,583	400,000
Bank for Savings, New York, N.Y.	1819	66,429	21,695,401	1,150,067
Society for Savings, Hartford, Conn.	1819	23,876	8,100,097	299,820
Providence Institution for Savings, R. I.	1819	5,203	8,508,380	170,895
Savings-Bank of Newport, R. I.	1819	5,204	4,658,092	Unknown
Portsmouth Savings-Bank, N. H.	1823	7,304	2,440,043	55,081

The mode of organization differs in different states, some banks being organized on the mutual and some on the joint-stock plan. In some states the incorporators are authorized to add to their number, and to elect therefrom trustees or directors. In others the trusteeship is vested in the corporators, who may sometimes fill vacancies, while in some cases these are filled by external and appointed authority. The following tables exhibit the resources and liabilities, number of depositors, amount of deposits, and average to each depositor for the years and in the banks designated:

Between 1871 and 1877 18 savings-banks failed in New York city, owing depositors \$8,973,093. There were in that city at the close of 1880 24 savings-banks doing business. In the state of Massachusetts 14 savings-banks have been placed in the hands of receivers between 1875 and 1880, and are under perpetual injunction. The amount due depositors by these banks was \$9,976,229.05. The number of savings-banks in Massachusetts, Oct. 31, 1880, was 164.

SAVONA, a maritime city of northern Italy, in the province of Genoa, and 25 m. s.w. of the city of that name. It is situated on a plain near the sea, and has numerous manufactures, including extensive potteries. The neighborhood produces olives, fruits, grain, wood, and wines. It carries on a brisk trade with Marseille. The harbor, one of the safest in the Mediterranean, was 25 to 30 ft. deep, till the Genoese in the 16th c. filled it with stones; but since the opening of the Mont Cenis tunnel, which promises to increase the commerce of Savona, steps have been taken to have it cleared out. Pop. '73, 19,664. The city is the third in importance on the Riviera. It is a very ancient city, and in the time of the Romans was called Sava, founded, according to tradition, by Janus. It flourished under the Roman empire, was destroyed by Rotharis (639), was rebuilt by Ludovic the Pious (981), and was afterward laid waste by the Saracens.

SAVONAROLA, JEROME, the celebrated preacher and political as well as religious reformer of Florence, was b. of a noble family at Ferrara, September 21, 1452. He was educated at home, and, at a very early age, became deeply versed both in the philosophy of the schools and in the old Greek philosophy, which at that time had become popular in Italy; but his disposition from the first was strongly tinged with religious asceticism, and, in 1474, he formally withdrew from secular affairs, and entered the Dominican order at Bologna. Having completed his novitiate and the studies of the order, his first public appearance as a preacher seems to have been in 1482 at Florence where he had entered the celebrated convent of his order, San Marco, and where he preached the Lent in that year. His first trial, however, was a signal failure. His voice was harsh and unmusical, and he so utterly failed to interest his hearers, that, after a time, the course of lectures was entirely deserted. Some time afterward Savonarola was sent to a convent of his order

at Brescia, where, by degrees, his earnestness and zeal began to attract notice, and eventually, the disadvantages of manner and address, which had told against the effect of his early efforts, either were overcome through practice, or ceased to be felt under the influence of his sterling genius and irresistible enthusiasm. In 1489 he was once more recalled to the convent of San Marco at Florence. His second appearance in the pulpit of San Marco was a complete success. The great subject of his declamation was the sinfulness and apostasy of the time; and in his denunciation of the vices and crimes of his age, he took as his theme what has been the topic of enthusiasts in almost every age, the mystical visions of the apocalypse, which he applied with terrible directness to the actual evils with which, as with a moral deluge, the age was inundated; and in these half-expositions, half-prophetical outpourings, his followers claimed for him the character of an inspired prophet. Under the rule of the great founder of the family of the Medici, Lorenzo the Magnificent, art, literature, and philosophy, had all followed the common direction of that elegant but semi-pagan revival, which the scholars of the 15th c. had inaugurated; and the whole spirit of the social as well as intellectual movement of which Florence, under the Medici, was the center, was utterly at variance with the lofty Christian spirituality and severe asceticism in which Savonarola placed the very first conditions of the restoration of true religion and morality. His preaching, therefore, in its spirit, as well as in its direct allusions, was no less antagonistic to the established system of the government, than to the worldly and irreligious manners of the age; the visions and predictions ascribed to him had quite as much of political applicability as of religious significance; and thus, to the aristocratic adherents of the Medici, Savonarola early became an object of suspicion, if not of antipathy and dread. It is said by Pico de Mirandola, that he refused to grant absolution to Lorenzo, when the latter lay dying in 1492; but the statement does not accord with Poliziano's account of his patron's death. Through all this time, however, Savonarola's relations with the church were, if not of harmony, at least not of antagonism; and when, in the year 1493, a reform of the Dominican order in Tuscany was proposed under his auspices, it was approved by the pope, and Savonarola was named the first general vicar. About this time, however, his preaching had assumed a directly political character, and the predictions and denunciations which formed the staple of many of his discourses, pointed plainly to a political revolution in Florence and in Italy, as the divinely ordained means for the regeneration of religion and morality. In one of his discourses he pointed plainly to the advent of the French under Charles VIII.; and when this prediction was fulfilled by the triumphant appearance of the French expedition, Savonarola was one of a deputation of Florentines to welcome Charles VIII. as the savior of Italy, and to invite him to Florence. Very soon, however, the French were compelled to leave Florence, and a republic was established, of which Savonarola became, although without political functions, the guiding and animating spirit, his party, who were popularly called *Pugnani*, or "Weepers," from the penitential character which they professed, being completely in the ascendant. It was during this brief tenure of influence that Savonarola displayed to the fullest extent, both the extraordinary powers of his genius, and the full extravagance of the theories to which his enthusiastic asceticism impelled him. The republic of Florence was to be the model of a Christian commonwealth, of which God himself was the chief ruler, and his gospel the sovereign law; and thus the most stringent enactments were made for the repression of vice, and of all the sinful follies by which it is fomented and maintained. All the haunts of debauchery were suppressed; gambling in all its forms was prohibited; the vanities of dress were restrained by sumptuary enactments; and, under the impulse of the popular enthusiasm which the enthusiasm of the prophet engendered, women flocked in troops to the public square to fling down their costliest ornaments; and gay gallants and grave scholars destroyed, in one common *auto da fé* before the gates of the cathedral, whole hecatombs of the amatory poetry or licentious fiction of the day, in conjunction with the elegant paganism or unconcealed immorality of the classic period. Meanwhile, the extremes of his rigorism; the violence of his denunciations, which did not spare even the pope himself; the assumption by him, or attribution to him, of a supernatural gift of prophecy; and the extravagant interpretation of the Scripture, and especially of the apocalypse, by which he sought to maintain his views, drew upon him the displeasure of Rome. He was cited, in the year 1495, to answer a charge of heresy at Rome; and on his failing to appear, he was forbidden to preach; the brief by which the Florentine branch of his order had been made independent was revoked, and he was again summoned to Rome. Once again Savonarola disregarded this order. But his domestic difficulties now began to deepen. The measures of the new republic proved impracticable. The party of the Medici, called "Arrabbiati" (enraged), began to recover ground. A conspiracy for the recall of the exiled house was formed; and although for the time it failed of success, and six of the conspirators were condemned and executed, yet this very rigor served to hasten the reaction. The execution of these conspirators was a direct violation of one of Savonarola's own laws, and it tended to direct the popular sympathy in their favor. At the critical point of the struggle of parties came, in 1497, a sentence of excommunication from Rome against Savonarola. Savonarola openly declared the censure invalid, because unjust, and refused to hold himself bound by it. In the following year, however, 1498, when the new elections took place, the party opposed to Savonarola, the Arrabbiati,

came into power. He was ordered to desist from preaching, and the struggle was brought to a crisis by the counter-denunciations of a preacher of the Franciscan order, long an antagonist of Savonarola, Francesco da Puglia. In the excited state of the popular mind thus produced, an appeal was made by both of the contending parties to the interposition of divine providence by the ordeal of fire. But at the moment when the trial was to have come off, difficulties were originated by the party of Savonarola, and nothing was actually done. The result of this was to destroy with the populace the prestige of Savonarola's reputation, and to produce a complete revulsion of public feeling. In the midst of this reaction he was cited before the council, and brought to trial for misleading the people by false prophecies. He denied the charge; but being threatened with torture he is said to have made a confession, which, however, his friends say was garbled, if not utterly falsified. He was declared guilty of heresy and of seditious teaching. The acts of the trial were sent to Rome, where the sentence was confirmed, and he with two others of his order were given up to the secular power. An effort was made to procure a remission of the capital sentence which was passed upon them, but in vain; and on May 23, 1498, this extraordinary man, with his two companions, F. Domenico da Pescia and Silvestro Maruli, were executed, and their bodies burned by the executioner. They died professing their adherence to the Catholic church, and humbly accepting the last absolution from the papal commissary; and it is still a question among Catholics whether Savonarola is to be regarded in the light of a confessor of the truth, or of a fanatical forerunner of the movement which so soon reached its full development in the reformation. The works of Savonarola are very numerous. They were all written either in Latin or in Italian, but have for the most part been translated into French, German, Spanish, and other languages. His works in Latin are: (1) *On the Simplicity of the Human Soul*; (2) *The Triumph of the Cross*; (3) *A Dialogue of the Spirit and the Soul*; (4) *A Fourfold Exposition of the Lord's Prayer*; (5) *On the Perfection of the Spiritual Life*. Most of them were translated contemporaneously into Italian, and some even by Savonarola himself. His principal Italian works are: *A Treatise on Humility*; *On the Love of Jesus Christ*; *On the State of Widowhood*; *Two Treatises on Prayer*; *Rules of Christian Living* (together with a work of a title almost the same which he wrote while in prison, and at the desire of his jailer); *On the Mysteries of the Mass*; and several other doctrinal and ascetical treatises. No collected edition of his sermons has been published, and his correspondence also has, for the most part, disappeared; but the works which survive sufficiently illustrate the peculiarities of his genius, and the stern and almost fierce enthusiasm which was the secret of his influence on that corrupted but yet cultivated age.—See Madden's *Life of Savonarola* (2 vols. 8vo, 1854); abbé Carle's *Histoire de Fra Hieron Savonarola* (Paris, 1842); Revere's *I Piagnoni e gli Arrabbiati al Tempore Savonarola* (2 vols. Milan, 1843).

SAVONETTES, soap of fine quality, perfumed and made into balls or other shapes for use at the toilet.

SAVORY, *Satureja*, a genus of plants of the natural order *labiate*, nearly allied to thyme (*thymus*), and differing from it in the regularly 5-toothed or 5-cleft calyx, and the stamens bent together into an arch under the upper lip of the corolla. The species are herbaceous and half-shrubby plants, all natives of the south of Europe and the east. They have narrow, linear-lanceolate, entire leaves, with resinous dots, and short, axillary, little corymbs. The COMMON SAVORY, or SUMMER SAVORY (*S. hortensis*), is commonly cultivated in kitchen gardens for flavoring dishes. It is an annual plant $\frac{1}{2}$ to 1 ft. high, with leaves not prickly pointed, and lilac or white flowers; has a strong and agreeable aromatic smell, and an aromatic pungent taste, and is in common use both fresh and dried for flavoring dishes, and especially for flavoring beans. It is stomachic and tonic.—WINTER SAVORY (*S. montana*) is used exactly in the same way. It is a half-shrubby plant, with prickly-pointed leaves and larger flowers. Its taste is pungently aromatic.—Summer savory is propagated by seed; winter savory by slips and cuttings.

SAVOY, a cultivated variety of cabbage (q.v.), forming a large close head like the true cabbages, but having wrinkled leaves. A number of sub-varieties are in cultivation. The mode of cultivation and the uses are the same as those of cabbage. Savoyes are much cultivated for winter use; they require a light rich soil.

SAVOY, formerly a duchy belonging to the kingdom of Sardinia (q.v.), now incorporated with France, is bounded on the n. and e. by Switzerland, e. and s. by Piedmont, and w. by the French departments of Isère and Ain. While an Italian duchy it was politically divided into seven provinces, a division which exhibited the successive steps of its acquisition by the house of Savoy; but since its annexation to France this division has been modified, though the change has been little more than nominal. It is now separated into two departments: first, SAVOIE, or CHAMBERY, the southern part of Savoy, with an area of 2,282 sq. m., and a pop. of (1872) 267,958, which is divided into four arrondissements—Chambery (old province of *Chambéry*), Albertville (*Alta-Savoia*), Montiers (*Tarantasia*), and Saint Jean de Maurienne (*Maurienne*)—and has Chambery for its capital; secondly, HAUTE-SAVOIE, or CONFLANS, the northern part of Savoy, which has an area of 1319 sq. m., with a pop. of 273,027, and is divided into four arrondissements—Bonneville (*Fossigny* or *Faucigny*), Thonon (*Clabese* or *Chablais*), Annecy

and St. Julien (*Genevève*)—Annecy being the capital. The two departments resemble each other so much in all respects that they may be described together.

Savoy is the most elevated tract in Europe, and is mostly covered with mountains, which break up the country into a number of valleys, each watered by its own snow-fed torrent or stream. The highest elevation of Savoy is the summit of Mont Blanc (q.v.), and the lowest is the bank of the Rhone at Saint-Genix d'Aosta, 670 ft. above sea level. The Graian Alps run along the eastern boundary of Savoy, and form a natural barrier between it and Piedmont, several breaks or gorges affording means of communication between the two countries; from this range the mountains gradually decrease in height toward the valley of the Rhone, which is on the western boundary.

Savoy (especially Haute-Savoie) is extremely picturesque, and within a comparatively limited space exhibits at once the curious, the beautiful, the grand, and the wild and forbidding phases of natural scenery. There we have the lakes of Geneva, Annecy (9 m. by 1½), Aiguebellette, each perfect in its own style of beauty; the subterranean lakes of Bauge, the cascades of Sallanches and Bout-du-monde, the intermittent springs of Pignos and Haute-Combe, the grottoes of Balme, Bauge, and Sallanches, the hot springs of Aix-le-bains (near Chambéry), of Saint Gervais, Bride, Echallion, and others; the smiling valleys of Chambéry, Faverges, Maglan, and Albertville; the glaciers of Chamounix, Buet, and upper Tarantasia; the wooded mountain-sides of Ciablèse, the bare rugged peaks which surround Mont Blanc, the frowning gorge of Challes, and the wild and savage glens and dells of Maurienne. Tourists consequently flock in great numbers to Savoy, the robust to gratify their love of sight-seeing, and the invalids to benefit by the thermal springs, which are much esteemed.

The whole of the country is drained by streams which flow either into lake Leman (the northern boundary) or the Rhone. Chief of the former is the Drance, which traverses Chablais; among the latter are the Arve, which drains the Chamounix valley, the Usses, the Fier, the Laisse, the Guier, and the Isère. The geology of Savoy is marked by the presence of three distinct ranges, exhibiting respectively the primary, transition, and secondary series of rocks with great completeness; and the depth of the crevasses, the height of the mountains, inversions of strata, débris on the mountain-sides, afford excellent opportunities for a thorough study of the constitution and elements of the earth's crust.

The whole of Savoy is broken up into a multitude of small estates, and the country is as a consequence most carefully cultivated, some of the fertile valleys resembling a continuous garden abounding in flowers and fruits. The ground suitable for cultivation being very limited, the enterprising natives have made extraordinary efforts to increase it by constructing line above line of parapets along the steep mountain-sides, and by filling in earth behind, forming long and narrow terraces, on which, if they can succeed in growing two rows of vines, they consider themselves well rewarded for their labor. These terraces are most common in the hilly districts of Tarantasia and Maurienne.

The climate of Savoy is in general cold, the winters are long and severe, and the summers frequently follow without an intermediate spring. Yet Savoy can boast of the vegetation of warm countries, as well as of that of higher latitudes: the vine is found growing almost to the edges of the glaciers, and cereals and fruits of various sorts are produced in great perfection. The pasturage is rich and abundant, and mulberry trees are largely planted. Although it is essentially an agricultural country, the industrial arts are not unrepresented; fabrics of cotton, printed calico and gauze, stockings, felt hats, woolen cloth, are manufactured in various localities; and tanneries, breweries, distilleries, glass-works, potteries, etc., are occasionally met with. The chief occupation, however, is the breeding of cattle, horses, and mules, all of which are much esteemed and fetch good prices; and bees and silkworms are tended as a source both of amusement and profit.

Savoy is rich in minerals—silver, iron, copper, antimony, manganese, lead, zinc, asphalt, marble, granite, gypsum, sulphur, and salt. The principal mines are the spathic iron mine of Saint Georges d'Hurtieres, and the lead mine of Macot. Coal is found in Maurienne.

The exports consist of the surplussage of these products, and also of cheese, hemp, silk, both raw and spun, and wood of various sorts. Savoy is, with the exception of Bavaria, the only country of Europe in which advanced education is given gratuitously, there being within the country 14 colleges for this purpose. Ordinary education is also well provided for, as more than 1200 schools exist, nearly the whole of which are supported on old foundations.

The Savoyards are honest, intelligent, religious, hospitable, and enthusiastically patriotic, even to a greater extent than the Swiss. More than 20,000 of them expatriate themselves annually for the purpose of pursuing various callings, but the greater portion return early in summer, while others wait till they have amassed wealth sufficient for the rest of their lives.

SAVOY, HOME OF. The small territory of Savoy formed a part of ancient Gaul, and after the decline of the Roman power was seized by the Burgundians (407 A.D.), and along with Burgundy passed under the Franks (534). On the breaking up of the Frankish empire, Savoy was joined to *Transjuran Burgundy*, and along with that king

dom was united to *Cisjurane Burgundy*, or Arles. On the accession of the last king of Arles to the imperial throne as Conrad II., the great lords of north-western Italy, such as the lords of Suza, Chablais, Maurienne, and Turin, became vassals direct of the empire. The counts of Maurienne, the ancestors of the house of Savoy, are generally believed by most historians who have investigated their genealogy to have descended directly in the male line from a son of Wittekind the great, the last independent king of the Saxons; and Count HUMBERT, *the white-handed*, was the first of the family who, by the addition of Chablais and Valais (grants from the emperor Conrad the Salic) to his hereditary lordship of Maurienne, rose to high position among the princes of northern Italy. One of his descendants, HUMBERT II. (1078-1103), succeeded to the marquisate of Suza (which included the greater part of Piedmont), and further increased his little territory by the conquest of Tarantasia. The family now commenced to form alliances with the royal houses of France, Portugal, England, Naples, Spain, and Germany, which added greatly to its political importance. AMADEUS III. (1103-49) received from the emperor Henry V. the title of Count of SAVOY (1111), and his grandson, THOMAS I. (1188-1233), obtained important accessions in Chambéry, Turin, the country of Vaud, and many other lordships. Count Thomas was the initiator of the policy so long and successfully adopted by his successors, "of preserving armed neutrality in all contests between France and the empire, and of vigorously supporting the empire against the papacy." From this time the counts of Savoy became the arbiters of all quarrels in north, and occasionally in south Italy, and their bravery in the field and keen political sagacity* increased at once their political influence and their territorial jurisdiction. After the death of count Boniface, in 1263, without heirs, his uncle, PIETRO, the earl of Richmond and lord of Essex, usurped the crown; but in 1285 the rightful heir, AMADEUS V. (1285-1323), the grandson of Pietro's elder brother, obtained the succession; and his grant to his brother THOMAS of the principality of Piedmont as a hereditary fief, founded the two lines of Savoy and Piedmont, which continued to rule over their respective territories till, on the latter becoming extinct in 1418, Piedmont reverted to the elder line. (See AMADEUS V., VI., and VIII.) Amadeus VIII. was the first DUKE OF SAVOY, being so created by the emperor Sigismund in 1416. CHARLES I. (1482-89) obtained from Charlotte of Lusignan, queen of Cyprus, the transference of her rights, and from this date (1485) the dukes of Savoy also claimed to be kings of Cyprus and Jerusalem. The elder male line becoming extinct in 1496, the next collateral heirs were PHILBERT II. (1496-1504) and CHARLES III. (1504-53); but the latter, having sided with Charles V. against Francis I. of France, was deprived of the duchy of Savoy in 1533, the countries of Valais and Geneva placed themselves under the protection of Switzerland, and in 1526 the country of Vaud was seized by the people of Bern. But his son, PHILBERT EMMANUEL, who was the Spanish governor in the Netherlands, succeeded, at the peace of Cateau-Cambresis (1559), in obtaining repossession of Savoy. It was this duke who attempted to convert the Vaudois (q.v.), and who founded the now important silk-production in Piedmont, besides, to the utmost of his power, encouraging the prosecution and development of other branches of industry. He reannexed (1576) the principality of Onegle, and conquered the county of Tende. His successor, CHARLES EMMANUEL I. (1580-1620), was celebrated as a scholar, statesman, and warrior, but he was cursed with an inordinate ambition, which involved him in unfortunate contests with Geneva (a former town of Savoy, of which he wished to regain possession), with the French, who in revenge took possession of his dominions, and with the Spaniards. His two sons, VICTOR AMADEUS I. (q.v.) (1630-37) and Thomas, were the respective founders of the two lines of Savoy and Savoy-Carignan. Victor Amadeus speedily regained the dominions which his father had lost; and with the consent of France added to them Montferrat, Alba, and some other places, relinquishing Pignerol, La Perouse, Angrone, and Lucerne to the French. As generalissimo of the French army in Italy, he gained two victories over the Spaniards, but died soon after. His grandson, VICTOR AMADEUS II. (1675-1730), was one of the claimants for the Spanish throne on the extinction of the Spanish-Hapsburg dynasty (see SUCCESSION, WAR OF THE SPANISH); and by his adroit policy in the contest between the Hapsburgs and Bourbons for the possession of this crown, he succeeded in obtaining extensive additions to his little territory, the chief of these being Alessandria, Val-di-Sesia, and other portions of the Milanese, the island of Sicily, in 1713, and along with this latter the title of king. He and his descendants were also recognized as the legitimate heirs of the Spanish throne, should the Bourbon dynasty ever become extinct. But in 1720 he was compelled to surrender Sicily to Austria, in exchange for the island of Sardinia, which, along with Savoy, Piedmont, and his other continental possessions, was then erected into the Kingdom of Sardinia, (q.v.)

SAVOY, TWE, on the Thames, in London, is the site where once stood the magnificent palace, built in 1245 by Peter, earl of Savoy and Richmond. A century later it became the property of John of Gaunt, duke of Lancaster. In this building the French king Jean was royally imprisoned, from his capture in the battle of Poitiers to his death in 1364. The palace was twice the object of popular violence. In the outbreak caused

* It is a remarkable fact, in connection with the history of this family, that they have numbered among them more great warriors and politicians than any other royal house of Europe.

by the duke of Lancaster protecting Wycliffe it narrowly escaped destruction; and in Wat Tyler's insurrection it was burned and made a heap of ruins. After another hundred years Henry VII., great-grandson of John of Gaunt, erected on these ruins a house for the temporary support of destitute, diseased, helpless, and homeless persons. This well-intended charity soon became a refuge for the dissolute and vicious, rather than for the worthy poor. It was therefore suppressed by Edward VI., but was restored by queen Mary, and profusely refurnished by the ladies of her court from their private resources. In the management of this establishment great abuses prevailed. Its officials embezzled the fund, and the inmates continued to come from the degraded and criminal classes. The combined hospital and poor-house maintained a nominal existence through successive reigns, a portion of the buildings being occupied by Charles II. as a home for disabled soldiers and sailors, and was finally discontinued by queen Anne. In building the Waterloo bridge in 1810, the deep foundations on which the ancient buildings had rested were all removed. Nothing remained but the chapel built alongside these ruins by Henry VII. This chapel was made a church by queen Elizabeth, and was one of the chapels royal, under the name of St. Mary-le-Savoy. It was burned down in 1864, but was rebuilt, though without aisles or chancel, and elegantly furnished for public worship by queen Victoria. The vaults beneath contain the remains of many persons of distinction.

SAVOY CONFERENCE, the name given to an ecclesiastical conference held in 1661 at the Savoy palace (so called because built in 1245 by Peter, earl of Savoy and Richmond [see AMADEUS]; burned by Wat Tyler in 1381, it was rebuilt and endowed in 1505 as an hospital for poor persons) between the Episcopalian and Presbyterian divines, with the view of ascertaining what concessions would satisfy the latter, and thereby lead to "a perfect and entire unity and uniformity throughout the nation." During the rule of the protector Cromwell the church of England had been in a very anomalous condition. Most of the clergy who held office during the early period of the civil wars were strong royalists, and either were ejected or fled when the cause of the parliament triumphed. Their places had been supplied in many cases by zealous Presbyterians—a rather numerous body in England at that time, and thus it happened at the restoration of Charles II. that a considerable section of the ministers *within the church* were hostile to the reintroduction of Episcopalian order and practice. Aware of this feeling, yet desirous of not adopting severe measures, if such could possibly be avoided, the king issued letters-patent dated Mar. 25, appointing twelve bishops, with nine clergymen as assistants on the side of the Episcopal church, with an equal number of Presbyterian divines, "to advise upon and review the *Book of Common Prayer*." Among the Episcopalian commissioners were Frewen, archbishop of York, Sheldon, bishop of London, Gauden of Exeter, Reynolds of Norwich, etc.; among their assistants, Dr. Peter Heylin, Dr. John Pearson, and Dr. Thomas Pierce. The most notable representatives of the Presbyterian party were Richard Baxter, Dr. John Wallis (then Savilian professor of geometry at Oxford), Edmund Calamy, William Spurstow, and Matthew Newcomen. The conference (which lasted four months) was opened on April 13. The Presbyterians (according to Burnett) demanded that archbishop Usher's scheme of a "reduced Episcopacy," in which the elements of the Scotch system of presbyteries, synods, and general assemblies were combined with distinctions of ecclesiastical ranks, should be made the basis to begin with; that responses should be given up; that the prayers in the litany should be combined into one; that no lessons should be taken out of the Apocrypha; that the psalms read in the daily service should be according to the new translation; that the term regeneration (among others) should be struck out of the baptismal service; and that the use of the surplice, of the cross in baptism, of godfathers as sponsors, and of the holy days, should be abolished. They were told in reply that the commission had no authority to discuss questions affecting the government of the church, such as were contained in archbishop Usher's scheme; whereupon they proceeded to consider the minor points, such as the alterations of the liturgy. Baxter, with the consent of his party, drew up a "reformed liturgy" which the Episcopalian commissioners would not look at, considering the wholesale rejection of the older *one-utterance* on their part. Finally, the parties separated without arriving at any conclusion; and this fruitless attempt at "comprehension" was followed in 1662 by the famous "act of uniformity," the result of which was that 2,000 clergymen were forced to abandon their livings in the church of England.

SAVOY CONFESSION, named from the hospital building in the Strand, London, in which it was drawn up—a document adopted by an assembly of Congregational ministers, who, by Cromwell's permission, unwillingly given just before his death, met in the Savoy palace, Sept., 1658, to declare the principles of their faith and polity. The doctrinal part agrees in substance and almost verbally with the Westminster confession. Its outline of church polity, however, is in its principles Congregational, though not entirely accordant with modern Congregational usage. It contains the following propositions: 1. A particular church consists of officers and members, the Lord Christ having given his followers—united in church order—liberty and power to choose persons fitted by the Holy Ghost to be over them in the Lord. 2. The officers appointed by Christ are pastors, teachers, elders, and deacons. 3. The way appointed by Christ for calling persons to these offices is that they be chosen thereunto by the common suffrage of the church

itself, and set apart by fasting and prayer, with the imposition of hands of the eldership of that church; and those who are so chosen, though not set apart after that manner, are rightly constituted ministers of Jesus. 4. The work of preaching is not so confined to pastors and teachers but that others also, gifted and fitted by the Holy Ghost and approved by the people, may perform it. 5. Ordination alone, without election or consent of the church, doth not constitute a person a church officer. 6. A church furnished with officers, according to the mind of Christ, hath power to administer all his ordinances, even where for a time some of the offices are not filled; but where there are no teaching officers the church cannot authorize any persons to administer the seals. 6. Every church hath power to execute all the censures appointed by Christ as a means of edification, on those who do not walk according to his laws. These censures are admonition and excommunication; and as some offenses may be known only to some members, those members must first admonish the offender in private; in public offenses, and in cases of non-amendment on private admonition, the offense being related to the church, the offender is to be admonished in the name of Christ by the whole church, through the elders; and if he do not repent, then he is to be excommunicated with the consent of the members. See SAVOY CONFERENCE, *ante*.

SAVU ISLANDS, THE, lie in the Indian Ocean. Pop, 35,000. They are small except Savu, in 121°45' to 122°7' e. long. and 10°25' to 10°36' s. lat.; area 237 sq. miles. It is healthy and moderately fertile, the thermometer ranging from 76° to 88° Fahr. by day and 68 to 70° by night. The products are those of the Archipelago, including tobacco and horses, but ships from Timor no longer call for horses. The five rajahs have relations with the Dutch Indian government, whose post-holder resides at Seba, the rajah of which possesses much influence, is a Christian, and has a missionary on the island. There is good anchorage at Seba. The Savumese are of Malay race—brave, and feared by their neighbors. Their religion is a traditionary heathenism, in which the offering of sacrifices of dogs is frequently practiced.

SAW, one of the most important tools used in working timber. It usually consists of a long strip of thin steel, with one edge cut into a continuous series of sharp teeth. Notwithstanding the great simplicity of the principle upon which the saw is made, it admits of great variation, and modern carpentry has brought into use a great many kinds of saws adapted to different purposes. The most common is the *hand-saw* in general use. For this the blade is broader at one end than the other, and a wooden handle is fixed to the broader end, without which it could not be used. This kind of saw is varied by the manner in which the teeth are cut and set, and in the shape and width of the blade, as in *compass* or *key-saws* for cutting small holes. Other kinds of hand-saws, such as the *back-saw* and the *tenon-saw* have straight blades, and the back is guarded and strengthened by a piece of brass or iron bent over it. The *bow-saw* is used for a variety of purposes; the blade, which is always thin, is stretched like a bowstring to an iron frame. The *frame-saw*, chiefly used in sawpits and mills for cutting timber longitudinally, is similar in shape to the ordinary hand-saw, but much larger, with holes at each end, for fixing it in the frame by which it is moved up and down. For cutting timber transversely, the *cross-cut-saw* is used; this differs not only in shape, but in the set of the teeth from other saws. Within the present century, the *circular-saw* has come into universal use wherever machinery can be had for working it. It is generally so fitted as to be worked under a flat bench; a part only of the blade projecting through a narrow slit cut in the top of the bench. It is made to revolve with great rapidity, and the wood resting on the bench is pushed against the saw in the direction it is intended to be cut. The rapidity with which wood is cut by the circular-saw is truly marvelous. The *ribbon-saw* is comparatively a new invention. It consists of a very long band—or web, as it is called—of steel, usually very narrow, and with finely cut teeth. The two ends are joined together so as to form an endless band, which is passed over two revolving drums, one above, and the other below the working bench, through holes in which the saw passes. With this work, the finest patterns in open work may be cut out with great ease and rapidity. Numerous other kinds of saws are in use, but these are the chief.

SAWDUST. The waste made by sawing timber, formerly of little or no use, has now become a material of some value in localities where it can be applied. Its most interesting application is one very recently patented by Messrs. Dale & Co. of Manchester, whereby it is converted into oxalic acid, and with so much success as to have nearly or altogether displaced every other method of making that chemical. The process is very simple. The sawdust is first saturated with a concentrated solution of soda and potash in the proportion of two of the former to one of the latter; it is then placed in shallow iron pans, under which flues run from a furnace, whereby the iron pans are made hot, and the saturated sawdust runs into a semi-fluid pasty state. It is stirred about actively with rakes, so as to bring it all in contact with the heated surface of the iron, and to granulate it for the succeeding operations. It is next placed in similar pans, only slightly heated, by which it is dried. In this state it is oxalate of soda mixed with potash. It is then placed on the bed of a filter, and a solution of soda is allowed to percolate through it, which carries with it all the potash, leaving it tolerably pure oxalate of soda. It is then transferred to a tank, in which it is mingled with a thin milk of lime, by which it

is decomposed, the lime combining with the acid to form oxalate of lime, and the soda being set free. Lastly, the oxalate of lime is put into a leaden cistern, and sulphuric acid is poured in; this takes up the lime, and sets free the oxalic acid, which readily crystallizes on the sides of the leaden cistern, or on pieces of wood placed on purpose. So rapid and cheap is this method, compared with that formerly in use, that several extensive manufactories for making oxalic acid in the old manner have been shut up, being unable to compete with the patent process.

Another interesting use of the sawdust of hard woods, such as rosewood, ebony, etc., is that recently made known in France under the name of *Boisdurci*. The various kinds of sawdust used are reduced to fine powder, and mixed with blood into a paste; other materials are doubtless added, for when pressed into molds it is jet black and receives the most beautiful impressions. Messrs. Latry, Senior & Co. of Paris produce some very beautiful medallions and other small articles in this material.

SAW-FISH, *Pristis*, a genus of cartilaginous fishes, constituting the family *Pristidae*, which is ranked with the rays (q. v.), although the elongated form of the body agrees rather with that of the sharks. In a number of anatomical characters, however, the saw-fishes differ from sharks, and agree with rays, and conspicuously in the position of the gill-openings, which are not on the sides, as in sharks, but on the under surface, as in rays. The mouth is on the under surface of the head, and is furnished with pavement-like teeth, adapted for crushing. But the saw-fish is particularly remarkable for the elongation of the snout into a flat bony sword, armed on each edge with about twenty large bony spines or teeth; a most formidable weapon, of which it seems to make use for killing prey, rushing among shoals of fishes, and slaying them right and left. Whales are said to be sometimes killed by saw-fishes, and the saw has been sometimes driven into the hull of a ship. There are six or seven known species of saw-fish, and they are distributed over the whole world. The COMMON SAW-FISH (*P. antiquorum*) was known to the ancients, being found in the Mediterranean. It is a very widely distributed fish, being found both in polar and tropical seas. It sometimes attains the length of eighteen feet, including the saw. Saw-fishes are seldom seen near the shore, and no species is reckoned among British fishes.

SAW-FLY, *Tenthredo*, a Linnæan genus of insects of the order *hymenoptera*, now divided into many genera; and constituting a family of which the species are very numerous. They derive the name saw-fly from the ovipositor of the females, which is sealy, serrated, pointed, and inclosed in a sheath of two concave plates. By means of this instrument, the female saw-fly perforates the stalks or other parts of plants, laying an egg in each hole. The hole soon becomes filled with a frothy liquid, and sometimes a gall-like swelling is formed, within which the larva resides. The larvæ of many saw-flies, however, live in no such nests, but feed on foliage, like caterpillars, which they very much resemble. One of the most common species of gooseberry "caterpillar" is the larva of a saw-fly (*nematus ribesii*). Saw-flies have the abdomen cylindrical, and so united to the thorax that the distinction is not easily perceived. They vary much in the antennæ. Both pairs of wings are divided by nervures into numerous cells. Among the more notable species is the CORN SAW-FLY (*cephus pygmaeus*), which, in its perfect state, abounds on umbelliferous flowers, a shining black insect, marked with yellow, the abdomen elongated. The larva consumes the inside of the straw of corn; and descending to the base of the straw, cuts it down level with the ground.—Another important species is the TURNIP SAW-FLY (*altalis spinarum*), reddish, spotted with black; the larva nearly black, and known by the names of *Black Jack* and *Nigger*. The turnip saw-fly is sometimes very troublesome and destructive for a year or two, and then almost completely disappears for a number of years. It has sometimes been very destructive to the turnip-crops of Britain.—The saw-fly of the pine (*lophyrus pinu*) is a common British species, and sometimes, though not very often, strips pine and fir trees of their leaves.

SAW-MILL. Within the present century, the art of working saws by machinery has been invented, and large mills for cutting up timber by means of large saws worked by machinery are to be found in most civilized countries. They are worked both by steam and water-power, and in Holland, wind-mills are made to work sawing machinery. The arrangements of a saw-mill are very simple: they consist of a fixed horizontal frame, with rollers at short intervals, upon which the tree or log of timber is laid; at the end of this, another frame is placed in a vertical position; it contains as many saws placed side by side as it is proposed to cut planks out of the log, and they are set as far apart as the desired thickness of the planks or boards. A rapid up and down motion is given to these saws by the machinery, and at the same time the log is pulled forward on the rollers by the same power, so as to be kept constantly up to the saws. In this way, a large tree or log of wood may be cut into twenty planks in much less time than was formerly required by laborious hand-labor to cut one single thickness.

The circular saw is also much used in mills for cutting planks and boards into pieces of almost any form.

SAWYER, CAROLINE M. (FICHER), wife of Thomas J. Sawyer; b. Mass., 1812. She contributed to the *Boston Evening Gazette*; edited the youth's department of the *Christian Messenger*, and the articles written by her were afterward published in a series of volumes. She has edited the *Rose of Sharon*, a Universalist annual, and the *Ladies' Re-*

pository, a Universalist monthly; published the *Poems* of Mrs. Julia H. Scott, with a memoir; and made many translations from the French and German.

SAWYER, THOMAS JEFFERSON, D.D., b. Vermont, 1804; graduated at Middlebury college in 1829; studied for the ministry, and in 1830 settled over a Universalist society in New York; became principal of the Liberal institute, Clinton, N. Y., in 1845, teaching also classes in theology; returned to his former charge in New York in 1852. He was one of the founders of Tufts college at Medford, Mass., where he was appointed professor of theology in 1869. He refused the presidency of Tufts college, of St. Lawrence university, N. Y., and Lombard university, Ill. He published a *Discussion of the Doctrine of Universal Salvation*.

SAXE, HERMANN MAURICE, Count of, one of the greatest warriors of the 18th c., was the natural son of Augustus II. (q.v.), elector of Saxony and king of Poland, and the countess Aurora von Königsmark, and was born at Goslar, Oct. 28, 1696. When only twelve years of age, he ran off from home, made his way to Flanders, joined the army of Marlborough, and took part in the capture of Lille and the siege of Tournay. With a boyish love of change, he joined the Russo-Polish army before Stralsund (1711), and after the taking of Riga, returned to Dresden, where his mother induced him, in 1714, to espouse a young and amiable German heiress. In the two following years, he took part in the civil war then raging in Poland; but having quarreled with his father's favorite minister, he returned to Dresden, where the well-grounded jealousy of his wife made his life sufficiently disagreeable. Obtaining the annulment of his marriage, and a pension from his father, he came to Paris in 1720, where he devoted himself for some years to the study of military tactics, and originated and developed an entirely novel system of maneuvers, which was highly spoken of by the chevalier Folard, the celebrated military engineer. In 1726 he was elected duke of Courland, and for a time maintained himself in his new possession against both Russians and Poles, but was compelled to retire to France in the following year. Joining the army on the Rhine, under the duke of Berwick, he signalized himself at the siege of Philipsburg (1734), and decided the battle of Ettlingen by a desperate charge at the head of a division of grenadiers. For these services he was made a lieutenant-gen. in 1736; and on the breaking out of the war of the Austrian succession, he obtained the command of the left wing of the army which was appointed to invade Bohemia, and took the strongly fortified town of Prague by storm with marvelous celerity. The capture of Egra was similarly effected a few days afterward, and the rest of the campaign showed that his abilities in the field were not inferior to his skill against fortifications. In 1744 he was made a marshal of France, and appointed to command the French army in Flanders, and on this occasion he gave decisive proofs of the soundness and superiority of his new system of tactics, by reducing to inaction an enemy much superior in number, and taking from him, almost before his face, various important fortresses. The following year was for him more glorious still; his army was re-enforced, and though so ill with dropsy that he had to submit to tapping (April 15), he laid siege to Tournay on the 22d, and on the advance of the duke of Cumberland to its relief, took up a position at Fontenoy, and awaited attack. He was assailed on May 11, and the desperate valor of the English for a time bore down everything before them; but Saxe sped about on his litter, encouraging his troops, and when the critical moment came, the fire of his artillery disorganized the English, and a charge of the French completed the victory. Four months afterward every one of the numerous strong fortresses of Belgium was in his hands. In 1746 Saxe, by a series of able maneuvers, threw back the allies on the right bank of the Maese, and gained (Oct. 11) the brilliant victory of Raucoux, for which he was rewarded with the title of marshal-gen., an honor which only Turenne had previously obtained. For the third time, at Laufeldt (July 2, 1747), the victor of Culloden suffered complete defeat at the hands of Saxe, whose favorite system of tactics was again brought into full play; and the brilliant capture of Bergen-op-zoom brought the allies to think of peace. The Dutch, however, were still disposed to hold out, till the capture of Maestricht (1748) destroyed their hopes, and the peace of Aix-la-Chapelle followed. Saxe had previously carried on a correspondence with the great Frederick of Prussia, and he now took occasion to visit him at Berlin, experiencing the most brilliant reception. In the following year, Frederick wrote to Voltaire: "I have seen the hero of France, the Turenne of Louis XV.'s time. I have received much instruction from his discourse on the art of war. This general could teach all the generals in Europe." Saxe lived at his estate of Chambord for some time afterward, and died there of dropsy, Nov. 30, 1750. His work on the art of war, entitled *Mes Réveries*, was published at Paris in 1757.

Saxe was probably the greatest captain of his time, and a gallant and enterprising leader, but he was a mere soldier, and the offer of membership made to him by the Académie Française is sufficiently ridiculous. Saxe had, however, the good sense to decline the proffered honor, and he did so in a sentence, the extraordinary orthography of which accidentally rebuked more than the most cutting sarcasm could have done, the mean sycophancy of the Académie. He wrote: "*Ils veulent me faire de la cadémie; cela m'irrit comme une bague à un chas.*"

Many biographies of Saxe have been written, but few of them are to be much depended upon.—See *Moritz von Sachsen* (Dresden, 1863), by Karl von Weber; and the

Nouvelle Biographie Générale (art. "Saxe"). His character and genius are also well, though not flatteringly, portrayed in Carlyle's *Life of Frederick the Great*.

SAXE, JOHN GODFREY, LL.D., b. Highgate, Vt., 1816; graduate of Middlebury college 1839; practiced law in Vermont, 1843-50. In 1850-55 he was editor of the *Burlington Sentinel*; state attorney, 1851. He was a contributor to the *Knickerbocker* magazine, and in 1849 published *Progres*, a satire, with other poems. His productions are marked with a ready and forcible wit. He read a poem on *The Times* before the Boston Mercantile library association, and on *Literature and the Times* on the second anniversary of the New York free academy. In 1859 he published other poems; and new editions of his works have appeared every alternate year till 1873. He resides at present in Brooklyn, N. Y.

SAXE-ALTENBURG, the smallest of the minor Saxon states, is a duchy bounded by Saxe-Weimar, Prussian Saxony, the kingdom of Saxony, Saxe-Meiningen, and Schwarzburg-Rudolstadt, and separated into two nearly equal parts by the interposed principality of Reuss-Gera. The eastern portion, or *circle of Altenburg*, from its being watered by the Pleisse, was formerly called *Pleissengau*. It contains 254 English sq.m., with a pop. '71, of 94,502. The western part, or *circle of Saal-Eisenberg*, is watered by the Saale, with the Orla and Rode, and contains 256 English sq.m.; pop. '71, 47,620. Total area, 510 sq.m.; pop. '71, 142,122; '75, 145,844, nearly half of whom are inhabitants of towns. The vast bulk of the population (999 in 1000) are Protestants, there being in 1872 only 193 Catholics, 16 Christian sectaries, and 10 Jews. The eastern portion is open, undulating, and very fertile, and agriculture has here attained considerable perfection, and is diligently pursued by a large proportion of the population, so that much more corn is produced than is necessary for home consumption. The peasants in this circle, though speaking the Thuringian dialect exhibit in their dress, manners, and customs a family resemblance to the Wendish-speaking Serbs of Lusatia; and numerous names of places, especially those ending in *itz*, indicate their Slavic origin. They are celebrated throughout Germany for their skill as agriculturists, and their superior intelligence, knowledge, and comparative wealth. The budget estimate of revenue for 1875-77 was £111,178; and the expenditure, including the duke's civil list of £22,900, to the same sum. The troops are, of course, under the command of the emperor of Germany. Saxe-Altenburg is a limited monarchy, in accordance with the constitution of April 29, 1831, modified somewhat by the events of 1848-49. By the law of 1870 the single chamber consists of 30 members, 9 representing the towns, 12 the country, and 9 the persons who pay most taxes. The government is in the hands of a ministry of three. As a member of the empire, Saxe-Altenburg has one vote in the council, and one representative in the diet. Altenburg (q. v.) is the seat of government. See GERMANY.

SAXE-COBURG-GOTHA (in German, *SACHSEN-KOBURG-GOTHA*), the third in point of size and population of the minor Saxon states, is a duchy comprising the duchy of *Gotha*, lying between Prussia, Schwarzburg, Meiningen, and Weimar, and containing 542 English sq.m.; pop. '71, 122,630; and the duchy of *Coburg*, 18 m. south of Gotha, lying between Meiningen and Bavaria, and containing 215 English sq.m.; pop. '71, 51,709. Total area, 757 English sq.m.; pop. '71, 174,339; '75, 182,599. In 1871 there were 172,786 Protestants; 1263 Roman Catholics, and 210 Jews. Gotha lies on the north side of the Thuringer-wald, which extends along and within its southern frontier; but the rest of this duchy consists of low, undulating, and very fertile land, and is watered by the Werra, an affluent of the Weser, the Unstrut, a tributary of the Saale, and several smaller streams. Coburg lies on the southern slope of the same range, is watered by the Itz and Rodach, affluents of the Main, and has extensive forests, and many beautiful valleys between the spurs of the Thuringer-wald. Of the surface of the whole duchy, $\frac{2}{3}$ is arable, $\frac{1}{3}$ is wood, $\frac{1}{4}$ waste land, and the rest pasture and gardens. In the plains and valleys, the climate is mild and salubrious, but in the mountainous parts of Gotha it assumes a more inclement character. Agriculture is the principal occupation of the people, and is pursued with energy and skill; corn and flax being produced in abundance, as also potatoes, and various leguminous plants. The breeding of horses, cattle, and sheep is also successfully conducted. The mineral wealth includes coal (chiefly in Gotha), iron, cobalt, manganese; also marble, porcelain-earth, mill-stones, and salt. The manufactures are not of much importance, and are chiefly confined to Gotha. There is a large beet-sugar factory at Gotha. The extensive forests of the duchy employ a large proportion of the population in the production of pitch, tar, and potash. The duchy is a limited monarchy, in accordance with the fundamental law of May 3, 1852. Coburg and Gotha have each a *landtag*, or diet; that of the former consisting of 11, and of the latter of 19 deputies; besides which there is a common landtag for the whole state, composed of 7 of the Coburg and 14 of the Gotha representatives, who are elected by their several diets. The particular diets for the two duchies are elected by the people at large. There are two ministers for carrying on the government—one for Coburg and another for Gotha. As a member of the empire, Saxe-Coburg-Gotha has one vote in the federal council, and has the right to choose two deputies to the imperial diet. As in other German states, the troops are under the command of the emperor of Germany. Education is well diffused; and the higher education is cultivated by the several gymnasias and academies.

The finances of the two portions of the duchy are separately administered. For the period 1877-81, the estimated annual revenue of Coburg (both revenue from the crown domains and state revenue) was close on £66,000, the expenditure being £58,500. Of Gotha, the total annual revenue is given at £227,000, and the expenditure at £185,000. The joint debt of both in 1878 was £545,000, of which, however, a large portion is "active capital." The present ducal family is distinguished for the spirited and liberal character of its members, as well as for physical and mental gifts. It is allied with several of the royal families of Europe, the present duke's younger brother having been the late prince Albert of Great Britain, and his uncle, Leopold I., the late king of the Belgians. The heir-apparent to the duchy is Alfred, duke of Edinburgh, the second son of queen Victoria of Great Britain. All the Saxon ruling families are descended from the counts of Wettin, a place near Magdeburg. See GERMANY.

SAXE-MEININGEN (also called **SAXE-MEININGEN-HILDEBURGHAUSEN**), the second in size and population of the minor Saxon states, is a duchy, consisting of one large crescent-shaped territory, which lies immediately n. of Bavaria and Coburg, with the horns of the crescent pointing northward, and contains 852 English sq. m., and two small isolated territories, Kranichfeld and Kamburg. The area of the whole is 955 sq. m., with a pop. in '71, of 187,884; '75, 194,494. In 1866, when other administrative changes and reforms were introduced, the territory, which till then had been divided into 11 administrative districts, was distributed into 4. Of the total population, 181,964 were, in 1871, Protestants; 1544 were Roman Catholics; 1625 were Jews; and 115 Christian sectaries of various kinds. The crescent is composed of the old duchy of Meiningen, the old duchy of Hildburghausen, and the principality of Saalfeld (both of which, along with Kamburg, were annexed to Meiningen in 1826). Saxe-Meiningen forms the s. w. of Thuringia (q. v.), and is traversed in the e. and n. by the Thuringer-wald, offshoots from which also cover the w., while the Rhön-gebirge enters the country at the s. w. Its surface is thus necessarily hilly, in some places even mountainous, Kiefern in the Thuringer-wald being 2,700 ft., and Gehe-berg in the Rhön-gebirge, 2,308 ft. above sea level; but between the mountain ridges are numerous fruitful valleys, and that of the Werra in particular is one of the most fertile and picturesque in Germany. The Werra, Saale, Milz, Steinach, Itz, etc., water the country. Two fifths of the country is arable land; a nearly equal extent is under wood; and the rest is meadow, garden and vineyard, and waste. In the lower lands agriculture is in an advanced condition, and is prosecuted with such vigour that corn enough is produced for home consumption; potatoes, hemp, flax, and tobacco are the other chief crops.

The mining industry of the e. and n. is considerable, employing recently about 550 men; and the important mineral products are iron, copper, cobalt, coal, porcelain-clay, sulphur, and salt from the works of Salzungen, Neusulza, and Friedrichs-hall. Saxe-Meiningen is also an active manufacturing district, chiefly in woolen, cotton, and linen fabrics, and paper; and brewing, distilling, the making of glass and porcelain, and various other branches of industry, are prosecuted. The fabrication of wooden toys in the district around Sonneburg employs 2,092 men, and the produce is bought up by the Sonneburg dealers for export. A grape-sugar factory is maintained. Saxe-Meiningen is a limited monarchy in accordance with the fundamental law of 1829, and the laws of 1871 and 1873. The diet consists of 24 representatives—4 representing the more extensive land-owners, 4 the persons who pay most taxes, and 16 being the deputies of the rest of the inhabitants. As a member of the empire, Saxe-Meiningen has one vote in the federal council, and sends 2 deputies to the diet of the empire. The troops of Saxe-Meiningen form part of the imperial army. The government is carried on by four ministers, each of whom heads a separate department. The budget for 1875-77 gives as receipts £211,182 (of which £92,764 come from the domains); as expenditure, £189,682. On Jan. 1, 1876 the public debt amounted to £1,100,000. The late duke, Bernard-Erich-Freund, who reigned for 63 years, spontaneously gave his subjects a liberal representative constitution in 1824. Saxe-Meiningen had for some time the distinction of being the best-governed state in Germany. See GERMANY.

SAXE-WEI MAR-EI SENACH, the largest of the minor Saxon states, is a grand-duchy, consisting of *Weimar*, which lies between Prussia, Altenburg, and Schwarzburg-Rudolstadt, and contains (inclusive of Allstädt, on the Unstrut, within Prussia, 45 English sq. m., and Ilmenau, in the s. e. of Gotha, 32 English sq. m.) 683 English sq. m., with a pop. '71, of 151,379; *Eisenach*, the western portion, which lies to the n. of Meiningen and Bavaria, and contains (inclusive of Ostheim, in the Rhön-gebirge, in Bavaria, 23 English sq. m.) 471 English sq. m., with a pop. '71, of 84,298; and *Neustadt*, which lies on the western boundary of the kingdom of Saxony, and contains 229 English sq. m., pop. '71, 50,506; total area, 1103 English sq. m.; pop. 286,183, of whom 275,492 are Protestants, 9,401 Roman Catholics, 53 Greek Catholics, 1120 Jews; the Jews and Catholics being chiefly in Eisenach. Pop. '75, 292,933. The Eisenach portion is traversed in the n. by the Thuringer-wald, and in the s. by the Rhön-gebirge, the intermediate districts being also hilly and undulating, and watered by the Werra and its feeders, the Fulda, Ulster, Suhl, and Orsel. The Neustadt division is traversed from s. e. to n. w. by several offshoots of the Erz-gebirge, but most of the surface belongs to the plain of the Saale, and is watered by the Elster and Orla, affluents of that river. The *Weimar* portion is also.

partly hilly and uneven, and partly belongs to the plain of the Saale, which, with its tributary, the Ilm, traverses it. The highest peak in the grand-duchy is Hinkelhahn (2,694 ft.), in the detached territory of Ilmenau. The climate is somewhat inclement in the high lands, more temperate in the plains, and particularly pleasant along the valley of the Saale. Of the whole surface, about $\frac{2}{5}$ is arable, $\frac{3}{11}$ is forest, and the rest is meadow-land, gardens, and vineyards. Agriculture is in an advanced condition, and is diligently prosecuted, there being frequently a surplus of grain over and above that required for home consumption, in spite of the occasional infertility of the soil; and potatoes, pulse, hemp, flax, hops, and (on the banks of the Saale) vines are also cultivated. Horse and cattle breeding is a common pursuit in Neustadt and Eisenach, and sheep-breeding in Weimar, the sheep having the usual good reputation of the Saxon breed. The mineral wealth comprises coal, iron, copper, cobalt, and marble. Eisenach is the chief seat of the manufacturing industry, with the exception of the woollen manufactures, which are principally carried on in Neustadt. The form of government is, according to the revised fundamental law of Oct. 15, 1850, a limited monarchy; the diet, or landtag, is composed of 31 deputies, 1 representing the landed nobility, 4 chosen by landed proprietors with incomes under 1000 thalers, 5 by those who possess the same income from other sources, and 21 by universal suffrage. The government is administered by three heads of departments. As a member of the empire, Saxe-Weimar-Eisenach has one voice in the federal council, and elects three deputies to the imperial diet. The troops of Saxe-Weimar-Eisenach form part of one of the Thuringian regiments in the 11th *corps d'armée* of the empire. The budget for the financial period 1875-77 shows annual receipts amounting to £316,000, and an annual expenditure of £314,000, leaving a small balance in favor of the exchequer. The public debt amounted in 1876 to a total of £438,340. The grand-duke of Weimar is the chief of the Ernestine branch of the house of Saxony. The most celebrated of the Weimar family was duke Karl-August, the Mæcenas of the art, literature, and science of Germany, who took the reins of government in 1775, and displayed extreme anxiety to favor the development of public prosperity and the progress of education. Under his fostering care, the university of Jena became a focus of intellect and knowledge to Germany; and the presence of Herder, Goethe, Schiller, and others, at his court well entitled it to be denominated the abode of the muses. He also elevated the theater of Weimar to its present position as the chief German school of dramatic art. In 1806 he joined the confederation of the Rhine with the title of duke, and received from the congress of Vienna an accession of territory, and the title of grand-duke. In 1816 he granted a liberal representative constitution to his subjects, expressly guaranteeing the liberty of the press, and died June 14, 1833. His successors have followed in his footsteps. See GERMANY.

SAXIFRAGE, *Saxifraga*, a genus of plants of the natural order *saxifragæ*, or *saxifragaceæ*. This order has a calyx; usually of five sepals more or less cohering at the base; a corolla usually of five perigynous petals, alternate with the sepals, rarely wanting; numerous stamens; a hypogynous or perigynous disk; an ovary, usually of two carpels, cohering more or less by their face, but diverging at the apex; fruit generally a 1 or 2 celled capsule, the cells opening at the ventral suture, and often divaricating when ripe; the seeds usually minute and numerous. The order *saxifragæ* is sometimes regarded as including above 900 species, divided into several suborders, which are elevated by some botanists into distinct orders—leaving, however, more than 300 species to the reduced order **SAXIFRAGÆ**, which contains herbaceous plants, often growing in patches, with entire or divided alternate exstipulate leaves, natives chiefly of mountainous tracts in the northern hemisphere, and often found up to the limits of perpetual snow, some of them forming there a rich and beautiful turf, and adorning it with their very pleasing flowers. A considerable number are natives of Britain. Some of the genus *saxifraga* are well known in gardens, and are employed to cover rock-works, etc. *S. umbrosa*, London pride, or none-so-pretty, is familiar in all cottage gardens. It is a native of the hills of Spain, and of the s. and w. of Ireland.

SAXO-GRAMMATICUS (i.e., Saxo the "grammarian" or "scholar"), the most celebrated of the early Danish chroniclers, flourished in the 12th c., and was secretary to archbishop Absalom. He is said to have died at Koeskilde in 1204. Saxo-Grammaticus undoubtedly formed his style on that of the later Roman historians, particularly Valerius Maximus, yet in his whole mode of representation he belongs to the school of mediæval chroniclers, although ranking first in that school. Erasmus half wondered at his elegance. Moreover, it adds mightily to our respect for Saxo-Grammaticus that, although a cleric, he did not in the very least degree allow himself to be swayed in his historical conceptions by the prejudices incident to his profession. His work is entitled *Historia Danica*, and consists of 16 books. The earlier portions are of course not very critical, but in regard to times near his own, Saxo-Grammaticus is a most invaluable authority. According to his own statement, he derived his knowledge of the remoter period of Danish history—the "heroic age" of the N.—from old songs, runic inscriptions, and the historical notices and traditions of the Icelanders; but he is not sharply critical in his treatment of the Danish sagas, although a rudimentary critical tendency is occasionally visible. The best edition of the *Historia Danica* is that undertaken by P. E. Müller, and finished by J. M. Velschov (Copen. 1839). It is furnished with a

complete critical apparatus. There are good translations from the original Latin into Danish.

SAXON ARCHITECTURE, the style of building used in England before the introduction of the Norman architecture at the conquest. There are few specimens remaining which can be depended upon as genuine. The Saxons built chiefly in wood, and all their wooden edifices are now lost. It seems probable that a rude and simple style, not unlike early Norman, was that used by the Saxons. There are several buildings in England which Mr. Rickman considers entitled to rank as Saxon. Amongst these, the tower of earl's Barton, Northamptonshire, is one of the best examples. The peculiar "long and short" work of the quoins, the projecting fillets running up the face of the walls, and interlacing like wood-work, and the baluster-like shafts between the openings of the upper windows, are all characteristic of the style.

SAXON LAND. See TRANSYLVANIA.

SAXON STATES, MINOR. The capitulation of Wittenberg, which followed the rout of Mühlberg (see SAXONY), and deprived John Frederick the magnanimous of the electorate of Saxony, at the same time despoiled him of a large portion of the hereditary possessions of the Ernestine branch. The remainder, amounting—after the acquisition of Coburg, Altenburg, Eisenberg, etc., in 1554—to little more than one-fifth of the whole Saxon territory, was divided into two portions, *Saxe-Gotha* and *Saxe-Weimar*, the former falling to John Frederick II., and the latter to John William, the two sons of the deposed elector. Each of these portions was afterward subdivided, the former into *Saxe-Coburg* and *Saxe-Eisenach*, and the latter (1573) into *Saxe-Weimar* and *Saxe-Altenburg*. It would only bewilder the reader to attempt to follow the endless subdivisions and reunions that followed. Suffice it to say that the gradual adoption of the law of primogeniture during the 18th c., and the extinction of various cadet branches, has left the four states of Saxe-Altenburg, Saxe-Coburg-Gotha, Saxe-Meiningen, and Saxe-Weimar-Eisenach, as described under their several names. Should the Albertine or Saxon-royal line become extinct, the duke of Weimar succeeds to the throne; and failing his family, the lines of Saxe-Meiningen, Saxe-Altenburg, and Saxe-Coburg-Gotha obtain in this order the right of succession.

SAXON SWITZERLAND. See SAXONY.

SAXONS (Lat. *Saxones*, Ger. *Sachsen*), a German people, whose name is usually derived from an old German word *saks*, meaning a "knife," are first mentioned by Ptolemy, who makes them inhabit a district s. of the Cimbric peninsula. Toward the end of the 3d c., a "Saxon league" or "Confederation" makes its appearance in north-western Germany, to which belonged, besides Saxons proper, the Cherusci, the Angrivarii, and the largest part of Chauvi. In the times of the emperors Julian and Valentinian, Saxons and Franks invaded the Roman territory; but their piratical descents on the coasts of Britain and Gaul are far more famous. At what period these commenced, it is impossible to tell, but it is believed to have been much earlier than is commonly supposed. Recent investigations seem to prove that Saxons had established themselves in England long before the time of the mythical Hengist and Horsa (see ANGLO-SAXONS); and we know that as early as 287 A.D., Carausius, a Belgic admiral in the Roman service, made himself "Augustus" in Britain by their help. They had firmly rooted themselves, at the beginning of the 5th c., in the present Normandy, where a tract of land was named after them, the *Limbs Saxonicus*. They fought against Attila (q.v.) in the Catalaunian plain, 451 A.D. They also obtained a footing at the mouth of the Loire; but all the Saxons who settled in France "disappeared" before the Franks, i.e., were probably incorporated with their more powerful kinsmen of southern Germany. At home, the Saxons (called *Alt Sachsen*, or "Old Saxons," to distinguish them from the emigrant hordes who found their way to England and France) enlarged, by conquest, their territory n. and n.w. as far as the North Sea, the Yssel, and the Rhine; s., as far as the Sieg, and nearly to the Eder; eastward, to the Weser and Werra, the southern Harz, the Elbe, and the Lower Saale. Along with the Franks, they destroyed the kingdom of the Thuringians in 531, and obtained possession of the land between the Harz and the Unstrut; but this district was in turn forced to acknowledge the Frankish sovereignty. From 719, wars between the Saxons and the Franks became constant; but the latter, after 722, were generally successful, in spite of the vigorous resistance offered by Wittekind; and 804, the Saxons were finally subjugated by the arms of Charlemagne. Wittekind was the last Saxon king, and the first Saxon duke of the German empire. A collection of the old national laws and usages of the Saxons, under the title of *Lex Saxonum*, was made during the reign of Charlemagne.

During 1830-40, A. Schmeller published (from two manuscripts, one preserved at Munich, and the other in the British museum) an "Old Saxon" poem of the 9th c., called *Heliand*, i.e., the "Healer," or "Saviour," which narrates in alliterative verse the "History of Christ" according to the gospels, whence it is also called the "Old Saxon Gospel Harmony." It is probably a part of a more comprehensive work, embracing a poetical treatment of the history of the Old and New Testament, which Ludvig the pious intrusted to some celebrated Saxon singer. This unknown poet lived, as his language leads us to conjecture, somewhere between Münster, Essen, and Kleve. His work is

not only the almost sole monument of the old Saxon tongue left us, but is also of high poetical value, through its warmth of feeling, and the strength and splendor of its diction—worthy, indeed, to take its place alongside the contemporary Anglo-Saxon and old Norse poetry.—See Vilmar's *Deutsche Alterthümer im Heliand* (Marb. 1845).

SAXONY (Ger. *Sachsen*), KINGDOM OF, the second in importance and population of the minor German states, though inferior to three of them in extent, is bounded on the n. and n.e. by Prussia, s.e. and s. by Austria, and w. by Bavaria, Thuringia (q.v.), and Prussia. It is divided, for administrative purposes, into the following circles:

	English Sq. Miles.	Pop. in 1875.
Dresden.....	1680	749,503
Leipsic.....	1370	639,731
Zwickau.....	1790	1,031,905
Bautzen.....	950	339,203
Total.....	5,790	2,760,342

The kingdom is somewhat of the form of a right-angled triangle, with the right angle in the n.w., and the longer side lying along the foot of the Erz-gebirge range, which sends its spurs northward over the southern half of the country, giving to that portion a somewhat mountainous character, while the northern half remains a flat or undulating plain. The whole country, with the exception of a small portion in the extreme e., which belongs to the Oder basin, and is watered by the Neisse, is drained by the Elbe (which is wholly navigable in Saxony) and its tributaries the Mulde, the Weisseritz, Trubsch, Mulde, and White Elster, on the w., and the Wesnitz, Black Elster, and Spree on the east. From the point where the Elbe bursts through the Erz-gebirge chain to within about 8 m. of Dresden, it traverses a district rich in picturesque scenery, to which the somewhat inappropriate name of *Saxon Switzerland* has been given. This district, which averages about 24 m. long by 23 broad, is an elevated plateau of coarse crumbling sandstone (much resembling the English green-sand); and though destitute of the perpetually snow-clad mountains, glaciers, serrated ridges, and escarped peaks which give a character of lofty grandeur to its namesake, it can boast of features equally peculiar and strikingly romantic. From the soft nature of the rock, it has yielded freely to the action of the mountain rills, which rise from the hills on its e. and w. borders, and converge to the Elbe, and is cut up in all directions by deep narrow gorges (so symmetrical in their formation as to resemble artificial lanes), the constantly deepening beds of these mountain torrents, which here form cascades, there sullenly glide through deep vales bordered by rocks of the most fantastic forms, or by steep rugged slopes thickly clad with trees. High above the level of the plateau rise towering rocks, some of them pyramidal or conical, others pillar-like, while a few taper almost to a point, and then bulge out at the top; all clearly testifying to the agency by which they have been produced. The mediæval knights took advantage of these curious results of nature's so-called freaks, to erect castles upon the summits of some of them; several of these castles still exist, and one of them, Königsstein, is almost the only virgin fortress in Europe. The most remarkable of these peaks are Königsstein (864 ft.), Lilienstein (1254 ft.), the Bastei (600 ft.), Nonnenstein, Jungfernsprung, and seven others, each of which possesses its group of traditionary gnomes and kobolds. The lakes of Saxony are unimportant, and the only canals are those constructed between the mines and ore mills.

Climate, Soil, Products, &c.—The climate is healthy, and on the whole temperate, though occasionally severe in the south-western districts. Of the whole surface, more than one-half is arable, nearly one-third is in forest, about one-ninth in meadow, while the rest is occupied by gardens and vineyards, coarse pasture and waste land, or quarries and mines. The arable land has long been in a high state of cultivation, as is the case with the whole of Upper Saxony (see *History*), yet notwithstanding this, and its extreme fertility, the produce is hardly sufficient to supply the wants of the dense population (441 to the English sq. mile). The agricultural products consist of the usual cereals and leguminous plants, with rape, buckwheat, hops, flax, and potatoes, and all kinds of fruits suited to the climate. The forests, the largest of which are in the Voigtland (the s.w. corner of Zwickau), and along the northern slopes of the Erz-gebirge, supply timber of excellent quality, and in such abundance as to render them one of the great sources of wealth and industry. The rearing of cattle is an important employment in the mountainous districts of the s.w. Sheep, for which Saxony was formerly so famous, have been less generally attended to of late years, though, from the introduction of merinos, and increased care in breeding and rearing, the quality of the wool has much improved, and at the present day it occupies a high position in the markets of the world. Minerals are another great source of national wealth, the ore being both rich and abundant, and the processes of excavation and smelting in a high state of perfection. Most of the mines belong to the crown: they are situated in Zwickau and Dresden, and mostly on or near the northern slope of the Erz-gebirge. The mineral wealth includes silver, tin, iron, cobalt, bismuth, zinc, lead, nickel, arsenic, antimony, and other metals, besides coal, marble, porcelain-earth, vitriol, and various gems. In 1870 there were in opera-

tion 548 mines; 10,045 men were employed in the iron-mines, and 18,377 in coal-mines. The products raised in that year had a value of 12,929,360 thalers (£1,939,404).

Manufactures, Commerce, etc.—Manufacturing industry has also been greatly developed, and several branches have been carried to a high degree of perfection. This species of labor employs nearly three-fifths of the whole population. The oldest manufacture is that of linen, which at present employs more than 16,000 looms; but it is now eclipsed by the cotton-spinning and weaving, which is the most important branch of Saxon industry, has its chief seats at Chemnitz, Frankenberg, Zschoppau, Folkland, and Lausitz, and gives work to upward of 150 spinning-mills. The woollen manufactures are also extensive. Broadcloth, thread, merinos, silks, mixed silk, and woollen wares, etc., are also produced in considerable quantity, and of excellent quality; the muslin de kaines being still preferred by many to those of England and France, while the laces and embroideries preserve their ancient well-won reputation. Saxon pottery and porcelain have long been famous. The chief centers of manufacturing industry are in Bautzen and in the mountainous country to the n. of the Erz-gebirge. Owing to this extension of manufacturing industry, combined with a deficiency in the supply of home-grown articles of consumption, an extensive foreign commerce is rendered necessary, and this is chiefly carried on through the medium of the great fairs of Leipsic (q.v.). The chief imports are corn, wine, salt (not found in Saxony, though common enough in Prussian Saxony), cotton, silk, flax, hemp, wool, coffee, tea, etc. The country is well provided with roads, railways, and lines of telegraph.

Government, Religion, Education, Revenue, etc.—The government of this very interesting country—the reading of the history of which leaves on one's mind a firm sense of both past ages and present activity—is a limited monarchy, hereditary in the Albertine line, and is carried on according to the constitution of Sept. 4, 1831, modified by changes in 1849, 1851, 1860, 1861, 1868, and 1874. By the electoral law passed in the year 1868, the first of the two chambers which constitute the legislature consists of the princes of the royal family, certain nobles, representatives of the Lutheran and Roman Catholic churches, the chief proprietors, representatives of the universities, and the burgomasters of the eight principal towns. The second chamber comprises 35 deputies from the towns, and 45 from the rural communes. The supreme administration is managed by six ministers (of justice, finance, the interior, war, religion and education, and foreign affairs). The established religion is the Lutheran, though the reigning family, since the time of Fr. Augustus I., have been Roman Catholic. The church department must, so long as the reigning family remains Catholic, be administered by a member of the established church. In 1871 there were 2,484,075 Lutherans; 9,347 Reformed; 53,642 Roman Catholics. The population of Saxony is by no means purely German; in 1875 there still were upward of 50,000 who spoke Wendish. Saxony has upward of 2,000 elementary schools, 11 gymnasia, and 12 *real-schulen*; the university is at Leipsic. The budget for 1876-77 showed receipts to the amount of 53,856,977 marks; the expenditure was a little less. The public debt at the beginning of 1877 amounted to 404,882,925 marks (of which a large proportion was incurred for railways). The Saxon troops form the twelfth *corps d'armée* of the German empire. Saxony has a war ministry of its own; but after the war of 1866 Saxony paid the penalty of her opposition to Prussia by being compelled to make over to the king of Prussia the supreme military command of the Saxon army, the right to garrison the fortress of Königstein, the management of the postal, railway, and telegraphic systems, and the charge of the diplomatic representation of Saxony abroad. As a member of the German empire, Saxony has four voices in the federal council, and has a right to send 23 deputies to the diet.

History of the Great Duchy of Lower Saxony, and of the Ascanian Electorate of Upper Saxony.—After the final conquest of the Saxons by Charlemagne they became one of the components of the German empire; but their country by no means corresponded to what is now known as Saxony. It included the most of the country between the Elbe, the Harz mountains, the Rhine, and Friesland; and, in 850, was erected into a dukedom, with Lubeck for its capital, and ruled by hereditary princes. Ludolf, the first duke, is said to have been the great grandson of Wittekind, but nothing is certainly known of his ancestry. His second son, Otho the illustrious (880-912), was the most distinguished of the German princes; he fought valiantly against the Normans, and, on the extinction of the Carolingian dynasty (911), refused the crown of Germany which was unanimously offered him by the electors. His son duke Henry (912-936), surnamed "the Fowler," obtained the throne (919), and commenced the Saxon line of German sovereigns, which was continued by Otho I. (q.v.), Otho II. (q.v.), Otho III. (q.v.), and Henry II., and ended in 1024. Otho I. handed over the great duchy of Saxony to Hermann Billung in 960, on condition of military service; and this family held it till 1106. Under the Billung dynasty the prosperity of the country greatly increased, and Meissen, Thuringia, East Saxony in Lusatia, Saxony in the Northern Mark, Anhalt, Saltzwedel, and Slesvig were all dependent on the Saxon duke. A portion of Saxony had, however, been reserved by the emperor, Otho I., for his nephew Bruno, who founded a lordship of Saxony-Brunswick; and, in the middle of the 11th c., a duchy of "Saxony on the Weser" was also founded; but both of these (united by marriage in 1090 or 1096) came (1113) by marriage to count Lothar of Supplinburg, who was also invested (1106) with the great

duchy of Saxony, which was now more extensive than ever, stretching from the Unstrut in Gotha, to the Eider, and from the Rhine to Pomerania. After Lothar's accession to the imperial throne in 1125, he handed over (1127) the duchy to his son-in-law, Henry the proud, the Guelphic duke of Bavaria, who was thus the ruler of more than half of Germany; but this overgrown dominion did not long exist, for under his son, Henry the lion (q.v.), it was wrested (1180) from the house of Guelph, Bavaria being given to the house of Wittelsbach; East Saxony created an electorate, and given to Bernhard of Ascania; Brunswick and Luneburg mostly restored to Henry's son; while the numerous and powerful bishops of Northern Germany divided among themselves Westphalia, Oldenburg, and many portions of Luneburg and Brunswick; Mecklenburg and Holstein became independent, and the Saxon palatinate in Thuringia went to the landgraf Ludwig. Saxony, now shorn of its former greatness, consisted chiefly of what is now Prussian Saxony, a few districts separated from Brandenburg, and Saxe-Lauenburg, the last being the only portion of the great duchy of Saxony, or *Lower Saxony*, as it is called, which retained the name. Wittenberg was the capital of the new duchy. Saxony was diminished in 1211 by the separation of Anhalt as a separate principality; and in 1260 it was permanently divided into two portions, *Saxe-Lauenburg* and *Saxe-Wittenberg*, to the latter of which the electoral dignity remained, and to which, on subsequent dispute between the two branches, it was confirmed by the celebrated golden bull (1356). The Ascanian line became extinct in 1422 with duke Albert III., and the duchy then passed to Frederick the warlike, markgraf of Misnia, and landgraf of Thuringia, who was invested with it by the emperor Sigismund in 1423. His possessions consisted of Thuringia, the present kingdom of Saxony, Prussian Saxony, in fact the whole of *Upper Saxony*, with the exception of Anhalt.

History of the country now known as Saxony.—The earliest inhabitants of upper Saxony, since the Christian era, were the Hermuduri (see THURINGIA), and on the destruction of the great Thuringian kingdom in the beginning of the 6th c., their settlements were taken possession of by the Sorbs, a Slavic race, who practiced agriculture and cattle-breeding. The Carlovingian rulers, dissatisfied with the ingress of those non-German tribes, erected "marks" to bar their progress; and duke Otho the illustrious of Saxony, and his celebrated son, Henry the Fowler, warred against them, the latter—subduing the Heveller, the Daleminzer, and the Miltzer—founded in their country the marks of Brandenburg (q.v.), Misnia (Meissen), and Lusatia (Lausitz), and planted colonies of Germans among the Sorbs. In 1090 the mark was bestowed on the house of Wettin (a supposed off-shoot of the race of Wittekind), and was confirmed as a hereditary possession to that family in 1127; and the markgraf, Henry the illustrious (1221–88), whose mother was heiress to the landgrafdom of Thuringia, with its appendages, combined the whole into a powerful state. Business, commerce, and mining industry now flourished; great roads for commercial purposes were constructed throughout the country, and the Leipzig fairs were established; and, in spite of much internal discord, and frequent partitions of Saxony, its prosperity increased. At last FREDERICK THE WARLIKE (1381–1428) succeeded in uniting the several portions of Saxony, to which were added, by purchase and marriage, various districts in Franconia; and in 1423 the electorate of Saxony (see above). The Saxon elector was now one of the most powerful princes of Germany; but unfortunately the fatal practice of subdividing the father's territories among his sons still continued, and during the reign of the elector FREDERICK THE MILD (1428–64), whose brother William had obtained Thuringia, a civil war broke out, and was carried on for years. ERNEST (1464–86) and ALBERT (1464–1500), the sons of Frederick, in accordance with the will of their father, reigned conjointly over the hereditary domains of the family (the duchy of Saxony with the electoral dignity, being reserved always to the eldest) till the death of their uncle (1485), when Ernest obtained Thuringia, and Albert, Meissen, while Osterland was equally divided between them. Ernest, the founder of the *Ernestine*, which was also the *elder* or *electoral line*, was succeeded by his son, FREDERICK THE WISE (1486–1525), who favored the reformation, and firmly supported and protected Luther against the overwhelming power of the Catholic party, which he was enabled to do, from his personal influence with the emperors Maximilian and Charles V. His brother and successor, JOHN THE CONSTANT (1525–32), was still more a partisan of the new doctrines, as was also his son and successor, JOHN FREDERICK THE MAGNANIMOUS (1532–47); but the latter, by the defeat of Muhlberg (q.v.) (see SCHMALKALD), was forced to resign both his electoral dignity and his states. Albert, the founder of the *younger*, *dual*, or *Albertine line*, was succeeded by his sons, George the bearded (q.v.) (1500–39), a rabid Catholic, and HENRY THE PIOUS (1539–41), a no less zealous Protestant; after whom came the celebrated MAURICE (1541–47) who was a professed Protestant, but joined the Catholic party against the league of Schmalkald, obliged the Protestant army to retreat from the Danube, and took possession of the estates of the elector John Frederick, who, however, speedily drove him out, and took possession of dual Saxony in his turn. After the rout of the Protestants at Muhlberg, Maurice received the electoral title (1547–53), and the greater portion of the estates of his vanquished cousin. But the arbitrary political measures and religious severities which were either instituted or promoted by the emperor, induced Maurice to join the Protestants, and, by a sudden march on Innspruck, he forced the emperor to agree to the peace of Passau. New tyrannical measures of the emperor

caused him to look to an alliance with France, but the scheme was frustrated by his death, July 11, 1553, near Sievershausen, where two days before he had totally defeated the markgraf Albert of Kulmbach, a secret agent of the emperor's. His brother, August I. (q.v.) (1553-86), the first economist of the age, has left a memory dear to Saxony, from the numerous excellent institutions which he established; he considerably increased his territories by purchase and otherwise, and restored Altenburg to the Ernestine line. CHRISTIAN I. (1586-91), a weak prince, surrendered the reins of government to his chancellor, Crell, who was sacrificed, in the succeeding reign of CHRISTIAN II. (1591-1611), to the revenge of the offended nobility. Christian II. weakly neglected to assert his claims to Juliers, on the death of its last duke, and allowed it to become a prey to Brandenburg and the palatine house of Neuberg; but his brother, JOHN GEORGE I. (1611-56), in revenge for this spoliation, allied himself to Austria, and conquered upper and lower Lusatia and Silesia. Subsequently the good understanding between these powers was destroyed, and the elector allied himself with Gustavus Adolphus (1631), and took part in the thirty years' war. But on the death of Gustavus the elector separated from the Swedes, and made a separate peace (1635) with Austria, by which he obtained upper and lower Lusatia, acquisitions confirmed by the general treaty of Westphalia (1648). This was the period of the electorate's greatest power. His sons, JOHN GEORGE II. (1656-80), August, Christian, and Maurice, divided the estates, the three latter founding cadet lines, all of which became extinct before 1750. The reigns of his successors, JOHN GEORGE III. (1680-91) and JOHN GEORGE IV. (1691-94), are unimportant, but that of Frederick August I. (q.v.) (1694-1733) well-nigh ruined the hitherto prosperous electorate. Frederick August had been chosen king of Poland; and his attempt, in company with the czar and the king of Denmark, to dismember Sweden brought down upon him and his two states the vengeance of the northern, "fire-king." Poland was utterly devastated, and Saxony exhausted of money and troops. Besides, the king's habits were most extravagant, and to maintain his lavish magnificence, he was forced to sell many important portions of territory. Frederick August II. (q.v.) (1733-63), also king of Poland, took part in the war of the Austrian succession (q.v.) against Maria Theresa, but finding the treaty of Berlin (1742) not so satisfactory for himself as he expected, he joined the empress in 1745. The country was atrociously ravaged during the seven years' war (q.v.), and a long time elapsed before it recovered its previous peaceful and prosperous state. FREDERICK CHRISTIAN (1763-63) and FREDERICK AUGUST I. (1763-1827), labored zealously for the good of their subjects; and under the reign of the latter, agriculture, manufacturing, and industrial enterprise progressed with rapid strides. In spite of his love for peace the elector was led into the quarrel respecting the Bavarian succession (q.v.); but he refused the crown of Poland in 1791, and declined to take part in the convention of Pilnitz, though he joined the Prussian confederation of German princes, and had an army of 22,000 Saxons at the battle of Jena. But the pressure of the French compelled him to join the confederation of the Rhine in 1806, and from this time his army fought side by side with the French. He obtained the union to Saxony of the duchy of Warsaw (see POLAND); but fearing that the disasters of the French, in 1812, would be fatal to their supremacy, and to the interest of Saxony, he withdrew to Bavaria, and thence to Prague, renounced the duchy of Warsaw, and made every attempt to come to amicable terms with the allies. But he was again compelled to join the French, between the battle of Lutzen (May 2, 1813) and that of Leipsic (Oct. 16-19, 1813), after which he became the prisoner of the allies, and his army was joined to theirs. For his support of Napoleon he was deprived of the greater portion of Saxony, which was handed over to Prussia, but he retained the title of king, which had been conferred upon him in 1806. The rest of his reign was occupied with internal reforms. ANTONY (1827-36) reformed the entire legislation of the country, and granted a liberal constitution, being urged thereto by a popular outbreak in the autumn of 1831. The constitution was proclaimed Sept. 4, 1831, and the state's representatives first assembled, Jan. 27, 1833. FREDERICK AUGUST II. (1836-54), his nephew, who had been regent for several years, now succeeded, and though favorable to constitutionalism, he was unable to obtain the smooth and harmonious working of the new system. In 1842 violent contests commenced, accompanied by occasional riots in the principal towns, on the subject of the liberty of the press, and the publicity of legal proceedings. Sometimes the constitutionalists, and sometimes their opponents, gained the supremacy, and for a long time the efforts of the two parties counteracted each other. Toward the close of the king's reign he was a mere tool in the hands of the reactionary party, headed by his brother JOHN, who succeeded in 1854. John, however, supported constitutionalism, and established courts of justice throughout the kingdom. For the hostile attitude assumed by Saxony toward Prussia before 1866, and its subsequent history, see GERMANY.

SAXONY, PRUSSIAN, the most westerly, undetached province of Prussia, bounded on the e. and n.e. by the province of Brandenburg. Area, 9,730 sq. m.; pop. '75, 2,168,988. The w. districts are occupied by the Harz mountains, and the peak of the Brocken (3,738 ft. high) is the chief elevation. The greater portion of the surface, however, is level, and slopes toward the n., in which direction flow the principal rivers—the Elbe, with its tributaries, the Saale and Mulde. The climate is mild and healthy, and the soil is exceedingly fertile and well cultivated. More than the half of the area is under crop,

and nearly $\frac{2}{3}$ are uncultivated, and in water and wood. The *Goldene Aue*, in the s.w., is especially famous for its abundant fertility. Manufacturing industry is most actively carried on, and there are spinning, weaving, and oil-mills in great numbers. The capital is Magdeburg (q.v.). The larger portion of Prussian Saxony (7,911 sq.m.) was detached from the kingdom of Saxony, and ceded to Prussia, by decree of the congress of Vienna, 1815. See SAXONY.

SAXTON, JOSEPH, 1799-1873; b. Penn.; received a common-school education; in his youth made improvements in machinery for nail factories; went to Philadelphia 1817; invented there a machine for cutting the teeth of chronometer wheels, and an escapement with compensating pendulum, and constructed a clock for the steeple of Independence hall, which remained a long time in use; resided 9 years in London, where he became intimate with Faraday; was chosen principal assistant in the Adelaide gallery of science, and made several valuable mechanical contrivances. Having returned to Philadelphia, he superintended the making of machinery for the U. S. mint, and afterward had charge of the construction of standard weights and measures, accurate sets of which he furnished for the state capitals and the custom-houses. He received several gold medals for his skillful inventions. Among his ingenious contrivances may be mentioned the mirror comparator for comparing standard measures, and the tracing machine for dividing them; the deep-sea thermometer, used by the U. S. coast survey in exploring the Gulf stream; the self-registering tide gauge; and the immersed hydrometer.

SAXTON, Rufus, b. Deerfield, Mass., 1824; graduate of West Point 1849. In 1853-54 he was placed at the head of a surveying expedition which crossed the Rocky mountains. In 1855-59 he proceeded to the coast, and invented a self-registering thermometer for deep-sea sounding, which bears his name. In 1859 he was instructor at West Point. During the war of the rebellion he was quartermaster, with rank of capt.; was with capt. Lyon at St. Louis, with McClellan in West Virginia, and Sherman at Port Royal; made brig.gen. of volunteers 1862. In 1862-65 he was military governor of the department of the south; brevet brig.gen. U. S. army 1865.

SAY, JEAN BAPTISTE, an eminent French economist, was b. at Lyon, Jan. 5, 1767. Being destined by his father for a commercial career, he passed a part of his youth in England; and on his return to France, obtained a situation in a life insurance company, about which time he made his first acquaintance with the works of Adam Smith. During the revolution, he was for some time secretary to Clavière, the minister of finance; and from 1794 to 1800 edited a journal called *La Décade*, in which he expounded with great effect the views of Smith. Already Say had acquired a distinguished reputation as a thinker by his *Traité d'Economie Politique, ou Simple Exposé de la Manière dont se forment, se distribuent et se consomment les Richesses* (Paris, 1803), and other works. Called to the tribunate in Nov., 1799, was not slow to express his disapprobation of the arbitrary tendencies of the new consular government, and in 1804 he ceased to be a member of a body that had become a mere tool in the hands of Bonaparte. Under the despotism of the empire, Say was forced into private life, and betook himself to industrial pursuits, establishing (along with his son) at Auchy a large spinning-mill, which soon employed not less than 500 workmen; and when Bonaparte fell, Say found himself at the head of the economical and commercial movement that marked the epoch. In 1814 the second edition of his now celebrated *Traité* appeared, dedicated to the emperor Alexander, who had long called himself his "pupil;" and in the same year the French government sent him to England to study the economical condition of that country. In 1819 a new chair, that of *Economie Industrielle*, was created for him at the *Conservatoire des Arts et Métiers*; and Say added both to his influence and his popularity by the lucidity, grace, and intensity of conviction displayed in his lectures. In 1831 he was appointed professor of political economy at the *Collège de France*, but died Nov. 15, 1832. Although strictly a follower of Adam Smith, Say is an independent, sagacious, and penetrative thinker. Ricardo speaks of his works as containing "several accurate, original, and profound discussions." He was the first to teach Frenchmen to consider rationally such questions as customs-duties, the currency, public credit, the colonies, and taxation; and though the brilliant socialistic theorizers say that he is not an *économiste spiritualiste*, many will consider that defect a merit. Besides his *chef d'œuvre* already mentioned, Say wrote (among other works) *De l'Angleterre et des Anglais* (Par. 1812), *Catéchisme d'Economie Politique* (Par. 1815), *Lettres à Malthus* (Par. 1820), *Cours Complet d'Economie Politique* (Par. 1828-1830), and *Mélanges et Correspondance* (Par. 1833). His principal writings form vols. 9 to 12 in Guillaumin's *Collection des Economistes*.

SAY, THOMAS, 1787-1834; b. Philadelphia; in his youth engaged in trade, but meeting with no success, began the study of natural history and was a contributor to the journal of the Philadelphia academy of natural science, of which he was one of the founders. From 1818 to 1825 he was engaged in several scientific exploring expeditions, one being that of Long (q.v.), to the Rocky mountains. In 1825 he settled at New Harmony, Ind., and there spent the rest of his life. He made many discoveries in zoology and conchology, and especially in entomology. His principal works were *American Entomology*, and *American Conchology*.

SAYBROOK, a t. in s. Connecticut, at the s. terminus of the Connecticut Valley railroad, and on the Shore line, a division of the New York and New Haven and Hartford railroad; in Old Saybrook township; pop. '80 (of the township), 1303. It is 32 m. e. of New Haven on the n. shore of Long Island sound, at the mouth of the Connecticut river. It is the seat of Seabury institute, and was the first location of Yale college. It was the scene of the meeting of the representatives of Congregational churches which framed the Saybrook platform. It is much visited in summer, being a charming retreat for city residents. It has a manufactory of edged tools.

SAYRE, LEWIS AUSTEN, b. New Jersey 1820; graduated at Transylvania university in 1837; studied medicine with Dr. David Green in N. Y. city; graduated at the college of Physicians and Surgeons in 1842; became prosecutor to Dr. Willard Parker, the professor of surgery in that college, and in 1859-60 professor of orthopedic surgery in Bellevue hospital medical college. He is the author of several papers on orthopedic, or reparative surgery.

SAYRE, STEPHEN, 1734-1818; b. Long Island; educated at the college of New Jersey. He was a prosperous banker in London, of which he was elected sheriff. He enjoyed the confidence of the earl of Chatham; and his known zeal for the cause of the American colonies caused his imprisonment in the Tower on a charge of high treason, advantage being taken of an unguarded expression. He was released, but was financially ruined. He was for some time private secretary to Franklin, who employed him on several missions, as did Arthur Lee.

SCAB, in sheep, like itch in man, or mange in horses or dogs, depends upon the irritation of a minute acarus, which burrows in the skin, especially if dirty and scurfy, causing much itching, roughness, and baldness. The parasite readily adheres to hurdles, trees, or other objects against which the affected sheep happen to rub themselves, and hence is apt to be transferred to the skins of sound sheep. Chief among the approved remedies are diluted mercurial ointments, tobacco-water, turpentine and oil, and arsenical solutions, such as are used for sheep-dipping. One of the best and simplest applications consists of a pound each of common salt and coarse tobacco, boiled for half an hour, in about a gallon of water; to this are added 2 drams of corrosive sublimate; and the mixture diluted until it measures three gallons. For each sheep, a pint of this mixture should be carefully applied, from a narrow-necked bottle, along the back, and to any other scurfy itchy parts. A second dressing, after an interval of a week, will generally effect a perfect cure.

SCABBARD is the sheath for a sword or bayonet, at once to render the weapon harmless and to protect it from damp. It is usually made of black leather, tipped, mouthed, and ringed with metal; but the British cavalry wear scabbards of steel. These better sustain the friction against the horse's accouterments, but are objectionable from their noisiness, and the consequent impossibility of surprising an enemy. The sword-scabbard is suspended to the belt by two rings; the bayonet-scabbard hooks into a frog in connection with the waist-belt.

SCABBARD FISH, *Lepidopus argyreus*, an acanthopterous fish, belonging to the family *trichiuride*, and nearly allied to the mackerels. The members of the genus *lepidopus* are tenioid fishes with elongated snouts, projecting under jaws, and strong, sharp, cutting teeth. The ventral fins are reduced to small scaly plates, but there is a well formed forked tail. The *L. argyreus*, or scabbard fish, is of a bright silver color, attaining a length of 6 ft., and is one of the rarest of British fishes. See *TRICHIURIDÆ*.

SCABELLUM, a kind of pedestal to support busts.

SCABIES. See *ITCH*.

SCABIOUS (*Scabiosa*), an extensive genus of herbaceous plants, exclusively natives of the eastern hemisphere, of the natural order *dipsacaceæ*. See *TEASEL*. The flowers are collected in terminal heads, surrounded by a many-leaved involucre, so as to resemble those of the order *compositæ*. The *DEVIL'S BIT SCABIOUS* (*S. succisa*) is a very common autumnal flower in British pastures. The plant possesses great astringency, but no important medicinal virtues, although it was formerly supposed to be of great efficacy in all scaly eruptions, and hence the name scabious, from Latin *scabies*, leprosy. The end of the root appears as if abruptly bitten off, and the superstition of the middle ages regarded it as bitten off by the devil, out of envy, because of its usefulness to mankind! The *SWEET SCABIOUS* (*S. atropurpurea*) is a well known fragrant garden flower. It is supposed to be a native of India.

SCAD, *Caranx trachurus*, or *trachotrus vulgaris*, a fish of the family *scomberidæ*, sometimes called the *horse mackerel*, because of its resemblance to the mackerel, and its comparative coarseness. It is from 12 to 16 in. long, of a dusky olive color, changing to a resplendent green, waved with a bluish gloss, the head and lower parts silvery, the throat black. There are two small free spines in front of the anal fin. The species of *caranx* are very numerous, and it is sometimes divided into several genera; but the scad is the only one found on the British coasts. It is common on the south-western coasts of England, but comparatively rare to the north. It sometimes appears in immense shoals, pursuing the fry of herring or similar prey, and the multitudes have sometimes been so great and so crowded together, that they could be lifted out of the sea by buckets, and overloaded

nets have been torn to pieces. The scad has something of the mackerel flavor. Although not much cared for when fresh, it is often salted, and in that state is esteemed as an article of food.

SCA'FELL, a double-peaked mountain in Cumberland, on the Westmoreland border, 13 m. s.s.w. of Keswick, is a chief feature in the scenery of the lake country, in the heart and center of which it stands. Of its two peaks, the higher is 3,229 ft., the other 3,092 ft. in height.

SCAGLIOLA, a composition made to imitate the most costly kinds of marble, and other ornamental stones; and so successfully is it done, that it is often difficult to distinguish between the artificial and the real stone. It consists of finely ground plaster of Paris mixed with a thin solution of fine glue, and colored with any of the earthy colors, such as ochers, umber, Sienna earth, Armenian bole, and sometimes chemical colors, such as the chrome yellows, etc. This is spread over the surface intended to represent marble; and while still soft, pieces of fibrous gypsum, marble, alabaster, and other soft but ornamental stones, are pressed into it, and made level with the surface. When the composition is set hard, it is rubbed down, and polished with the ordinary stone-polishing materials, which give it a very fine gloss. This kind of work is only adapted for interiors, because scagliola will not bear exposure to damp for any length of time; but its lightness, and the extreme ease with which it may be applied to walls, pillars, pilasters, and even cornices, render it very useful for the decoration of the better class of dwellings and public buildings.

SCALA, the name of an Italian family whose seat was Verona, of which place the Ghibelline MASTINO DELLA SCALA was elected *podestà* in 1260. After being in office five years he was made perpetual capt. of the city. Assassinated in 1273, he was succeeded by his son, Albert, who was soon made lord of Feltre, Vicenza, and Belluno. The greatest of the family was CAN FRANCESCO, or Can Grande, as he was called (1290-1329) the friend of Dante, and who filled his court with sculptors, poets, and painters. He was capt. of the alliance between Mantua, Verona, Este, and other cities; an ally of Henry of Luxembourg; and the head of the Ghibellines in Lombardy. His power extended over almost all the later Venetia, including Este, Cremona, Monfalcone, Padua, Feltre, Vicenza, and Treviso. His descendants ruled till 1387, when Verona came under the dominion of the Visconti.

SCALA NO VA, a sea-port of Asiatic Turkey, stands on an eminence at the head of a gulf of the same name, 40 m. s. of Smyrna. The ruins of the ancient city of Ephesus (q.v.) are in the vicinity. An important export trade is carried on. Pop. stated at 20,600. The gulf of Scala Nova, confined on the s. by the island of Samos, is 40 m. long and about 20 m. broad.

SCALD-HEAD (a corruption probably of *scalded head*) is the popular name of a fungous parasitic disease of the scalp (and occasionally of the face and other parts) known in medical phraseology as *favus*, *tinca favosa*, and *porrigo scutulata*. The primary seat of the parasite is in the lowest portion of the hair-follicles, outside the layer of epithelium which covers the root of the hair. The plant is, however, often found in cup-shaped depressions on the surface of the scalp, forming the yellow honeycomb-like masses which suggested the specific name *favus* (honeycomb) for the disease. The honeycomb crust continues to increase, preserving its circular form and depressed center, till it occasionally reaches a diameter of nearly half an inch. These crusts commonly appear in crops, and may be either distinct or confluent. "At a more advanced stage," says Dr. Aitken, "the epidermis disappears, and a viscid fluid is secreted in such abundance as to form one entire incrustation over the entire head; hence the *porrigo larvalis*—mask or vizor-like scald-head. The smell of the scab is peculiar, and has been compared to that of the urine of a cat, or of a cage in which mice have been kept. It is probably due to a species of alcoholic fermentation in connection with the vegetable growth." The scab sometimes resembles a lupine, or a minute shield, rather than the cell of the honeycomb, and hence the varieties of scald-head which have been described under the name of *porrigo lupinosa* and *porrigo scutulata*.

The great point to be aimed at in the treatment of this affection is to destroy the cryptogamic parasite, and to eradicate its germ. For this purpose the head should be shaved, and poultices then applied till the scabs are removed. Tar-ointment should then be applied, night and morning, the old ointment being washed off with soft soap and water before the fresh dose is laid on. Dr. Aitken states, that in the early stage of the disease, in place of the preceding treatment, it is sometimes sufficient to cut the hair close, and to wash the affected parts, night and morning, with oil of turpentine. If the disease does not yield to these applications, the same treatment as that recommended for RINGWORM must be tried.

SCALDS. See BURNS.

SCALE-ARMOR consisted of small plates of steel riveted together in a manner resembling the scales of a fish. From the small size of the plates, it possessed considerable pliability, and was therefore a favorite protection for the neck, in the form of a curtain hanging from the helmet. Scale-armor is now obsolete, except, perhaps, among some eastern potentates.

SCALE INSECT. See COCCUS.

SCALE, MUSICAL, a succession of notes arranged in the order of pitch, and comprising those sounds which may occur in a piece of music written in a given key. The ultimate criterion of what should constitute a musical scale is doubtless what gives most pleasure to a cultivated ear; but the sounds that please the ear are also found to be those that stand in certain simple mathematical relations to each other. Among the ancient Greeks, various different scales or *modes* were in use, of which six were generally enumerated—the Dorian, Phrygian, Lydian, Mixo-Lydian, Ionic, and Æolian. Excepting in the music of the Greek church and of the Ambrosian chant, modern musical feeling has rejected all of these but two, the Ionic and Æolian, the former of which is now known as the major, and the latter the minor mode. In both modes, the scale consists of a series of seven steps leading from a given note fixed on as the tonic or key-note to its octave, which may be extended indefinitely up or down, so long as the sounds continue to be musical.

Major Mode.

Minor Mode.

For an explanation of the principles on which these scales are founded, and of their derivation from the harmonic triad, see MUSIC. The major scale is derived from much simpler proportions than the minor. The minor scale requires to be modified by occasionally sharpening its sixth and seventh.

SCALES OF FISHES. They are divided by Agassiz, whose classification is generally adopted, into the *placoid*, *ganoid*, *ctenoid*, and *cycloid* forms. *Placoid* scales (from the Gr. *platē* a broad plate) lie side by side without overlapping or imbricating. They are often elevated at the center so as to form a strong projecting point. All the cartilaginous fishes, except the sturgeon, have placoid scales. *Ganoid* scales (from the Gr. *ganos*, splendor) are covered with a fine enamel, and generally of a rhomboidal form and imbricated. The sturgeon and the bony pike (*lepidosteus*) have scales of this nature, but the finest examples of these scales are found in fossil fishes. *Ctenoid* scales (from *kteis*, a comb) are generally of a rounded or oval form, with teeth or projections on their posterior margin. They are devoid of enamel, and present an imbricated arrangement. The perch and many osseous fishes possess these scales. *Cycloid* scales (from the Gr. *kyklos*, a circle) consist of concentric layers of horn or bone, without spinous margins, and not covered by enamel. They are soft and flexible, present a variety of linear markings on their upper surface, and usually exhibit an imbricated arrangement. The carp, herring, salmon, etc., possess these scales. In many cases, two kinds of scales occur in the same fish, while in other cases the different species of a single genus exhibit different kinds of scales.

For anatomical details regarding the structure and mode of development of scales, the reader is referred to prof. Huxley's article "Tegumentary Organs" in the *Cyclopædia of Anatomy and Physiology*, and to prof. Williamson's memoirs in the *Philosophical Transactions*, 1849-52. In their chemical composition, the scales of fishes approximate to the bones, except that they contain more organic matter. The brilliancy of tint exhibited by many fishes is due apparently to the phenomena of optical interference, rather than to the presence of coloring matter. Figures of ctenoid and ganoid scales are given in the articles CTENOID FISHES and GANOID FISHES.

SCALES OF NOTATION are the various "radicles" which determine, as explained under notation (q.v.), the form and digits of the number expressing any numerical quantity. Thus the number 289, in the decimal or common system whose radix is 10, signifies 9 units, 8 tens, and 2 hundreds, or $2 \times 10^2 + 8 \times 10 + 9$. To express the same number in the quinary scale, for instance, we must group the 289 units into multiples and powers of 5; an operation which may be performed in either of two ways, as follows:

$$\begin{array}{r} 5)289 \\ \underline{5)57-4} \\ 5)11-2-4 \\ \underline{2-2-4} \end{array}$$

$$\begin{array}{r} 289 \\ 10 \\ \hline 103 \text{ (taking in 8, and carrying} \\ 10 \text{ by 5)} \\ \hline 2134 \end{array}$$

$$\begin{array}{r} 2134 \text{ (quinary)} \\ 5 \\ \hline 11 \text{ (carrying by 10)} \\ 5 \\ \hline 57 \\ 5 \\ \hline 289 \end{array}$$

or 2124 (i.e., $2 \times 5^3 + 1 \times 5^2 + 2 \times 5 + 4$) in the quinary scale represents the same numerical quantity as 289 in the decimal scale. The following list shows the same

numerical quantity according to the scales having for their radices the first 11 numbers after unity, and will partly indicate the advantages and disadvantages of each scale:

In the binary	(radix 2) scale.....	100,100,001
" ternary (" 3) "	101,301
" quaternary (" 4) "	10,301
" quinary (" 5) "	2,124
" senary (" 6) "	1,301
" septenary (" 7) "	562
" octary (" 8) "	441
" nonary (" 9) "	351
" decimal (" 10) "	250
" undenary (" 11) "	243
" duodecimal (" 12) "	201

It will be observed that the binary scale possesses only two symbols, 0 and 1, the ternary has 3, while the undenary would require a symbol in addition to the 9 digits and zero to express 10, which is a digit in that scale, and the duodecimal scale two additional symbols for 10 and 11. A glance at the above table shows at once that if the binary scale had been in ordinary use, great facility in the "performance" of arithmetical operations would have been obtained at the cost of largely increasing their "extent," and that both the advantage and disadvantage diminish as we raise the scale. The selection of "ten" as the ordinary scale is very prevalent, and was evidently suggested by the number of fingers; but the scales of two, three, four, five, six, and twenty have at various times been made use of by a few nations or tribes. The scale of twelve has long been generally employed in business among northern European nations, as is instanced by such terms as "gross," signifying 12 times 12, and "double gross," denoting 12 times 12 times 12; and it has also been largely introduced into the standard measurements of quantity, as inches, pence, ounces, troy, etc., causing a considerable amount of complexity in calculation, as all abstract numerical calculation follows the decimal system. To remedy this acknowledged evil, it has been proposed to introduce the decimal system *in toto*, as has been done in France, Italy, Russia, etc., or else to do the same with the duodecimal system. Those who hold to the first proposal have the argument of conformity in their favor; those who support the latter do so on the ground that 12 has in proportion far more aliquot parts than 10 has, and that on this account the number of fractions, and the size of each numerator and denominator, would be diminished; while both parties can bring overpowering arguments against the continuance of the present method, or rather want of method. See DECIMAL SYSTEM.

SCALIGER, JULIUS CÆSAR, one of the most famous men of letters that have appeared since their revival, was born in 1484. In after-life he created for himself a noble pedigree, and made out that he was descended from the princely family of the Scalas of Verona, and that his birthplace was the castle of Riva, on the banks of the Lago di Garda. According to his own account, he was educated first under the famous Fra Giocundo; was afterward attached as a page to the emperor Maximilian, whom he attended for 17 years in peace and war; was next made a pensioner of the duke of Ferrara; thereafter studied at Bologna; commanded a troop of cavalry at Turin under the French viceroy; prosecuted his studies there in philology, philosophy, and medicine; and in 1525 went to Agen, in France, with the bishop of that diocese, a member of the Rovere family, to whose household he became physician. Tiraboschi's account, however, which is the more probable, represents him as having been born at Padua, the son of Benedict Bordon, who was a geographer and miniature-painter of that city, and who, either from the sign of his shop or the name of the street he lived in, assumed the surname Della Scala. Up to his 42d year, young Giulio Bordon resided chiefly in Venice or Padua, engaging in the study and practice of medicine, and appearing under his true name as an author. In 1525 he withdrew to Agen, either from some advantageous offer, or with a view to promote his fortune, and there fixed his abode. He became physician to the bishop of the diocese, and in that capacity sought in marriage Andietta de Roques-Lobejac, a young lady only 16 years of age, and of noble and rich parentage. An obstacle was thrown in the way of this alliance; and probably with the purpose of improving his position, and lessening the disparity in station between himself and the object of his affections, he procured, in 1528, letters of naturalization as a French subject, under the name of Jules-César de Lescalle de Bordonis. This was probably the occasion when he added Cæsar to his baptismal name of Julius. The marriage took place in 1529, and was both happy and fruitful. He died in 1558 leaving behind him a mass of publications on various subjects, and a reputation for extent and depth of learning, which, considering the ripe age at which he made the majority of his acquirements, redounds to the credit of his vigorous understanding and extraordinary memory. As a thinker, he was more independent than sound; and as a man, was of violently irritable temper and excessive vanity. His best known publications are—*Commentarii in Hippocratis Librum de Insomniis* (Commentaries on the Hippocratic Treatise on Dreams); *De Causis Lingue Latine Libr. XVIII.*, celebrated as the first considerable work written in the Latin language in modern times, and not without value even yet; his Latin translation of Aristotle's *History of Animals*; his *Exercitationum Exotericarum liber quintus decimus de Subtilitate ad Hieronym. Cardanum*; his seven books of *Poetics* (also in Latin, and on the whole his

best work); his *Commentaries on Aristotle and Theophrastus*; his two orations against Erasmus; his Latin poems, etc.

SCALIGER, JOSEPH JUSTUS, the tenth son of J. C. Scaliger and Andietta de Roques-Lobejac, and much his father's superior in learning, was born in 1540 at Agen, whence, at the age of 11, he was sent, along with two of his brothers, to the college of Bordeaux, where for three years he studied Latin. A pestilence breaking out in the town, he was recalled by his father, who supplemented the scanty knowledge which his son brought home with him by making him write a Latin declamation every day upon any subject he chose. Under this training he soon attained great proficiency as a Latinist; and in his 19th year, on the death of his father, he went to Paris, where he studied Greek under the famous Turnebus. He was less indebted, however, to any master than to himself; and finding that his progress was slow under his great preceptor, he closeted himself alone with Homer, and in 21 days read him through, with the aid of a Latin translation, and committed him to memory. In less than four months he had mastered all the Greek poets. Next, Hebrew, Syriac, Persian, and the most of the modern European languages succumbed in rapid succession to his industry, while at the same time he was assiduous in his composition of verses both in Latin and Greek. About this time he boasted that he could speak 13 languages, ancient and modern; and such was his ardor in study, that he allowed himself only a few hours' sleep at night, and would frequently pass whole days without rising from his books even for meals. His proficiency in literature, especially in the history, chronology, and antiquities of Greece and Rome, secured him, in 1583, an honorable engagement from Louis de la Roche Pozay, at that time French ambassador at the pontifical court. The year before, however, he had become a Protestant, which rendered it difficult for him to retain an appointment in France. Except that he traveled a good deal, at the generous instance of his patron, and visited the chief universities of France and Germany, and even found his way to Scotland, we know little of his life between 1565 and 1593. He is conjectured to have traveled in Italy, and to have gone as far as Naples. Certain it is, however, that in the year last named he complied with an invitation of the Dutch government, and went to fill the chair of literature, vacated by Lipsius in Leyden university, where he spent the residue of his days. His labor now consisted chiefly in interpreting and illustrating the classical authors. He died of dropsy on Jan. 21, 1609, and was never married. We have said that he far excelled his father in learning; but it should be added that he was not a whit less irritable, arrogant, or vain; that he fully shared the paternal pride of pedigree, spurious as he probably knew his own to be; and that he endeavored to support his father's genealogical fictions in his well-known letter to Dousa on the splendor of the Scaliger family. His writings abound with expressions of hatred and contempt toward his opponents, and he has enriched the vocabulary of learned abuse to an extent well-nigh proverbial. He was, however, a man of immense vigor of understanding, and must be credited with having been the first to lay down in his treatise *De Emendatione Temporum* (Paris, 1583) a complete system of chronology formed upon fixed principles. It was this most learned achievement, and his invention of the Julian period, that secured for him the title of the father of chronological science. It was subjected to much emendatory criticism by censors like Petavius, and also by himself, its errors having been partly corrected by him in his later work, the *Thesaurus Temporum*, completens Eusebii Pamphili *Chronicon cum Isagogicis Chronologia Canonibus* (Amst. 1658, 2 vols. fol.). Among the classical authors whom he criticised and annotated are Theocritus, Seneca (the tragedies), Varro, Ausonius, Catullus, Tibullus, Propertius, Manilius, and Festus. His other works are *De Tribus Sectis Judæorum*; *Dissertations on Subjects of Antiquity*; *Poemata*; *Epistolæ*; a translation into Latin of two centuries of Arabian proverbs, etc. He numbered among his friends the most illustrious scholars of the time, such as Lipsius, Casaubon, Grotius, Heinsius, the Dupuys, Saumaise, Vossius, Velsar, P. Pithou; and interesting notices of him are preserved in such works as the *Huetiana*, and above all, in the two vols. of *Scaligerana*, which embody his conversations, and which were collected and published after his death.

SCALLOP, more commonly escalop (q.v.), in heraldy, a species of shell. It has been considered the badge of a pilgrim, and a symbol of the apostle St. James the greater, who is usually represented in the garb of a pilgrim.

SCALLOP-SHELL. See PECTEN.

SCALP, TUE, is the term employed to designate the outer covering of the skull or brain-case. Except in the fact, that hair in both sexes grows more luxuriantly on the scalp than elsewhere, the skin of the scalp differs so slightly from ordinary skin that it is unnecessary to enter into any details on this point. But besides the skin, the scalp is composed of the expanded tendon of the occipito-frontal muscle, and of intermediate cellular tissue and blood-vessels. Injuries of the scalp, however slight, must be watched with great caution, "for they may be followed by erysipelas, or by inflammation and suppuration under the occipito-frontal muscle, or within the cranium, or by supuration of the veins of the cranial bones, and general pyæmia that may easily prove fatal."—Druitt's *Surgeon's Vade Mecum*, 8th edition, p. 332. In the treatment of a wound of this region, no part of the scalp, however injured it may be, should be cut or torn away; and, if possible, the use of stitches should be avoided, as plasters and bandages

will generally suffice to keep the separated parts in apposition. The chance of suppuration may be prevented by coagulating the blood externally, by dressing the wound with lint, saturated with *früers' balsam* (*unctura benzoin, comp.*), so as to seal up the injured part from the access of air. The patient should be confined to the house (and in severe cases to bed), should be moderately purged, and fed upon non-stimulating, but not too low diet.

Burns of the scalp are very liable to be followed by erysipelas and diffuse inflammation, but the brain is comparatively seldom affected in these cases.

Tumors of the scalp are not uncommon, the most frequent being the cutaneous cysts popularly known as *wens* (q.v.), and vascular tumors.

SCAMANDER, the ancient name of a river in the Troad (see **TROY**), which, according to Homer, was also called Xanthus (Gr. yellow) by the gods, and as a divinity took an important part in the Trojan war, its destructive floods doing serious injury to one party, and thus materially assisting the other. The Scamander rose in mount Ida (q.v.), and, flowing w. and n.w., discharged itself into the Hellespont, after being joined by the Simois, about 2 m. from its mouth: the two rivers, however, since the 1st c. A.D., have had separate courses. There has been much controversy as to what modern river corresponds to the ancient Scamander; Mr. C. Maclaren, however, in his *Plains of Troy*, has clearly identified it with the Mendere.

SCAMIL LUS, a small plinth below the bases of Ionic, Corinthian, and other columns.

SCAMMONY is a gum-resin of an ashy-gray color, and rough externally, and having a resinous, splintering fracture. Few drugs are so uniformly adulterated as scammony, which, when pure, contains from 81 to 83 per cent of resin (which is the active purgative ingredient), 6 or 8 of gum, with a little starch, sand, fiber, and water. The ordinary adulterations are chalk, flour, guaiacum, resin, and gum tragacanth.

Scammony, when pure, is an excellent and trustworthy cathartic of the drastic kind, well adapted for cases of habitual constipation, and as an active purgative for children. The resin of scammony, which is extracted from the crude drug by rectified spirit, possesses the advantage of being always of a nearly uniform strength, and of being almost tasteless. The *scammony mixture*, composed of four grains of resin of scammony, triturated with two ounces of milk, until a uniform emulsion is obtained, forms an admirable purgative for young children in doses of half an ounce or more. According to Christison, "between 7 and 14 grains of resin, in the form of this emulsion, constitute a safe and effectual purgative" for adults. Another popular form for the administration of scammony is the *compound powder of scammony*, composed of scammony, jalap, and ginger, the dose for a child being from 2 to 5 grains, and for an adult from 6 to 12 grains. Scammony is frequently given surreptitiously in the form of biscuit to children troubled with thread worms.

The plant which produces this valuable drug is *convolvulus scammonia* (see **CONVOLVULUS**), a native of the Levant. It is a perennial, with a thick fleshy tapering root, 3 to 4 ft. long, and 3 to 4 in. in diameter, which sends up several smooth slender twining stems, with arrow-head shaped leaves on long stalks. The root is full of an acrid milky juice, which indeed pervades the whole plant. The scammony plant is not cultivated, but the drug is collected from it where it grows wild. The ordinary mode of collecting scammony is by laying bare the upper part of the root, making incisions, and placing shells or small vessels to receive the juice as it flows, which soon dries and hardens in the air.

The name *French* or *Monspelier scammony* is given to a substance which is prepared in the s. of France, chiefly from the juice of *cynanchum monspeliacum*, a plant of the natural order *asclepiaceæ*. It is a violent purgative.

SCANDALUM MAGNÆTUM. This offense was committed in speaking words in derogation of a peer, judge, or great officer of the realm, and a special action was brought for such words, the punishment being damages and imprisonment. But now this proceeding, though not expressly abolished, is superseded by the ample remedies of criminal information (q.v.), indictment, or action. A somewhat similar offense in Scotland is called leasing-making (q.v.).

SCANDERBEG (properly, *Iskander-beg*, "the prince Alexander," the name given him by the Turks), the famous patriot chief of Epirus, was b. in that country in 1414. His real name was George Castriota, and his father, John Castriota, was one of the great lords of Epirus, his mother, Voisava, being a Servian princess. In 1423, he was given as one of the hostages for the obedience of the Albanian chiefs, and his physical beauty and intelligence so pleased Amurath II, that he was lodged in the royal palace, and subsequently circumcised and brought up in Islamism, being also put under the tuition of skillful masters in the Turkish, Arabic, Slavic, and Italian languages. In 1423, he greatly distinguished himself in Asia as a Turkish pasha (of one tail); but being offended at the confiscation of his paternal domains, and being solicited by some Epirote friends to return to his native country to aid in the restoration of its independence, he watched an opportunity of withdrawing from the Turkish army. He had not long to wait, for the generous and unsuspicious sultan, who had caused him to be brought up as if he had been his own son, gave him the command of a large division of the army which was destined to act against the Hungarian invaders. Scanderbeg, having concerted his plans

with 390 of his fellow-countrymen in the Turkish army, deserted during the confusion of the first battle (1443), and having previously compelled Amurath's secretary (whom he afterward murdered to avoid detection) to prepare an order investing him with the government of Croia (now *Ak-hissar*), the capital of Epirus, he and his companions fled thither with all possible speed. The unsuspecting governor at once resigned the town into his hands, and was massacred along with the garrison. At the news of Scanderbeg's success, the whole country rose in insurrection, and in 30 days he had driven every Turk, except the garrison of Sfetigrad, out of the country. In order to strengthen himself in his new position, he invited a number of the neighboring princes and Albanian chiefs to a conference, at which it was unanimously agreed to make no terms with the Turks, and to obey Scanderbeg implicitly as their leader. Scanderbeg then raised an army of 15,000 men, with which he completely scattered (1444) the 40,000 Turks whom the indignant sultan had sent against him, killing an immense number of them, and taking a few prisoners. Three other Turkish armies shared the same fate, and the "animus" with which the contest was carried on may be imagined, when we consider that the number of prisoners taken in the last (1448) of these three battles amounted to *seventy-two*. Amurath himself in 1449 took the field, and stormed many of the principal fortresses, but being then ill of his fatal malady, he retired from before Croia, to die at Adrianople (1450). Scanderbeg's splendid successes brought in congratulations from the pope and the sovereigns of Italy and Aragon, but many of the Epirote chiefs were becoming wearied of the continual strife, and fell off from him, some of them even joining the Turks. Scanderbeg's career was now, in consequence, of a more checkered character, but in spite of occasional defeats, he stoutly refused all the liberal and fair proposals of the sultan, Mohammed II., who had a profound admiration for him, and sheltered by the mountainous nature of the country, carried on an unceasing warfare. At last an armed convention was agreed to in 1461, and Scanderbeg profited by this leisure to pay off his debt to the pope and the king of Aragon (both of whom had supplied him with material assistance during his greatest need), and crossing over to Italy, he routed the partisans of Anjou, and restored the kingdom of Naples to the latter of his benefactors, returning home laden with honors and benedictions. At the instigation of the pope, who had tried in vain to raise the other Christian princes of Europe against the Turks, Scanderbeg broke the armed truce in 1464, and repeatedly defeated the Turks: but Mohammed becoming furious at these unprovoked aggressions, equipped two mighty armies, the first of which invested Croia, the second, under his own leadership, advanced more leisurely. The first army was, after a desperate contest, defeated by Scanderbeg in 1466; but the restless and indomitable chief, worn out with the incessant toil of 24 years, died at Alisso, Jan. 17, 1467. The war continued to rage some time longer, but the great mainstay of the country was now wanting, and before the end of 1478, the Turkish standard floated undisturbed over Epirus. Barlesio, a fellow-countryman of Scanderbeg, who has written his biography (*De Vita et Moribus ac rebus gestis Geo. Castrioti*, Rome, 1537), remarks his sobriety, the purity of his manners, and the strictness of his religious belief. He had vanquished the Turks in 22 pitched battles.

SCANDINAVIA, a large peninsula in the n. of Europe, bounded on the n. by the Arctic ocean; on the w. by the Atlantic, North Sea, Skager Rack, Cattegat, and Sound; and on the s. and e. by the Baltic sea, gulf of Bothnia and Finland, with which it is connected on the n.e. by an isthmus 325 m. wide. This peninsula comprises the two kingdoms, Norway (q.v.) and Sweden (q.v.); is 1240 m. long, from 230 to 460 m. broad, area 300,000 sq. m. The ridge of mountains which traverses the peninsula in the direction of its length gives character to the whole conformation. The western division of the Scandinavian peninsula is covered with mountains; the eastern half, Sweden, consists principally of low-lying country. The mountains of Scandinavia extend from Waranger Fjord, in the extreme n.e., to the promontory of the Naze, in the extreme s.w., with an average breadth of 180 miles. They consist principally of gneiss and micaceous schist, sometimes, but rarely, of porphyry, syenite, granite, and chalk; salt is not found; silver, copper, and iron abound. The Scandinavian mountains, though forming in reality one great range, are considered as forming four sections—the Lapland mountains, in the n., from 1000 to 2,060 ft. high; the Kjölen mountains, from 1500 to 2,575 ft. high; the Dovre Fjelde, from 2,500 to 3,600 ft. high; and lastly, the Southern Fjelde, 4,000 to 5,150 ft. high. Though of considerable height, yet the numerous glaciers and snow-fields of the mountains of Scandinavia impart to this range almost an Alpine character. The climate of Scandinavia is much milder on the w. than on the e. side, a fact to be ascribed probably to the influence of the Gulf stream. The character of the country, its physical features, industries, etc., are given under the articles **NORWAY** and **SWEDEN**.

The ancient *Scandia*, or Scandinavia, included northern Denmark, as well as the peninsula that still retains the name. It is first mentioned by Pliny, who, unaware that the peninsula was attached to Finland on the n. considered Scandinavia as an island.

SCANDINAVIAN LANGUAGE AND LITERATURE. The language which was spoken during the heathen ages in all the northern or Scandinavian lands, and which, in accordance with traditionary belief, had been introduced by Odin and his companions, when the Gothic tribes supplanted the more ancient races of the Finns and Lapps, is always referred to by the oldest authorities either as the *Dönsk tunga*, "Danish tongue," or as the

Norræna, "Norse." We never hear of the "Swedish" or "Gothic tongue," and although different dialects no doubt existed, from an early period, among the Scandinavian people, it is certain that substantially the same language was spoken by the Northmen generally till the 11th century. According to recent inquiries, the race of the Northmen, before their settlement in Sweden and Norway, was divided into an eastern and western branch, the former of which is supposed to have used the old language of Norway and Iceland, and the latter the Swedish and Danish dialects. These two divisions of the race had entered Scandinavia by different routes, the eastern having passed along the gulf of Bothnia, through the country of the Finns and Lapps, while the western branch had crossed from Russia to the Åland islands, and spread from thence southward and westward: and it seems natural to infer that in their respective lines of migration they may have incorporated into their own speech some of the special characteristics that belonged to the language of the peoples with whom they came in contact. But the differences thus introduced could not have been important, for we find the same language employed in the several most ancient laws of the different people of Scandinavia, while the two Eddas (q.v.)—the oldest monuments of Scandinavian speech—which were compiled in Iceland, whither the Northmen had carried their language on their settlement in the island in the 9th c., give evidence of an almost complete identity of local and personal names. This unity of language is further proved by the agreement which is found to exist in all runic inscriptions, from Cleswick to the northern parts of Sweden, and from Zealand to the western shores of Iceland. All monuments of this old Northern tongue would, however, have been lost to us, had not the *Norræna* or Norwegian form of it been carefully preserved and cultivated in Iceland through the short songs (*hjóð* or *quidu*) relating to the deeds of the gods and heroes of the north, which had existed as early probably as the 7th c., and had passed with the religion and usages of Norway to the new colony. After the introduction of Christianity into Iceland in the year 1000, schools were founded there, classic literature was cultivated, and Roman characters were adopted for the writing of the national tongue, but this did not interfere with the zeal with which the national laws and poems were collected and studied by native scholars. This literary activity continued unabated till the 13th c., when the republic of Iceland, after having long been distracted by the dissensions of the rival aristocratic families of the island, was conquered by Hakon VI., king of Norway. Since 1380, Iceland has formed part of the Danish dominions, and although since that period the colonists have partly succumbed to the cramping influences of the subordinate and dependent conditions in which they have been placed; the distance from the mother-country, and the tenacity with which the people cling to all memorials of their former history, have enabled them to preserve their language so unchanged, that the Icelandic of the present day can read the sagas of a thousand years since, and still writes in the same phraseology that his forefathers used ages ago. But while the old Scandinavian tongue was thus preserved in the far-distant colony, it had undergone great changes in Norway; and when, by the union of Calmar in 1380, the latter country was united to Denmark, the Danish form of speech, that had in the meanwhile been changing under the modifying influences due to the introduction of Latin and to contact with other nations, supplanted the Norwegian language, which thenceforth being banished from the pulpit, the law courts, and from literature, split up into numerous dialects peculiar to special valleys and fjords, but unknown in the larger towns.

When we come to examine the Icelandic or ancient Scandinavian, which is closely allied to its sister Teutonic languages, and like them betrays its eastern origin, we find that it differs from the latter in several important points. It has this striking peculiarity, that the definite article, instead of coming before the noun, is appended as a termination to the end of the word. The adjective, moreover, when in its indefinite form is subject to inflections, for all genders and cases, undergoes, when in its definite form, fewer and slighter changes. Again, while in the German tongues the verb in the infinitive ends in a consonant, in the old Scandinavian it invariably terminates in a vowel. The old Scandinavian language has a passive form of the verb unknown to its Gothic sister tongues; and while in German the third person of the present tense differs from the second person, such is not the case in Old Northern. In the latter, the vowel sounds are greatly modified by a very perfect system of combinations, indicated by dots or accents; and in addition to the consonants of the Gothic languages, it has an aspirated *d* and *t*. It possesses, moreover, a flexibility and richness of construction, which admit of favorable comparison with those of the ancient classical languages, while in regard to the number and comprehensiveness of its words, and its consequent independence of foreign derivatives, it presents a character of regularity and unity which is wanting to the other Germanic languages. Its mode of construction is simple in prose, and in the earlier forms of poetry, although in the latter periods of the skalds (q.v.) it degenerated into a state of artificial complexity. The chief feature of the metrical system employed in Old Northern poetry was alliteration (q.v.). The alliterative method was continued after the introduction of terminal rhyme, but the simplicity of the ancient lay gave way in the 10th c. to the most artificial complexity of versification in the meters invented by the skalds. Besides these skaldic measures, of which 106 are enumerated in the *Hiatalykki*, or Key of Meters, drawn up in the 13th c. by the Icelandic, Snorri Sturlesson (q.v.), the skalds were required to know the *Kenningar*, or poetic synonyms, of which there

were an enormous number; some words, as *Odin*, *island*, etc., having upward of 100. The main feature of the system was that nothing must be called by its right name: thus a ship was a beast of the sea, a serpent of the waters, a dragon of the ocean, etc.; a woman was a graceful tree, a fair pearl, etc.; a wife was a husband's *Rune* (q.v.), or his confidential and intimate friend, etc.

The fragments of old northern poetry that have come down to us in the *Eddas* belong for the most part to the 8th c., or even perhaps to the 7th c.; and consist of short songs (*ljóð* or *quidu*), which are either mystic, didactic, mythic, or mytho-historic in their character. See *EDDA*. It is supposed that some of these compositions, and several of the poems which celebrate the adventures of the gods, giants, and elves, were composed prior to the immigration into Scandinavia of *Odin* and his followers; while, on the other hand, the local coloring of others sufficiently prove their northern origin. In addition to the subjects belonging to the *Odinic* mythology, we have in the mytho-historic lays, known as the songs of the famous *Smith Völundr*, or the *Völundar-quidu*, a cycle of heroic poems similar to the old German epic the *Nibelungenlied* (q.v.); but much more ancient in form than that in which the latter has reached us. In the 9th and 10th centuries the ancient epic and the simple songs of the older poets gave place to the artificial poetry of the *skalds*, which, from its earliest development, manifested a realistic tendency, and made the real adventures of living men the subject of their compositions. Many of these compositions, as the *Flókasmál*, or the Death and Apotheosis of King *Eric Bloodaxe*, who died in 952; the *Hakonar-mál*, or Fall of *Hakon the Good*; and several poems by the famous Icelandic *skald* *Egill Skallagrímson*, while they afford valuable materials for the early history of the north, are among the latest of the *skaldic* productions that preceded the more degenerate periods of the art. To the 11th and 12th centuries belong the poems known as *Grongvildr* and *Solar-ljóð*, which were composed in imitation of the ancient compositions, and consist of moral and didactic maxims, the former conceived from an assumed heathen, and the latter from a Christian point of view. In the 13th c. the *skaldic* art thoroughly declined, and gave place, in Iceland, to a puerile literature, based upon biblical stories and saints' legends. In Scandinavia proper, a more modern form of national literature was in the meanwhile being gradually developed by means of oral transmission, whence arose the folk-lore and popular songs of Norway and Sweden, and the noble Danish ballads known as the *Kempe visen*, whose composition in the old northern or Icelandic tongue may probably be referred to the 14th century. The earliest Icelandic prose belongs to the beginning of the 12th c., when *Ari Þinnir Frode*, or the wise, composed a history of his native island and its population in the *Islenzka-bók* and *Landnámabók*, the latter of which was continued by others. He was the first northern writer who attempted to assign fixed dates to events by reference to a definite chronology, and his work is remarkable as the earliest historical composition written in the old Danish or Norse, as it still remains in the living language of Iceland. These works, which have since perished, entered largely into the composition of the annals of the early kings of Norway, compiled a century later by *Snorri Sturlesson* under the title of the *Heimskringla*. Throughout the middle ages the literature of Iceland was enriched with numerous national and other sagas, the materials of which were drawn from *skaldic* songs, folk-lore, local traditions, and family histories; and in its later stages of development included among its subjects the mythic cycle of *Arthur* and his knights, *Merlin*, *Alexander*, *Charlemagne*, etc. The compilation of the laws of the island attracted the attention of the Icelanders at an early period; and in 1118 a complete code, known as the *Gragas*, which had been derived from the ancient Norse law, was submitted to the allthing or popular assembly, and a few years later the canons of the church, or the *Kristinnrettir*, were settled and reduced to writing. A collection of those enactments in the ancient and subsequent codes, which are still in force in Iceland, has been made by *Stephensen* and *Sigurdsson* (Copen. 1853), under the title of *Lagasafn handa Íslandi*; while the ancient Norse laws, beginning with the *Gulathing-lög* and the *Hirtskra* of *Hakon the good*, which date from the 10th c., have been ably and critically edited in Norway under the title of *Norges gamle Love* (Christ. 1846-49). The study of the old northern language and literature, which was successfully inaugurated by the native scholars of Iceland in the 17th c., was soon prosecuted with equally happy results in Denmark and Sweden, and within the last 20 years in Norway, where the subject forms a necessary introduction to the investigation of the language and history of the country. Copenhagen has, however, in recent times, been the principal seat of these inquiries, the successful prosecution of which has been materially facilitated by the large number of important Icelandic MSS. contained in its libraries, and by the foundation of the *Arne-Magnussen* collection in 1772; and the different societies especially designed to promote the study of Icelandic and of northern antiquarian monuments. Among the Icelandic and Danish scholars who have gained pre-eminent distinction in these departments of research, we may instance *Arne-Magnussen*, *Torfæus*, *Olavsen*, *Pinn Magnussen*, *Worm*, *Resenius*, *Bartholin*, *Thorlacius*, *Müller*, *Rask*, *Rafn*, *Keyser*, *Munch*, *Unger*, *Lange*, etc. In the study of the grammar and comparative structure of the language, which excited an interest as early as the 13th c., as is proved by the grammatical treatises and rules of prosody incorporated in the younger *Edda*, no one has evinced a higher order of scientific acumen and critical learning than *Rask* (q.v.), who in his erudite work *Om det gamle Nordiske Sprogs Oprindelse* (Kjopenh. 1818) threw a flood

of new and important light on the subject; while the labors of Jakob Grimm, Munch, and others, have tended materially to exhibit the affinities between the old northern and the Teutonic languages, and to assign to it its right position among the kindred Indo-Germanic tongues.

SCANDINAVIAN MYTHOLOGY. Our knowledge of Scandinavian mythology is mainly derived from the collections of ancient northern sagas known as the Eddas (q.v.), which constitute the Odinic bible, as it were, of heathen Scandinavia. The value and interest attaching to these records of the ancient faith of the Northmen are enhanced by the fact that there are strong grounds for assuming that the closest affinity, if not identity, of character existed between their religious doctrines and practices and those of the Germanic nations generally. Hence, in the absence of anything beyond the incidental notices of the pagan religion of Germany, which are contained in the classic writers, the Eddaic exposition of northern mythology is of the highest importance to the student of the history of every nation of Teutonic origin. Owing to the remote situation of the Scandinavian lands, and the hold which the Odin religion had taken of the minds of the Northmen—whose natural tendencies inclined more to the pagan merits of valor, courageous endurance of hardships, indomitable resolution, and unflinching fidelity in hate and love, than to the Christian virtues of submission, meekness, and forgiveness of injuries—Christianity took root slowly and insecurely in those lands, and only long after a national literature, based upon the superstitions and memorials of the ancient faith, had been firmly established among the people. But although there is every reason to believe that all branches of the great Indo-Germanic family of nations had essentially the same system of belief and worship, and venerated the same deities, minor differences were numerous. Thus, for instance, while Danes, Saxons, and Gothlanders worshiped Odin as their chief god, the Swedes generally paid supreme honors to Frey, the god of the year; some tribes of northern Germany regarded Hlodyn, or the earth, as their principal deity; and the Norwegians directed their worship to Odin's son, Thor; while in some parts of Norway even, as in Halgoland, the people worshipped deities not honored elsewhere in Scandinavia. Thus the chief objects of worship in the latter district were Thorgerd, Horgabrud, and Irpa, the daughters of Halogi, or high flame, from whom the name of the country was derived, and who was probably identical with Loki (fire), who, after having, according to the myth, been beneficent in the beginning of time and united with the All-father, fell from his high estate, and, like some fallen angel, became crafty, evil, and destructive as a desolating flame. Halgoland appears from remains discovered there to have been a special seat of fire or sun worship, which seems to have been nearly universal at one period of the world's history.

Leaving for the present the discussion of the sources from whence the northern mythology derived some of the numerous complex elements which entered into its composition, we proceed to give a short summary of its cosmogony: In the beginning of time a world existed in the n. called Niflheim, in the middle of which was a well, Hvergelmeer, from which sprang twelve rivers. In the s. was another world, Muspelheim, a light, warm, radiant world, the boundary of which was guarded by Surt with a flaming sword. Cold and heat contended together. From Niflheim flowed venomous, cold streams called Elivaager, which, hardening into ice, formed one icy layer upon the other within the abyss of abysses that faced the n., and was known as the Ginnunga-gap. From the s. streamed forth the sparkling heat of Muspelheim; and as heat met cold, the melting ice-drops became instinct with life, and produced, through the power of him who had sent forth heat, a human being, Ymir, the progenitor of the frost-giants, by whom he was called Egelmer, or chaos. He was not a god, but evil, both he and all his race. As yet there was neither heaven nor earth, neither land nor sea, but only the abyss Ginnunga-gap. Ymir drew his nourishment from the four milky streams which flowed from the udders of the cow Aedhumla, a creature formed from the melting frost. From Ymir there came forth offspring while he slept—a man and woman growing from under his left arm, and sons from his feet; and thus was generated the race of the frost-giants, or Hrimthursar, among whom the All-father dwelt in the beginning of time before the heavens and the earth were created.

In the meanwhile, as the cow Aedhumla licked the frost-covered stones, there came forth the first day a man's hair, the second day a head, and the third day an entire man. This man, *Buri*, or the producing, had a son *Bör* (the produced), who married Beltsa, one of the giant race, by whom he had three sons, Odin, Vili, and Ve.

These three brothers, who were gods, slew Ymir, and carrying his body into the middle of Ginnunga-gap, formed from it the earth and the heavens. Of his blood they made all seas and waters, taking the gore that flowed from his body to form the impassable ocean which encircles the earth; of his bones they made the mountains, using the broken splinters and his teeth for the stones and pebbles; of his skull they formed the heavens, at each of the four corners of which stood a dwarf, viz., Austri at the e., Vestri at the w., Northri at the n., and Suthri at the south. Of his brains they formed the heavy clouds, of his hair plants and herbs of every kind, and of his eyebrows they made a wall of defense against the giants round Midgard, the central garden or dwelling-place for the sons of men. Then the three brothers took the glowing sparks that were thrown out of the world Muspelheim, and casting them over the face of heaven, raised

up the sun, moon, stars, and fiery meteors, and appointed to each its place and allotted course; and thus arose days, months, and years.

Night was of the race of the giants, and in turn married three husbands, by one of whom she had a daughter, Earth, and by another a son, Day, who was bright and beautiful like the gods, or Æsir, to whose race his father Delling belonged. To this mother and son, who were akin to the opposite races of the frost-giants and the gods, Allfader committed chariots and horses, and placed them in heaven, where Night rides first through her twenty-four hours' course round the earth with her horse Hrimfaxi, from whose bit fall the rime-drops that each morning bedew the face of the earth. Close after her comes her fair son Day, with his horse Skinfaxi, from whose shining mane light beams over heaven and earth. All the maidens of giant race were not dark like Night, for to Mundilföri were born a son and daughter of such beauty that their father gave to them the names of Mani or Moon, and Sol or Sun. The gods, incensed at this presumption, took them up to heaven, and ordained that they should direct the course of the sun and moon, which had been made to give light to the world, and thenceforth Sol drove the chariot of the sun, which was drawn by two horses, Arvakur (the watchful) and Alsvidh (the rapid), under whose shoulders the gods in pity placed an ice-cool breeze. A shield named Svalin (the cooling) was also by their care attached to the front of the car to save sea and land from being set on fire. Mani directs the course of the moon, and he, like his sister, is followed by a wolf that seems about to devour him; and in the end of time this animal, which is of giant race, will with his kindred swallow up the moon, darken the brightness of the sun, let loose the howling winds, and sate himself with the blood of all dying men.

When heaven and earth were thus formed, and all things arranged in their due order, the chief gods or Æsir, of whom there were 12, met in the middle of their city Asgard, which lay on the plain of Ida. These gods were Odin, or All-father, who has 12 names in Asgard besides many others on earth; Thor, Baldr, Tyr, Bragi, Heimdal, Hod, Vidar and Vali his sons, and Niord, Frey, Ull, and Forseti. Here they raised for themselves a court with a high seat for All-fader; a lofty hall for the goddesses; and a smithy, in which they worked in metal, stone, and wood, but chiefly in gold, of which precious substance all the implements which they used were made, and hence this period of their existence was known as the golden age.

This age of peaceful labor lasted till three beautiful but evil maidens made their way from the giants' world, Jotunheim, to Asgard, when confusion and ill-will arose in the world. Then the gods, taking counsel, determined to create new beings to people the universe, and first they gave human bodies and understanding to the dwarfs, who had been generated like maggots within the dead body of Ymir, but who now took up their abodes in the bowels of the earth, in rocks and stones, and in trees and flowers. Then Odin, with two companions, Hænir and Lodur, went forth on an excursion to the earth, where, finding two trees, Ask and Embla, created a man and a woman of them, Odin giving them spirit or the breath of life, Hænir sense and motion, and Lodur blood and a fair color, with sight, speech, and hearing; and from this pair, whose dwelling was in Midgard, the human race has sprung. A bridge of three colors, Bifrost, known to men as the rainbow, connects Midgard with Asgard, and over this the gods ride daily on their horses to the sacred fountain of Urd, where they sit in judgment. This fountain lies at one of the three roots of the ash, Yggdrasil, whose branches spread over the whole world and tower above the heavens. Under one of these roots is the abode of Hel (q.v.), the goddess of the dead, under another, that of the frost-giants, while under the third is the dwelling of human beings. Below the tree lies the serpent Nidhogg, who is constantly gnawing the roots, and striving with his numerous brood of lesser serpents to undermine Yggdrasil, whose branches are as constantly refreshed by water from the well of Urd, which is poured over them by the Norns. These are three maidens known as Urd, Verdandi, and Skuld (or Past, Present, and Future), who dwell in a fair hall below the ash-tree, where they grave on a shield the destiny which they determine for the children of men.

Besides gods, frost-giants, dwarfs, and men, there were other beings, as the Vanir, who dwell in the world vanahaim, lying between the abodes of the gods and of men, and the light elves and dark elves, the former of whom were friendly to mankind, and of great beauty, while the latter were of evil, demoniacal natures, and blacker than pitch.

Now, after the three giant maidens came to Asaborg, dissensions soon broke out among these different races, and Odin, by casting a spear among mankind, created war and discord in the world. Then his maidens, the Valkyriur (or choosers of the doomed), surrounded by lightnings, rode forth with bloody corselets and radiant spears, to choose on every battle-field those who should fall, and to lead them into Valhal, where the chosen heroes, known as einheriar, daily go forth to fight and slay one another, but returning at early morn sound and fresh, recruit themselves for the next night's combats by drinking beer with the gods and eating the flesh of the sacred hog. It is, however, only men of rank, as jarls (or earls), who enter Odin's hall after death, for the base-born, or thralls, belong to Odin's powerful son, Thor (q.v.), who rules over Thrudheim, and drives through the world in a chariot drawn by he-goats, bearing with

him his magic hammer *Mjolnir*, the iron gloves which he requires to grasp the haft, and his belt of power.

Among the gods there reigned good-will and happiness even after the rest of the world had been disturbed by war, until *Loki*, or the impersonation of evil, who in infancy had been *Odin's* foster-brother, was admitted into *Asaborg* as their equal. By his treachery *Baldur* (q.v.), the purest, most beautiful, and best loved of *Odin's* sons, was slain. The gods, indeed, had power to inflict temporary punishment on *Loki*, and to chain him under a hot sulphur spring, where he lay for ages, but at length a time will come when *Loki's* evil progeny will prevail over the gods and the world. This terrible age of destruction, the *ragnarök*, or twilight of the gods, will be marked by a three years' winter of hard frost, cutting winds, and smothering air uncheered by summer or spring-tide, when there will be bloodshed throughout the world, brothers will slay one another, parents and children will be at war. The wolf *Fenrir* will break loose, the sea will burst its bounds as the serpent *Jormundgard*, encircling *Midgard*, writhes in fierce rage, and struggles to reach the land. The wolf *Sköll*, will swallow up the sun, and when the world is plunged in almost total darkness, his brother *Hati* will devour the moon, while the stars will vanish from heaven. As *Midgard's* serpent and the wolf *Fenrir* go forth, scattering venom through air and water, the heavens will be rent asunder; the ship *Naglfar*, which is made of dead men's nails, will be floated on the waters; the *Æsir* will ride forth across the bridge *Bifrost*, which will break away behind them; and all the friends of *Hel*, led on by *Loki*, will offer battle to the gods on *Vigrid's* plain. Then *Odin*, having taken counsel at *Mimir's* well, will advance armed with his spear *Gungnir* against the wolf *Fenrir*, while *Thor* encounters *Midgard's* serpent, and is killed by the venom which it exhales from its mouth. Although *Fenrir*, the wolf, will swallow *Odin*, and thus cause his death, he will himself be slain by the god *Vidar*, while *Loki* will fall beneath the hand of *Heimdall*, the watchman of the gods, and *Surt*, hurling fire from his hand, will burn up the whole world. After the conflagration of heaven and earth and the whole universe, there will still be dwellings for the evil and the good, the worst of which is *Nastrond*, a horrible habitation for perjurers and murderers, where serpent-heads pouring forth venom line the walls, while in *Gimli*, *Odin's* best heaven, the good and virtuous will find a happy resting-place.

But from the great destruction of the universe, another earth, verdant and fresh, will arise from the deep waters of the ocean, the unsown fields will bear fruits, and all evil will cease; *Baldur* and other gods will then return to *Ida's* plain, where *Asgard* once stood, and taking counsel together, will find the golden tablets which their race had possessed at the beginning of time, and remembering their deeds of old, will await the coming of the mighty All-father, the ruler of all things, who will pronounce judgments, and establish peace that shall endure to the end of time.

The above brief epitome of the *Odin* cosmogony serves as a framework for the numerous beautiful prose and poetic myths which make up the substance of northern mythology; and are contained in a rich mass of sagas, not all complete in themselves, but each capable of throwing some light on the others.

Many theories have been advanced to explain the origin and the fundamental ideas on which the northern myths have been based; and while some expositors have seen in them a mere re-clothing of Bible narratives, and a perversion of Christian truths, and have referred their composition to monks living in the middle ages, others, feeling that their title to antiquity could not be set aside, have gone to the other extreme, and tried to prove that they reflected the truths of Christianity, and represented under active and tangible forms the mysteries of revelation; and that thus, for instance, in the narrative of *Thor* crushing the serpent we have a figurative delineation of Christ. Other interpreters, again, have attached very different meanings to these myths, regarding them as historic, psychical, physical, or even chemical; but against each of these assumed modes of explanation, taken in their full integrity, conclusive arguments might be adduced; and all that can be safely accepted is, that they are partly historical and partly an impersonation of the active forces of nature. Like the northern languages, their original seat was in the south and east, where kindred mythologies existed among the ancient tribes of India and Persia; and it is probable that the more practical and energetic spirit of the northern myths, and the more warlike character of the gods of the north, when compared with the reflective and contemplative nature of their oriental prototypes, may be due to the gradual effect on the minds of a people who had passed from the soft, enervating influences of a southern climate to the stern rigors of the north, where man lived in constant warfare with the elements and with his fellow-men. According to *Snorri Sturleson* (q.v.), whose opinion seems to a certain extent to have been a mere re-echo of the traditional belief of his forefathers, *Odin* and his sons and companions were earthly kings and priests of a sacerdotal caste, who had migrated from Asia—perhaps, as some conjectured, from *Troy*—and who conquered and ruled over various parts of Scandinavia and northern Germany, where, after their death, they were regarded by the people as deities. In conjunction with this mode of representation, the mythic tales of the warfare of the gods with giants, their intercourse with dwarfs, and spirits of the air and water, and their wanderings on earth, are interpreted as memorials of real war with pre-existing races, and of the spread of *Odin's* religion from its chief seat in Sweden

over the neighboring countries. This theory explains only a few of the myths; while some, as we have already observed, may be referred to traces of an older faith, which lingered among the Finns and Lapps after the advance of the more civilized conquering races had driven those tribes from the southern districts of Scandinavia, which they originally occupied, to the barren recesses of the north.

The worship of the gods was celebrated either in spacious temples, of which there were many in different parts of Scandinavia, or on stone heaps or altars, known as *horg*. These altars were always near some well, and close to a sacred grove, or a solitary tree, on which the votive offerings were suspended, after they had been washed at the neighboring spring by the attendant priestesses, known as *horgabrudar*. Human sacrifices, although never resorted to on ordinary occasions, were not uncommon in times of public calamity, arising from war, failure of crops, disease, etc.; and the horse, whose flesh was highly esteemed, was a frequent victim, while the fruits of the earth and spoils of war were the usual offerings. Three great festivals were held every year, the first of which was celebrated at the new year in the Yule month, when Thorablot, or the sacrifice of Thorri, an ancient god of the Finns and Lapps, was offered. On these occasions, offerings were made to Odin for success in war, and to Frey for a fruitful year, the chief victim being a hog, which was sacred to the latter god, on the assumption that swine first taught mankind to plow the earth. Feastings and Yule games occupied the whole of the month, whence it was also called the merry month. The second festival was in mid-winter, and the third in spring, when Odin was chiefly invoked for prosperity and victory on the Vikings, or sea-roving expeditions which were then entered upon. On the introduction of Christianity, the people were the more ready to conform to the great church festivals of Christmas and easter, from the fact of their corresponding with the ancient national sacrificial feasts; and so deep-rooted was the adhesion to the faith of Odin in the north, that the early Christian teachers, unable to eradicate the old ideas, were driven to the expedient of trying to give them a coloring of Christianity. Thus the black elves, giants, evil subterranean sprites, and dwarfs, with which the Northmen peopled earth, air, and water, were declared by them to be fallen angels or devils, and under their latter character suffered to retain their old denominations. Belief in these imaginary beings survived the spread of the Reformation, and can scarcely be said to have died out in Scandinavian lands among the superstitious and ignorant, while among the more enlightened the myths connected with them are still related, and serve to give a poetic interest to special localities.

Our own association with the Scandinavian mythology is perpetuated in numerous superstitions and usages still lingering among us, and in the names of the days of the week. See WEEK.

The best northern authorities on Scandinavian mythology are N. M. Petersen, *Danmarks Historie i Hedenold* (1837); Rask, in his edition of *Semund's Edda*; Jakob Grimm; *Deutsche Mythologie*; Faye, *Norske-Folke-Sang*; Thorpe, *Northern Mythology* (Lond. 1851).

SCANSO RES. See CLIMBERS.

SCANTLING, the sectional breadth and thickness of timbers for roofs, floors, etc. The term is also applied to quarterings or pieces of timber of about 5 in. in thickness and under.

SCAPHOID BONE (Gr. *skaphe*, a boat), a term applied to two somewhat boat-like bones, of which one occurs in the carpus or wrist (see HANU), and the other in the tarsus of the foot (q.v.).

SCAPPLE, a kind of work applied to masonry. To scapple a stone is to work the surface even without making it smooth.

SCAPULA. THE, or SHOULDER BLADE, is a flat triangular bone, which, when the arm hangs loosely down, extends posteriorly and laterally from the first to about the seventh rib. It presents for examination an outer convex and an inner, smooth, and concave surface, three borders (a superior, an inferior or axillary, and a posterior), three angles, and certain outstanding processes.

It is divided into two unequal parts, the supra-spinous fossa, and the infra-spinous fossa, by the spine, a crest of bone commencing at a smooth triangular surface on the posterior border, and running across toward the upper part of the neck of the scapula, after which it alters its direction, and projects forward so as to form a lofty arch, known as the acromion process, which overhangs the glenoid cavity, or receptacle for the head of the humerus or main bone of the arm. This acromion (so called from the Greek words *akros* *ōmos*, the summit of the shoulder) obviously serves to protect the shoulder joint, as well as to give great leverage to the deltoid muscle which raises the arm. It is this process which gives to the shoulder its natural roundness. From the upper part of the neck there proceeds a remarkable curved projection, termed the coracoid process, from its supposed resemblance to the beak of a raven (Gr. *korar*). It is about 2 in. long, and gives attachments to several muscles. The upper border of the scapula presents a very remarkable notch, which in the recent state is bridged over with a ligament, and gives passage to the supra-scapular nerve. This bone articulates with the clavicle and

humerus, and gives attachment to no less than 16 muscles, many of which, as the biceps, triceps, deltoid, serratus magnus, are very powerful and important.

The uses of this bone may be stated as follows: 1. It connects the upper extremity to the trunk, and participates in and is subservient to many of the movements enjoyed by the arm; 2. By its extended flat surface it furnishes a lateral protection to the chest; and 3. It affords attachments to various muscles which modify the size of the thoracic cavity, and is thus concerned in the process of respiration.

SCAPULAR, or **SCAPULARY** (Lat. *scapula*, the shoulder), a portion of the monastic habit, so called from its being worn upon the shoulders. It consists of a long stripe of serge or stuff, the center of which passes over the head, one flap hanging down in front, the other upon the back. The scapular of the professed monks in most orders reaches to the feet, that of the lay brothers only to the knees. The color differs for different religious orders or congregations. Besides the scapular worn by the members of religious orders strictly so called, there exists also in the Roman Catholic church a religious association or confraternity, the members of which, while living in the world and mixing in ordinary life, wear, although not conspicuously, a small religious emblem called a scapular. The chief duties of this confraternity consist in the recitation of certain prayers, or the observance of certain religious or ascetical exercises through devotion to the Blessed Virgin. The members may or may not bind themselves by a vow of chastity. This pious association was founded in the middle of the 13th c. by an English Carmelite friar named Simon Stock, and is said to have originated in a vision, which has been the subject of much controversy, as well with Protestants as among Catholics themselves.

SCARABÆIDÆ, a very numerous tribe of lamellicorn coleopterous insects (see **LAMELICORNES**), of which more than 3,000 species are known, the greater number inhabitants of tropical countries, although species are found in almost all parts of the world. Some of the tropical species are among the largest of beetles; those found in colder regions, as in Britain, are of comparatively small size. The tribe is divided into six sections: *coprophagi* (dung-eaters), *arecoliti* (dwellers in sand), *xylophili* (delighting in wood), *phyllophagi* (leaf-eaters), *anthobii* (living on flowers), and *melitophili* (delighting in honey), named according to prevalent and characteristic habits of the species belonging to them, although the names do not accurately denote the habits of all the species of each section. The sections are distinguished by differences in the organs of the mouth and the antennæ. To the section *erophagi* belong the greater number of the dung beetles (q.v.), or scavenger beetles, so useful in warm countries in removing offensive matter; amongst which is the sacred *scarabæus* of the ancient Egyptians (*scarabæus*, or *ateuchus sacer*). Some of the *xylophili*, as the great Hercules beetle (q.v.), have remarkable projections from the head or the thorax of the males. The cockchafer (q.v.) is an example of the *phyllophagi*; the Goliath beetle (q.v.) is one of the *melitophili*, to which section the rose beetle, common in Britain, also belongs. None of the *anthobii* are British.

SCARABÆUS, the name of a beetle held sacred by the Egyptians, commonly known in entomology as the *scarabæus* or *ateuchus sacer*. It was called *heliocantharus* or *cantharus*, by the Greeks, and *scarabæus* by the Latins. Scarabæi were employed for rings, necklaces, and other purposes by the Egyptians, Phenicians, and Etruscans (see **GEMS**). These are principally distinguished by the absence or presence of striated elytra and other marks. Entomologists have recognized four distinct species of the *ateuchus* on the Egyptian monuments, viz., *A. scirpuncatus*, *A. laticollis*, *A. morbillosus*, *A. puncticollis*. Several mystical ideas were attributed to the scarabæus: the number of its toes, 30, symbolized the days of the month; the time it deposited its ball in which its eggs were deposited, was supposed to refer to the lunar month; the movement of the clay-ball referred to the action of the sun on the earth, and personified that luminary. The scarabæus was supposed to be only of the male sex, hence it signified the self-existent, self-begotten generation or metamorphosis; and the male or paternal principle of nature. In this sense it appears on the head of the pygmean deity, Ptah-Socharis Osiris, the demiurges, and in astronomical scenes and sepulchral formulas. In the hieroglyphs it is used for the syllable *khepru*, and expresses the verb "to be, exist." In connection with Egyptian notions, the Gnostics and some of the fathers called Christ the scarabæus. The insect, during its life, was worshiped, and after death, embalmed. — *Horapollo*, i. c. 10; *Ælian*, *De Nat. Anim.* x. 15; Pettigrew, *History of Mummies*, p. 221; Wilkinson, *Man, and Cust.* v. p. 255.

SCAR-AMOUCH (Ital. *scaramuccia*, skirmish), a character in the old Italian comedy, originally derived from Spain, representing a military poltroon and braggadocio. He was dressed in a sort of Hispano-Neapolitan costume, including a black *toque* and mantle, and a mask open on the forehead, cheeks, and chin, and always received an inglorious drubbing at the hands of harlequin.

SCAR-BOROUGH (i.e., fortified rock), a seaport and municipal and parliamentary borough in Yorkshire, in the North Riding, 42 m. n.e. of York, and about 20 m. n.w. of Flamborough head. It is built around a charming bay open to the s. and s.w., and protected on the n.e. by a promontory ending in a castle-crowned height, which looks out on the North sea. From the sands the town has gradually climbed the rising ground

behind in successive terraces and crescents. The chief buildings are churches, chapels, and benevolent and other institutions, with which the town is well furnished. A fine cast-iron bridge, 75 ft. high, and stretching over a chasm 400 ft. wide, connects the old and new towns, and leads to the spa, and a bridge was erected in 1865 over a picturesque ravine to connect the western part of the town with its large and fashionable southern suburb. The springs, which are saline and chalybeate, are on the margin of the sea, and are surrounded by walks and ornamental grounds. The harbor, composed of three piers, and furnished with a light-house, is the most important in this part of the e. coast. Every accommodation is offered to visitors for sea-bathing, and Scarborough is reputed the most fashionable watering-place on the n.e. coast. The season lasts from June to the middle of October. In 1872, 284 vessels, of 18,699 tons, entered and cleared the port. Pop. '71, 24,259. The castle was erected about the year 1126. It was held against the barons by Piers Gaveston, who, however, surrendered, and was afterward beheaded. It was twice besieged by the parliamentary forces. At present it serves as a barrack, and is fortified by batteries.

SCARBOROUGH, JOHN, D.D., b. N. Y., 1836; graduated at Trinity college, Hartford, Conn., and at the general theological seminary of the Protestant Episcopal church, New York; was minister at Poughkeepsie, N. Y.; afterward at Trinity church, Pittsburgh; elected bishop of the diocese of New Jersey, 1874.

SCARCEMENT, a plain set-off or projection in a wall; foundations have generally one or more scarcements.

SCARF, in heraldry, a small ecclesiastical banner suspended from the top of a crosier.

SCARFING, the junction of two pieces of timber made to overlap, and united so as to appear as one piece.

SCARIDÆ, a family of teleost fishes erected out of the genus *scarus*, belonging to Cuvier's family *labridæ* (q. v.). See also PARROT FISH (*scarus*), *ante*.

SCARLATINA, or SCARLET FEVER, is one of the group of diseases called exanthemata (q. v.). In addition to the characters common to the group, scarlatina is almost always attended by sore throat, and the rash or eruption, which is of bright scarlet color, commonly appears as early as the second day after the manifestation of the febrile symptoms, and ends in desquamation of the cuticle on the sixth or seventh day. Most writers on medicine make three varieties of this disease—viz., *scarlatina simplex*, in which there are the fever and the rash, but scarcely any throat-affection; *scarlatina anginosa*, in which, in addition to the fever and the rash, the throat-affection is the most prominent symptom; and *scarlatina maligna*, a name which is applied to certain cases of extreme violence, in which the system is at once overwhelmed by the force of the disease, or in which the symptoms evince an extraordinary degree of weakness and want of vital power.

The disease begins with shivering, lassitude, headache, a frequent pulse, a hot dry skin, a flushed face, thirst, loss of appetite, and a furred tongue. Shortly after the appearance of the febrile symptoms, the throat begins to feel irritable, and, on examination, is found to be red, and often more or less swollen. This redness becomes diffused over the interior of the mouth and the tongue. The rash begins in the form of minute red points, which soon become so numerous that the surface appears of an almost uniform red. It first appears on the neck, face, and breast, whence it gradually spreads over the trunk and extremities. The reddened surface is smooth to the touch, and the color temporarily disappears on pressure of the finger. Along with the true rash, minute vesicles, known as *sudamina* (q. v.), sometimes occur. The eruption, in ordinary cases, is persistent for three or four days, after which it gradually disappears, and is usually gone by the end of the seventh day. The cuticle then begins to scale off in small branlike scurf, or in flakes of various sizes. Specimens of an almost entire epidermic covering of the hand or foot, forming a natural glove or slipper, are of common occurrence in our pathological museums; but it is comparatively seldom that such perfect molting takes place. The desquamative process is usually completed in a fortnight, or rather more, from the commencement of the disease. The fever does not abate on the appearance of the rash, but continues in a more or less decided degree through the progress of the case; it often presents exacerbations toward the evening, and is occasionally attended with delirium, or even with comatose symptoms. If the urine be examined, both chemically and microscopically, a few days after desquamation has set in, it will be found to contain albumen, and to exhibit a large amount of epithelium from the uriniferous ducts of the kidneys (q. v.).

Malignant scarlatina is so terrible a disease that its characteristic symptoms require a brief special notice. The rash comes out late and imperfectly, and sometimes is hardly perceptible; or, having appeared, it may suddenly recede; and sometimes it is intermixed with livid spots. The pulse is feeble, the skin is cold, and there is extreme prostration of strength. In such a case as this, death may occur (apparently from blood-poisoning) in a few hours. Other cases rapidly assume a typhus-like character. "The pulse (says Dr. Watson) becomes frequent and feeble; the tongue dry, brown, and tremulous; the debility extreme; the breath offensive; the throat is livid, swollen, ulcerated,

and gangrenous; and the respiration is impeded by viscid mucus, which collects about the fauces. Over this variety of the disease medicine has comparatively little control."

Even in *scarlatina anginosa* there is very considerable danger. The disease may prove fatal (1) from inflammation or effusion within the head, or (2) from the throat-affection, which too often proceeds to disorganization and sloughing of the adjacent parts. Moreover, in parturient women even the mildest form of the disease is fraught with the greatest peril. Further, when the disease is apparently cured, the patient is exposed to great hazard from its consequences or *sequela*. Children who have suffered a severe attack of scarlet fever are liable (in the words of the eminent physician to whom we have already referred) "to fall into a state of permanent bad health, and to become a prey to some of the many chronic forms of scrofula—boils, strumous ulcers, diseases of the scalp, sores behind the ear, scrofulous swellings of the cervical glands and of the upper lip, chronic inflammation of the eyes and eyelids. The above-named consequences not unfrequently follow small-pox and measles, but, in addition to these, scarlatina is often followed by the form of dropsy known as *anasarca*, or serous infiltration of the subcutaneous cellular tissue, frequently accompanied with dropsy of the larger serous cavities. Strange as it may at first sight appear, this dropsy is much more common after a mild than after a severe form of the disease; but this apparent anomaly is probably due to the fact that less caution is observed in the former than in the latter cases during the dangerous period of desquamation. If the patient (for example) is allowed to go out while new cuticle is still forming, the perspiratory power of the skin is checked by the cold, and the escape of the fever poison through the great cutaneous outlet is thus prevented. An excess of the poison is therefore driven to the kidneys, where it gives rise to the form of renal disease known as "acute desquamative nephritis."

Scarlatina is a disease that—like all the exanthemata—occurs in the epidemic form; and each epidemic presents its peculiar type, the disease being sometimes uniformly mild, and in others almost as uniformly severe. The treatment of this disease varies according to the preponderating symptoms. In *scarlatina simplex* nothing is required except confinement to the house, a non-stimulating diet, and the due regulation of the bowels, which are apt to be costive. In *scarlatina anginosa*, cold or tepid sponging gives much relief if the skin is hot. If there is much fever, and especially if delirium supervene, a few leeches should be applied behind the ears, or if the patient were previously in robust health, blood might be cautiously taken from the arm. If, however, no bad head-symptoms are present, all that is necessary is to prescribe saline draughts, of which citrate of ammonia, with a slight excess of carbonate of ammonia, forms the best ingredient, and to keep the bowels open once or twice a day by gentle laxatives. In *scarlatina maligna* there are two main sources of danger, which were first recognized as distinct by Dr. Watson, who describes them as follows: "The one arises from the primary impression of the contagious poison upon the body, and particularly upon the nervous system, which is overwhelmed by its influence. The patients sink often at a very early period, with but little affection either of the throat or skin. If we can save such patients at all, it must be by the liberal administration of wine and bark, to sustain the flagging powers until the deadly agency of the poison has in some measure passed away. But another source of danger arises from the gangrenous ulceration which is apt to ensue in the fauces, when the patient is not killed by the first violence of the contagion. The system is re-inoculated, I believe, with the poisonous matter from the throat. Now, under these circumstances also, quinia, or wine, and upon the whole, I should give the preference to wine, is to be diligently though watchfully given." In addition to these remedies, a weak solution of chloride of soda, of nitrate of silver, or of Condy's disinfectant fluid, should be used as a gargle; or if, as is too often the case, the patient is incapable of gargling, the solution may be injected into the nostrils and against the fauces by means of a syringe or elastic bottle.

Three medicines have been so highly commended in scarlet fever generally, by trustworthy observers, that it is expedient to notice them. The first is chlorate of potash (K.O.ClO_2) dissolved in water in the proportion of a dram to a pint. A pint, or a pint and a half, may be taken daily. It was originally prescribed under the idea that it gave off its oxygen to the blood, and was eliminated from the system as chloride of potassium (KCl). Although this view is now known to be incorrect, there is no doubt that the salt is often prescribed with great benefit in this and some other diseases, as for example, diphtheria and typhus fever. The second medicine is a very weak, watery solution of chlorine, of which a pint may be taken in the day; and the third is carbonate of ammonia in five-grain doses three times a day, given in beef-tea, wine, etc.

In the early stage, before the appearance of the rash, scarlatina may be readily mistaken for several other febrile diseases; after the appearance of the rash, the only disease for which it can be mistaken is measles, and we must refer to the article on that disease for a notice of the distinctive characters of the two affections.

There is no complaint in which the final result is more uncertain than this, and the physician should give a very guarded opinion as to how any special case may terminate.

Whether the disease is contagious throughout its course, or only at one particular period, is unknown; and if the physician is asked at what period the danger of imparting the disease on the one hand, or catching it on the other, is over, he should candidly

declare that he does not know. That the contagion remains attached to furniture, clothing, etc., for a long period is undoubted. Dr. Watson gives a remarkable instance of a small piece of infected flannel communicating the disease after the interval of a year.

The popular delusion that *scarlatina* is a mild and diminutive form of *scarlet fever* should always be corrected, as the error, if uncorrected, may do much harm by leading to a disregard of those precautions which are always necessary in this disease.

SCARLATTI, ALESSANDRO, a musician of great eminence, b. at Trapani in Sicily in 1659. He is said to have studied under Carissimi; if so, it must have been when very young. In 1680 Searlatti visited Rome, and composed his first opera, *L'onesta nell'amore*, first performed at the court of queen Christina of Sweden. His opera *Pompeo* was performed at Naples in 1684. In 1683 he composed the oratorio, *I Dolori di Maria sempre Vergine*, and the opera *Teodora*, in which orchestral accompaniments were first introduced to the recitatives, and a separate design given to the accompaniments to the airs. In the following eight years, during part of which time he held the office of *maestro di capella* at Naples, he produced various operas, the most remarkable being *Laodicea e Berenice*, composed in 1701. Between 1703-9 he held the situation of *maestro di capella* at St. Maria Maggiore at Rome; he then returned to Naples; and in 1715 produced *Il Tigrane*. Alessandro Searlatti died in 1721. His musical works comprise 117 operas, several oratorios, and a great deal of church music, besides various madrigals and other chamber music. He was the founder of the Neapolitan school, in which were trained most of the great musicians of last century, and whose influence can be traced in the works of almost every composer who has flourished since. His invention was rich and bold, his learning great, and his style pure. His modulations, often unexpected, are never harsh, and never difficult for the voice. His son, DOMENICO (born 1685, died 1757), was the first harpsichord player of his day. Among his compositions are a number of sonatas, remarkable for invention, graceful melody, and skillful construction. Domenico Searlatti had a son, GIUSEPPE (born 1718, died 1796), who was also known as an eminent musician.

SCARLET COLORS. Cochineal furnishes the only scarlet color generally employed in dyeing, and for this purpose it is very extensively used; a solution of tin and cream of tartar is employed as the mordant to fix it. Scheffer, who produced the best formula for dyeing this color, also added starch, the proportions being as follow: Starch, 9 lbs.; cream of tartar, 9 lbs. 6 oz.; solution of tin, 9 lbs. 6 oz.; and cochineal, 12 lbs. 4 oz. These are the quantities required for 100 lbs. of wool or cloth.

SCARLET RUNNER. See KIDNEY BEAN.

SCARP. See ESCARP.

SCARPA, ANTONIO, a celebrated anatomist, was born on June 13, 1747, at Castello-Motta, a village in the Friuli. He was educated at Padua, where his ardor attracted the attention of the octogenarian Morgagni, who, having lost his sight shortly after the arrival of Scarpa at the university, engaged the young enthusiast as his secretary, and dictated to him in Latin the answers which he made to letters soliciting his advice. The intervals between their medical studies were employed by Morgagni and Scarpa in the perusal of the Latin authors, and it is to this practice that we must ascribe the elegance that distinguished the scientific style of Scarpa in his subsequent publications. In 1772 he was appointed professor of anatomy in Modena. He afterward visited France, Holland, and England; and while in London, was so enamored of John Hunter's museum, that he did not rest until he had constructed a similar one at home. In 1783 he filled the anatomical chair at Pavia. He made, in the following year, a journey throughout the greater part of Germany, and in the course of it acquired the experience that made him one of the greatest clinical surgeons in Europe. On his return to Pavia, he published in rapid succession treatises on the anatomy of the organs of smell and hearing; on the nerves of the heart, and on the minute anatomy of bone. These, especially that on the innervation of the heart, which settled the question whether that viscus was supplied with nerves, gave Scarpa a European reputation. His work on the diseases of the eye, published in 1801, was followed in 1804 by his observations on the cure of aneurism. But his greatest achievement was his work on hernia, published in 1809. His reputation was now at its highest, but three years afterward, he had to give up the work of public teaching, and entered, in 1814, on the office of director of the medical faculty of Pavia. His next publication was some valuable observations on the operation for stone. For the last years of his life he suffered from almost total blindness, until, on Oct. 30, 1832, he died at Pavia, of inflammation of the bladder. Scarpa's merits as an observer, a teacher, and a writer were very great. Industrious, scholarly, artistic, he appeared to great advantage in nearly every subject he undertook.

SCARPANTO (anc. *Carpantos*), an island in the Mediterranean, belonging to Turkey, midway between the islands of Rhodes and Crete. It is 32 m. long, and about 8 m. in extreme breadth, and its surface is covered with bare mountains, which reach the height of 4,000 feet. The ruins of towns, which are found in several places, seem to indicate that formerly the island was well peopled. At present the inhabitants are only about

5,000 in number, and are mostly employed as carpenters and workers in wood, a trade of which they seem peculiarly fond, and in commerce.

SCARPE, in heraldry, a diminutive of the bend sinister, being half the breadth of that ordinary.

SCARRON, PAUL, the creator of French burlesque, was b. at Paris in 1610. His father, a counselor of parliament, was a man of fortune and good family; but he having married again after the death of Paul's mother, discord broke out between the second wife and her step-children, the result of which was that Paul had to leave the house. About 1634; he visited Italy, where he made the acquaintance of Poussin the painter. On his return to Paris, he delivered himself over to a life of very gross pleasure, the consequence of which was that, in less than four years, he was seized with permanent paralysis of the limbs. What makes this incident in his career still interesting is the fact, that it undoubtedly exercised no inconsiderable influence on the development of his peculiar genius, which, as a French critic justly says, was "the image of his body." His love of burlesque, of malicious buffoonery, of profane gaiety, was simply a way of escape through the gates of mockery from the *tourmens recheus* of his incurable ailment. His scramble for the means of living is excusable when we consider his hapless infirmity. He wrote verses, flattering dedications, begging-letters for pensions, etc.; and in 1643 he even managed to get a benefice at Mans, which he held for three years, when he returned to Paris, and lived in a sort of elegant Bohemian style. He had a pension from Mazarin of 500 crowns; but when the cardinal declined (probably from avarice) to allow the *Typhon* to be dedicated to him, Scarron got absurdly indignant, and joining the Frondeurs, lampooned Mazarin with spleenful virulence. However, when the war of the Fronde was at an end, and Mazarin had triumphed, Scarron was ready with an ode to

Jule, autrefois l'objet de l'injuste satire.

This baseness, however, did not win him back his pension, which the "object of his unjust satire" had withdrawn; and it might have fared hard with the poet had other friends not started up—for example, Fouquet, who granted him a pension of 1600 crowns—and had he himself not been the most consummate beggar that ever lived. If he could not get a benefice or a purse of gold, or a lodge at court, he would take a load of firewood, or a carriage, pasties, capon, cheese, poodles, etc.—nothing came amiss; and his ample acknowledged rements showed how thoroughly he had mastered the art of expressing gratitude. Doubtless his physical helplessness induced this bad habit, but his importunities were so pleasantly worded that they never estranged the friends on whom he fastened. In 1653, Scarron married François d'Aubigné—a girl of 17, who subsequently became the mistress of Louis XIV., and is known as Madame Maintenon (q.v.). He died early in October 1660—the exact date is not known, but he was buried on the 7th. It is a proof of the charm of his company that his rooms were frequented by most of the men and women of his day who were distinguished either in literature or society. Among his works may be mentioned *Le Typhon*, *Virgile Travesti* (Par. 1648-52), *La Mazarinade* (1649), *La Bironade*, *Léandre et Héro*, *Ode Burlesque*, *La Relation du Combat des Purques et des Poëtes sur la Mort de Voiture*, *Poésies Diverses* (Par. 1643-51), comprising sonnets, madrigals, epistles, satires, songs, etc.; *Le Roman Comique* (Par. 1651), a most amusing account of the life led by a company of strolling players—it is the best known, and perhaps the best of all Scarron's productions; *Nouvelles Tragico-miques*, from one of which (*Les Hypocrites*) Molière has taken the idea of Tartuffe; besides a number of clever but coarse comedies. The editions of his works are very numerous, but the best is that of Bruzen de la Martinière (Amster., 10 vols., 1737; Par., 7 vols., 1786). Victor Fournel, to whom we are indebted for most of the information in this article, republished *Le Roman Comique*, in 1837, and *Le Virgile Travesti* in 1858.

SCATTERY ISLAND, a small islet in the estuary of the Shannon, 3 m. s.w. of the town of Kilrush. Besides a fort, the islet contains fragments of several small churches, and an ancient round tower 120 ft. high.

SCAUP DUCK, *Fuligula*, or *Nyroca*, *marila*, an oceanic species of duck, of the same genus with the pochard (q.v.) an inhabitant of the northern parts of the world, spending the summer in arctic or subarctic regions, and visiting the coasts of Britain and of continental Europe as far s. as the Mediterranean in winter, when it is also to be seen in great flocks in the United States, not only on the sea-coast, but on the Ohio, Mississippi, and other rivers. It breeds in fresh-water swamps. It is nearly equal in size to the pochard. The male has the head, neck, and upper part of the breast and back black, the cheeks and sides of the neck glossed with rich green; the back white, spotted and striped with black lines; the wing-coverts darker than the back, the speculum white; the rump and tail-coverts black. The female has brown instead of black, and old females have a broad white band around the base of the bill. The flesh of the scaup duck is tough, and has a strong fishy flavor.

SCAURUS, MARCUS ÆMILIUS, B.C. 163-89; b. Rome; served with distinction in the army, and became curule ædile in 123. He was elected *prætor urbanus* in 120, and consul in 115. During his term in the latter office, he was made *princeps senatus*, and

awarded a triumph for his defeat of the Ligurians. In 112 he headed a legation to Jugurtha in Africa for the purpose of persuading the latter to redress the injuries which he had done to Adherbal. The mission failed, and in the subsequent war Scæurus was legate of the consul Bestia. Scæurus, with others, was bribed by Jugurtha to negotiate peace, but escaped punishment. He was again consul in 107. His son, MARCUS ÆMILIUS, was Sulla's stepson, and acquired an immense estate by his stepfather's proscription, and by receiving bribes in Asia, when he was *questor* to Pompey. He spent his riches in celebrating the games while curule ædile, was prætor in 53, and gained another fortune by his extortions in Sardinia, which he governed in 55. He was tried, defended by Cicero and Hortensius, and acquitted.

SCÆTTÆ. See NUMISMATICS.

SCENA. See THEATER.

SCÉPTER (Gr. *skēptron*, staff; from *skēpto*, to send or thrust) originally a staff or walking-stick, hence in course of time, also a weapon of assault and of defense. At a very early period the privilege of carrying it came to be connected with the idea of authority and station. Both in the Old Testament and in Homer, the most solemn oaths are sworn by the scepter, and Homer speaks of the scepter as an attribute of kings, princes, and leaders of tribes. According to Homer, the scepter descended from father to son, and might be committed to any one to denote the transfer of authority. Among the Persians, whole classes of persons vested with authority, including eunuchs, were distinguished as the "scepter-bearing classes." The scepter was in very early times a truncheon pierced with gold or silver studs. Ovid speaks of it as enriched with gems, and made of precious metals or ivory. The scepter of the kings of Rome, which was afterward borne by the consuls, was of ivory and surmounted by an eagle. While no other ensign of sovereignty is of the same antiquity as the scepter, it has kept its place as a symbol of royal authority through the middle ages and down to the present time. There has been considerable variety in its form; the scepter of the kings of France of the first race was a gold rod as tall as the king himself.

SEPTICISM. See SKEPTICISM, *ante*.

SCHADOW, GODESHAUS FRIEDR. WILH. VON, a distinguished German painter, of the Düsseldorf school, was b. at Berlin, Sept. 6, 1789. His father, Joh. Gottf. Schadow, an eminent sculptor, died director of the Berlin academy of arts, in 1850. At first young Schadow did not give much promise of excellence, but during his first visit to Rome, the influence of Overbeck, Cornelius, Führich, Veit, etc., awoke his dormant genius, and both singly and in company with some of these artists, he executed several pictures remarkable for their depth of religious sentiment; as "An Explanation of the Dream of Joseph," and "The Grief of Jacob when told of the Death of his Son." While residing in the city of the pope, he passed over to Roman Catholicism. Scarcely had Schadow returned to Berlin when he was appointed professor of the academy, and soon gathered round him a host of brilliant pupils; but in 1826 he went to Düsseldorf as successor of Cornelius, in the direction of the notable academy there. His pupils followed him, and ever since the "Düsseldorf school" has been associated specially with their names. Schadow's principal works are "Mignon" (1828); "The Four Evangelists," "The Wise and Foolish Virgins," "The Source of Life," "The Assumption," and "Heaven," "Purgatory," and "Hell." Schadow was ennobled in 1843. *Der Moderne Vasari* (1854) is a book from his hand. He died Mar. 19, 1862.

SCHAFF, PHILIP, S.T.D., LL.D.; b. Coire, Switzerland, 1819; studied at Stuttgart, Tübingen, Halle, and Berlin; traveled in 1841 as private tutor in France, Switzerland, and Italy; returned to Berlin and lectured on theology 1842-44; emigrated to America in 1844: professor of theology in the German Reformed theological seminary at Mercersburg, Penn., 1844-62; lectured at Andover on church history, 1862-67; secretary of the New York Sabbath committee, 1864-69; elected professor of church history in Hartford theological seminary in 1868; became professor of church history in the Union theological seminary, New York in 1871, which position he still holds. Of his numerous works the following are the most important: *The Sin against the Holy Ghost*; *James the Brother of the Lord*; *The Principle of Protestantism as related to Romanism and the Present State of the Church*; *History of the Apostolic Church, with a General Introduction to Church History*; *The Life and Labors of St. Augustine*; *America: A Sketch of the Political, Social, and Religious Character of the United States of America*; *Germany, its Universities, Theology, and Religion*; *History of the Christian Church from the Birth of Christ to the Reign of Constantine*; *German Hymn-Book*; *Essay on the Moral Character of Christ*; *The Christ of the Gospels*; *Essay on Slavery and the Bible*; *The Civil War in America*; *The Creeds of Christendom*. He was editor of several German reviews, and a copious contributor to many American and European periodicals. He is the editor of Lange's Commentary, and the secretary of the American committee for the revision of the authorized version of the Scriptures.

SCHAFFHAUSEN, the most northern canton of Switzerland, is bounded on all sides but the s. by the duchy of Baden. Area, 116 sq.m.; pop. '70, 37,721, of whom about 34,500 are Protestants, and 3,050 are Catholics. The chief river is the Rhine, which

forms part of the southern boundary, and within the basin of which the canton is wholly included. The surface is hilly, especially in the n. and e., and of the many rich valleys that slope southward to the Rhine, that of the Klettgau is famous for its unusual fertility, and for its wines, the bouquet of which is peculiarly fine. The climate is mild; the soil, which is mostly calcareous, is generally fruitful, and agriculture is the principal branch of industry. Grain, fruits, flax, hemp, and wine are the chief crops. Iron is obtained. The sovereignty is usually exercised by the great council of 600 members, wholly renewed by ballot every four years; but the people have the right of veto. Schaffhausen sends two members to the national council.

SCHAFFHAUSEN, a t. of Switzerland, capital of the canton of the same name, beautifully situated on the right bank of the Rhine, immediately above the celebrated falls of that river. Higher up the slope on which the town stands is the curious castle of Munoth, and this edifice and the minster, founded in 1052, are the chief buildings. The town is remarkable for the antique architecture of its houses. The old wall and gateways of Schaffhausen are also very picturesque. Pop. '70, 10,300, partly engaged in the manufacture of iron, cotton, and silk goods. The *falls of Schaffhausen*, about 3 m. below the town, form, perhaps, the most imposing spectacle of the kind in Europe. The river is here 300 ft. broad, and the entire descent is about 100 feet. From a projecting balcony, which overhangs the roaring cataract, the visitor may appreciate the full grandeur of the fall.

SCHALL, JOHANN ADAM VON, a celebrated Jesuit missionary to China, was b. of noble family at Cologne in 1591, and having made his studies and entered the Jesuit order in Rome in 1611, he was selected, partly in consequence of his great knowledge of mathematics and astronomy, to form one of the mission to China in 1620. Having, with the characteristic skill and ability of his order, turned to good account among the Chinese his familiarity with mathematical and mechanical science, he not only succeeded in forming a flourishing mission, but was ultimately invited to the imperial court at Peking, where he was entrusted with the compilation of the calendar, and the direction of the public mathematical school, being himself created a mandarin. Such was his favor with the emperor, that, contrary to all the received etiquette, he had the privilege of free access to the presence of the emperor Chun-Tehe, the founder of the Tartar dynasty (1645), and was honored by visits from the emperor at four stated times in each year. Through this favor with the emperor, Schall obtained an edict which authorized the building of Catholic churches, and the liberty of preaching throughout the empire; and in the space of 14 years the Jesuit missionaries in the several provinces are said to have received into the church 100,000 proselytes. On the death of this emperor, however, a change of policy fatal to the prospects of Christianity took place. The favorable edict above referred to was revoked; Schall was thrown into prison and sentenced to death. He was afterward liberated; but he was again imprisoned, and, at the end of a long incarceration, died Aug. 15, 1669. He had acquired a perfect mastery of the Chinese language, in which he compiled numerous treatises upon scientific and religious subjects. A large MS. collection of his remains in Chinese, amounting to 14 volumes in 4to, is preserved in the Vatican library. He also translated into Chinese several works, doctrinal and medical, especially some treatises of father Lessius, a Flemish Jesuit, the most important of which was that *On the Providence of God*.—See Mably's *Histoire Générale de la Chine* and Hue's *Le Christianisme en Chine*.

SCHÄS BURG, or SCHÄSSBURG (Magyar, *Szeged*), a t. of Austria, in Transylvania, on the great Kokel. It consists of the burg or upper town and the lower town. Pop. '69, 8,204.

SCHAUFFLER, WILLIAM GOTTLIEB, D.D., PH.D., LL.D.; b. Stuttgart, Germany, in 1798; went with his parents at the age of six to Odessa, Russia; at the age of 23 became religiously impressed, and desired to be a missionary; began to study English with a young English merchant in 1825; met at Odessa the eccentric Joseph Wolf, and accompanied him to Turkey for mission work, but, convinced that he needed more study, resorted to America by advice of the rev. Jonas King, whom he met at Smyrna; went to Andover; worked part of the time at his trade as a turner. After a three years' course in the theological seminary, he remained another year studying Chaldee, Syriac, Arabic, Persian, Turkish, and Spanish; was ordained in 1832 and sent by the American board to Paris to study Arabic and Persian with De Sacy, and Turkish with prof. Kieffer; went to Constantinople; preached in German, French, Spanish, Turkish, and English. By appointment of the British and foreign American Bible societies, he devoted himself to the translation of the Bible into the Ottoman, or the higher and purer Turkish language. In 1867 he received the degree of D.D. and PH.D. from the universities of Halle and Wittenberg. He published, twice, an ancient Spanish version of the Old Testament, revised by himself, with the Hebrew original, in parallel columns, a grammar of the Hebrew language in Spanish, and a Hebrew and Chaldee lexicon of the Old Testament in the same language; *Meditations on the Last Days of Christ*, discourses delivered in Constantinople, first printed in Boston in 1837, and recently issued by the American tract society. He contributed articles in Spanish to a missionary periodical in Salonica.

SCHAUMBURG-LIPPE, a sovereign German principality, includes the western part of the former county of Schaumburg, and is bounded on the w. by Westphalia and the n. by Hanover. Area 170 sq.m.; pop. '75, 33,123. Till 1866 the constitution was on the ancient patriarchal basis; but since, the Schaumburg-Lippe has a representative diet of 15 members, 10 of whom are elected by the towns and the country districts, the rest by the prince, the nobility, and the clergy and educated classes. It has one vote in the federal council of the German empire, and sends one deputy to the Reichstag. The revenue of Schaumburg-Lippe in 1878-79 was £35,225; the expenditure just balanced it. The debt amounted to £18,000, besides £55,800 as quota toward the paper money of the empire.

SCHEELE, CHARLES-WILLIAM, an eminent Swedish chemist, was b. at Stralsund, 1742, and after receiving a brief and incomplete education was apprenticed to an apothecary at Gothenburg, where he laid the foundation of his knowledge of chemistry. In 1767 he settled at Stockholm as an apothecary; and in 1770 removed to Upsala, where at that time the celebrated Bergmann was professor of chemistry. It was during his residence at Upsala that he carried on those investigations in chemical analysis which proved so fruitful in important and brilliant discoveries, and placed their author by the side of Linnæus and Berzelius, his countrymen—in the front rank of science. In 1777 he removed to Köping to take possession of a vacant apothecary business, but died of ague-fever, May 24, 1786, at a time when he was receiving the most tempting offers from England to persuade him to settle in that country. The chief of his discoveries were tartaric acid (1770), chlorine (1774), baryta (1774), oxygen (1777), and glycerine (1784), the second last of which had been previously made known through the labors of Priestley, though Scheele was not aware of this till after his own discovery of it in 1777. In experimenting on arsenic and its acid, he discovered the arsenite of copper, which is known as a pigment under the name of *Scheele's green* or *mineral green*. In 1782, during an eminently delicate and subtle investigation to determine the nature of the coloring matter in Prussian blue, he succeeded in obtaining, for the first time, prussic acid in a separate form. The mode and results of his various investigations were communicated from time to time, in the form of memoirs, to the academy of Stockholm, of which he was an associate, and also in his chief work, the *Chemical Treatise on Air and Fire* (1777), and in an *Essay on the Coloring Matter in Prussian Blue* (1782).

SCHEELE'S GREEN. See ARSENIOS ACID.

SCHEFFER, ARY, a French painter, b. at Dort, in Holland, Feb. 10, 1795; studied under Guérin of Paris, and made his début as an artist in 1812. Some years later appeared his "Mort de Saint-Louis," "Le Dévouement des Bourgeois de Calais," and several *genre* pieces, such as "La Veuve du Soldat," "Le Retour du Conscrit," "La Sœur de Charité," "La Scène d'Invasion," etc., which have been popularized in France by engravings; but compared with his later performances these early pictures have little merit. It was not till the "Romantic" movement reached art that Scheffer began to feel conscious of his peculiar power. The influence of Goethe and Byron became conspicuous in his choice of subjects, and to the remarkable facility of execution that had always marked him, he now added a subtlety and grace of imagination that give an inexpressible charm to his works. The public admired his new style greatly, and lavished eulogy with liberal hand on his "Marguerite à son Rouet," "Faust Tourmenté par le Doute," "Marguerite à l'Eglise," "Marguerite au Sabbat," "Marguerite sortant de l'Eglise," "Marguerite au Jardin," "Marguerite à la Fontaine," "Les Mignons," "Le Larmoyeur," "Francesca de Rimini," etc. Toward the year 1836 his art underwent its third and final phase—the religious. To this class belong his "Le Christ Consolateur," "Le Christ Rémunérateur," "Les Bergers conduits par l'Ange," "Les Rois Mages déposant leurs Trésors," "Le Christ au Jardin des Oliviers," "Le Christ portant sa Croix," "Le Christ enseveli," and "Saint Augustin et sa Mère Sainte Monique," some of which are well known in England by engravings. Scheffer also executed some remarkable portraits; among others, those of LaFayette, Béranger, Lamartine. He died at Argenteuil, near Paris, June 15, 1853.

SCHELDT, THE (pron. *Skelt*; Lat. *Scaldis*, Fr. *l'Escaut*) rises in the French dep. of Aisne, flows northerly to Cambrai, Valenciennes, Bouchain, and Condé, when, entering Belgium, it passes Doornik, Oudenarde, Ghent, Dendermonde, Rupelmonde, and Antwerp, having received, among other tributaries, the Lys, Dender, and Rupel. Navigable from its entrance into Belgium, the Scheldt at Antwerp becomes a noble river, of sufficient depth for large ships. From Antwerp the course is n.w. to fort Bath, in the Netherlands, where, coming in contact with the island of South Beveland, it divides into two arms. The left or southern, called the Honte or Western Scheldt, takes a westerly direction, s. of the islands of Zeeland, and meets the North sea at Flushing; the northern or right arm, called the Kreekerak, flows between Zeeland and North Brabant, near Bergen-op zoom, dividing again into two branches, the left, called the Easter Scheldt, passing between the islands of Tholen and Schouwen on the right, and the Bevelands on the left, reaches the sea through the Roompot (*Romanorum portus*); the other branch, flowing between North Brabant and Zeeland, discharges itself by several passages. These several mouths of the Scheldt, forming various islands, are called the Zeeland streams.

The Dutch had long monopolized the navigation of the lower Scheldt; and by the treaty signed in London (April 19, 1839), the Netherlands secured the right of levying 2s. 6d. per ton on all vessels. By a treaty signed at Brussels, July 16, 1863, this toll has been bought up, nominally by Belgium, but in reality from a sum of £750,000 paid to that country by the powers whose ships navigate the Scheldt, the proportion falling to Great Britain being fully £350,000.

SCHELLENBERG, a village in the s.e. of upper Bavaria, 6 m. s.w. of the Austrian town of Salzburg, near which occurred the first battle of the "war of the Spanish succession," in which the English took part. Maximilian-Emmanuel, elector of Bavaria, had fortified the hill of Schellenberg to resist the progress of Marlborough; but on July 4, 1704, the work was attacked by the English, led on by prince Ludwig of Baden, and carried by storm after a bloody fight.

SCHELLING, FRIEDR. WILH. JOS. VON, an illustrious German philosopher, was b. at Leonberg, in Württemberg, Jan 27, 1775, studied at Tübingen and Leipsic, and in 1798 proceeded to Jena, then the headquarters of speculative activity in Germany, through the influence of Reinhold and Fichte. Schelling's philosophical tendencies were originally determined by Fichte; in fact, he was at first only an expounder, though an eloquent and independent one, of the Fichtian Idealism, as one may see from his earliest speculative writings, *Ueber die Möglichkeit einer Form der Philosophie* (On the Possibility of a Form of Philosophy, Tüb. 1795), *Vom Ich als Princip der Philosophie* (Of the Ego as the Principle of Philosophy, Tüb. 1795), and others. Gradually, however, Schelling diverged from his teacher, and commenced what is regarded as the second phase of his philosophy. Fichte's idealism now seemed to him one-sided and imperfect through its rigorous and exclusive subjectivity, and he sought to harmonize and complete it. The result of his speculations, in this direction, was the once famous *Identitätsphilosophie* (Philosophy of Identity), which claimed to show that the only true knowledge, and, therefore, the only philosophy, was that of the infinite-absolute, in which the "real" and ideal, "nature" and "spirit," "subject" and "object," are recognized as absolutely the same; and which affirmed the possibility of our attaining to such knowledge by a mysterious process, known as "intellectual intuition." The "Philosophy of Identity," though only the second stage in Schelling's speculative career, is the most important, and is the one by which he is best known in England—sir William Hamilton having elaborately discussed it, and endeavored to demonstrate its untenableness in his essay on the "philosophy of the conditioned" (see *Discussions in Philosophy and Literature, Education and University Reform*, 1852). The principal works in which it is more or less completely developed, are *Ideen zu einer Philosophie der Natur* (Ideas toward a Philosophy of Nature, Leips. 1797, 2d ed. 1803); *Von der Weltseele eine Hypothese der Höhern Physik zur Erläuterung des Allgemeinen Organismus* (Of the World-soul, an Hypothesis of the higher Physics in elucidation of the Universal Organism, Hamb. 1798, 3d ed. 1809); *Erste Entwurf eines Systems der Naturphilosophie* (First Attempt at a Systematic Philosophy of Nature, Jena, 1799); and *System des Transcendentalen Idealismus* (System of Transcendental Idealism, Tüb. 1800). In 1803, after the departure of Fichte from Jena, Schelling was appointed to succeed him, but in the following year went to Würzburg, whence, in 1808, he was called to Munich as secretary to the academy of arts, and was ennobled by king Maximilian-Joseph. Here he lived for 33 years, during the last 14 of which he occupied the chair of philosophy in the newly-established university of Munich, but in 1841 he followed a call from Friederich-Wilhelm IV. to Berlin, where he mainly resided for the rest of his life. He died at the baths of Ragaz, in Switzerland, Aug. 20, 1854. We now revert to Schelling's philosophical career. What may be regarded as its third period, if not its third phase, is chiefly marked by incessant controversy. With the exception of *Bruno, oder über das Göttliche und Naturliche Princip der Dinge* (Bruno, a Dialogue concerning the Divine and Natural Principle of Things, Berl. 1802), and the *Vorlesungen über die Methode des Akademischen Studiums* (Lectures on the Method of Academical Study, Stuttgart, and Tüb. 1803), most of Schelling's writings are polemical—often hotly so. The most notable are, his *Philosophie und Religion* (Tüb. 1804), in reply to Eschenmayer; *Denkmal der Schrift von den Göttlichen Dingen* (Tüb. 1812), in reply to Jacobi; and *Darlegung des Wahren Verhältnisses der Naturphilosophie zur verbesserten Fichte'schen Lehre* (Statement of the true relation of the Nature-philosophy to the improved Fichtian Doctrine, Tüb. 1806). Meanwhile, a most formidable adversary had risen up in his old college friend Hegel (q. v.), who was at first an ardent disciple of Schelling's, just as Schelling had been of Fichte, but who had, in a similar manner, broken away, and was now pursuing an independent, and professedly antagonistic, course of speculation. During the reign of Hegelianism, Schelling preserved an almost unbroken silence. For more than 20 years he published almost nothing, but we know that he was far from being idle. He was observing narrowly the practical as well as the speculative results of the rival system, and maturing his own philosophy for the final phase which it assumed, and which he called variously, the "positive," the "historical," and the "system of freedom"—the design of which was to interpret, at once philosophically and reverentially, the history, and, especially, the religious history of mankind. Schelling admitted that his earlier speculations, though sound in themselves, attained only to "negative" truth, and to show that the most transcendental metaphysician need not be a Pantheist, but

might be a believer in a personal God, or even in a Trinity, with a whole Augsburg Confession to boot, he began to apply or develop in a practical way what he conceived to be the principles of his system. It cannot be said that the result has proved satisfactory, though many of his contemporaries thought it would—Neander, for example, dedicating to him, in the most eulogistic terms, the first volume of his *Kirchengeschichte*, on the ground that it was in harmony with Schelling's new philosophy. The writings that contain the fruits of Schelling's latest thinking were for the most part posthumously published, although a general idea of them had become known to the public through such lectures as those on the *Philosophy of Mythology*, and the *Philosophy of Revelation*. Schelling's *Sämmtliche Werke* (14 vols. Stuttg. 1856-61) were edited by his sons, Karl Friedr. Aug., and Hermann Schelling. His correspondence was published at Munich in 1863. Various French writers, such as MM. Matter, Remusat, Cousin, Michelet, have tried (with indifferent success) to explain the great mystic to their countrymen; and English philosophical literature is dubiously associated with his name, through what may be called the somnambular plagiarisms of a kindred genius, Samuel Taylor Coleridge. These were first pointed out by prof. Ferrier in *Backwood's Magazine*, Mar. 1840.

SCHEM, ALEXANDER J. B., b. Westphalia; studied at Paderborn, Bonn, and Tübingen; co-editor, 1849-51, of *Westphalisches Kirchenblatt*, and editor of *Volksblatt für Stadt und Land*; editorially connected with the *Methodist Quarterly Review* and *The Methodist*; has contributed to the *Independent*, *Christian Advocate*, *The World*, and *Appleton's* and *McClintock and Strong's Cyclopaedia*. He published, with rev. George R. Crooks, a *Latin-English School Lexicon*, and was one of the editors of Steiger's *Cyclopaedia of Education*.

SCHEMNITZ, the largest and most famous mining town of Hungary, stands in a narrow mountain gorge, at the height of 1054 ft., on a river of the same name, 70 m. n. of Pesth. Together with its six suburbs, some of which, however, are at a distance of several miles, it has a pop. of 22,000; but the town proper has only (1869) 14,029 inhabitants. The academy for mining and woodcraft, embracing collections of minerals and a chemical laboratory, is the principal building, and forms the chief architectural feature of the town. It is attended by about 200 students, who receive lessons from six professors. A highly-esteemed kind of tobacco-pipe heads are manufactured here. The mines, which extend under the town, have been worked for centuries, though recently they have yielded but an inconsiderable profit. They produce gold and silver, as well as copper, iron, and sulphur. One of the passages is more than 9 m. long. Twelve of the mines belong to the crown, the others are private property.

SCHENCK, NOAH HUNT, D.D., b. New Jersey, 1825; graduated at Princeton college in 1844, and at Gambier theological seminary in 1853; ordained a minister of the Protestant Episcopal church, rector, for several years, of Emmanuel church, Baltimore; became pastor of St. Ann's church, Brooklyn, N. Y., in 1867. He established and edited, 1858-60, the *Western Churchman*, Chicago; was co-editor of the *Protestant Churchman* in 1867; contributed to the *Western Episcopalian*, and published numerous sermons, essays, treatises, and orations.

SCHENCK, ROBERT CUMMING, b. Ohio, 1809; graduated at Miami university 1827; taught there; admitted to the bar; served in the state legislature; in 1843 elected to congress, where he served four terms; minister to Brazil 1851-53. When the war broke out he was made brigadier, of volunteers, and served at Bull Run, in West Virginia, and in the Shenandoah valley. In the second battle of Bull Run he commanded a division under Sigel, and had his arm shattered by a ball. He continued in the army, but in 1863 was again elected to congress, where he remained until 1871, when he was appointed minister to England by president Grant, which position he held until the spring of 1876.

SCHENECTADY, a co. in e. New York, intersected in the e. by the Erie canal, the New York Central, the Schenectady and Saratoga, the Schenectady and Troy, the Schenectady and Duaneburg, and the Albany and Susquehanna railroads; 200 sq. m.: pop. '80, 23,558—19,808 of American birth, 162 colored. It is drained by Norman's Kill, the Mohawk, and Schoharie rivers. Its surface is uneven, and the soil in the e. along the Mohawk valley is very fertile, producing grain, tobacco, broom corn, and dairy products. The pasturage is excellent, and large numbers of live stock are raised. Among the industries are the manufacture of brooms and brushes. Co. seat, Schenectady.

SCHENECTADY, a city of New York, on the Erie canal and the south bank of the Mohawk river, 16 m. n.w. of Albany. It is the seat of Union college, and contains 17 churches, 4 banks, 6 newspapers, large machinery and locomotive works, 4 foundries, cotton-mills, and manufactories of shawls, agricultural implements, etc. Schenectady was settled by the Dutch in 1661. In 1690 a large number of the inhabitants were massacred by the French and Indians. Pop. in 1870, 10,890.

SCHENECTADY (*ante*), the chief town in Schenectady co., N. Y.; 17 m. n.w. of Albany; on the New York Central, the Albany and Susquehanna, the Schenectady and Duaneburg, and the Rensselaer and Saratoga railroads. Pop. 80,13,675. The city charter was obtained in 1798. Union college, situated here, was founded in 1795. Schenectady is noted as the seat of this university and for its many and varied manu-

factures; there are several brush factories, locomotive works, and flour mills; other articles manufactured are agricultural implements, woolen goods, stoves, etc.; there are 4 banks, 4 hotels, 15 churches, 2 daily and 4 weekly papers.

SCHENKEL, DANIEL, b. Switzerland 1813; studied theology at Basle and Göttingen; professor of theology at Basle in 1849, and at Heidelberg in 1851. He published *Christliche Dogmatik*, 2 vols.; *Das Charakterbild Jesu*; *Das Wesen des Protestantismus*, 3 vols.; besides many essays and pamphlets, and edited *Allgemeine Kirchliche Zeitschrift*; *Allgemeine Kirchenzeitung*; *Bibel-lexicon*.

SCHERZO (Ital. jest, sport), in music. A term applied to a passage or movement of a lively and sportive character, forming part of a musical composition of some length, as a symphony, quartet, or sonata.

SCHIEVENINGEN (pron. *Skäveningen*), a populous and thriving village in s. Holland, is situated on the coast of the North sea, about two miles from the Hague. Pop. about 8,500. Fishing is the chief industry; ship-building, rope-spinning, and making sail-cloth being also carried on. It is the most fashionable sea-bathing resort in the Netherlands, and is visited by many distinguished strangers, there being an excellent "bath house," and other hotels. In the neighborhood are summer residences of the royal family and nobility. A range of sand hills defends the village from the sea, which has, nevertheless, made so great encroachments that the Protestant church, originally built in the center, is now close by the strand. The road from the Hague to Schieveningen is a long avenue of fine trees and wooded banks, with a tramway for passengers and goods.

SCHIEDAM, a t. in s. Holland, situated on the Schie, which is connected with the Maas by a canal. Pop. ('75) 21,103, of whom nearly two-thirds are Protestants. The streets are narrow, irregularly built, and, compared with other Dutch towns, have a dirty appearance, from the distilleries, malting-works, and grain-mills. Gin is so largely manufactured that the air and water smell and taste of it. In 1875, 418,572 hectoliters of spirits were produced, the grain-mills and malt-works giving 24,040,771 kilogrammes of rye-meal, and 21,150,331 of malt. The neighboring meadows are rich in cattle, partly fed from distillery refuse. Imported 660,000 hectoliters rye, 900,000 barley, 17,670 wheat, etc.; exported 54,940 hectoliters of spirits, 7,600,000 kilos of yeast, etc. The stearine factory used 4,700,000 kilos tallow and palm oil, producing 1,405,000 kilos stearine in cakes, 1,825,000 kilos candles, 1,404,000 oleine, and 244,500 of glycerine. Beer-brewing, metal-founding, basket-making, cork-cutting, etc., are carried on.

SCHILLER, JOHANN CHRISTOPH, FRIEDRICH VON, one of the greatest poetical geniuses of Germany, was b. at Marbach, a little town of Württemberg, on Nov. 11, 1759. His father, Joh. Kaspar Schiller, was overseer of the nurseries attached to a country-seat of the duke of Württemberg. Schiller received his first formal instruction from the parish priest Moser, at Lorch; and in 1773, the duke, who had formed a favorable opinion both of Schiller and his father, offered to educate the boy, free of expense, at the military academy founded by him at the castle of Solitude, and afterward transferred to Stuttgart under the name of Karls-schule. The offer was accepted, and entering the rigorous academy, Schiller tried to devote himself to jurisprudence. His success in the new study was small, and after two years he exchanged it for medicine. But literature, especially poetry, was the secret idol of his soul, and its chief delight. Already the characteristics of his genius—his tendencies toward epic and dramatic idealism—were showing themselves in his predilections. His first literary attempts of any moment were dramatic—*Der Student von Nissau* and *Cosmus von Medici*—which were consigned (doubtless not without reason) to the fire. Meanwhile, the poet's general intellectual culture and his professional studies went steadily on; and in 1780 he passed as a military surgeon, but with no liking for such a career. In 1778 Schiller completed the first sketch of his memorable drama, *Die Räuber* (The Robbers), the publication of which, in 1780, excited the most violent enthusiasm among the young all over Germany, so wild, and strong, and glowing were the passion and fancy displayed in it. Respectable people, dignitaries, functionaries and the like, were, of course, deeply scandalized; and the duke himself, a "serene highness" sort of man, was induced to lecture the poet on his delinquency, and forbade him to write any more poetry "without submitting it to his inspection!" In 1782 *The Robbers* was brought upon the stage at Mannheim—the poet being present without the knowledge of his superiors, the result of which was arrest for a fortnight! This led to further complications, and finally, in October of the same year, Schiller fled from the harsh service of the duke into Franconia, and lived for a year under a feigned name at Bauerbach, near Meiningen, where he completed his *Fiesco* and *Cabale und Liebe*, begun at Stuttgart. *Don Carlos* was also sketched in outline here. In Sept., 1783, he went back to Mannheim, and was for some time closely connected with actors and theatrical life. To this period belong several of his lesser poems. With the *Cabale und Liebe* above mentioned ended the first poetic period in Schiller's career, otherwise known as the *Sturm und Drang* period, in which a burning energy of passion and a robust extravagance, passing often into sheer bombast of speech, are the predominant characteristics. In Mar., 1785, Schiller left Mannheim and proceeded to Leipzig, where he became acquainted, among others, with Huber and Körner, and wrote his beau-

tiful *Lied an die Freude*; thence, after a few months, he went to Dresden, where he began the practice of composing during the night, which so fatally assisted in shortening his life. *Der Geisterscher* (The Ghost-seer), a strikingly powerful romance, was written here; and the drama of *Don Carlos* was completed. In 1787 he was invited to Weimar, and was at once warmly received by Herder and Wieland; but some years elapsed before Goethe and he could understand one another; after that, they became the closest friends. Henceforth, Schiller owed more to Goethe than to all other men: we may even call the later and best writings of Schiller inspirations of Goethe. The study of the spirit and literature of antiquity in particular exercised a wholesome influence over him, and in his *Götter Griechenlands* (Gods of Greece), which belongs to this stage, we see how calm, and clear, and sunny his once turbid and stormful imagination was gradually becoming. Reinhold of Jena introduced him to the Kantian philosophy, and for some little time Schiller was in danger of lapsing from a poet into a metaphysician. The philosophical and æsthetic treatises springing out of this new study were collected and published under the title of *Kleine prosaischen Schriften* (4 vols., Jena, 1792-1802). His *Geschichte des Dreissigjährigen Kriegs* (History of the Thirty Years' War) originally appeared in the *Taschenkalender für Damen* (1790-93). On the occasion of the poet's marriage in 1790 with Charlotte von Lengefeld, the duke of Meiningen made him a *hofrath* (privy-councillor); the French republic also conferred on him the right of citizenship; and in 1802 the emperor raised him to the rank of nobility. While staying for a year with his relatives in Württemberg he wrote his exquisite *Briefe über ästhetische Erziehung* (Letters on Æsthetic Culture). This period, reaching to the close of 1794, is generally regarded as Schiller's transition period; in poetic accomplishment it is not rich, but in earnest, thoughtful, and manifold speculation it was highly important to the poet, and we find that it prepared the way for the last and most splendid development of his genius. After 1795 the finest of his lyrics and dramas were produced—as *Der Spaziergang* and the *Lied der Glocke* (Song of the Bell) in 1796, *Wallenstein* (1799), *Maria Stuart* (1800), *Die Jungfrau von Orléans* (1801), *Bräut von Messina* (Bride of Messina, 1803), and finally, his greatest drama, *Wilhelm Tell* (1804). But his health had been long giving way, partly owing to a natural weakness of constitution, and partly to incessant application to study; and on May 9, 1805, he expired, at the early age of 46. Ever since his death the fame of Schiller has been on the increase; he has long been recognized as, next to Goethe, the greatest poet that Germany has produced, and innumerable editions of his works in whole or part have been published. The best account of him and his works is given by Carlyle in his *Life of Friedrich Schiller* (Lond. 1835).

SCHILLING JOHANNES, b. Saxony, 1828; studied art at Berlin and Dresden. He resided for a number of years in Rome, and in 1868 was made professor at the Dresden royal academy of art. His most famous works are the group representing the seasons, now at Dresden; the Schiller monument at Vienna, and the later designed life-size figures on it; and the group "Amor and Psyche."

SCHINKEL, KARL FRIEDR., a German architect of great celebrity in his own country, was b. at Neuruppin, Mar. 13, 1781, and studied the principles of drawing and design at Berlin under prof. Gilly. In 1803 he went to Italy to extend his professional knowledge; but on his return in 1805 he found the aspect of public affairs so threatening that he could obtain little employment, and was forced to betake himself to landscape-painting. In May, 1811, he was elected a member of, and in 1820 a professor at, the Berlin academy of arts. Other offices and honors were also conferred on him. He died Oct. 9, 1841. The designs to which he chiefly owes his reputation are those of the royal guard-house, the memorial of the war of liberation, the new theater, the new Potsdam gate, the artillery and engineers' school, in Berlin; the casino in Potsdam; another in the gardens of prince Karl at Blienike, near Potsdam; and a great number of castles, country-houses, churches, and public buildings. Schinkel was a man of powerful and original genius; his designs are remarkable for the unity of idea by which they are pervaded, and the vigor, beauty, and harmony of their details. See Kugler's *Karl Friedr. Schinkel* (Berlin, 1842).

SCHINUS, a genus of trees and shrubs of the natural order *anacardiaceæ*, natives of South America. The leaves so abound in a resinous or turpentine-like fluid, that upon the least swelling of the other portions of the leaf by moisture it is discharged from the sacs which contain it. Thus they fill the air with fragrance after rain, or if thrown into water, start and jump about as if alive, discharging jets of this peculiar fluid. The same phenomenon is exhibited by the leaves of some species of the kindred genus *duvaua*, of which specimens are occasionally to be seen in our greenhouses. The leaves and twigs when bruised have a very strong odor of turpentine.

SCHIO, a t. in Italy, 15 m. n.w. of Vicenza, situated in a fertile plain between the rivers Leogra and Timonchio; pop. 5,597. It contains manufactories of woolen cloth, and silk and dye works. It is somewhat noted for its mineral springs, and has churches, hospitals, and other public buildings.

SCHISM, GREEK, the separation between the Greek and Latin churches, which originated in the 9th, and was completed in the 12th c. See GREEK CHURCH

SCHISM, WESTERN, a celebrated disruption of communion in the western church, which arose out of a disputed claim to the succession to the papal throne. On the death of Gregory XI. in 1378, a Neapolitan, Bartolomeo Prignano, was chosen pope by the majority of the cardinals in a conclave at Rome under the name Urban VI. Soon afterward, however, a number of these cardinals withdrew, revoked the election, which they declared not to have been free, owing to the violence of the factions in Rome by which the conclave had, according to them, been overawed; and, in consequence, they proceeded to choose another pope under the name Clement VII. The latter fixed his see at Avignon, while Urban VI. lived at Rome. Each party had its adherents, and in each a rival succession was maintained down to the council of Pisa in 1410, in which assembly both were deposed, and a third pope, John XXIII., was elected. This measure not having been acquiesced in by all, a new council was convened at Constance in 1417, in which not alone the former rivals, but even the new pontiff elected, by consent of the two parties, at Pisa, were set aside, and Otho Colonna was elected under the name of Martin V. In this election the whole body may be said to have acquiesced; but one of the claimants, Peter de Luna, called Benedict XIII., remained obstinate in the assertion of his right till his death in 1430. The schism, however, may be said to have terminated in 1417, having thus endured nearly 40 years.

SCHISMA, the name given to one of the very small intervals known in the theory of music, which amounts to the difference between the *comma ditonicum* and *comma syntonicum*. See **COMMA**.

SCHIST (Gr. *schistos*, split) is a term applied somewhat loosely to indurated clays, as bituminous schist and mica schist. It is more correctly confined to the metamorphic strata, which consist of plates of different minerals, as mica schist, made up of layers of quartz separated by laminae of mica; chlorite schist, a green rock in which the layers of chlorite are separated by plates of granite or felspar; and hornblende schist, a black rock composed of layers of hornblende and felspar, with a little quartz.

SCHIZOPHYTE, a microscopic organism belonging to Cohn's order *schizosporea*, and allied to bacteria, having so near a relation indeed as to be regarded as a variety of *bacillus*, or as a phase in the growth of this organism. See **GERM THEORY OF DISEASE**, vol. vi., p. 647. But, in whatever manner it may be classified, a certain kind of schizophyte is one of the organisms which are regarded as *disease germs*, and, as has probably been established, is the peculiar disease germ in the *swine plague* (q.v.) of this country. Whether it has any agency in the production of other diseases is uncertain, for whatever agency disease germs have in producing disease the precise manner of communication has not been determined.

SCHLAGINTWEIT, HERMANN, ADOLF, and ROBERT, three brothers b. in Munich—Hermann 1826, and Adolf 1829; Robert being the youngest. While at the university the two older brothers made original researches, chiefly in the eastern Alps; in 1851 they explored the vicinity of Monte Rosa, the highest peak of which they were the first to ascend and measure accurately, finding its height 14,284 French feet. In 1854 the three brothers were sent out by the British East India company to continue the scientific survey of India. They ascended the Himalaya mountains, examining the glacier of Milun, 10 m. long and 3,000 ft. broad; crossing 4 passes about 18,000 ft. high; the peak of Gunshankosor, 19,640 ft. high, near the sources of the Indus; and on the highest mountain of Thibet, reached an elevation of 22,260 feet. The whole extent of their travels was about 18,000 miles. Adolf, having determined to continue his researches, advanced alone into regions of Thibet and Turkistan never visited by any scientific traveler. He lost his life 1857, probably through the hostility and misapprehension of the native tribes.

SCHLANGENBAD, one of the most distinguished spas of Germany, on the northern frontier of the Rheingau district, 6 m. w. of Weisbaden, in a beautiful and secluded situation, embosomed amid wooded hills. The water of the baths has a temperature of 80° F., and contains the muriates and carbonates of lime, soda, and magnesia, with a slight excess of carbonic acid. The baths have a marvelous effect in beautifying the skin, and in soothing and tranquillizing. The village is itself very small, and in the height of the season the pop. is only about 2,000.

SCHLATTER, MICHAEL, 1716-90; b. Switzerland; educated at St. Gall; was ordained and sent by the synods of Holland to the German Reformed emigrants in Pennsylvania; was pastor of the Reformed churches in Philadelphia and Germantown, 1746-51; and organized churches in Pennsylvania, New Jersey, Maryland, and Virginia. He assisted in organizing the synod of the German Reformed church in 1747; visited Europe in 1751, and returned with six other missionaries. In 1757 he was chaplain of an expedition to Nova Scotia against the French, and espousing the cause of the colonies at the outbreak of the revolution he was imprisoned in 1777.

SCHLEGEL, AUGUST WILHELM VON, a distinguished critic, poet, and scholar, was b. at Hanover, Sept. 8, 1767, and studied at Göttingen, where he acquired a reputation by his devotion to philological and classical studies. He first began to assume a prominent position in literature while a lecturer at Jena, contributing assiduously to Schiller's *Horen* and *Musen-Almanach*, and to the *Allgemeine Literaturzeitung*. About the same

time his translation of Shakespeare began to appear (9 vols. Berl. 1797-1810), the influence of which on German poetry and the German stage was equally great. Subsequently the poet Tieck, with Schlegel's consent, undertook a revision of the work, together with a translation of such pieces as Schlegel had omitted (12 vols. Berl. 1825, 1839, 1843); and from their conjoint labors the people of Germany are able to form a faithful idea of the surpassing genius of our countryman. Schlegel also delivered at Jena a series of lectures on æsthetics, and, along with his brother Friedrich, edited the *Athenæum* (3 vols. Berl. 1796-1800), which in spite of, perhaps because of, the severity of its criticism, gave a lively and wholesome impulse to the poetry of its time. He published besides his first volume of poems (*Gedichte*, Tüb. 1800); and, again in company with his brother, the *Charakteristiken und Kritiken* (2 vols. Königsb. 1801). In 1802 Schlegel left Jena for Berlin, where he gave a second series of lectures on literature, art, and the spirit of the time. Next year appeared his *Ion*, an antique tragedy of considerable merit. It was followed by his *Span. Theater* (2 vols. Berlin, 1803-9), consisting of 5 pieces of Calderon's, admirably translated, the effect of which has been to make that poet quite a favorite with the German people; and his *Blumensträuße der Ital., Span., und Portug. Poesie* (Berl. 1804), a charming collection of lyrics from the sunny south, from the appearance of which dates the naturalization in German verse of the metrical forms of the Romanic races. Probably his most valuable, and certainly his most widely popular work, was his *Vorlesungen über dramatische Kunst und Literatur* (3 vols. Heidelb. 1809-11), originally delivered at Vienna, in the spring of 1808, and translated into most European languages. During 1811-15 Schlegel published a new collection of his poems (*Poetische Werke*), which contains his masterpieces, "Arion," "Pygmalion," "St. Lucas," and is notable for the richness and variety of its poetic forms, as also for the singular facility and elegance of the versification. In 1818 Schlegel, now raised into the ranks of the nobility, and privileged to use the sacred *von* before his name, was appointed professor of history in the university of Bonn, and devoted himself especially to the history of the fine arts and to philological research. He was one of the first students of Sanskrit in Germany, established a Sanskrit printing-office at Bonn, and an *Indische Bibliothek* (2 vols. Bonn, 1829-35). Among the proofs of his scholarly activity in this department of knowledge may be mentioned his edition of the *Āgastya Gita*, an episode from the epic poem *Mahābhārata*, with a Latin translation (2d ed. Bonn, 1846), and of part of the *Rāmāyana* (Bonn, 1829-39). His other works it is unnecessary to mention. Schlegel was not happy in his domestic relations. He was twice married, first to a daughter of prof. Michaelis of Göttingen, and again to a daughter of prof. Paulus of Heidelberg, but in both cases a separation soon became necessary. Schlegel was quarrelsome, jealous, and ungenerous in his relations with literary men, and did not even shrink from slander when his spleen was excited. He died May 12, 1845.

SCHLEGEL, KARL WILHELM FRIEDRICH VON, distinguished both for his scholarship and intellectual ability, was a brother of the preceding, and was b. at Hanover, Mar. 10, 1772. He studied at Göttingen and Leipsic, and in 1797 published his first work, *Griechen und Römer* (The Greeks and Romans), which won praise from old Heyne. It was followed in the course of a year by his *Geschichte der Poesie der Griechen und Römer* (History of Greek and Roman Poetry), a sort of fragmentary continuation of the former. Both of these productions bore evidence of rich learning, independent thought, and a thorough appreciation of the principles and method of historic criticism; but the chief vehicle at this time for the dissemination of his philosophical views of literature was the sharp-fanged periodical called the *Athenæum*, edited by himself and his brother, August Wilhelm. Proceeding to Jena, he started there as a *privat-docent*, holding lectures on philosophy, which met with great applause, and still editing the *Athenæum*, to which he also began to contribute poems of a superior quality, and in the most diverse meters. In 1802 appeared his *Atarkos*, a tragedy, in which the antique-classical and new-romantic elements are singularly blended. From Jena, he soon went to Dresden, and thence to Paris, where he gave a few more of those philosophical prelections, in the manufacture of which both he and August Wilhelm were unhappily much too expert; edited the *Europa*, a monthly journal (2 vols. Frankf. 1803-5); and applied himself assiduously to the languages of southern Europe, and still more assiduously to Sanskrit, the fruits of which were seen in his treatise, *Ueber die Sprache und Weisheit der Indier* (Heidelb. 1808). See **PHILOLOGY**. During his residence in Paris he also published a *Sammlung Romantischer Dichtungen des Mittelalters* (Collection of Mediæval Romantic Poems, 2 vols. Par. 1804), and the pious-chivalric romance of *Lothar und Maller* (Berl. 1805). On his return to Germany he published a volume of dithyrambic and elegiac poems (*Gedichte*, Berl. 1809). At Cologne, he passed over to the Roman Catholic Church, a change to which his mediæval studies powerfully contributed, and which, in its turn, no less powerfully affected his future literary career. In 1808 Schlegel went to Vienna, where, in 1811, appeared his *Ueber die neuere Geschichte* (Lectures on Modern History), and in 1815 his *Geschichte der alten und neuen Literatur* (History of Ancient and Modern Literature). In 1822 a collected edition of his writings, in 12 vols. (*Sämmtliche Werke*), was published by himself. Subsequently he delivered two series of lectures, one on the Philosophy of Life (*Philosophie des Lebens*, Vienna, 1828),

and another on the Philosophy of History (*Philosophie der Geschichte*, Vienna, 1829), both of which are well known in England and other countries through the medium of translations. Schlegel died Jan. 12, 1829. His MSS. were published by his friend Windischmann (2 vols. Bonn, 1836-37).

SCHLEICHER, AUGUST, 1821-68; b. Germany, educated at Leipsic, Tübingen, and Bonn. He was appointed professor of philology at Bonn in 1850, and at Jena in 1857. As a comparative philologist his rank was second only to Bopp. Among his works are *Zur Vergleichende Sprachengeschichte* (1848-50); and *Compendium der Vergleichenden Grammatik der Indo-Germanischen Sprachen* (1862).

SCHLEIERMACHER, FRIEDRICH ERNST DANIEL, one of the greatest and most influential theologians of modern times, was born at Breslau, Nov. 21, 1768. His boyish years were spent in the school kept by the Moravian brotherhood at Niesky, and here he first received those religious impressions, the influence of which was visible in his whole after-life. In 1787 he proceeded to the university of Halle; and, on the conclusion of his academic course, acted for some time as a teacher; but in 1794 became assistant-clergyman at Landsberg-on-the-Warthe, where he remained for two years. He then went to Berlin, and occupied himself partly in the translation of some of Blair's and Fawcett's sermons, and in the redaction of the *Athenæum*, conducted by his friend Friedrich Schlegel; but the first work that won for him general celebrity was his *Reden über die Religion* (Discourses on Religion, Berl. 1799), which startled Germany from its spiritual torpor, vindicated the eternal necessity of religion, and sought to separate those elements of it that are essentially divine from the incrustations of dogma and the formalities of practice. Neander looked upon these *reden* as making the turning-point in his spiritual career. They are now regarded as both making and marking an epoch in the theological history of Germany. The *reden* were followed by the *Monologen*, and the *Briefe eines Predigers ausserhalb Berlin* in 1800. Two years later he was appointed preacher at the charity-house in the Prussian capital; and during 1804-10 produced his famous translation of Plato, with commentary, which is considered in Germany, to this day, the most profound and penetrating treatise on the philosophy of the great Athenian, though English scholars are disposed to regard its criticism as decidedly too subjective, and in many important respects baseless. In 1801 appeared the first collection of his *predigten* (sermons), followed between 1808 and 1833 by no fewer than six other collections. They are masterpieces of penetrating and eloquent discussion, appealing equally to the heart and the intellect of hearers and readers. In 1802 Schleiermacher went as court-preacher to Stolpe, where he published his *Grundlinien einer Kritik der bisherigen Sittenlehre*; and in 1804 was called to Halle as university-preacher, and professor of theology and philosophy. In 1807 he returned to Berlin, having previously published *Die Weihnachtsfeier, ein Gespräch* (Christmas festival, a dialogue, Halle, 1806), bearing on the calamitous state in which Germany then found herself, owing to the victorious insolence of the French. Among his next publications may be mentioned *Ueber den sogenannten ersten Brief des Paulus an den Timotheus* (concerning the so-called first epistle of Paul to Timothy, Berl. 1807). In 1809 he became pastor of Trinity church, Berlin; and in 1810, when the university of Berlin was reopened, with a brilliant array of professors, under the rectorship of Fichte, no name shone more conspicuous than that of Schleiermacher. In 1811 he was chosen a member of the Berlin academy of sciences, in whose Transactions are to be found many valuable papers by Schleiermacher on the ancient philosophy, and in 1814 secretary of the philosophical section. In 1817 he was appointed president of the synod assembled in Berlin. His latest, and perhaps his most important work is *Der Christliche Glaube nach den Grundsätzen der Evang. Kirche in Zusammenhange dargestellt* (the Christian faith systematically presented according to the fundamental propositions of the evangelical church, 2 vols. Berl. 1821-22), in which his deepest and most Christian thought is visible. He died at Berlin, Feb. 12, 1834. The list of Schleiermacher's disciples—i.e., of men who have derived the groundwork of their principles from him—is one of the most splendid that any theological reformer could show, embracing, among others, the names of Neander, Nitzsch, Twisten, Olshausen, Lucke, Bleek, and Ullmann. In 1864 appeared a posthumous work of Schleiermacher, *Das Leben Jesu, Vorlesungen an der Universität zu Berlin im Jahr, 1822*, in which he conceives of Jesus as a man in whom the divine spirit works as perfectly as it possibly can in humanity, and treats his history accordingly. Strauss has replied in a critique (Berl. and Lond. 1865). Schleiermacher was very far from what in England is called orthodox, but he was a great, earnest, devout Christian man, of massive understanding, and whose eloquence was scarcely less golden than that of Plato himself. Germany overflows with literature on Schleiermacher, his system, and his ideas.—For an account of his earlier life, see the autobiographical sketch first published in Niedner's *Zeitschrift für historische Theologie* (1851); and for his later life, *Aus Schleiermacher's Leben in Briefen* (1858; translated by Frederica Rowan, Lond. 1860).

SCHLESWIG. See SLESWICK.

SCHLETTSTADT (French *Schlestadt*), a t. of lower Alsace, on the left bank of the Ill, 26 m. s.w. of Strasburg. Till the war of 1870-71 Schlettstadt was a French fortress of the third class. It was bombarded and compelled to capitulate Oct. 24, 1870. The fortifications have been demolished. Pop. '75, 9,094; '66, over 10,000.

SCHLEUSNER, JOHANN FRIEDRICH, D.D., 1756-1831; b. Leipsic; studied theology and philosophy in Leipsic university; professor of theology in Göttingen in 1784; professor of theology, and provost of the college church in Wittenberg in 1795. His principal works are *Lexicon Græco-Lat. in Novum Testamentum*, 2 vols.; *Thesaurus, sive Lexicon* in LXX., 5 volumes. His lexicon on the Septuagint continues to be a standard work. He edited with Ständlin the *Göttingische Bibliothek der Neuesten Theologischen Literatur*.

SCHLEY, a co. in s.w. Georgia; drained by Muckalee creek, and other branches of the Flint river; about 250 sq.m.; pop. '70, 5,129—2,851 colored. The surface is level. There are great forests. The soil is fertile. The principal productions are cotton, corn, rice, and molasses. Co. seat, Ellaville.

SCHLIEMANN, HEINRICH, b. Germany, 1822; son of a Lutheran pastor, who inspired him at an early age with an enthusiastic admiration of the heroes of ancient Greece. His mother died when he was nine years old, and he then lived for two years with his uncle at Kalkhorst. At fourteen he was compelled to enter a grocer's shop at Fürstenburg to support himself. He remained in that humble position for over five years, when he obtained a position as clerk in the Amsterdam firm of B. H. Schroeder and Co. In 1846 he was sent to St. Petersburg by his firm as their local agent, and a year later established there a business of his own. In the course of a busy life he traveled extensively in Europe and America, and acquired many languages. After he had amassed wealth he commenced his archaeological investigations and excavations in the east, and published, in 1869, *Ithaque, Le Péloponèse, Troie; Recherches Archéologiques*. In 1874 he published *Troy and its Remains*, containing an account of his discoveries at Hissarlik. In 1874 he obtained permission from the Greek government to excavate Mycenæ, where, in 1877, he made the marvelous discovery of the five royal tombs, which local tradition pointed out to Pausanias as those of Agamemnon and his companions, who were murdered by Ægisthus. He then wrote in English, *Mycenæ; a Narrative of Researches and Discoveries at Mycenæ and Tiryns*. In his explorations Dr. Schliemann has been greatly assisted by his wife, who is a native of Greece, and an accomplished Greek scholar. See ARCHEOLOGY.

SCHLOSSER, FRIEDR. CHRISTOPH, a distinguished German historian, was b. at Jever, Nov. 17, 1776, educated at Göttingen, and after spending many years as a private tutor and academic teacher, he was, in 1817, called to Heidelberg as a professor of history, where he died, Sept. 23, 1861. His principal writings (arranged in the order of time) are *Abälard und Dulcin* (Gotha, 1807); *Leben Beza's und des Peter Martyr Vermili* (Heidelb. 1809); *Geschichte der Bilderstürmenden Kaiser des Oeström. Reichs* (Frankf. 1812); *Weltgeschichte in Zusammenhängender Erzählung* (Frankf. 1817-24); *Geschichte des 18 Jahrh.* (Heidelb. 1823); *Universalhistorische Uebersicht der Geschichte der Alten Welt und ihrer Cultur* (Frankf. 1826-34); *Weltgeschichte für das Deutsche Volk* (1844-53); and *Studien über Dante* (1856). Of these works, the most notable are the *Geschichte des 18 Jahrh.*, continued by Schlosser in the later editions till the fall of Napoleon, and the *Weltgeschichte für das Deutsche Volk*, which have been translated into English and other tongues. Schlosser is a keen, critical, and powerful writer, who judges men and events by a stern ethical standard.

SCHLÖZER, AUGUST LUDWIG VON, 1735-1809; b. Württemberg, studied in Wittenburg and Göttingen; was a private tutor in Sweden. In 1759 he studied medicine in Göttingen, and in 1761 accompanied the Russian historiographer Müller as literary assistant to St. Petersburg, and taught in the academy as professor of Russian history, 1765-67. In 1804 he was made privy counselor of justice. Among his most important works are a *General History of the North* and a translation of Nestor's *Russian Chronicles* to 980 A.D.

SCHMALKALD, LEAGUE OF, the name given to the defensive alliance concluded provisionally for nine years at Schmalkalden (q.v.), Feb. 27, 1531, between 9 Protestant princes and 11 imperial cities, with whom other 5 princes and 10 imperial cities subsequently made common cause; and the elector of Saxony and the landgrave of Hesse were appointed chiefs of the league, and empowered to manage its affairs. The object of this formidable alliance, which included the whole of northern Germany, Denmark, Saxony, and Württemberg, and portions of Bavaria and Switzerland, was for the common defense of the religion and political freedom of the Protestants against the emperor Charles V. and the Catholic states. The league was not rendered superfluous by the religious peace of Nürnberg in 1532, and on the rumor that the emperor was meditating new hostile measures against the Protestants, another meeting of the confederates was held Dec. 24, 1535, which resolved to raise a permanent army of 10,000 foot and 2,000 cavalry, and to prolong the league for ten years. The confederation was further consolidated by articles of guaranty which were drawn up by Luther at Wittenberg in 1536, and being subscribed by the theologians present at the meeting of the league at Schmalkalden in Feb., 1537, were called the *Articles of Schmalkald*. Against the league the emperor, engaged as he was at the time in contests with the Turks and French, found himself unable to contend, though supported by the holy league, a Catholic confederation formed in 1538, in opposition to the Protestant one. But impolitic management, mutual jealousies, and

conflicting petty interests dissipated their energies, and prevented their united action. The "war of Schmalkald" commenced by the advance of the army of the league, under Sebastian Schärtlin, into Suabia, to bar the approach of the imperial army from Italy. Schärtlin forced his way to the banks of the Danube, but the miserable jealousy of the Saxon princes paralyzed his action. The emperor, by a proclamation bearing date July 20, 1546, put the two chiefs of the league under the ban of the empire; Maurice, duke of Saxony, took possession of the electorate, by virtue of an imperial decree; and the Protestant army was forced to retreat. The elector of Saxony reconquered his electorate in the autumn of 1546, but meantime the imperial army subdued the northern members of the league of Schmalkald, and advanced into Franconia to meet the combined armies of Saxony and Hesse. The latter were totally routed at Mühlberg (April 24, 1547), and both chiefs fell into the emperor's hands. This defeat, which has been ascribed to treason, and was perhaps as much owing to this cause as to weakness, finished the war. The object of the league, the guaranty of the liberty of religion to the Protestants, was subsequently effected by Maurice, now elector of Saxony, who, by a brilliant feat of diplomacy and generalship, compelled the emperor to grant the treaty of Passau (July 31, 1552), by which this freedom was secured.

SCHMALKALDEN, an old and interesting t. of Hessen Nassau, Prussia, at the confluence of the Stille and Schmalkald, 11 m. n. of Meiningen. It is surrounded with double walls, contains two castles, and carries on considerable mining operations, especially in iron, and various manufactures, the chief of which are hardwares. Pop. '75, 6,187.

SCHMID, LEOPOLD, 1808-69; b. Zurich; studied theology at Munich and Tübingen; appointed professor of theology at Giessen in 1839, and subsequently of philosophy. Though a Roman Catholic he was opposed to the ultramontane party. He was elected bishop of Mentz in 1849, but the pope refused to confirm him. He published *Der Geist des Katholicismus oder Grundlegung der Christlichen Irenik*, 2 vols.; *Ultramontan oder Katholisch*.

SCHMIDT, HENRY I., S.T.D., b. Penn., 1806; educated at the Moravian pædagogium and the theological seminary at Nazareth, Penn.; pastor of Lutheran churches in New Jersey 1831-33; professor at Hartwick seminary, N. Y., 1833-36; pastor of a German church in Boston 1836-38; professor at Gettysburg, Penn., 1838-43; pastor of Lutheran churches in Montgomery co., N. Y., 1844; principal of Hartwick seminary, 1845-47; elected professor of the German language and literature in Columbia college, New York, in 1848. He published *History of Education and Plan of Culture and Instruction*; *The Scriptural Character of the Lutheran Doctrine of the Lord's-Supper*; *Course of Ancient Geography*.

SCHMITZ, LEONHARD, PH.D., LL.D., b. Germany, 1807; studied history and philology at the university of Bonn; became professor in a gymnasium of that city; went to England 1836; rector of the high school at Edinburgh 1845-66; classical tutor to the prince of Wales 1839, and to prince Alfred, 1862-63; principal of London international college 1866-74, afterward classical examiner in the university of London; translated into English Niebuhr's lectures and Zumpt's *Latin Grammar*; contributed to Dr. Smith's classical dictionaries and to cyclopedias; and published Latin and Greek grammars and a series of histories for colleges and schools.

SCHMUCKER, SAMUEL S., D.D., 1799-1873; b. Md.; educated at Princeton college, ordained a Lutheran minister in 1818; pastor of a church in Newmarket, Va., 1820-26; professor of didactic theology in Gettysburg theological seminary 1826-64, and also president. On his resignation he was made emeritus professor. The following are some of his publications: *Christian Temple*; *Formula of Government and Discipline*; *Plea for Sabbath-school System*; *Elements of Popular Theology*; *Discourse in Commemoration of the Glorious Reformation*; *Appeal on Christian Union*; *Retrospect of Lutheranism*; *Psychology*; *Capital Punishment*; *Christian Pulpit*; *Church Development*. He edited *Evangelisches Magazin*; contributed to *Biblical Repository* and other reviews.

SCHNEE BERG, a pleasantly-built and important mining t. of Saxony, surrounded by mountains, 20 m. s.w. of Chemnitz. The principal products of the mines are silver (though not in its former great abundance), cobalt, bismuth and nickel, iron, etc. Cloth, shoes, and segars are manufactured. Pop. '75, 8,074.

SCHNEE KOPPE, the culminating point of the mountain chain of the Riesengebirge. See BOHEMIA.

SCHNEIDER, HORTENSE CATHERINE, b. France, 1835; a French actress who played at the age of fifteen at the *Athénée* of Bordeaux. She then received instruction in singing, and played for three years at Agen in secondary parts. After that she obtained an engagement at the Bouffes-Parisiens of Paris; and in 1856 made her début in *Le Chien de Garde* at the *Théâtre des Variétés*, where in 1864 she achieved a great success by her acting in *La Belle Hélène*. She appeared in *La Grande Duchesse de Gêrolstein* in 1867 in which she won a great triumph.

SCHNEIDER, JOHANN GOTTLÖB, 1750-1822; b. Saxony; educated at Leipsic, where he devoted himself to classical literature and philology. In 1774, in association with Brunk, he prepared an edition of the Greek poets, and two years later was made professor at Frankfort-on-the-Oder. In 1811 he was called to a chair at Breslau. Besides a num-

ber of works on natural history, and editions with notes of various Greek writers, _e published, 1797-98, a critical dictionary of the Greek language.

SCHNETZ, JEAN VICTOR, 1787-1870; b. France; studied painting with David, Gros, and Regnault. He painted many religious and historical pictures, of which the best-known, perhaps, are "Christ Calling little Children unto Him," "The Monk Engaged in Prayer," and "The Gypsy Foretelling the Future of Sixtus V." He was long director of the French academy at Rome.

SCHNORR VON KARLSFELD, JULIUS, 1794-1853; b. Leipsic; received his first instruction from his father an eminent painter, studied in the academy of painting at Vienna; went to Rome, 1815, and attached himself to the school of young German artists under the auspices of Cornelius and Overbeck. Considered one of the most promising of this band, he was chosen with Cornelius and Overbeck to paint the walls of the villa Massini at Rome in fresco with designs from Dante, Ariosto, and Tasso. Ludwig, king of Bavaria, employed him to decorate his great works at Munich. Schnorr's greatest works were the frescos from the ancient German poem *Nibelungen Lied* for the new palace, and the historical paintings in encaustic in that part of the palace called *Fest-Saalbau*. He was appointed professor of historical painting in the academy of the fine arts at Munich, 1827, and in 1846 professor of the fine arts, and director of the picture gallery in Dresden.

SCHŒLCHER, VICTOR, b. France, 1804; educated at the college Louis-le-Grand. He was an early advocate of the abolition of slavery, and studied the question in Mexico, Cuba, and the United States in 1829. In 1848, as under-secretary for the navy, he secured the passage of a law abolishing slavery in the French colonies. He was returned to the constituent assembly for Guadeloupe and Martinique, and to the legislative assembly for the former. Expelled from France after the *coup d'état*, he remained in England till the fall of the second empire, when he returned to France, and during the siege of Paris commanded the artillery of the national guard. In 1871 he was returned to the national assembly for the department of the Seine, for Guiana, and for Martinique, and took his seat for the latter. He was afterward elected a life senator. He is a member of the extreme left. He has published several books on slavery, a *Life of Handel*, and *The Sunday Rest*, 1870.

SCHÖFFER or SCHAFFER, PETER, 1430-abt. 1503; b. Gernsheim; began life as a copyist in Paris, afterward employed by Gutenberg and Faust, printers, at Mainz. He is said to have "discovered the more easy method of casting types." In 1455 Gutenberg retired, and he became a member of the firm with Faust; the latter died 1466, and he carried on the business alone. His name appears with Faust's at the end of the Psalter, 1457. He married the daughter of Faust, and had three sons, all printers; John Schöffler succeeded him. A monument to his memory has been erected in his native place.

SCHOFIELD, JOHN McALLISTER; b. N. Y., 1831; graduated at West Point 1853, and was commissioned in the artillery. He was for some years instructor in natural philosophy at West Point, and afterward at Washington university, St. Louis. At the beginning of the rebellion he held the rank of capt.; was made chief-of-staff to gen. Lyon, and was with him at Wilson's creek. In 1861 he was placed in command of the Missouri militia, and in the next year of that military district. He defeated Hindman near Pea Ridge, Ark., Oct., 1862, and drove the confederate forces back to the Arkansas valley. In 1864 he was made a brig.gen. in the regular army after most valuable services under gen. Sherman in the Atlanta campaign and in the movements leading to the surrender of Johnston. Later he was in command at the battles of Franklin and Nashville, and captured Wilmington and Goldsborough, N. C. He was brevetted maj.gen. 1865; in 1867 was in charge of the Virginia district; was secretary of war 1868-69; and was then assigned to command the Missouri military department. Still later he was at the head of the West Point academy, and is now, 1881, in command in the north-west.

SCHOHARIE, a co. in e. New York, intersected by the Albany and Susquehanna, the Middleburg and Schoharie Valley, and other railroads; 700 sq.m.; pop. '80, 32,939—32,199 of American birth, 481 colored. It is drained by Schoharie, Catskill, and Cobleskill creeks. Its surface is hilly; the Catskill mountains occupy the s. and w., and the Helderberg the e. portion. It is largely covered with forests of oak, hickory, and ash in the highlands; and groves of sugar-maple and elm by the rivers. In the n.w. sulphur springs are found, and it contains extensive ledges of Helderberg limestone and sandstone. The soil is fertile, producing grain, potatoes, hops, maple sugar, dairy products, etc. Live stock is raised. The manufactures consist of cooperage, iron castings, agricultural implements, paper, leather, etc. Co. seat, Schoharie.

SCHOLARSHIP, a benefaction, generally the annual proceeds of a bequest permanently invested, paid for the maintenance of a student at a university. At the university of Oxford there are 37, and at Cambridge 43, scholarships; their values ranging from £20 to £100 per annum. In both universities the scholars are chosen from the undergraduates, and are often elected before they have begun their attendance at the university. They are on the foundation, but their connection with the college is not so intimate as that of the fellows. The regulations under which they are placed, and the advantages

which they enjoy, differ in the different colleges. A number of the scholarships which were formerly restricted have recently been thrown open to public competition. The bursaries (q.v.) of the Scottish universities are nearly analogous to the scholarships of the English.

SCHOLASTICS, or **SCHOOLMEN**, originally the name given to the teachers of rhetoric at the public schools under the Roman empire, but now used almost exclusively to denote the so-called philosophers of the middle ages. After the fall of the old classic civilization there ensued a long anarchy of barbarism, lasting from the 6th to the 8th c.; but from the time of Charlemagne a visible improvement took place. That great monarch encouraged learning; and the monasteries as well as the schools which he established, became subsequently the seats of a revived culture of philosophy. Conformably, however, to the spirit of a time in which learning and literary skill were confined to churchmen, philosophical activity showed itself chiefly in the domain of theology. This preparatory period of scholasticism—say from the 9th to the 11th c.—embraces the distinguished names of Johannes Erigena Scotus (see *ERIGENA*), who cannot, however, be properly classed among the scholastics; Gerbert of Aurillac, afterward pope Sylvester II. (q.v.); Berengarius (q.v.) of Tours; and Lanfranc (q.v.), Archbishop of Canterbury. A further development of scholasticism occurred toward the middle of the 12th c., when Roscelinus opened up the question concerning the nature of universal conceptions, which led to the great struggle between the *Nominalists* (q.v.) and *Realists* (q.v.). This struggle terminated in the triumph of the latter; and henceforth, during the golden age of scholasticism (the 12th and 13th centuries), it continued to be the prevalent mode of thought in philosophy. Still, however, scholasticism regarded philosophy as dependent on theology. No one dreamed of doubting, or at least of disputing, the truth of any of the church doctrines. These were alike too sacred and too certain to be so handled, and the only thing left for a humble philosopher to do was, in fact, to sort and systematize them; hence the expression *philosophia theologice ancilla* (philosophy is the handmaid of theology), which has found its way down to modern times. Whatever did not directly belong to ecclesiastical dogma was either neglected or treated in accordance with the vague traditions of Platonic or Aristotelian thought handed down from antiquity. Hence sprung that vast array of artificial subtleties and distinctions which had no better foundation to rest on than gross ignorance of the matters discussed, combined with a restless speculative-ness. The formulas of logic were abused through an irrational realism, which regarded them not only as a means to the attainment of philosophical knowledge, but as the material organon of philosophy itself. At first the dialectic treatment of dogma was only fragmentary, as we see it in the principal scholastics of the 12th c., Gilbert de la Porrée, Alanus ab Insulis, and Petrus Lombardus (q.v.). During the 12th c., however, the increased intercourse of the west with the Arabs and Greeks led to a more definite acquaintance with the physical and metaphysical writings of Aristotle, though still only through the medium of incomplete translations, and in this way the circle of vision of the scholastics at least widened, if it did not become clearer. From this period dates the almost *papal* authority of the great Stagirite in philosophy, and the rise of the vast and elaborate systems of mediæval theology. The three chiefs of scholasticism in this, its highest development, were Albertus Magnus (q.v.), Thomas Aquinas (q.v.), and Duns Scotus (q.v.); around each of whom stand groups of more or less independent scholars and followers. The celebrity of such teachers was largely increased by the want of books, which compelled their pupils to rely upon their oral communications, and necessitated those extraordinary public disputations which were the only means "philosophers" had of advertising their wares in the middle ages. The honor paid to them by their admirers is visible in the epithets attached to their names; thus Alanus is the *doctor universalis*; Alexander Hales (q.v.), the *doctor irrefragabilis*; Duns Scotus, the *doctor subtilissimus*; Thomas Aquinas, the *doctor angelicus*; Guillaume Durand of St. Pourcain, the *doctor resolutissimus*, etc.

With Thomas Aquinas and Duns Scotus scholasticism culminated. After their time, various causes co-operated to bring about its decline and fall. The mystical theology (see *MYSTICISM*) gradually developed its natural antagonism to speculations resting on a basis of formal logic, and not appealing to the human heart and spirit. Such men as St. Bernard (q.v.) of Clairvaux, and the monks of St. Victor at Paris, in the 12th c., together with Bonaventura in the 13th, were unconsciously hostile to the dominant style of thought; while in the 14th and 15th centuries Tauler, Thomas à Kempis, Gerson, Nicholas of Clemangis, and others, deliberately set themselves against it. The very nature of the scholastic thought was inimical to its own perpetuity. The hyper-logical, hair-splitting course which it followed produced rival systems, and results discordant with the doctrines of that theology which it undertook to support, until it finally laid down the astounding proposition, that a thing might be philosophically true and theologically false, and *vice versa*. The quarrels of the two great orders—the Dominicans and the Franciscans—each of which took part with its metaphysical chief; the former being called Thomists (from Aquinas), and the latter, Scotists (from Duns Scotus), materially injured the common cause of scholasticism; and the revival of nominalism under William of Occam (q.v.), its most distinguished advocate, powerfully contributed to the same result; but it was not till after the revival of letters had done its work of

enlightening the judgment and purifying the taste of Europe, that scholasticism was visibly in danger. The reformation shook the system to its foundations—Luther himself leading the assault with the strength and valor of a *cœur-de-lion*; but still, so tenaciously did it cling to the semblance of life, that in the universities it held its footing till the 17th c., and even later. In fact, in some Roman Catholic states, such as Spain, it is still almost the only kind of philosophy going. The two great intellectual reformers whose writings mark the transition from the mediæval to the modern mode of thought, are lord Bacon (q.v.) and Descartes (q.v.), who may be said to have administered the death-blow to scholasticism. The literature of this phase of speculation is enormous, and few critics have ventured far into its cobwebbed regions. For example, the printed writings of Albertus Magnus, Thomas Aquinas, and Duns Scotus, amount to 51 folio volumes; but however glad we may be that the reign of scholasticism is over, and however thankful to men like Laurentius Valla, Erasmus, Rudolf Agricola, and Ramus, who riddled its ancient and time-honored flag with the sharp shot of their wit and logic, we ought never to forget, that in ages when the conditions of scientific knowledge or refined taste did not exist, these old monkish dialecticians kept alive the philosophical faculty in Europe by the vivacity and restless ingenuity with which they prosecuted their fantastic speculations.

SCHOLTEN, **JOHANNES HENDRIK**, b. at Vleuten, near Utrecht, Netherlands, 1811; was minister at Meer Kerk 1838–40; professor of theology at the atheneum of Franeker 1840–43, when he was appointed to the university of Leyden. He is the founder of a new school of Dutch theology which claims independence in applying scientific principles. He has published *Geschiedenis der Gods dienst en wijsbegeerte*; *De leer der hervormde kerk in hare grondbeginselen*, 2 vols.; *De vrye wil kritisch onderzoek*; *Het evangelie naar Johannes*; *De oudste getuigenissen aangaande de Schriften des Nieuwe Testaments*; *Supernaturalisme in verband mit Bijbel, christendom en protestantisme*.

SCHOMBERG, **FREDERICK HERMANN**, Duke of; 1616–90; b. Heidelberg, Germany; son of count Schomberg and a daughter of lord Dudley; began his military career in the Swedish army during the thirty years' war, and was punished by the emperor for the part he took by confiscation of his property; entered then the service of the Netherlands under Frederick, prince of Orange; afterward went to France, where, 1650–85, he distinguished himself, and rose to the rank of marshal. In the campaign with Spain he compelled that country to recognize the Portuguese dynasty of Braganza, for which he received a pension of £5,000 from the kingdom of Portugal, with reversion to his heirs. In 1685 the revocation of the edict of Nantes drove him elsewhere. After going to Portugal and Holland he went to the elector of Brandenburg, and was chosen commander of his forces; joined the prince of Orange, 1688, in his descent upon England, and was made commander of his forces. The next year he was made baron, earl, marshal, and duke, and received £100,000 from the house of commons. In August he was sent to Ireland to oppose James II., but by his inaction lost half his army. He fought bravely at the battle of the Boyne, but was killed while leading a body of French Protestants across the river.

SCHOMBERG, **HENRI**, Comte de, 1575–1632; b. Paris; appointed grand master of artillery and superintendent of finance in 1619. After defeating the Protestants in s. France, he became prime minister. His power rendered him an object of jealousy to Richelieu, who obtained his removal in 1624, after holding the office three years. Created marshal, he drove the English out of Ré in 1627, was conspicuous at the siege of La Rochelle, and captured Pinerolo in 1630. Two years later he defeated the duke of Montmorency at Castelnaudary, and made him prisoner. He was governor of Languedoc at the time of his death.

SCHOMBURGK, **SIR ROBERT HERMANN**, a celebrated traveler, was born at Freiburg in Prussian Saxony, June 5, 1804. He began at an early age to apply himself to geographical science and natural history, and subsequently made an abortive attempt to succeed as a tobacco manufacturer in Virginia. In 1830 he went to Anegada, one of the Virgin isles, and having, by the advice of the governor, carefully surveyed the island, and laid a report before the royal geographical society, he was charged by that learned body with the survey of Guiana in 1835. This enterprise, which was surrounded with formidable difficulties, he satisfactorily achieved, and from time to time laid the results of his investigations before the society, in whose *Journal* they were regularly published. It was during this exploration, and while he was ascending the Berbice river, that he discovered, Jan. 1, 1837, the magnificent aquatic plant denominated the *Victoria regia* (q.v.). On his return to England in 1839, he was presented with the medal of the geographical society for his *Travels and Researches in British Guiana in 1835–39* (Lond. 1840), a work which largely contributed to almost every branch of natural science. In 1840 he returned to Guiana, this time under the auspices of the British government, to complete his survey of that country, and survey the boundary line between it and Brazil; and on his return in 1844, after the completion of his labors, he received the honor of knighthood. The *Description of British Guiana*, a valuable work, was the fruit of this expedition. In 1847 he published an excellent and elaborate *History of Barbadoes*, and in the following year departed for San Domingo, whither he had been accredited as British consul and representative. In this new sphere he continued to pursue his geo-

graphical and scientific researches, the results of which he communicated in reports to the geographical society till 1853. In 1857 he was appointed British representative to the Siamese court. He returned ill in 1864, and died next year.

SCHÖNBEIN, CHRISTIAN FRIEDRICH, a German chemist, was born at Mitzenzen in Würtemberg, Oct. 18, 1799; studied natural science at Tübingen and Erlangen, and in 1824-25 taught chemical physics at Keilhau, near Rudolstadt. To increase his knowledge, he visited England in 1826, repairing thence to Paris; and in 1828 he was called to a chair in the university of Basel, where his eminent qualifications were speedily recognized. In 1839 he discovered *ozone* (q.v.), and invented *gun-cotton* (q.v.) in 1845, obtaining from it by dissolution in ether the material called collodion (q.v.). In his later years he confined himself chiefly to experiments with oxygen. Of his works, which generally first appeared in periodicals, the chief are: *Das Verhalten des Eisens zum Sauerstoff* (Basel, 1837), *Beiträge zur Physikalischen Chemie* (Basel, 1844), *Ueber die Erzeugung des Ozons* (Basel, 1844), *Ueber die langsame und rasche Verbrennung der Körper in Atmosphärischer Luft* (1845). He died in 1868.

SCHÖNERUNN, a royal palace in the outskirts of Vienna (q.v.), the summer residence of the imperial family.

SCHÖNEBECK, a manufacturing t. of Prussia, ten m. s.e. of Magdeburg, on the left bank of the Elbe. The chemical works, which give employment to about 400 men; the salt refineries, where the brine obtained from the abundant salt-springs is boiled down, and salt made to the annual value of 413,000 thalers; and the breweries and distilleries, are the principal industrial establishments. Pop. '75, 10,979.

SCHOOLCRAFT, a co. in upper Michigan, bounded on the n. by lake Superior, on the s. by lake Michigan; drained by Manistee and White Fish rivers; about 2,250 sq.m.; pop. '70, 1290. The surface is uneven and heavily timbered. The soil is fertile. The principal productions are lumber and iron. The soil is not, as yet, extensively cultivated. In the n. is a sand-wall 300 ft. high, and several m. in length, called "The Pictured Rocks." Co. seat, Onota.

SCHOOLCRAFT, HENRY ROWE, American author, geologist, and ethnologist, was born at Watervleit (now Guilderland), N. Y., March 28, 1793. He entered Union college in his 15th year, and studied French, German, Hebrew, chemistry, and mineralogy. In 1817-18 he visited the mining region w. of the Mississippi, sent a collection of minerals and geological specimens to Washington, and wrote *A View of the Lead Mines of Missouri*, etc. (8vo, New York, 1819), and a narrative, since enlarged, entitled *Scenes and Adventures in the Semi-alpine Region of the Ozark Mountains of Missouri and Arkansas* (8vo, Philadelphia, 1853). In 1820 he was appointed geologist of an exploring expedition to the copper regions of lake Superior and the upper Mississippi. He was afterward secretary of a commission appointed to investigate Indian claims and negotiate treaties, at Chicago. As the result of these labors, he made a report to the government, and wrote also *Travels in the Central Portion of the Mississippi Valley* (8vo, New York, 1825). In 1822 he was appointed Indian agent for the north-western frontier, and established himself at Sault Ste Marie. In 1823 he married Miss Johnston, granddaughter of an Indian chief, who had been educated in Europe. At this period, being in intimate relations with many Indian tribes, he devoted himself to the study of their history and ethnology. From 1828 to 1832 he was an active member of the legislature of Michigan territory, and founded its historical society, and the Algic society of Detroit. For his lectures on the Indian languages he received the gold medal of the French institute. Adding poetry to science, he wrote: *The Rise of the West; Gehele, an Indian Lament; Indian Melodies; The Man of Bronze, or Portraits of Indian Character; Isoco, or the Vale of Norma*; also a grammar of the Algonquin language. In 1832 he was appointed to the command of an expedition which discovered the sources of the Mississippi, the *Narrative* of which was published (8vo, New York, 1834). As superintendent and disbursing agent for the Indians, he negotiated treaties by which the government acquired lands to the extent of 16,000,000 acres. He visited Europe in 1842, and the following year he made a tour, chiefly for the observation of Indian antiquities in western Virginia, Ohio, and Canada. In 1845 he collected the statistics of the Six nations, and published *Notes on the Iroquois*, etc. (8vo, Albany, 1848). In 1847 the United States congress authorized his publication of *Historical and Statistical Information Concerning the History, Condition, and Prospects of the Indian Tribes of the United States, in six volumes quarto, with 336 plates by Major Eastman and others* (Philadelphia, 1851-57). He also published *Algic Researches; Thirty Years with the Indian Tribes of the North-western Frontier; The Indian in his Wigwag*, etc. In 1847 he was married, for the second time, to Miss Howard of South Carolina. He died in 1864.

SCHOOL-MASTER, ARMY AND NAVY. In the army, the school-master is a non-commissioned officer of the first class, ranking next to a sergt.maj. His pay varies with length of service, rising gradually from 4s. a day on appointment, to 8s. a day after long service. He has an advantage over other non-commissioned officers in quarters and certain allowances. To become an army school-master, it is necessary either to be a certificated school-master, or to have served the apprenticeship as a pupil-teacher, and to pass through a course of training for one year at the normal school in the royal military asy-

lum, Chelsea. After the completion of the training, the candidate is required to enlist as a common soldier for ten years' general service, whereupon he is immediately promoted to the rank of school-master. A few of the most deserving school-masters are promoted to be sub-inspectors of schools, when they rank as lieutenants, and have 10s. a day for pay. The duties of the school-master are to teach the soldiers and their children the rudiments of general knowledge, to examine the girls' school, and to deliver lectures to the soldiers. There were, in 1874, 180 army school-masters, besides 13 sub-inspectors.

In the navy, the school-master is a chief petty officer, whose duties are analogous to those of the army school-master, except that he has no pupils younger than the ship's boys. Among the subjects he teaches are the taking of solar and lunar observations, and the elements of navigation. His pay ranges from 4s. to 6s. a day.

SCHOOLMEN. See *SCHOLASTICS*, *ante*.

SCHOOL-MISTRESS, ARMY, is a person attached to each regiment or corps for the purpose of instructing the daughters of soldiers and their sons under eight years old in the rudiments of English and in plain needlework. She must be a certificated school-mistress, or a pupil-teacher who has served her apprenticeship. After admission to the service, she is specially trained for six months at one of four training institutions. This training is at the expense of government. The salary of a school-mistress varies from £36 a year in the third class to £50 a year in the first class. Proper provision is made for the quarters and supplies of the school-mistress, whose somewhat anomalous position among rough men calls for the most circumspect behavior. The annual charge (1873-74) for army school-mistresses amounted, for 161, to the sum of £5,362.

SCHOOL OF MINES OF COLUMBIA COLLEGE. See *COLUMBIA COLLEGE*.

SCHOOLS. See *COLLEGES, AMERICAN*; *COMMON SCHOOLS*; *INDUSTRIAL INSTITUTIONS*; also, *EDUCATION*; *NATIONAL EDUCATION*, *ante*.

SCHOOLS, BROTHERS OF CHRISTIAN, a religious congregation in the Roman Catholic church, established for the religious and secular education of the poor. It originated in France in the end of the 17th c., and was organized by a charitable ecclesiastic, the abbé de la Salle, canon of the church of Rheims. The members are all lay brothers, and are subject to one general head. Houses of the order are found in almost every country of Europe. In France this congregation was one of those which were specially excepted from among the suppressed orders, and which were re-established in France by gen. Bonaparte in the concordat of 1801. It continues to flourish in that country, as also in Belgium, Italy, Southern Germany, Great Britain, and North America. The brethren are bound by the ordinary religious vows of poverty, chastity, and obedience. Their system of education has received the highest testimonies, and they still form one of the most flourishing of all the lay orders in the Roman church, numbering, it is said, nearly 3,000 members. Besides this order, which is of French origin, similar institutes have been formed under the same or analogous names in other countries, the several varieties of which it would be tedious to enumerate.—**SISTERS OF THE CHRISTIAN SCHOOLS.** Several congregations of women for the education of poor female children also exist in the Roman Catholic church. A long catalogue of these, with the history of their origin, and their specific constitution, will be found in Wetser's *Kirchen-Lexicon*, vol. ix., pp. 782-784.

SCHOOLS, PUBLIC AND GRAMMAR. Under their respective heads, *GYMNASIUMS*, *EVENING SCHOOLS*, *REFORMATORY SCHOOLS*, and *INDUSTRIAL SCHOOLS*, have been treated of at sufficient length for the purposes of an encyclopædia. The list of educational institutions would, however, be incomplete were nothing to be said regarding the public and grammar schools of England. By the term "public schools" are generally designated the ancient foundations of Winchester, Eton, Harrow, Westminster, Charterhouse, Shrewsbury, St. Paul's school, and Merchant Taylors'. But there exist more modern seminaries, which have been instituted chiefly on the model of these, such as Marlborough college, Cheltenham college, and Wellington college. Endowed grammar schools of old foundation exist in almost all the principal towns of England, and are frequented both by day pupils and boarders from the country. As almost all the independent and endowed grammar schools of England are taught by men whose notions of school discipline have been formed at one or other of the great public schools, these may fairly be added to those already enumerated as in point of fact public schools. The course of instruction pursued, the methods of teaching, and the habits of life and of discipline, will be found to be substantially similar in all endowed middle schools, whether called public or grammar schools. A great number of these schools derive not only the *fixed* emoluments of the masters from old bequests, but also the means of boarding and educating a certain number of boys on the foundation. It was originally for these foundationers or collegians that a large proportion of the old schools were founded; but round them has grown up a large community composed of pupils from all parts of the British dominions, tutors, and keepers of boarding-houses. The foundationers consequently form simply the nucleus of these schools. The course of instruction is intended to prepare for the universities, and is consequently adapted to this purpose. Latin and Greek form the basis of the whole instruction; geography, ancient history,

arithmetic, and mathematics being admitted to a very subordinate place in the curriculum. The school time devoted to arithmetic and mathematics is now, however, considerably greater than was formerly given, and modern languages and the elements of science begin to receive a larger share of attention. There are, of course, tutors available at these educational seats for all usual branches of instruction, including music and drawing; but these subjects are alien to the proper work of the school, and do not affect the standing or promotion of the pupils. At Rugby the school course includes *both* French and German, and natural science is admitted as an alternative study with these. In the more modern institutions, such as Marlborough, Cheltenham, and Wellington colleges, attempts have been made to provide a modern course of instruction, running parallel with the classical, for the benefit of those boys who either show an inaptitude for classical studies, or who are not destined for the universities. That a sound education may be obtained by means of science and modern languages cannot be doubted; but its value, as compared with classical discipline, even for those who do not contemplate a university course, or one of the learned professions, is still an open question. If, however, it be the case that there is a natural inaptitude in some boys for linguistic discipline, who *yet* possess capacity for scientific study or the acquisition of a modern language, we are driven to the conclusion that such a course of study ought to be provided for this portion of the youth of Great Britain. Whether it ought to be provided at the existing grammar and public schools is a subject at present keenly debated, but must be ultimately very much a question of finance. In Germany many of the gymnasiums provide a course of modern or *real* study, and this, combined with the wide diffusion of middle schools, under the name of *real-schulen*, meets all the reasonable wants of that portion of the middle class which does not contemplate a professional life. In France the *lycées* provide an ancient and modern course, running parallel with each other, for all pupils above a certain age. Up to that age all are taught the same subjects. In Scotland, the number of middle schools in important towns, either established by private enterprise or by the town council or endowment, renders it unnecessary for boys to seek away from their homes the preparation necessary for either the Scottish universities or commercial life. The Scotch schools are elastic in their system, adapting themselves to the wants of parents, and all of them admit the modern element into their course of study; but the curriculum of study does not carry pupils so far as it ought, and the funds of the schools are wholly inadequate.

The "schools inquiry commission" reported on the grammar schools of England in 1863, and their report led to the appointment of an endowed schools executive commission for purposes of reform. The Scotch endowed schools commission reported to government in 1874-75.

SCHOOL-SISTERS (SCHOOL BROTHERS and SISTERS, *ante*).

SCHOOLS, REGIMENTAL, in the British army, comprise the school for adults and boys above eight years of age, under the school-master (q.v.), and the infant and industrial schools under the school-mistress (q.v.), for girls and little boys. In the first, plain subjects are taught to soldiers who voluntarily attend, or to soldiers' children. The education is wholly secular, the only theological teaching being exposition of a portion of Scripture during the first half-hour of morning school; but even at this, attendance is at the option of the parents. The infant school is conducted on similar principles. The industrial school is to fit girls for the occupations of life, and to render them capable of entering domestic service; a grant of money is made by government for the provision of materials. There is a school of each sort in every battalion of infantry or regiment of cavalry, the total cost of which amounts, for 1873-74, to £36,253. Adult soldiers are admitted gratuitously; for children, there is a nominal charge of 1d. each a month. The orphans of soldiers and the children of soldiers serving abroad are received at any neighboring school without payment; those of pensioners, contractors, etc., at 3d. a month; and the children of officers at 5s. a month. It is forbidden that any difference should be made in the schools in the treatment of these different classes of pupils.

SCHOONER is a swift, sharply-built vessel, carrying usually two masts, though occasionally a greater number, and commonly is of small size. There are two classes of schooners—the "fore-and-aft schooner," or schooner proper, and the "topsail schooner." In the former, both foremast and mainmast are rigged like the mainmast of a cutter, with fore-and-aft sails. In the latter, the foremast carries a square topsail and a square topgallant sail. Off a wind, the former rig has a great advantage, as the schooner can sail up within $4\frac{1}{2}$ or even 4 points of the wind; but before the wind, the square topsail gives the advantage to the topsail schooner; and as the latter can on occasion strike her squaresails, and set a fore-and-aft topsail in their place, she has usually the preference. No sailing-vessel is faster than a schooner of fine build, when she carries ample canvas; hence it is a favorite form for the larger class of yachts; and before the introduction of steam dispatch-vessels, was employed much in the packet service. Schooners are still employed in the navy as revenue cruisers; and to a great extent in the merchant service for running small cargoes, and especially those of perishable goods, as fish or fresh fruit. They are easily managed by a small crew; but from the sharpness of their build, have no great amount of stowage.

SCHOPENHAUER, ARTHUR, a German philosopher, son of Johanna Schopenhauer, an authoress of considerable distinction (born 1770, died 1838), was born at Danzig, Feb. 22, 1788. He studied first at Göttingen, where the lectures of Schulze inspired him with a love of philosophy, and afterward at Berlin and Jena, in the last of which places he graduated in 1813. During the same year he published his first treatise, *Ueber die vierfache Wurzel des Satzes vom zureichenden Grunde* (Rudolst. 1813, 2d ed. Frankf. 1847), in which he lays down the logical basis of his future system. Schopenhauer spent the winter of 1813 at Weimar, where he enjoyed the society of Goethe, and the orientalist Friedr. Maier, who first turned his attention to the ancient Indian literature and philosophy, the study of which exercised a great influence on his future development. He then proceeded to Dresden, where he published a treatise on sight and color (*Ueber das Sehen und die Farben*, Liep. 1816), which was followed, three years later, by his great work, *Die Welt als Wille und Vorstellung* (The World considered as Will and Idea, Leip. 1819; 2d ed. 1844). After 1820 Schopenhauer lived partly in Italy and partly in Berlin, up till 1831, when he fixed himself in Frankfurt-on-the-Main, devoting himself uninterruptedly to the elaboration of his system. The fruits of his studies were *Ueber den Willen in der Natur* (Frankf. 1836); *Ueber die Freiheit des Willens*, *Ueber das Fundament der Moral*, the supplements to his principal work, which appear in the 2d edition of 1844; and *Parerga und Paralipomena* (Berl. 1851). He died Sept. 21, 1860. The fundamental doctrine of Schopenhauer is that the only essential reality in the universe is will; that what are called appearances exist only in our subjective representations, and are merely forms under which single original will shows itself. This will is not necessarily accompanied by self-consciousness, though it ever strives after its attainment, and hence Schopenhauer declared himself the uncompromising opponent of all the contemporary systems—those of Fichte, Schelling, and Hegel—in which the “absolute reason,” “consciousness,” etc., are posited as the necessary basis of thought. For his great rivals, Schopenhauer professed the most unmeasured scorn—calling Hegel, for example, a mere “scribbler of nonsense”—and in return was treated by them with such sovereign contempt that for years his name was almost unknown to the majority of German students. His theories of ethics and aesthetics also rest on peculiar and not very intelligible grounds. The best account of Schopenhauer's philosophy is to be found in Frauenstädt's *Briefe über die Schopenhauersche Philosophie* (Leip. 1854). See *Life*, by Helen Zimmern (1876).

SCHORL. See TOURMALINE.

SCHORL ROCK is a granitoid rock, in which the mica is replaced by schorl or tourmaline. Some specimens occur in which the felspar is also absent, and the mass is composed entirely of quartz and schorl. Schorl rocks are rare, occurring probably only as small bosses in granite.

SCHOTTISCHE (Ger. *Scottish*) a somewhat fanciful name given to a slow modern dance in $\frac{3}{4}$ time.

SCHOULER, WILLIAM, 1814-72; b. Scotland; emigrated to the United States, and edited the Lowell *Courier*, 1841-47. He had charge of the Boston *Atlas*, the organ of the New England whigs, 1847-53; served in the legislature and in the constitutional convention of 1853; was connected with the Cincinnati *Gazette*, 1853-56, and with the Ohio *State Journal*, 1856-58, when he resumed his position on the Boston *Atlas*. He was adj. gen. of Massachusetts during the war of the rebellion. He published a *History of Massachusetts in the Civil War*.

SCHOUWEN, an insular portion of the province of Zealand (q.v.), is bounded on the s. by the Scheldt, on the n. by the most southern branch of the Maas, and on the w. by the North sea. Area, 60 sq. m.; pop. (including the eastern part, called Duivland) Jan. 1, 1875, 23,829. The surface is low, and the island is protected on both sides by dykes. Agriculture is the chief employment of the inhabitants; the soil is fertile; and the principal crops are grain, oil-seed, and flax. Sea-fowl in immense flocks breed on the s. side of the island, and the sale of their eggs is an important item in the trade of Zierikzee (pop. 8,043), which is the principal town.

SCHRADER, JULIUS, b. Berlin, 1815; studied at Düsseldorf. Having taken the great prize at Berlin in 1844, he was able to spend 3 years in Rome. Among his best works are the fresco in the Berlin museum of the “Consecration of the Church of St. Sophia in Constantinople by the Emperor Justinian;” “Lady Macbeth;” and “The Death of Leonardo de Vinci.” He was appointed professor in the Berlin academy in 1851.

SCHREVELIUS, CORNELIUS, a Dutch scholar, whose name was once better known than it is now, was born at Haarlem in 1615, and educated mainly by his father. In 1642 he succeeded his father as rector of the university of Leyden, and died Sept. 11, 1664. Schrevelius was a laborious and eudite man, but possessed little critical discernment. His most notable performance was a *Lexicon Manuale, Græco-Latinum et Latino-Græcum* (Leyden, 1654, 1657, 1664), of which there have been innumerable editions. It was long extensively used as a text-book in English schools, and, in the absence of anything better, deserved perhaps the respect which it obtained; but otherwise it cannot be pronounced a good dictionary. It is not at all exhaustive of the words in the Greek language; it does not sufficiently explain their different meanings, and its etymologies

are often erroneous and inept. Schrevelius also executed many *variorum* editions of the classics, Juvenal (1648), Hesiod (1650), Terence (1651), Virgil (1652), Horace (1653), Homer (1656), Martial (1656), Lucan (1658), Quintus Curtius (1658), Justin (1659), Cicero (1661), Ovid (1662), and Claudian (1665). These editions are remarkable for their correctness, and for the excellence of the paper and typography, but the notes are deficient both in taste and acumen.

SCHREYER, ADOLPH, b. Germany, 1828; studied painting in Munich, Stuttgart, and Düsseldorf. In 1854 he went with the Austrian army through the provinces along the Danube. His travels extended through Hungary, s. Russia, and Turkey; and he afterward visited the east and Algeria. He then took up his residence in Paris. He has made a special study of horses, and his landscapes are distinguished by strength and mastery of color. The best known of his pictures are perhaps, "The Dying Horse;" "The Wallachian Extra Post;" and "Horses Frightened by Wolves."

SCHRIVER, EDMUND, b. Penn., 1812; graduate of West Point, 1833; entered the army in the 2d artillery, was transferred to adj. gen. department with the rank of capt., 1838; resigned 1846. He was president of the Rensselaer and Saratoga railroad company, 1851-61. In April, 1861, he was aid-de-camp to gov. Morgan; and in the war of the rebellion was commissioned lieut. col. 11th infantry, 1861; inspector of the army of the Potomac, 1863-65; rising through successive grades to brig. gen. in the regular army 1864. He was raised to maj. gen., 1865, for gallant service in the Shenandoah valley. He was in the northern Virginia and the Richmond campaign from the Rapidan to the surrender of the confederate stronghold.

SCHRÖCKH, JOHANN MATTHIAS, 1733-1808; b. Vienna; a German church historian. He held for many years a professorship at the university of Wittenberg, where he lectured successively on philosophy, poetry, and history. He is best known by his *Christliche Kirchengeschichte* (35 vols. 1768-1803), and *Kirchengeschichte seit der Reformation* (10 vols. 1804-12) the two last volumes of which were added by Tzschirner.

SCHRÖDER, ANTOINETTE SOPHIE, 1781-1868; b. Germany; a noted actress. She appeared on the stage when only 12 years old at St. Petersburg, where her parents were acting. In 1795 she married Stollmers, the director of another company but was separated from him soon afterward. Her second husband was the singer Friedrich Schröder, who died in 1818; and she then married the actor Kunst. She acted in all the principal theaters in Germany, and acquired a great reputation by her impersonations of Phædra, Medea, Lady Macbeth, and other tragic characters. She retired from the stage in 1840. See *Sophie Schröder*, by P. Schmidt (1870).

SCHRÖDER, FRIEDRICH LUDWIG, 1744-1816, b. Germany. He began acting in the company of his parents when a mere child, and made a great reputation as a tragedian before he was thirty years of age. He became manager of the theater at Hamburg in 1771, and introduced to the German public several of Shakespeare's plays which he had translated. He was the author of many plays, and his *Dramatische Werke* were edited by Bülow with an introduction by Tieck.

SCHRÖDER-DEVRIENT, WILHELMINE, 1804-60, b. Germany; daughter of Friedrich Ludwig. She was a ballet dancer till she was fifteen years old, when she made her début at Vienna in Racine's *Phédre*. In the following year, after cultivating her powerful voice, she appeared as prima donna with great success in such operas as *Fidelio*, *Euryanthe*, *Norma*, the *Huguenots*. She was separated in 1828 from her first husband, Karl August Devrient, and after separating from her second husband, Döring, married a Livonian nobleman, Von Bock.

SCHRÖDTER, ADOLPH, b. Prussia, 1805; studied art at Berlin and Düsseldorf. In 1859 he became professor of drawing at the Carlsruhe polytechnic school. His humorous pictures are well known, and engravings of them are common in this country. The best are the "Wine Tasters," "Auerbach's Cellar," Falstaff, and "The Two Monks."

SCHUBERT, FRANZ, a German musical composer, who was born at Vienna in 1807, and died at the early age of 25. During his lifetime his works attracted little notice, but they acquired a high and deserved reputation after his death, and have gained for their composer a large share of posthumous fame. His songs and ballads are hardly to be surpassed for masterly construction and richness of fancy, while they are full of simple, ornate, and expressive melody. Schubert also composed several operas, symphonies, sonatas, and other larger works.

SCHUBERT, GOTTHILF HEINRICH VON, 1780-1860; b. Germany. After studying theology at Leipsic and medicine at Jena, he practiced as a doctor at Altenburg, Freiberg, and Dresden. He acted as director of an educational institution at Nuremberg 1809-16, and then was tutor to the children of the grand duke of Mecklenburg-Schwerin till 1819. He held a professorship of the natural sciences at Erlangen till 1827, and afterward at Munich.

SCHULTE, JOHANN FRIEDRICH; b. Winterberg, Westphalia, 1827; studied law, and practiced in Berlin and Bonn; was appointed professor of canon law at Prague in 1855 and at Bonn in 1872. His publications are: *System des Katholischen Kirchenrechts*; *Die Lehre von den Quellen des Katholischen Kirchenrechts*; *Die Rechtsfrage des Einflusses*

der *Regierung bei den Bischofswahlen*. He opposed the dogma of papal infallibility and joined Bösinger and Reinkens.

SCHUMACHER, HEINRICH CHRISTIAN, 1780-1850; b. Denmark; educated at Copenhagen and Göttingen. In 1813 he was appointed director of the Mannheim observatory, and in 1815 professor of astronomy and director of the Copenhagen observatory. In 1821 he was director of the Holstein and Lauenberg survey; in 1824 co-operated with the English board of admiralty in determining the difference of longitude between Greenwich and Altona, and in 1822 published tables of the distances of Jupiter, Saturn, Mars, and Venus from the moon. In 1821 he began the publication of his *Astronomische Nachrichten*, which survives him.

SCHUMANN, ROBERT, a modern German musical composer of considerable note. He was born at Zwickau, in Saxony, in 1815, and studied chiefly at Leipzig. He is looked on in Germany as one of the founders of a new musical school, of which the other principal exponent is Richard Wagner. This school has undertaken to say what the "music of the future," or as some of the school express it, "work of art of the future," is to be. Whatever may be said as to Schumann's relation to the future, his influence on the music of the present day has been very considerable. English musicians have, however, hesitated to agree with his countrymen in placing him on an equally exalted pinnacle with Beethoven. His compositions evince deep study of Sebastian Bach, as well as a large share of individuality, freshness, and scientific knowledge. They continually surprise us by startling modulations, and the frequent interruptions in the time impart to them an air of eccentricity. Schumann's works comprise several symphonies, a cantata called *Paradise and the Peri*, and a number of small pieces, which have obtained more favor in this country than his larger compositions. Schumann married Mlle. Clara Wieck, one of the most celebrated of living pianists, and died in 1856.

SCHURZ, CARL, b. Prussia, 1829; educated at Cologne and Bonn. He edited a liberal newspaper in association with Gottfried Kinkel, professor of rhetoric at Bonn, where he endeavored unsuccessfully to organize an insurrection in 1849; escaped with Kinkel; was adjutant in the revolutionary force, and on the capture of Rastadt, which he helped defend, fled to Switzerland. He returned to Germany in 1850 and contrived the escape of Kinkel, who had been sentenced to 20 years' imprisonment. After a residence in Paris as correspondent for German papers, and in London, where he was a teacher, he settled in Philadelphia, 1852. Removing to Madison, Wis., in 1855, he made republican campaign speeches in German in 1856, and the next year was an unsuccessful candidate for lieutenant-governor. In 1858 he began to practice law in Milwaukee. He was a member of the republican convention in 1860, and delivered both English and German speeches during the canvass of that year. Late in 1861 he resigned the position of minister to Spain, to which president Lincoln had appointed him, and joined the army. He was made brig. gen. in 1862; commanded a division at the second battle of Bull Run, was commissioned maj. gen. 1863, led the 11th corps at Chancellorsville, was at Gettysburg and Chattanooga, and at the close of the war resumed the practice of law. He was Washington correspondent of the *N. Y. Tribune*, 1865-66; founded the *Detroit Post* in 1866, and the next year became editor of the *St. Louis Westliche Post*. He was temporary chairman of the republican convention at Chicago in 1868, and U. S. senator from Missouri, 1869-75. He opposed many of the measures of the Grant administration, and in 1872 was president of the Cincinnati convention which nominated Greeley for president. During the state canvass in Ohio in 1875, he made some powerful speeches against the inflation of the currency. He was secretary of the interior under the Hayes administration, 1877-81. In 1881 he became editor of the *New York Evening Post*.

SCHUYLER, a co. in w. Illinois, bounded on the s.e. by the Illinois river, and on the s.w. by Moin river, traversed by the St. Louis, Rock Island and Chicago and the Buda and Rushville railroads; about 425 sq. m.; pop. '80, 16,249-15,692 of American birth. The surface is rolling. There are heavy forests. The soil is fertile. The principal productions are corn, wheat, oats, and cattle. Co. seat, Rushville.

SCHUYLER, a co. in n. Missouri, adjoining Iowa; bounded on the w. by the Chariton river; drained also by the n. fork of the Salt river, and the n. and middle Fabius rivers; traversed by the Missouri, Iowa and Nebraska, and the St. Louis, Kansas City and Northern railroads; about 325 sq. m.; pop. '80, 10,470-10,132 of American birth. The surface is rolling prairie or woodland. The soil is fertile. The principal productions are corn, wheat, oats, tobacco, and wool. Co. seat, Lancaster.

SCHUYLER, a co. in s.w. New York on the Chemung canal and the Northern Central railroad; about 350 sq. m.; pop. '80, 18,842-17,942 of American birth. The surface is hilly. The soil is fertile. The principal productions are oats, wheat, corn, barley, wool, and butter. Co. seat, Watkins.

SCHUYLER, PETER, b. about 1650; acted as mediator between the five nations of the Indian race and the white settlers of New York and the New England colonies. He was at the head of an expedition which destroyed the French settlements in 1691. In 1710 he went to England with a party of five Indian chiefs, whom he had invited to accompany him, for the purpose of awakening in the government an interest in the occupation of Canada, then held by the French. In 1719 he was governor of New York.

SCHUYLER, PHILIP, 1733-1804; b. Albany, N. Y.; entered the army during the French and Indian war, 1755, and was assigned by lord Howe to the commissary's department. After the war he was a member of the colonial assembly of New York, and resisted earnestly the British attempts to tax the colonies without their consent; was a delegate to the continental congress, 1775, by which he was made a maj.gen. and assigned to the command of the troops in New York and of the expedition against Canada; but sickness having compelled him to relinquish this service, it devolved on gen. Montgomery. On his recovery he actively superintended Indian affairs and army discipline. St. Clair's evacuation of Ticonderoga threw, for a time, unfounded suspicions on gen. Schuyler, which led to his being superseded; but a court of inquiry afterward fully approved his conduct, and Washington solicited him to accept a new command. Though he declined this, he rendered efficient service in the military operations in New York. Before the national constitution was formed he was a member of congress; and afterward twice represented his state in the U. S. senate.

SCHUYLKILL, a river of Pennsylvania, which rises in the carboniferous highlands of the eastern center of the state, and, flowing 120 m. s.e., empties into the river Delaware 5 m. below Philadelphia.

SCHUYLKILL, a co. in e. central Pennsylvania, drained by the Schuylkill, Little Schuylkill, and Swatara rivers, and Mahanoy and Cattawissa creeks: on the Philadelphia and Reading railroad; about 775 sq. m.; pop. '80, 129,977—103,831 of American birth. The surface is mountainous, heavily wooded; and there are extensive deposits of coal and iron. The so-called southern coal field is in this region. The chief export is anthracite coal, much of which is transported on the Schuylkill Navigation company's canal. Co. seat, Pottsville.

SCHWAB, GUSTAV, 1792-1850; b. Germany; educated at Tübingen; tutor in the theological seminary there till 1817. He was professor of ancient literature in the Stuttgart gymnasium, 1817-37, and a pastor there, 1837-45. He was afterward chief counselor of the Evangelical consistory. His ballads and romances are highly esteemed in Germany. His best-known prose work is, perhaps, *Die Schönsten Sagen des Classischen Alterthums* (1838-40). His chief poetical works are *Gedichte* (1828); and *Fünf Bücher deutscher Lieder und Gedichte* (1838).

SCHWALBACH, or **LANGENSCHWALBACH**, a German watering-place in Hesse-Nassau, n.w. of Wiesbaden; pop. '71, 2,643. Many visitors annually come to drink the waters; which are also largely exported. They are the strongest known chalybeate springs.

SCHWALBER, known as **CHELIDONIS**, a swallow, the Greek translation of Schwalber, d. 1521; a monk of the Scotch Benedictine abbey of St Egidius. He wrote the Latin verses to Albert Dürer's *The Apocalypse*, *The Passion of Christ*, and *The Life of the Virgin Mary*, while in the monastery; and verses on subjects connected with the church and its devotees. He had the reputation of being a good Latin scholar, and for his love of learning was nicknamed *Musophilus*. He became abbot of the *Schotten Kloster* near Vienna, 1515.

SCHWANTHALER, LUDWIG MICHAEL, a celebrated German sculptor, was b. in 1802 at Munich, where his father, Franz Schwanthaler, practiced the same art. Young Schwanthaler entered his father's workshop at the age of 16; and on the death of the latter in 1821, he undertook to carry on his father's business. His first important commissions were received in 1824 from king Maximilian. After a brief residence in Rome, he set up a studio of his own at Munich, and shortly after executed for the *Glyptothek* there two fine bas-reliefs from Homer: "Achilles struggling in the Scamander," and the "Battle by the Ships," besides a statue of Shakespeare for the saloon of the theater, and the Bacchus-frieze for the banqueting-hall in the palace of duke Maximilian. In 1832 he revisited Rome, for the purpose of preparing models for that portion of the national monument of Valhalla intrusted to his supervision. He remained two years. On his return to Munich, he began his bas-reliefs to illustrate Pindar's *Epinikia* (Triumphal Odes) and the myth of Aphrodite, the latter of which is a frieze. In 1835 he was appointed professor at the Munich academy. Henceforth, the interest of his career is mainly professional; but the number of his works is singularly great, while their excellence is such as to place him in the first rank of German sculptors. His distinguishing characteristics are a thorough originality of design, and boldness of imagination; while the extraordinary extent of his acquaintance with the sculpture of Greece and of the middle ages gave a great richness and variety to his execution of details. Among his works may be mentioned 24 statuettes in the *Pinakothek* at Munich; the great bas-relief frieze (in the Barbarossa hall), more than 200 ft. long; the models for the 12 statues of the ancestors of the house of Wittelsbach, the 15 colossal statues for the front pediment of the Valhalla, the models of the 15 statues of the "Battle of Arminius" for the northern end of the same structure, and the model of the colossal statue of Bavaria, 54 ft. high; a marble statue of the emperor Rudolf for the cathedral of Spire, models for the statues of Goethe and Jean Paul Richter, a statue of Mozart, marble groups of Ceres and Proserpina (at Berlin), etc., besides numerous other works executed by his pupils from his designs. He died in 1848.

SCHWARTZ. See SCHWARZ.

SCHWARZ, BERTHOLD, b. Germany, early in the 14th century; a Franciscan monk, whose name is thought to have been Konstantin Ancklitz. He was an alchemist, who lived at Nuremberg or Mentz, and was called Schwarz (i.e., "Black") from his supposed practice of the black art. He is said to have discovered gunpowder when in prison for sorcery. It is supposed that gunpowder was discovered as early as 1330, or at least before any date assigned to Schwarz's discovery, which probably consisted in utilizing it for military purposes. There is a monument to him at Freiberg, his birthplace.

SCHWARZ, CHRISTIAN FRIEDRICH, a distinguished German missionary, was b. at Sonnenburg, in Brandenburg, Oct. 26, 1726. He studied at Halle, and having resolved to become a missionary in the East Indies, obtained ordination at Copenhagen, with the view of joining the Danish mission at Tranquebar, where he arrived in 1750. His career is a beautiful example of what may be accomplished when piety, integrity, good sense, and a charity that knows how to prevent the virtue of zeal from lapsing into the vice of fanaticism, unite harmoniously in a man. After laboring 15 years at Tranquebar, he went to Trichinopoly, where he founded a church and school, and also acted as chaplain to the garrison. Here the fruits of his long and consistent career of pious activity gradually began to show themselves in considerable conversions from Hinduism. In 1777, another missionary was sent to his assistance; and by the permission of the rajah of Tanjore, whose friendship he had acquired, he built a church in that city. So highly did the native rulers admire his integrity, that once, when Hyder Ali, of Mysore, was arranging terms of peace with the Madras government, he demanded that Schwarz should act as their agent—"him, and no other one," said the sultan, "will I receive and trust." On this occasion, Schwarz resided three months at Seringapatam. During the terrible Carnatic war which soon after followed (1781-83), and for which Schwarz thought the British were to blame, a striking testimony was given of that universal respect entertained for his character. The inhabitants and garrison of Tanjore were dying of starvation, and neither the British nor the rajah could induce the cultivators to sell them provisions. In despair, Schwarz was appealed to, and when he gave his word that payment should be made, the farmers believed him, and sent the requisite supplies. On the death of the rajah of Tanjore in 1787, Schwarz was appointed tutor and guardian of his his young son, Maha Sarboji, who turned out, under Schwarz's care, one of the most accomplished sovereigns in or out of India. Schwarz died Feb. 13, 1798.

SCHWARZBURG, HOUSE OF, one of the oldest German families, founded about the middle of the 12th c., by Sizzo, count of Schwarzburg and Käsernburg. The two sons of Sizzo were Heinrich, who succeeded his father as count of Schwarzburg, and Günther, who became count of Käsernburg. The former, dying childless in 1184, his possessions went to his brother, who left two sons, Günther, who continued the family of the counts of Käsernburg, and Heinrich, from whom sprung the counts of Schwarzburg. In 1349, Günther XXI., the younger son of Heinrich XII., was elected emperor of Germany, but he died within the year of his election. Count Günther XL of Schwarzburg and Arnstadt, who introduced (1541) the reformation into his states, was the common ancestor of the two existing lines of the Schwarzburg family; his son, Johann Günther, founding the line of Schwarzburg-Sondershausen (q.v.), and Albert, that of Schwarzburg-Rudolstadt (q.v.).

SCHWARZBURG-RUDOLSTADT, a German principality, bounded on the e. by Weimar, Altenburg, and Meiningen, with a detached part, 30 m. to the n., in Prussian Saxony. Area, 367 sq.m.; pop. '75, 76,676, of whom above 76,000 were Lutherans. It consists of the Upper Lordship (*Rudolstadt*, 282 sq.m.) and the Lower Lordship (*Frankenhausen*, 85 sq. miles). The Schwarz, Ilm, and Saale water the surface, which is for the most part covered with spurs of the Thuringer-wald. The ordinary crops are raised, and timber, salt, and metals are the principal products. The principality contains many spots distinguished for beautiful scenery; and besides the vale of the Schwarz, the convent ruins of Paulenzelle, and the remains of the castle of Kyffhausen, attract many visitors. Schwarzburg-Rudolstadt has a diet of 16 members, of whom 12 are chosen by general election. Schwarzburg-Rudolstadt has one vote in the federal council, and one in the diet.

SCHWARZBURG-SONDERSHAUSEN, a German principality, is partly surrounded by Prussian Saxony. Area, 333 sq.m.; pop. '75, 67,480, mostly Protestants. It consists of a Lower Lordship (*Sondershausen*) and an Upper Lordship (*Arnstadt*). The former of these, watered by the Ilbe and Wipper, is fertile and agricultural; while the latter is mountainous, and is the seat of active manufactures. The diet contains five members nominated by the prince, 5 chosen by the most heavily taxed, and 5 by general election. Schwarzburg-Sondershausen has one voice in the federal council, and sends one representative to the imperial diet.

SCHWARZENBERG, a princely family of Germany, dates from 1420, when *Erkinger von Schinsheim* purchased the lordship of Schwarzenberg in Franconia, and was raised (1429) by the emperor Sigismund to the dignity of baron of the empire. Two of this family have acquired a European reputation; the first, ADAM, count of Schwarzenberg, who was born in 1587, and became prime-minister and adviser of Georg-Wilhelm, elector

of Brandenburg. He was all powerful during the Thirty Years' war, and brought down terrible calamities on Brandenburg by his obstinate adherence to the alliance with Austria against the Protestant league for which he was punished after the accession of the "great elector," in 1640, by being despoiled of his power, and imprisoned in the fortress of Spandau, where he died Mar. 17, 1641. The other, KARL PHILIPP, prince of Schwarzenberg, was born at Vienna, April 15, 1771, first served against the Turks, and had risen to the grade of lieutenant-marshal in 1799, at which date he raised a regiment of Hulus at his own cost. He was under the orders of Mack in the campaign of 1805, and commanded a division at Uhn; but when he saw that the battle was lost, he cut his way through the French army, and retired with his regiments to Eger, afterward taking part in the great battle of Austerlitz. He was ambassador at the Russian court in 1808, by the express wish of the emperor Alexander; fought at Wagram in 1809; and after the treaty of Vienna, conducted the negotiations preliminary to the matrimonial connection of Napoleon with the Hapsburg family; and both in this capacity and as ambassador at Paris, so gained the esteem of Napoleon, that the latter expressly demanded for him the post of general-in-chief of the Austrian contingent of 30,000 men which had been sent to aid France against Russia in 1812. Schwarzenberg with his little army entered Russia from Galicia, passed the Bug, and achieved some slight successes, but was afterward driven into the "duchy of Warsaw" (see POLAND), and took up a position at Pultusk, where he concluded with the Russians an armistice which secured the French retreat. Schwarzenberg was much blamed for his dilatory conduct at the time; and his tardiness, ascribed by the French historians to secret instructions from his own government, has since been much animadverted upon by them; but nevertheless Napoleon concealed any dissatisfaction he might have felt, and demanded (1813) for him from the Austrian government the baton of field-marshal. After a brief sojourn at Paris, Schwarzenberg was appointed to the command of the Austrian army of observation in Bohemia; and when Austria joined the allied powers, he became generalissimo of the armies of the coalition; gained the victory of Leipsic (q.v.), and introduced a cautious system of tactics, which insured a progressive hemming-in of the French, and in spite of their occasional successes, completely wore them out. On the return of Napoleon from Elba, he obtained the command of the allied army on the upper Rhine, and a second time entered France. On his return to Vienna, he was made president of the imperial council for war, received an extensive grant of lands in Hungary, and was allowed to engrave the imperial arms of Austria on his escutcheon. He died of apoplexy at Leipsic, Oct. 15, 1820.—His nephew, FELIX LUDWIG JOHANN FRIEDRICH, born Oct. 2, 1800, distinguished himself in the Italian campaign of 1848, was placed at the head of affairs in Vienna, called in the aid of the Russians against Hungary, and pursued a bold policy in Germany. He died at Vienna, April 5, 1853.

SCHWARZENBERG, FRIEDRICH JOHANN JOSEPH CELESTINUS VON, b. Vienna, 1809; descended from a princely German family, ennobled by the emperors Sigismund, 1417; Leopold, 1670; and Francis I., 1746; was made archbishop of Salzburg, 1836; cardinal, 1842; and archbishop of Prague, 1849. In the Vatican council he opposed as inopportune the declaration of the dogma of the pope's infallibility, but when it had been declared, accepted it.

SCHWARZWALD. See BLACK FOREST, *ante*.

SCHWEDT, a handsome t. of Prussia, in the province of Brandenburg, on the Oder, 31 m. s.s.w. of Stettin. Weaving, brewing, the manufacture of soap and of tobacco, which is here extensively grown and sold, are the principal branches of industry. Pop. '75, 9,613.

SCHWEGLER, ALBERT, 1819-57; b. Würtemberg; studied theology at the university of Tübingen; appointed professor there of classical philology, 1848; afterward of ancient history. In theology and criticism he was of the "Tübingen school." He published annotated editions and translations of the Clementine Homilies, 1847; Aristotle's *Metaphysics*, 1847-48; Eusebius, 1852; a *History of Philosophy*, often reprinted and translated into many languages—into English by prof. J. H. Seeley of Amherst college; his *History of Grecian Philosophy* was published after his death, 1859.

SCHWEIDNITZ, a charmingly situated t. of Prussian Silesia, on the left bank of the Weistritz, 42 m. s.e. of Liegnitz, and about the same distance s.w. of Breslau by railway. Woolen goods, leather, and agricultural implements are manufactured; and the fairs for corn, cattle, and yarn are much frequented. Schweidnitz was besieged and taken four times within 50 years, the last time by the French in 1807, when the defenses were in great part destroyed. Pop. '75, 19,892.

SCHWEINFURT, an ancient and long an imperial free city, the *Trajectus Suevorum* of the Romans, now a town of Bavaria, in Lower Franconia, on the Main, 29 m. n.e. of Würzburg by railway. It contains a beautiful market-place, in which important cattle and wool markets are held. Wine-culture, sugar-refining, and manufactures of chemicals and dyeing materials, as white-lead, ultramarine, Schweinfurt green, etc., are carried on. See GREEN. Pop. '75, 11,250.

SCHWEINFURTH, GEORG AUGUST, a distinguished African traveler, was b. in Riga, Sept. 29, 1835. He studied at Heidelberg, Munich, and Berlin, making botany his

specialty. In 1864 he made a journey through the valley of the Nile, and along the coasts of the Red sea; and on his return to Berlin in 1866 had the botanical, zoological, and geological fruits of his travels classified. In 1868, by the aid of a grant from the royal academy of sciences of Berlin, he again started for Africa and made his way from Khartoum into the interior in the company of the ivory-traders, along the valley of the White Nile. Between the 4th and 6th parallels of n. lat. he penetrated as far westward as the 26th meridian, carefully noting the nature of the countries through which he passed, and the character of their various tribes. He returned in 1872; and in 1874 published the results of his travels under the title of *Im Herzen von Afrika*, 2 vols. An English translation, *The Heart of Africa*, was published the same year. Schweinfurth was made president of the Egyptian geographical society in 1875.

SCHWEINITZ, EDMUND ALEXANDER VON, 1825-80; b. Bethlehem, Penn.; studied theology in the Moravian seminary there, and at the university of Berlin; became a clergyman, and was chosen one of the bishops of the Moravian church; editor of the *Moravian* for several years; one of the translators of *Herzog's Real Encyclopædia*; and author of *The Moravian Manual*; *Systematic Benevolence*; *The Moravian Episcopate*; and *The Life of Leisberger, the Western Pioneer and Apostle to the Indians*, 2 vols.

SCHWEINITZ, LEWIS DAVID VON, PH.D., 1780-1834; b. Bethlehem, Penn.; educated in Germany, and resided there, 1798-1812; went as a Moravian minister to Salem, N. C.; resided at Bethlehem, 1821-34. He was specially devoted to botany, and by original researches added 1400 new species to the catalogues of American flora; was author of several botanical monographs, among which are those on the genera *viola* and *carex*, catalogues of the fungi of North Carolina and of North America, and of plants collected by Thomas Say in the n.w. territory.

SCHWENKFELD, KASPAR VON, 1490-1561; b. Silesia; became an enthusiastic advocate of the reformation, but his views concerning the deification of the body of Christ, the Lord's supper, and the admission of only holy persons to the church, brought on him the opposition of the reformers. Having been expelled from Silesia he was driven from town to town. His moral character was never assailed by his opponents, and his writings are valuable contributions to the history of the reformation. A sect named after him arose in Silesia, but the most of them removed in 1734 to eastern Pennsylvania, where they still have about 1000 members, with churches and schools.

SCHWERIN, capital of the grand duchy of Mecklenburg-Schwerin, is agreeably situated on the w. shore of the Schweriner see, a lake 14 m. in length and 3 m. broad, and abounding in fish. Schwerin is divided into the old town, the new town, and the suburb, is well built, and contains one of the finest Gothic cathedrals in northern Germany, begun in 1248 and finished in the 15th century. The ducal castle, erected by Wallenstein, stands on a small island. In Schwerin there are tobacco-factories, an iron-foundry, breweries, etc. Pop. '75, 27,989.

SCHWERIN, KURT CHRISTOPH VON, Count, 1684-1757; b. in Swedish Pomerania. He became an ensign in the Dutch army when 16 years old; served under Marlborough and Eugene, and entered the Prussian service in 1720 as maj.gen. He was made field-marshal in 1740 by Frederick the great. In 1741 he won the battle of Mollwitz, through which Frederick secured Silesia. He took Prague in 1741 and was killed in the great battle of Prague during the seven years' war.

SCHWYZ, one of the mountain cantons in the middle of Switzerland, is bounded on the n. by the canton of St. Gall and the canton and lake of Zürich, and on the s. by the canton of Uri and the lake of Lucerne. Area, 350 sq.m.; pop. (July, 1876), 49,216, of whom only 800 are Protestants. The whole surface is covered with mountains, except small tracts in the s.w. and n.e.; but there are no glaciers nor any everlasting snow except on the Rieselstock, 8,890 ft. high, on the e. frontier. The canton comprises a third part of lake Zug, the most northern angle of the lake of the Four Cantons, the whole of the mountain-mass of the Righi (q.v.), the plain in which lies the small lake Lowerz, and the valleys of the Muotta, Sihl, and Aa, the principal rivers. Cattle-breeding is the employment of almost the whole of the inhabitants, and the number of cattle is estimated at about 20,000. Only about one-thirtieth of the whole area is cultivable; fruits and wine are cultivated to some extent; and cattle, cheese, and timber are exported. Woven fabrics for home use are almost the only manufactures.

Schwyz, one of the three original cantons, and also one of the four Forest Cantons, has supplied the name to the whole country of which it forms a part. The government is a representative democracy.—Schwyz, the capital, is a small town, containing a beautiful parish church, and most picturesquely situated 17 m. e. of Lucerne.

SCIAC'CA (anc. *Therma Scuntina*), a seaport of Sicily, in the province and 30 m. w.n.w. of the city of Girgenti. It is defended by the castle of Luna, is surrounded by old walls, and has a fine cathedral. Outside the walls are the hot springs, which are visited by invalids, and upon a neighboring height the so-called *Stufe di St. Calogero*. At the bottom of one of the wells a noise is heard resembling that of a cascade. Pop. '72, 18,896. Sciacca was the birthplace of Agathocles, tyrant of Syracuse, and of Fazelli the historian.

SCIENIDÆ, a family of acanthopterous fishes, somewhat resembling perches; having a compressed body; a simple or double dorsal fin, the first part spiny; the gill-covers variously armed; the head generally inflated, and its bones cavernous; the scales are ctenoid, and in general obliquely ranged. The scienidæ are divided into many genera, and widely distributed. Most of them are marine, but a few inhabit fresh water. Only two species are reckoned as British, the *maigre* (q.v.) and the bearded umbrina (q.v.), both excellent for the table. The power of emitting sounds which belongs to the *maigre* is possessed also by others of the family in a remarkable degree. Among these are species of *pogonius*, as *P. chromis*, known by the name **DRUM-FISH**, because the sound which it emits resembles that of a drum.

SCIAGRAPHY, the drawing of sections (q.v.) of buildings, so as to show the interior of them.

SCIATICA is the term given to neuralgia of the great sciatic nerve. See **NERVOUS SYSTEM**. It has been shown by Graves to be a frequent complication of gout; but rheumatism, or exposure to cold and wet, is its most common cause. It is characterized by irregular pains about the hip, especially between the great trochanter of the thigh-bone and the bony process on which the body rests when sitting, spreading into neighboring parts, and running down the back of the thigh to the leg and foot; or the pains may occupy only isolated parts, as the knee-joint, the calf of the leg, or the sole of the foot. Sciatica is a very obstinate disease, but the treatment is the same as that of neuralgia generally, except when it is merely a complication of gout, in which case the primary disease must be attacked as well.

SCIATIC STAY (possibly a corruption of *Asiatic*), in merchant vessels, is a strong rope fastened between the main and foremast heads. When loading or unloading, a traveling tackle is suspended to it, which can be brought over the fore or main-hatchway as occasion demands.

SCIACI, a t. of Sicily, in the province of Syracuse, on the small river Sciaci, 21 m. w.s.w. from Noto. The woolen manufacture is carried on. Sciaci is supposed to be the ancient *Casmenæ*. Pop. 10,029.

SCIENCES, the name for such portions of human knowledge as have been more or less generalized, systematized, and verified. Generality as opposed to mere particulars, system as opposed to random arrangement, and verification as opposed to looseness of assumption, concur in that superior kind of knowledge dignified by the title in question. Geography, chemistry, and political economy are now sciences. The first has been so for many ages, although greatly advanced in recent times; the two last, scarcely more than a century. Chemical facts and maxims of political economy had been known from a much earlier date, but they did not in either case amount to science; the generalities were few or bad, system and certainty were both wanting. In the different branches of natural history—mineralogy, botany, zoology—there had been a large store of accumulated facts before any one branch could be called a science. The *quality* of the knowledge is of more consequence than the quantity.

The term *philosophy* (q.v.) is to a certain extent, but not altogether, coincident with science, being applied to the early efforts and strainings after the explanation of the universe, that preceded exact science in any department. Both names denote the pursuit of knowledge as knowledge, or for intellectual satisfaction, in contrast to the search that is limited to immediate practice or utility.

The sciences have been variously classified, and the principles of their classification have been a subject of discussion. We shall here describe the mode of classifying them in accordance with present usage, and with the principles most generally agreed upon.

It is convenient to prepare the way by distinguishing between theoretical sciences, which are the sciences properly so called, and practical sciences. A theoretical science embraces a distinct department of nature, and is so arranged as to give, in the most compact form, the entire body of ascertained (scientific) knowledge in that department: such are mathematics, chemistry, physiology, zoology. A practical science is the application of scientifically obtained facts and laws in one or more departments to some practical end, which end rules the selection and arrangement of the whole; as, for example, navigation, engineering, mining, medicine. Navigation selects from the theoretical sciences—mathematics, astronomy, optics, meteorology, etc.—whatever is available for guiding a ship on the seas, and converts the knowledge into rules or prescriptions for that purpose. The arts that can thus draw upon the exact sciences are by so much the more certain in their operation; they are the scientific arts.

Another distinction must be made before laying down the systematic order of the theoretical sciences. A certain number of these sciences have for their subject-matter each a separate department of natural forces or powers; thus, biology deals with the department of organized beings, psychology with mind. Others deal with the application of powers elsewhere recognized to some region of concrete facts or phenomena. Thus, geology does not discuss any natural powers not found in other sciences, but seeks to apply the laws of physics; chemistry, and biology to account for the appearances of the earth's crust. The sciences that embrace peculiar natural powers are

called abstract, general, or fundamental sciences; those that apply the powers treated of under these to regions of concrete phenomena are called concrete, derived, or applied sciences.

The abstract or theoretical sciences as most commonly recognized, are these six: mathematics, physics, chemistry, biology (vegetable and animal physiology), psychology (mind), sociology (society). The concrete sciences are the natural history group—meteorology, mineralogy, botany, zoology, geology, also geography, and we might, with some explanations, add astronomy. The abstract or fundamental sciences have a definite sequence, determining the proper order for the learner, and also the order of their arriving at perfection. We proceed from the simple to the complex, from the independent to the dependent. Thus, MATHEMATICS relates to *quantity*, the most pervading, simple, fundamental, and independent attribute of the universe. The consideration of this attribute has therefore a natural priority; its laws underlie all other laws. As mathematics is at present understood, it has an abstract department, which treats of quantity in its most general form, or as applied to nothing in particular—including arithmetic, algebra, and the calculus—and a concrete or applied department—viz., *geometry*, or quantity in space or extension. It has been suggested that general mechanics, or the estimation of quantity in *force*, should be considered a second concrete department. But usually mechanics ranks with the next fundamental science in order, called physics.

NATURAL PHILOSOPHY has long been considered the name of a distinct department of science; the designation PHYSICS is now more common. This science succeeds mathematics, and precedes chemistry. Of all the fundamental sciences, it has the least unity, being an aggregate of subjects with more or less connection. Mechanics, hydrostatics, hydraulics, pneumatics, acoustics, astronomy, are all closely related; they represent the phenomenon of movement in *mass*, as applied to all the three states of matter, solid, liquid, and gas. The remaining subjects—heat, light, and electricity—together with the attractions and repulsions that determine cohesion, crystallization, etc., are described as relating to movement in the *molecule*. We have thus molar physics and molecular physics; and the tendency is now to treat the two separately.

CHEMISTRY lies between physics and biology, reposing upon the one, and supporting the other. It assumes all the physical laws, both molar and molecular, as known, and proceeds to consider the special phenomenon of the composition and decomposition of bodies considered as taking place in definite proportions, and leading to change of properties. The composition of a cup of tea from water, sugar, milk, and infusion of tea-leaf is physical; the composition of marble from oxygen, carbon, and calcium is chemical. In the one case, the properties of the separate ingredients are still discernible; in the other, these are merged and untraceable.

BIOLOGY, or the science of living organization, involves mathematical, physical, and chemical laws, in company with certain others called vital. It is most usually expounded under the designations vegetable and animal physiology; and in the concrete departments, botany, zoology, and anthropology.

PSYCHOLOGY, or the science of MIND, makes a wide transition, the widest that can be taken within the whole circle of the sciences, from the so-called material world, to the world of feeling, volition, and intellect. The main source of our knowledge of mind is self-consciousness; and it is only from the intimate connection of mind with a living organism that the subject is a proper sequel to biology. Not until lately has any insight into mind been obtained through the consideration of the physical organ—the brain; so that psychology might have been placed anywhere, but for another consideration that helps to determine the order of the sciences, viz., that the *discipline*, or method, of the simpler sciences is a preparation for the more abstruse. Mathematics and physics especially are an admirable training of the intellect for the studies connected with mind proper, although the laws of physics may not of themselves throw any direct light on the successions of thought and feeling.

These five sciences embrace all the fundamental laws of the world, and, if perfect, their application would suffice to account for the whole course of nature. To a person fully versed in them, no phenomenon of the explained universe can appear strange; the concrete sciences and the practical sciences contain nothing fundamentally new. They constitute a liberal scientific education. It is not uncommon, however, to rank SOCIOLOGY, or the laws of man in society, as a sixth primary science following on psychology, of which it is a special development.

Dr. Neil Arnott, in his work on *Physics*, first published in 1828, gave as the primary departments of nature—physics, chemistry, life, and mind (under which he would include the laws of society). He did not discard mathematics, but looked upon it as a system of technical mensuration, created by the mind to facilitate the study of the other sciences, as well as the useful arts. The natural laws expressed by mathematics are few and simple, and the body of the science consists of a vast scheme of numerical computation, whose value appears in its applications to astronomy and the other physical sciences.

Auguste Comte, who, in his *Cours de Philosophie Positive*, went over the entire circle of the theoretical, abstract, or fundamental sciences, enumerated these as follows: mathematics, astronomy, physics, chemistry, biology, sociology. He thus detaches astronomy from physics, considering it as the abstract science that brings forward and works out

the law of gravitation. He has no distinct science of psychology, an omission that has been generally condemned.

Mr. Herbert Spencer, in a tract on the *Classification of the Sciences*, takes exception to the scheme of Comte, and proposes a threefold division, according to the gradations of concreteness in the subject-matter. The first group is termed ABSTRACT SCIENCE, and treats of the *forms* of phenomena detached from their embodiments. The most comprehensive forms are space and time; and the sciences corresponding are mathematics and logic. The second group is ABSTRACT-CONCRETE SCIENCE, or the phenomena of nature analyzed into their separate elements—gravity in the abstract, heat in the abstract—as in physics and chemistry. These are two of the fundamental sciences in every scheme, and they are called abstract-concrete by Mr. Spencer, in comparison with the foregoing class. The great principle of recent introduction, termed the law of correlation, conservation, or persistence of force, serves to connect physics with chemistry, and imparts to the two taken jointly a greater unity than belongs to physics singly. The third and last group is CONCRETE SCIENCE, or natural phenomena in their totalities, or as united in actual things—astronomy, biology, psychology, sociology, geology, etc. Mr. John Stuart Mill, in an article in the *Westminster Review*, April, 1865, has described Comte's scheme at length, and also criticised that of Spencer.

It may be held as generally admitted that mathematics, physics, chemistry, biology, and psychology, with or without sociology, are the sequence of the primary or fundamental sciences, and that the natural history group, from not containing any new laws of nature, are not fundamental. Astronomy, or the laws of the solar system, and of the other celestial bodies, might be called a natural history or concrete science, if we supposed a prior abstract science that discussed the operation of gravity, together with the laws of motion in bodies generally, or without special application to the existing solar and sidereal systems. The first book of Newton's *Principia* would be the abstract, the third book the concrete, form of the science.

The practical sciences do not admit of any regular classification. They are as numerous as the separate ends of human life that can receive aid from science, or from knowledge scientifically constituted. Connected with mind and society, we have ethics, logic, rhetoric, grammar, philology, education, law, jurisprudence, politics, political economy, etc. In the manual and mechanical arts, there are navigation, practical mechanics, engineering civil and military, mining and metallurgy, chemistry applied to dyeing, bleaching, etc.

The medical department contains medicine, surgery, midwifery, materia medica, medical jurisprudence. A science of living, or of the production of happiness by a skilled application of all existing resources, was greatly desiderated by Plato, and would be the crowning practical science.

SCILLA. See SQUILL.

SCILLY ISLANDS. These islands, situated a little w. of 6° w. long., and about 50 n. lat., are the most southern parts of the United Kingdom of Great Britain, if we except the channel islands. The group consists of about 40, comprising a circuit of about 30 m.; and their general denomination is derived from a very small island, about an acre in extent, and almost inaccessible, called Scilly, probably from its position near dangerous rocks, similar to that of Scylla near Sicily. By the ancients, these islands were named Cassiterides, Hesperides, and Siluræ Insulæ. It would seem that the term Cassiterides, or "Tin islands," under which they were known to the Greeks and Romans, was once applied to the peninsula of Cornwall, or at least before the Roman settlement in Britain, there was some confusion between the Scilly islands and the peninsula of Cornwall. The inhabitants of Cornwall are said to have brought tin to these islands, where it was shipped off by foreign merchants.

Numerous remains may be seen of rude pillars, circles of stones, kistvaens, rock-basins, and cromlechs. The granite of which the islands are composed is, in general, of a rather coarse quality, and from its color, iron seems to be frequently associated with it. There are metalliferous veins, or lodes, in some of the rocks, but none that could have yielded any considerable quantity of ore. The Scilly islands were in 936 granted by Athelstane to some monks who settled at Tresco. They were afterward granted to the abbey of Tavistock by Henry I., and were conferred by queen Elizabeth on the Godolphin family. They are now the property of the crown.

Only five of the islands are inhabited. St. Mary's, the largest, comprises 1528 acres; Tresco, 697; St. Martin's, 515; St. Agnes (a light-house station), 313; Sampson and Bryher, 269. The inhabitants are chiefly engaged in agriculture. Barley, oats, and a little wheat are grown. Large quantities of potatoes are sent to London and Bristol. Fishing, though not to any great extent, occupies some portion of the population. The climate is mild. The soil is in general sandy, but in Tresco and St. Agnes it is remarkably fertile. The cliffs abound with sea-fowl, and are covered with samphire.

St. Mary's had, in 1871, a population of 1383, while the other four inhabited islands (Tresco, St. Martin's, St. Agnes, Bryher) were collectively inhabited by only 707 persons. Hugh Town is the capital, and contains an odd mixture of old-fashioned and neat modern houses. The pier, built in 1750 by lord Godolphin, has been much improved by Mr. Smith, the present lessee of the islands. The custom-house and post-office are in the

center of the town. Some remains of the old church are still seen in the fields on the southern side of the island. The modern church, at the e. side of the main street, is seated on rising ground, and forms a conspicuous object in the panorama of the islands.

At Tresco are the remains of an abbey founded in the 10th century. Among the objects of curiosity on this island are the ruins of Oliver Cromwell's camp, castle, and battery, built by the parliamentarians under Blake and Ayscough. At Dolphin down may be seen traces of ancient mining.

St. Agnes is about 3 m. s. w. from St. Mary's. It is well cultivated, and is surrounded by some fine rock-scenery. The principal attraction is the light-house, 78 ft. high, containing a revolving light, seen at a distance of 18 miles.

SCIMITER, a description of sword used among eastern nations. It is considerably curved, and has its edge on the convex side. Being usually of high temper, and its shape favorable to incision, it forms an admirable cutting instrument, but is powerless as a thrusting weapon. The scimiter is not, however, any match for the bayonet.

SCINDE. See **SINDE**, *ante*.

SCINTILLATION (Lat. *scintilla*), a term applied to denote the sparkling or flickering of the stars. The phenomenon is not yet quite explained, but that it is certainly due to the earth's atmosphere is proved by the following facts, which embrace nearly all that is known on the subject. If, on a clear evening, we look at a bright star, such as Sirius, we observe that the intensity and color of its light are constantly changing—from great brilliancy to almost total obscurity, from bright red to fine blue, and so on. As it rises above the horizon, these appearances diminish in intensity; and stars near the zenith scarcely scintillate at all. Again, the amount of the scintillation depends upon the character of the weather—on some evenings, all large stars appear to scintillate strongly; on others, there is barely a trace of the appearance. It is commonly said that a planet can be distinguished from a star by the absence of scintillation. This is nearly, but not quite, true; for feeble scintillations have been occasionally observed in Mars and Venus, but very rarely in Jupiter and Saturn. One of the reasons of the non-scintillation of planets seems to be their finite apparent size; for all the more conspicuous planets show a sensible disk even in a poor telescope, while no instrument that has ever been constructed has shown a real disk in a star. Thus, a single particle or vesicle of vapor may be large enough to conceal a star for an instant, while it could have no such effect on a planet. It is pretty certain that scintillation is not due to unequally heated masses of air, since it usually modifies only the *appearance*, not the *position*, of a star. Another cause is easily seen in the comparatively feeble light of the planets. It is well ascertained that the scintillation is much less when viewed from the top of a mountain.—For a good idea of what is known, and what we desire still to know on this subject, see a paper by prof. Dufour, *Philosophical Magazine*, 1860

SCIO, one of the most beautiful islands in the Ægean sea, belongs to Turkey, and lies 7 m. off the coast of Asia Minor, at the entrance to the gulf of Smyrna. It is 32 m. long, and 18 m. in greatest breadth. Area, 400 sq. m.; pop. about 60,600. It is mountainous in the n., and is extremely fertile. Silk, figs, cheese, wool, and gum-mastic are its principal products; and its wine, which was famous in ancient times, is still esteemed. Kastro, the capital, a thriving and handsome town of 18,800 inhabitants, stands on the e. coast, has a harbor, a castle, and two light-houses, and carries on a growing trade in fruits, confectionery, and silk and woolen goods.

In early times, Scio formed one of the 12 Ionian states, and it contributed 100 ships to the Greek force that fought and was defeated by the Persians in the sea-fight off Miletus (494 B.C.). In more recent times, the island was taken by the Genoese in 1346; and in 1566 by the Turks, in whose hands it has since, except for a short interval, remained. It was conferred as private property upon the sultana, enjoyed her protection, and consequently prospered. After it had enjoyed a long period of ease and wealth, a dreadful calamity befell the island at the outbreak of the Greek insurrection. A number of the Sciotes having, in 1822, joined the Samians, who had revolted, the island was attacked by a Turkish fleet and army, and the inhabitants, enervated by peace and wealth, were indiscriminately massacred; 25,000 fell by the sword, 45,000 were sold as slaves, and 15,000 escaped from the island. Subsequently, however, many of the Sciote families returned, and now the island is fast recovering the blow it sustained. Trade is returning; and the vineyards and the olive, citron, and mastic groves are again flourishing.

SCIO (*ante*). On Sunday, Mar. 27, 1881, Scio was visited by an earthquake, and shocks continued to follow each other at intervals for the next ten days. The villages on the s. side of the island were completely wrecked, hardly a house being left standing. The district of Scio suffered most severely, the old Genoese fortress, containing about 400 houses, inhabited by Jews and Mussulmans, being destroyed by the first shock, and the ground depressed about 20 inches. The center of the volcanic action was near Nenita, overlooking Megalo bay on the e. coast of the island, where 300 persons perished out of a population of 1200. On the w. side many houses fell, but no person was killed. The first shock was vertical, followed immediately by horizontal oscillations. The population of the island was at the time about 70,000, and the total number of the

dead was about 4,000. Of the survivors, about 25 per cent were believed to have been injured. Seven of the principal villages, containing 8,570 people, lost 1327 killed. At least nine-tenths of the houses in the s. and s.e. portions of the island were destroyed, and 30,000 out of the entire population of the island were left without shelter. Subscriptions were immediately taken in the principal cities of Europe and America, and large sums were sent to the island for the relief of the wounded and the destitute, many thousands being in a starving condition.

SCIOPIUS (Latinized form of *Schoppe*), KASPAR, a noted classical scholar and controversialist, was b. at Neumark, in the Palatinate, May 27, 1576; studied at Heidelberg, Altdorf, and Ingolstadt; and in 1597, visited Italy, Bohemia, Poland, and Holland. Already he had become celebrated by his Latin verse and his notes upon different Latin authors. Next year he abjured Protestantism, and became a Roman Catholic, in consequence of which he was decorated by the pope with various titles, and received a pension of 600 florins, together with a residence in the Vatican. Henceforth, his career is a series of fierce onslaughts chiefly on his former co-religionists, but also directed against all whom accident or malice led him to hate. The first person whom he selected for attack was the illustrious Scaliger (q.v.), against whom, in 1607, he launched his *Scaliger Hypobolimeus* (Mainz). In this production, Henry IV. is also assailed. Sent in 1608 by the court of Rome to the diet of Ratisbon, for the purpose of observing the religious condition of Germany, he published in the same year more than twenty pamphlets against the Protestants, recommending the Catholic powers to use every means for their extermination. Such sentiments were, of course, highly satisfactory to the emperor of Germany, who was a devoted Catholic; and, in consequence, Scioppius, on visiting Vienna, met with a favorable reception, and was raised to the dignity of count-palatine. In 1611 he fired off two libels against king James I. of England; the first was entitled *Ecclesiasticus Autoritati Ser. D. Jacobi, Mug. Brit. Regis, Oppositus* (Hartberg), and the second, *Collyrium Regium*, etc. Some three years after, when staying at Madrid, he was dreadfully beaten by the domestics of lord Digby, the English ambassador, in retaliation for the abuse of his sovereign. Scioppius fled from Spain to Ingolstadt, where he issued his *Legatus Latio* against the ambassador. In 1618 Scioppius went to Milan, where he resided for the next 12 years, devoting himself partly to philological studies, and partly to theological warfare. He died Nov. 19, 1649. Scioppius was a prodigious scholar, and might have rivaled Scaliger himself in reputation, as he did in learning, had it not been for the infirmities of his temper and judgment. To this day, his works, especially those on the Latin language, are reckoned valuable. The principal are: *Poematu Varia* (Heidelb. 1593); *Verisimilium Libri Quatuor*, etc. (Nürnberg. 1596); *Suspecte Lectiones* (Nürnberg. 1597); *De Arte Critica* (Nürnberg. 1597); *Symbola Critica in Apuleii Opera* (Augsburg, 1605); *Observationes Lingue Latine* (Frankf. 1609); *De Rectoriarum Exercitationum Generibus* (Mil. 1628); *Grammatica Philosophica, sive Institutiones Grammaticae Latine* (Mil. 1628); *Paradoxa Literaria* (Mil. 1628); *Mercurius Bilinguis*, etc. (Mil. 1628); *Rudimenta Grammaticae Philosophice* (Mil. 1629); *Astrologia Ecclesiastica* (1634); *De Scholarum et Studiorum Ratione* (Pad. 1636); *Mercurius Quadrilinguis* (Basel, 1637), etc.

SCIO TO, a river of Ohio, rises in the high lands of the n.w. portion of the state, flows s.e. to Columbus, then s. to its junction at Portsmouth with the river Ohio. It is 200 m. long, flows through a rich valley, is navigable 120 m., and for 90 m. feeds the Ohio and Erie canal. It is crossed by numerous railways.

SCIOTO, a co. in s. Ohio, adjoining Kentucky; bounded on the s. by the Ohio river; drained by the Scioto and Little Scioto rivers and Brush creek; on the Ohio canal and on a branch of the Marietta and Cincinnati and the Scioto Valley railroads; about 620 sq. m.; pop. '80, 33,511—30,568 of American birth. The surface is hilly and heavily wooded. The soil is fertile. The principal productions are corn, wheat, and grass. Much pig and forged iron is made. Co. seat, Portsmouth.

SCIP IO, PUBLIUS CORNELIUS, surnamed AFRICANUS MAJOR, one of the most accomplished warriors of ancient Rome, but whose reputation is perhaps somewhat greater than his merits, was b. 237 or 234 B.C. He is first mentioned as taking part, though only a youth, in the battle of the Ticinus (218 B.C.), where he saved his father's life. Two years later he fought at Cannæ as a military tribune, and was one of the few Roman officers who escaped from that disastrous field. In 212 B.C. he was elected ædile, though not legally qualified by age, and, in the following year, proconsul, with command of the Roman forces in Spain. His appearance there restored fortune to the Roman arms. By a bold and sudden march he captured *Nova Carthago*, the stronghold of the Carthaginians, and obtained an immense booty. His humane and courteous manners won over many of the native chiefs; and when he commenced the campaign of 209 B.C. his superiority over his opponents in address, if not in generalship, was manifest. At Bæcula, in the valley of the Guadalquivir, he defeated Hasdrubal with heavy loss, but could not prevent him from crossing the Pyrenees to the assistance of Hannibal. In 207 B.C. he won a more decisive victory over the other Hasdrubal, son of Gisco and Mago, at an unknown place called Silpia, or Elinga, somewhere in Andalusia—the effect of which was to place the whole of Spain in the hands of the Romans. Soon after he returned to Rome, where he was elected consul (205 B.C.), though he had not yet filled the office of pretor; and in the following year he sailed from Lilybæum, in Sicily, at the head of

a large army, for the invasion of Africa. His successes compelled the Carthaginian senate to recall Hannibal from Italy. This was the very thing that Scipio desired and had labored to achieve. After some abortive efforts at reconciliation the great struggle between Rome and Carthage, between Scipio and Hannibal, was terminated by the battle fought at Naragra, on the Bagradas, near Zama, Oct. 19, 202 B.C., in which the Carthaginian troops were routed with immense slaughter. Hannibal advised his countrymen to abandon what had now become a hopeless and ruinous contest, and his advice was taken. Peace was concluded in the following year, when Scipio returned to Rome and enjoyed a triumph. The surname of **AFRICANUS** was conferred on him, and so extravagant was the popular gratitude that it was proposed to make him consul and dictator for life, honors that would have been the destruction of the constitution, but which Scipio was either wise enough or magnanimous enough to refuse. When his brother, Lucius, in 190, obtained command of the army destined to invade the territories of Antiochus, Scipio served under him as legate; in fact, it was only when he offered to do so that the senate granted Lucius the province of Greece. The latter was victorious in the war, and on his return to Rome (189 B.C.) assumed (an imitation of his brother) the surname of **ASIATICUS**. But the clouds were now gathering heavily round the Scipios. In 187 B.C. Cato Major and others induced two tribunes to prosecute Lucius for allowing himself to be bribed by Antiochus in the late war. He was declared guilty by the senate, his property was confiscated, and he himself would have been thrown into prison had not his brother forcibly rescued him from the hands of the officers of justice. In 185 B.C. Scipio himself was accused by the tribune, M. Nævius; but instead of refuting the charges brought against him (and which were probably groundless), he delivered, on the first day of his trial, a eulogy on his own achievements, and opened the second day by reminding the citizens that it was the anniversary of the battle of Zama, and therefore not a time for angry squabbling, but for religious services. He then summoned the people to follow him to the capitol to give thanks to the immortal gods, to pray that Rome might never want citizens like himself. His audience were electrified, and the thing was done before opposition became possible. To resume the trial was out of the question; but Scipio felt that popular enthusiasm was not to be depended on; that the power of the oligarchy—of that compact body of ambitious and exclusive nobles—was irresistible; that its hatred of him was unappeasable, and that his day was over. He retired to his country-seat at Liternum, in Campania, where he spent the remainder of his life, and where he died, 183 or 185 B.C.—Scipio is commonly regarded as the greatest Roman gen. before Julius Cæsar; and certainly, in the brilliancy of his gifts and accomplishments, he was unsurpassed; but if his career be strictly criticised, it will be found that he owed as much to fortune as to genius. Nevertheless he won a multitude of splendid successes, and made the most of his great advantages. His beauty, bravery, and courtesy, his proud yet pious belief that the gods favored him with their inspiration, won him the love and reverence of soldiers and women; and his magnanimity toward his fallen rival, who flitted about the eastern courts in dreary exile, is a bright feature in his character, and nobly distinguishes him from the cruel-hearted oligarchs of the senate.

SCIPIO, QUINTUS CÆCILII METELLUS PIUS, d. B.C. 46; son of P. Cornelius Scipio Nasica; adopted son of Metellus Pius, and has been called P. Scipio Nasica as well as Q. Metellus Scipio. He divulged to Cicero the conspiracy of Catiline in B.C. 63. He was elected tribune in 60, was accused of bribery by the disappointed candidate, and Cicero took up his defense. In 53 he was nominated for the consulship, and was a leader of the Clodian mob against Milo. He was father-in-law of Pompey, who made him his colleague in 52, when he was chosen consul, they together re-establishing the consulship. His efforts were in accordance with every measure which would tend toward the overthrow of the power of Cæsar, and widen the breach between the aristocratic and democratic parties. He was an oppressive ruler of the province of Syria, where he was proconsul, was with Pompey in Greece, and after the battle of Pharsalia went to Yuba and took command of the army of Attius Varus. He was defeated at the battle of Thapsus, and again on the African coast he lost the day in an engagement with the fleet of Sithius, and rather than be taken prisoner he gave himself a mortal wound and plunged into the sea.

SCIPIO ÆMILIANUS, PUBLIUS CORNELIUS, surnamed **AFRICANUS MINOR**, b. 185 B.C., was a younger son of Lucius Æmilius Paulus, who conquered Macedon, but was adopted by his kinsman, Publius Scipio, son of the great Scipio, who had married the daughter of that Lucius Æmilius Paulus who fell at Cannæ. Scipio accompanied his father on his expedition against Macedon, and fought at the decisive battle of Pydna, 168 B.C. In Greece he made the acquaintance of Polybius the historian, who afterward became one of his closest and most valued friends. In 151 B.C. he went to Spain as military tribune, in the wake of the consul Lucius Lucullus, where he distinguished himself alike by his valor and his virtue. Two years later began the third and last Punic war, which mainly consisted in the siege of Carthage. Scipio still held the subordinate position of military tribune; but the incapacity of the consuls, Manius Manilius and Lucius Calpurnius Piso, and the brilliant manner in which he rectified their blunders, fixed all eyes upon him. The favorite both of the Roman army and the Roman people, Scipio was at length, in

147 B.C., when only a candidate for the ædileship, elected consul by an extraordinary decree of the Comitia, and invested with supreme command; old Cato, who could with difficulty be got to praise any one, applying to the young hero and his incapable comrades (according to Plutarch) the Homeric line—

He only is a living man; the rest are fitting shades.

The story of the siege of Carthage, the despairing heroism of its inhabitants, the determined resolution, the sleepless vigilance, the incessant labors of Scipio, are too well known to require description. Suffice it to say that after a protracted defense of months the city was finally taken by storm in the spring of 146 B.C.; and by the orders of the senate it was leveled to the ground, and the plowshare driven over its site. Scipio, a man of noble and refined soul, obeyed the savage behest with sorrow, even with horror. As he gazed on the ruin he had wrought the thought flashed across his mind that some day Rome too might perish, and the words of the *Iliad* rose to his lips—

The day shall come when sacred Troy shall perish,
And Priam and his people shall be slain.

Scipio, though probably the most accomplished Roman gentleman of his age, was rigorous in his observance of the antique Roman virtues: and when holding the office of censor in 142 B.C., he strove to follow in the footsteps of Cato. But his efforts to repress the increasing luxury and immorality of the capital were frustrated by the opposition of his colleague, Lucius Mummius, the rough conqueror of Corinth. In 139 B.C. Scipio was accused of the *crimen majestatis* by the tribune Tiberius Claudius Asellus, but was acquitted, and soon after was sent to Egypt and Asia on a special embassy. Meanwhile, however, affairs had gone badly in Spain. Viriathus, the Lusitanian patriot, had again and again inflicted the most disgraceful defeats on the Roman armies, and his example had roused the hopes of the Celtiberian tribes, who also rushed to war against the common foe. The contest continued with varying success; but the interest centers in the city of Numantia, whose inhabitants displayed amazing courage in the struggle with Rome. For long it seemed as if the Numantines were invincible—one consul after another finding their subjugation too hard a task—but at length, in 134 B.C., Scipio, re-elected consul, was sent over to Spain; and after a siege of eight months, forced the citizens, who were dying of hunger, to surrender, and utterly destroyed their homes. He then returned to Rome, where he took a prominent part in political affairs, appearing as the leader of the aristocratic party, in consequence of which his popularity with the democratic party greatly declined. Although a brother-in-law of Tiberius Gracchus, whose sister, Sempronia, he had married, he rather disclaimed any sympathy with his political aims; and when he heard of the murder of his kinsman, quoted his favorite Homer: "So perish all who do the like again." His attempt (129 B.C.) to rescind that portion of the agrarian law of Tiberius Gracchus relating to the lands of *Socii*, excited the most furious indignation. When he went home from the senate he had to be accompanied by a guard. Next morning he was found dead in his bed; the prevailing suspicion being that he was murdered either by or at the instigation of Papirius Carbo, his most rancorous political enemy. Scipio was neither a rigid aristocrat nor a flatterer of the people. Inferior in splendor of genius to his adoptive grandfather, he surpassed him in purity of character, in simplicity of patriotism, and in liberality of culture.

SCIRE FACIAS, in law, a writ used to enforce the execution of, or to vacate some already existing record. The sheriff is by it directed to give notice (in the Latin, *scire facias*) to the party against whom it is taken, to appear and show cause why its purpose shall not be carried out. The party resorting to it may be an original party, or a new party who claims injury from the record or wishes to take advantage of it. Records affected by it may be judicial, which are judgments or recognizances in the nature of judgments, or non-judicial, to wit: letters-patent and corporate charters. In the former case the object of the *scire facias* writ is to revive the judgment, which would otherwise lapse after the time by statute specified, or, at common law, in a year and a day. The defendant is ordered to come in and show cause why execution should not issue. If the record is in nature of a recognizance, the object is also to obtain execution. The chief case in which the writ of *scire facias* is employed, as regards non-judicial records, is to procure the repeal or forfeiture of letters-patent already issued, and in England the writ may be taken out by the crown or by an injured party. In this country, by an act of congress of 1793, the writ of *scire facias* is prescribed as the method to obtain repeal of a patent. The process must come before the United States circuit or district courts. *Scire facias* may also be brought by a state government to compel a corporation to resign its franchises and charter.

SCIR'PUS, a genus of plants of the natural order *cyperaceæ*. The English name club-rush is sometimes given to them. The common bulrush (q.v.) is a familiar example. There are several British species, some of them very small in comparison with the bulrush, as *S. caespitosus*, called *deer's hair* in the highlands of Scotland, which is only 2 or 3 in. high, and abounds in moors, affording food to sheep in spring. The root-stocks of *S. dubius* are eaten by the natives of the s. of India; as are the tubers of *S. tuberosus*, which is called *pi-tai* by the Chinese, and is cultivated by them in tanks and ponds, copious supplies of manure being given. The tubers are roundish.

SCIRRHUS (Gr. hard), a term applied to a kind of cancer (q.v.).

SCITAMINEÆ, or **ZINGIBERACEÆ**, a natural order of endogenous plants, herbaceous perennials. There are about 250 known species, among which are the different kinds of ginger, galangale, zedoary, cardamom, grains of paradise, turmeric, etc. Most of them are notable for their aromatic properties, which reside chiefly in their root-stalks or in their seeds. The root-stocks of some, particularly when young, contain much starch, which is used as arrow-root. All the species are tropical or subtropical.

SCIURIDÆ. See **SQUIRREL**.

SCLERODERMI, Cuvier's name for the family of fishes called *balistide* by Müller. See **BALISTES**.

SCLEROGENIDÆ. See **MAILED CHEEKS**.

SCLEROS TOMA (from the Gr. *scleros*, hard, and *stoma*, the mouth) is the term applied to a well-known genus of the family *strongylidæ*, belonging to the order of round worms or nematoidæ (q.v.). One species, the *sclerostoma syngamus*, is of special interest, as being the cause of the disease in poultry known as the gapes (q.v.). Since the article **GAPES** was published, it has been ascertained that the entozoon which infests the wind-pipe of the diseased birds is not a trematoid (or fluke-like) worm, but a round worm, possessing many very singular properties. Dr. Cobbold, to whom we are mainly indebted for our knowledge of this worm, removed from a chloroformed fowl with the gapes, seven sclerostomata. "Six were united in pairs, the odd worm being a female, from which the mail had in all likelihood been rudely torn during the withdrawal of the forceps" (*Entozoa*, 1864, p. 86). The females thus extracted had an average length of $\frac{5}{8}$ of an inch, while the males scarcely exceeded $\frac{1}{8}$ of an inch. In both sexes, the breadth of the body was nearly uniform throughout, being about $\frac{1}{16}$ of an inch in the female, and only $\frac{1}{32}$ of an inch in the male. The mouth of the female is furnished with six prominent chitinous lips. According to Siebold, after sexual congress, "there is ultimately a lasting continuity of the sexes by means of an actual growing together"—one of the most remarkable facts ever recorded in natural history. Hence the eggs, which are comparatively large, and many of which contain fully formed embryos, can only escape by a breaking-up of the body of the parent. "By whatever mode," says Dr. Cobbold, "the young make their exit from the shell, it is manifest that prior to their expulsion they are sufficiently developed to undertake an active migration. Their next habitation may occur within the bodies of certain insect larvæ, or even in small land mollusks; but I think it more likely that they either enter the substance of vegetable matters, or bury themselves in the soil at a short distance from the surface."

Considering that this worm infests the trachea of the domestic fowl, the turkey, the pheasant, and the partridge, as well as of many birds of less importance (as the magpie, the black stork, the starling, the swift, etc.), it is of the greatest importance to check its development. With this view, the worms must not only be removed by the means described in the article **GAPES**, and more fully in Cobbold's *Entozoa*, pp. 90, 91, but they must be *totally destroyed* after their removal. If they be merely killed and thrown on the ground, the mature eggs will probably remain uninjured; and when decomposition sets in, the young embryos will, sooner or later, escape from the shell, migrate in the soil or elsewhere, and ultimately find their way—how, we cannot tell—into the air-passages of certain birds, in the same manner as their parents did before them.

Dr. Cobbold, whose classification of intestinal worms will doubtless for many years be the standard one, places the *dochmius anchylostomum*, or *anchylostoma duodenale* (see **STRONGYLIDÆ**), in this genus, with the name of *sclerostoma duodenale*. This worm, which usually measures about $\frac{1}{2}$ of an inch in length, is especially characterized by an asymmetrical disposition of four horny, conical, oval papillæ, of unequal size, forming the so-called teeth. The female is larger than the male in about the ratio of 4 to 3, and is the more numerous in the ratio of 3 to 1. This worm was first discovered by Dubini at Milan in 1838, and though at first thought rare, is now known to be tolerably common throughout northern Italy. It is remarkably abundant in Egypt, where Pruner found it in nearly every corpse, sometimes in hundreds of specimens, in the jejunum, and to a less extent in the duodenum. Griesinger, in his memoir *On the Frequency of Entozoa in Egypt, and the Diseases they occasion* (1854), considers that about one-fourth of the population are constantly suffering from a severe anæmic chlorosis, occasioned solely by the presence of this parasite. A tolerably full account of this disorder, and of the treatment to be adopted, is given by Küchenmeister in his *Manual of Parasites*, vol. i. pp. 386—389.

SCLEROTIIUM, a spurious genus of fungi, now regarded as merely the mycelium of fungi, and these probably of very different kinds, which have been arrested in their development, assuming a peculiar form. This form is that of a fleshy mass, often a ball. Examples are to be found among almost all kinds of decaying vegetable matter, as fruits, esculent roots, etc. When a crop of onions rots off, as is often the case, to the vexation of the gardener, a sclerotium will generally be found attached to the bulbs in the form of little irregular black masses, or as a multitude of small granules. On the under side of decaying cabbage-leaves, and scattered on the ground beneath the plant to which they belong, may in like manner be seen little balls, varying from white or red-

dish brown to dark brown and black, in size about equal to cabbage-seeds, whence stories of showers of seeds have sometimes originated.

SCLOPIS DE SALERANO, PAOLO FEDERIGO, Count, 1798-1878; educated at the university of Turin. In 1848 he was minister of justice and ecclesiastical affairs; presided over the senate, 1849-61. In 1872 he was president of the court of arbitration at Geneva under the treaty of Washington, which settled the claims of the United States against Great Britain.

SCO'LEX. See TAPE-WORMS.

SCOLOPA'CIDÆ, a family of birds of the order *grallæ*, having a long, feeble, soft, and somewhat flexible bill, which is remarkably furnished with nerves, particularly toward the tip, so as to be extremely sensitive, whilst many of them have also a peculiar muscle, enabling them to separate the points of the mandibles the moment that their prey is felt. They are thus admirably fitted for seeking their food—which generally consists of worms; slugs, etc.—in mud, soft earth, or wet sand. The membrane of the tip of the bill is almost pulpy in many of them. The species are numerous, and very widely distributed, generally inhabitants of swampy or very moist places. Snipes, woodcocks, sand-pipers, and curlews are familiar examples.

SCOLOPEN'DRA. See CENTIPEDE.

SCOLOPENDRIUM. See HART'S TONGUE.

SCOLYTUS, a genus of coleopterous insects of the family *xylophagi*. See BARK-BEETLE. One species, *S. destructor*, a beetle only about one-sixth of an inch in length, of a dull color, with short antennæ, thickened at the extremity, has of late years destroyed great numbers of fine elms in the neighborhood of London and elsewhere in England. The female insect burrows in the wood, and lays a row of eggs; the larvæ, as soon as they are hatched, begin to feed upon the wood, and eat their way in long tunnels, diverging on all sides from the original one. This pest appears to be spreading in England.

SCOMBERESOCIDÆ, a family of fishes, of the order *plectognathi*, having the maxillary bones united with the elongated premaxillaries at the corners of the mouth. The flying-fish (*exocoetus*) belongs to this family. The gar-fish and the saury pike are the only species common on the British coasts. Until the *plectognathi* were recognized as a separate order, the *scomberesocidæ* were reckoned as belonging to the *esocidæ*, or pike family.

SCOMBERIDÆ, or **SCOMBRIDÆ**, a large family of acanthopterous fishes, containing many species highly esteemed as articles of food, and some of them of great value on account of the abundance in which they are caught. Some of them attain a large size. They have a smooth body, covered generally with small scales, and often very beautifully colored; the tail-fin generally large, and the tail very muscular and powerful. The gill-covers have no armature. The sides of the tail are often keeled and armed with sharp-keeled scales. The front spines of the anal fin are generally detached, and sometimes those of the first dorsal fin. The second dorsal fin is often represented by numerous finlets, as in the mackerel (q.v.). To the same tribe with the mackerel, characterized by finlets and by the want of armature on the lateral line, belong the bonito (q.v.), the tunny (q.v.), the albacore (see TUNNY), and the scirfish (q.v.). The importance of the mackerel fishery is well known, also that of the tunny fishery of the Mediterranean. The sword-fish (q.v.) is an example of another group, comprising only a few species, having no finlets, and remarkably characterized by the dagger-like prolongation of the muzzle. The pilot-fish (q.v.) belongs to a tribe having the first dorsal represented by isolated spines. There are other tribes or groups, some having the lateral line cuirassed, some not having this armature, and not having finlets nor detached spines. The dory (q.v.) and allied genera, often regarded as forming a tribe of *scomberidæ*, have been constituted into a distinct family, *zeidæ*.—The *scomberidæ* are all marine. They are more numerous in warm than in cold climates, although some are found in very northern seas, of which the mackerel is the most important instance. It and the scad (q.v.), or horse-mackerel, are the only species common on the British coasts, although several others are known as of rare occurrence.

SCONCE, in fortification, is a term applied to any small redoubt or fort, detached from the main works for some local object, as the defense of a pass or ford, etc. The word is not now often used.

SCONCE, a candlestick affixed to a wall by a bracket, and frequently with a mirror or other reflector.

SCONE (pronounced *Scoon*), a parish in Perthshire, lying on the left bank of the Tay, about 2 m. from Perth. It is famous as the seat of one of the most venerable of Scottish abbeys. Scone is first mentioned in the beginning of the 10th c., when a council was held there in the 6th year of the reign of king Constantine, at which time it is styled by the chronicle which records the fact, *regalis civitas*, the royal city. A monastery was built at Scone probably about the same period, and there was located the famous stone on which the kings of the Scots were inaugurated, and which was carried by Edward I. of England to Westminster abbey. In place of the ancient monastery, an abbey of can-

ons regular was founded by Alexander I. in 1115, and there the sovereigns continued to be inaugurated and crowned. Alexander III., the last of the ancient race of kings, and Robert Bruce, the founder of the new dynasty, were crowned at Scone; but after the accession of the house of Stuart, the coronation sometimes took place in other churches. In the summer of 1559, when Perth was held by the lords of the congregation, a disorderly multitude of their adherents assaulted the monastery of Scone, set it on fire, and left it a blackened ruin. The last coronation which was celebrated at Scone was that of Charles II. on Jan. 1. 1651. The abbey church had never been restored, and the solemnity took place in the parish kirk, the crown being placed on the king's head by the marquiss of Argyll. In Jan., 1716, the Jacobite leaders endeavored to encourage their followers by fixing a day for the coronation of the chevalier at Scone, but the design was abandoned. In the reign of James VI. the abbey of Scone was erected into a temporal lordship in favor of sir David Murray, afterward created viscount of Stormont. The great chief-justice, the earl of Mansfield, a younger son of the fifth viscount Stormont, was born at Scone; and the Scottish peerage is now merged in the British earldom. The viscounts of Stormont had a residence near the site of the abbey, and hence known as the palace of Scone. The present palace was erected on the same site in the beginning of this century.

SCOPAS, a celebrated Greek sculptor and architect, belonging to the later Attic school, the head of which was Praxiteles (q.v.), was b. in the island of Paros, and flourished during the first half of the 4th c. B.C. Nothing is known regarding his life or the period of his death. His principal architectural works are: "The Temple of Athena Alla at Tegea," the first both in point of size and beauty in the Peloponnesus; "The (second) Temple of Diana at Ephesus" (though Deinocrates is also and even more generally named as the architect of this building); some of the bas-reliefs in the famous mausoleum erected by Artemisia, queen of Caria, in memory of her husband (and now in the British museum). His sculptures, by which we mean his single statues and groups illustrating the divinities of Greek mythology, were very numerous, and for the most part were executed in marble. They embrace subjects from the myths of Aphrodite (Venus), Dionysus (Bacchus), Apollo, Artemis (Diana), etc. But perhaps the noblest, and certainly the most famous piece of sculpture executed by Scopas was that which latterly stood in the Flaminian circus at Rome, and represented Achilles conducted to the island of Leuce by the divinities of the sea. It included statues of Neptune, Thetis, the Nereids, Tritons, and a variety of sea-monsters, and, according to Pliny, the whole was so beautiful that it would have been sufficient to have immortalized Scopas, even if he had done nothing more.

SCOPELIDÆ. See SALMONIDÆ.

SCORE, in music, compositions for several voices or instruments, or for an orchestra, so written that each part has a separate staff for itself, these staves being placed over each other, bar corresponding to bar. It is so called because the bars are *scored* or drawn through all the parts from top to bottom. Occasionally, where there is a deficiency of staves for all the parts, or where any of the parts have so little to do that it is not worth while to assign them a separate staff, parts related to or connected with each other, as two flutes, two clarionets, or three trombones, may be written on the same staff together. The arrangement or distribution of the parts in a score is matter of some importance. As a general rule, the highest part should be placed uppermost, then the next lower, and gradually descending. All the parts of a chorus should be placed together. Perfection in reading score is not very easily attained, but is necessary for a thoroughly trained musician. The student of music who can read or play the great master-works from the score, will become far more intimately acquainted with them than he could by mere pianoforte arrangements, and will come to understand the means by which their composers have produced the wonderful effects that are to be found in their music. The use of so large a number of clefs, and the practice which has obtained of writing parts for particular instruments in other keys, have added greatly to the difficulty of studying the score. Among various suggestions for simplifying the score, one which was lately advocated in Brown's *Elements of Musical Science*, consists in the use of but one clef, the bass or F clef, the other parts being distinguished from the bass by short bars attached to the clef, which direct the performer to take the notes one, two, or three octaves higher.

SCORESBY, WILLIAM, D.D., a celebrated Arctic explorer and savant, was the son of William Scoresby, the most distinguished whale-fisher of his time, and was born at Cropton in Yorkshire, Oct. 5, 1789. He commenced a sea-faring life at the age of 10, and in his 21st year succeeded his father as commander of the *Resolution*, and carried on the business of whale-fishing. After having made 17 voyages to the Spitzbergen and Greenland whaling-grounds, he published the results of his observations of the countries within the Arctic circle in *An Account of the Arctic Regions* (2 vols., 1820), a work which not only increased and extended the author's reputation, but added largely to the sciences of meteorology, hydrography, and natural history. In 1822 he explored the e. coast of Greenland, a tract hitherto wholly unknown, and published in the following year at Edinburgh an account of this expedition and its fruits. In 1824 he was elected a fellow of the royal society of London, and some time after was chosen *correspondant*

of the French institute. He had retired from his profession in 1822, and now proceeded to give effect to a strong desire which had long possessed him, of becoming an authorized teacher of religion, by entering himself at Queen's college, Cambridge; he graduated as B.D. in 1834, subsequently (1839) received the degree of D.D., and labored faithfully and zealously, first at Liverpool and afterward at Bradford, till failing health compelled him to retire to Torquay. He still continued his physical researches, giving special attention to terrestrial magnetism, especially in its relation to navigation; and published the results, many of which were of great value and interest, in the form of memoirs in the *Philosophical Transactions*, the *Transactions of the Royal Society of Edinburgh*, the *Reports of the British Association*, and subsequently in an improved form in his *Magnetical Investigations* (Lond. 2 vols. 1839-52). For the better prosecution of these researches he made a voyage to the United States in 1847, and to Australia in 1853, returning from the last-named country in 1856, enfeebled in health by the arduous labors which he had undergone. He died at Torquay on Mar. 21, 1857. Besides his work on *Zoistic Magnetism*, which described a series of researches entered into for the purpose of eliciting some natural connection between magnetic and mesmeric agencies, he published various works of a religious nature. His life has been written by his nephew, R. E. Scoresby-Jackson (Lond., 1861).

SCORIE are the cinders and slags of volcanoes, more or less porous from the expansion of the gases contained in the melted materials. See **VOLCANIC ROCKS**.

SCORPÆNA, a genus of fishes, of the family of *mailed cheeks*. The head is large and compressed, more or less armed with spines or tubercles. The body is of a somewhat perch-like form. Some of the *scorpenæ* are remarkable for their ugliness; some exhibit very fine colors. They are numerous in the Mediterranean, and widely distributed in the seas of warm climates. They frequent rocky shores in shoals, and feed on crustaceans, small fishes, etc. They are popularly called *hog-fish* and *scorpion-fish*. The flesh is dry and tasteless, but the liver yields a useful oil.—The bergylt (q.v.) belongs to a nearly allied genus.

SCORPION, *Scorpio*, a genus of *arachnida*, of the order *pulmonaria*, formerly including the whole of the family *scorpionidæ*, to all of which the popular name is still extended. Scorpions are natives of warm climates, both in the eastern and western hemispheres. The species are numerous. They have the body elongated, and no marked division between the thorax and abdomen. Six segments of the abdomen are broad; but the last six are narrow, forming a tail; and the last segment is modified into a curved and sharp sting, having two pores on its lower side, from which the venom flows, supplied by two poison-glands in the base of the segment. The palpi are modified into pincers or claws like those of the lobster, by means of which prey is seized. There are four spiracles or breathing pores on each side of the abdomen. There are two remarkable comb-like appendages on the under surface of the thorax, the use of which is unknown. The number of eyes is various; in the restricted genus *scorpio*, of which the COMMON SCORPION (*S. Europæus*) of the south of Europe is an example, there are only six; but in some of the genera eight and twelve. Scorpions feed on beetles and other insects, and after seizing them, pierce them with the sting before eating them. They also eat the eggs of spiders, etc. They lurk under stones and in holes and crevices, but come forth to seek their prey, running with great activity. In running, they carry the tail curled over the back. When alarmed or irritated, they show great fierceness, evidently aware of the power of their sting, and moving it in all directions, as if threatening an adversary. They are universally disliked, and not a little dreaded, being apt to get into houses, and into beds, hiding themselves under pillows, in shoes, boots, etc., so that accidents are very frequent in countries where they abound. The sting of a scorpion is seldom fatal, but even that of the common European scorpion is very painful, and that of some of the largest species—which are 6 in. long—is much more severe, attended with much nausea and constitutional derangement, nor do the effects soon cease. It is of use to press a large key or other tube on the wound, so as to force out part of the poison. The best remedy is ammonia, internally administered, and also applied externally.

The female scorpion displays great regard for her young, which she carries for some time clinging in great numbers to her back, limbs, and tail.

SCORZONE RA, a genus of plants of the natural order *compositæ*, sub-order *cichoraceæ*, having yellow or rarely rose-colored flowers. The species are numerous, mostly natives of the s. of Europe and the east. No species is found in Britain. The common scorzonera of our kitchen-gardens, *S. Hispanica*, a native of the s. of Europe, has long been cultivated for its esculent roots. The root is black externally, white within, about the thickness of a man's finger, long, and tapering very gradually, whence the name *viper's grass*, sometimes given to the plant, the root being supposed to resemble a viper. It contains a white milky juice, and has a mild, sweetish, mucilaginous taste; it is very pleasant when boiled, the outer rind being first scraped off, and the root steeped in water, to abstract part of its bitterness. The leaves are an inferior substitute for mulberry leaves in feeding silkworms.—Other species of scorzonera are used in the same way.

SCOT. REGINALD, a writer who has acquired an honorable reputation as an early disbeliever in the reality of witchcraft, was a youngson of sir John Scot of Scotshall, near Smeeth in the co. of Kent, and was born in the first half of the 16th century. He studied at Oxford, and on his return home devoted himself exclusively to learned pursuits. Nothing further is known regarding him except that he died in 1599. His famous work, entitled *The Discoverie of Witchcraft*, was published in 1584, and is designed to demonstrate the absurdity of the prevalent belief on the subject. It is full of learning, and is marked in many passages by sound sense and humane feeling, qualities that naturally excited the antipathy of a person like king James, who wrote his *Demonology*, as he tells us, "chiefly against the damnable opinions of Wierus and Scot; the latter of whom is not ashamed in public print to deny there can be such a thing as witchcraft." But the "British Solomon" only reflected the general ignorance and superstition of his age, and Scot had to run the gantlet of a series of "answers" and "refutations" by a number of "eminent" divines, as well as by Glanvil, the author of the *Scepsis Scientifica*. Scot's book was ordered to be burned by the common hangman, and copies of it are now extremely rare. Besides *The Discoverie of Witchcraft*, Scot wrote *A Perfect Platform of a Hop Garden*.

SCOTCH STATUTES frequently mean the ancient acts of parliament beginning with the reign of James I. of Scotland, and continuing down to the union of England and Scotland. There are also many statutes passed since that date which are applicable exclusively to Scotland, and these are to be found among the statutes at large. The rules of construction of Scotch statutes do not differ from those affecting English or British statutes. One peculiarity, however, distinguishes the old Scotch statutes prior to the union, which is this, that those statutes lost their force by desuetude, that is, by mere lapse of time, coupled with neglect or non-observance, or at least with a contrary usage. In England, on the other hand, a statute, however ancient and however little acted upon, continues law until it is expressly, or by strong implication, repealed by some subsequent statute. Acts of sederunt—that is, rules of practice passed by the court of session—are also subject to the law of desuetude.

SCOTER. *Oidemia*, a genus of the oceanic section of ducks, having a short broad bill with an elevated knob at the base of the upper mandible, the tip much flattened, and terminated by a large flat nail, the mandibles laminated with broad strong widely separated plates; the wings of moderate length; the tail short and acute; the feet very large; the plumage generally very dark. Their food consists chiefly of marine shell-fish, crustaceans, etc. They obtain their food by diving.—The COMMON SCOTER, or BLACK SCOTER (*O. nigra*), is about the size of the common duck. The whole plumage of the male is deep black; the bill and legs are also black, except a line of orange along the ridge of the upper mandible. The female is dark brown. The black scoter is abundant in winter on many parts of the British coast, migrating to more northern regions in spring. The flesh is oily, and has a fishy taste; but being therefore permitted to Roman Catholics during Lent, is in great request in some countries, so that at Marseilles, Aix, and other places in the s. of France, arrangements are made by the magistrates for an annual shooting or *battue* of scoters, and great numbers are killed.—The VELVET SCOTER (*O. fusca*) is a less common winter visitant of Britain, plentiful only in Orkney.

SCOTIA. See MOULDINGS.

SCOTLAND. For the geography, see GREAT BRITAIN. *History*.—An account has been given under the article Picts (q.v. of the early inhabitants of the country which has long been known by the name of Scotland. The original Scotia or Scotland was Ireland, and the Scoti or Scots, at their first appearance in authentic history, were the people of Ireland. The Scots were a Celtic race, and their original seat in northern Britain was in Argyle, which they acquired by colonization or conquest, before the end of the 5th c., and from whence they spread themselves along the western coast from the firth of Clyde to the modern Ross. The name of Scotland seems first to have been given to the united kingdom of the Picts and Scots in the 10th century. It was then sometimes styled, by way of distinction, *Scotia Nova* (New Scotland), and it was a considerable time afterwards before the name of Scotland was applied to it, to the exclusion of Ireland. This interchange of names was a fruitful source of dispute between Irish and Scottish writers in the 16th and following centuries, and it can hardly be said that even now the controversy is entirely at an end.

The first prince of the British Scots mentioned in our authentic annals was Fergus, son of Ere, who crossed over to Britain about the year 503. His nation had been converted to Christianity by St. Patrick, and Fergus himself is said to have received the blessing of the saint in his early years. His great-grandson, Conal, was king of the British Scots when Columba (q.v.) began the conversion of the northern Picts; and by that prince, according to the best authorities, Iona was given for the use of the mission. Conal was succeeded by his nephew, Aidan, who was inaugurated as sovereign by St. Columba in the island of Iona—a ceremony which Scottish writers, misled by the great French antiquary Martene, long believed to be the first example of the benediction of kings. Aidan was a powerful prince, and more than once successfully invaded the English border, but toward the end of his reign he received a severe defeat from the Northumbrian sovereign Ethelfrid at the battle of Degestan.

The history of Aidan's successors is obscure and uninteresting, except to the professed students of our early history. Their kingdom was overshadowed by the more powerful monarchy of the Picts, with which, as well as with its neighbors in the s.—the Britons of Cumbria—it was engaged in almost unceasing conflict. The Scots were for a time under some sort of subjection to the English of Northumbria, but recovered their independence on the defeat and death of king Egfrid in battle with the Picts at Nechtansmere in 685. In the middle of the 9th c., by a revolution, the exact nature of which has never been ascertained, the Scots acquired a predominance in northern Britain. Kenneth, son of Alpin, the lineal descendant of Fergus and Aidan, succeeded his father as king of the Scots in 836. The Pictish kingdom was weakened by civil dissension and a disputed claim to the crown. Kenneth laid claim to it as the true heir in the female line, and was acknowledged king in the year 843.

King Kenneth transferred his residence to Forteviot in Stratherne, which had been the Pictish capital, fixing soon afterward the ecclesiastical metropolis of the United Kingdom at Dunkeld, where he built a church, dedicated to St. Columba. The Picts and Scots, each speaking a dialect of the Celtic tongue, gradually coalesced into one people, whose territory extended from the firths of Forth and Clyde to the northern extremity of Britain. The crown descended to a line of princes of the family of Kenneth, whose rule gave a unity and comparative tranquillity to the Scots of Britain, which those of Ireland, at no time really united under one prince, never possessed, and the good effects of which, as contrasted with the state of the sister island, are experienced to the present day. The first interruption to the descent of the crown in the line of Kenneth was the reign of a usurper named Grig, round whose name, amplified by Gregory by the writers of a later age, a cloud of legendary fiction gathered. The old family was restored on his expulsion in 893.

The reign of Constantine, son of Aodh, who succeeded in 904, was a remarkable one. In his time, it is probable that the seat of the ecclesiastical primacy was transferred from Dunkeld to St. Andrews, and that the regal residence was fixed at Scone. At the latter place, in the sixth year of his reign, the chronicles mention that Constantine the king, Kellach the bishop, and the Scots, swore to observe the laws and discipline of the faith and the rights of the churches and the gospels. This seems to indicate the meeting of some sort of council, civil or ecclesiastical, or more probably a combination of both, according to the form prevalent at this period both among the Celtic and the Teutonic nations. Even before the establishment of the kingdom of the Picts and Scots in the person of Kenneth, northern Britain had experienced the attacks of a new enemy, the Scandinavian invaders, generally spoken of under the name of Danes. Constantine resisted them bravely, but toward the end of his reign he entered into an alliance with them in opposition to the English. A powerful army, composed of Scots and Picts, Britons, and Danes disembarked on the Humber, and was encountered at Brunanburgh by Athelstane, king of England. A battle was fought there, the first of a series of unfortunate combats by Scottish princes on English ground. The confederate army was defeated, and though Constantine escaped, his son was among the slain. Weary of strife, the king soon afterward retired to the Culdee monastery at St. Andrews, of which he became abbot, and where he died in 953.

During the reign of Malcolm the first of that name, and the successor of Constantine, a portion of the Cumbrian kingdom, including the modern Cumberland and part of Westmoreland, which had been wrested from the Britons by Edmund, king of England, was bestowed by that prince on the Scottish sovereign. This grant was the foundation of that claim of homage made by the English kings on the Scottish sovereigns, which afterward became the cause or the pretext for the great struggle between the two nations. The northern kingdom was still further increased in the reign of Kenneth, son of Malcolm, by the acquisition of Lothian, and of northern Cumbria, or Strathclyde. The former province, formerly a part of the Northumbrian kingdom, and entirely English in its population, was bestowed on Kenneth by Edgar, king of England. The Cumbrian kingdom, which had at one time extended along the w. coast from the firth of Clyde to the border of Wales, had been weakened by the loss of its southern territories; and it now fell under the dominion of the Scottish king. The last addition to Scotland in the s. took place under Malcolm II., son of Kenneth, who acquired the Merse and Teviotdale, from the earl of Northumbria, and thus advanced his kingdom on the eastern border to the Tweed. The reign of Malcolm II. extended from 1003 to 1033. The kings who immediately followed are better known to the general readers than any of their predecessors, poetry having made their names familiar to every one. Malcolm's successor was his grandson, Duncan, whose brief reign was followed by that of Macbeth (q. v.). The latter was a vigorous and prudent ruler, munificent to the church, and famous as the only Scottish king who made a pilgrimage to Rome. But although by marriage he was connected with the royal line, he was unable to secure the affection of his subjects. Malcolm, the eldest son of Duncan, assisted by his kinsman, Siward, earl of Northumbria, invaded Scotland. The usurper was defeated and slain at Lumphanan, in Mar, in 1056, and Malcolm was acknowledged as king.

The long reign of Malcolm III. was the commencement of a great social and political revolution in Scotland. His residence in England, and still more his marriage with the English princess Margaret, the sister of Edgar Atheling, led to the introduction of Eng

lish customs, the English language, and an English population into the northern and western districts of the kingdom, which hitherto had been for the most part inhabited by a Celtic race. The influx of English colonists was increased by the tyranny of William the conqueror and his Norman followers. All received a ready welcome from the Scottish king, whose object it was to assimilate the condition of the Scots, in every respect to that of their fellow-subjects in Lothian; and what his stern, though generous, character might have failed to accomplish, was brought about by the winning gentleness and Christian graces of his English queen.

Malcolm fell in battle before Alnwick castle in the year 1093, and Margaret survived only a few days. On this event, it seemed as if the work of their reign was about to be utterly overthrown. The Celtic people of Scotland, attached to their old customs, and disregarding the claims of Malcolm's children, raised his brother, Donald Bane, to the throne. The success, however, of this attempt to restore a barbarism which the better part of the nation had outgrown, was of brief duration; Donald was dethroned, and Edgar, the eldest surviving son of Malcolm and Margaret, was acknowledged as king. The very name of the new sovereign marked the ascendancy of English influence. That influence, and all the beneficial effects with which it was attended, continued to increase during the reigns of Edgar and his brother and successor, Alexander I. The change went steadily on under the wise and beneficent rule of David (q.v.), the youngest son of Malcolm. His reign, which extended from 1124 to 1153, was devoted to the task of ameliorating the condition of his subjects, and never was such a work more nobly accomplished. David was in every respect the model of a Christian king. Pious, generous, and humane, he was at the same time active and just, conforming himself to the principles of religion and the rules of the church with all the devotion of his mother, but never forgetting that to him, not to the clergy, God had committed the government of his kingdom. He was all that Alfred was to England, and more than St. Louis was to France. Had he reigned over a more powerful nation, his name would have been one of the best known among those of the princes of Christendom. As it is, every Scottish scholar has delighted to do his character justice. At the time of David's accession, Scotland was still but partially civilized, and it depended in a great measure on the character of its ruler whether it was to advance or recede. It received a permanent stamp from the government of David. The Celtic people were improved morally socially, and ecclesiastically, and all along the eastern coast were planted Norman, English, and Flemish colonies, which gradually penetrated into the inland districts, and established the language and manners of that Teutonic race which forms the population of the greater part of Scotland. David encouraged and secured the new institutions by introducing a system of written law, which gradually superseded the old Celtic traditional usages, the first genuine collections of Scottish legislation belonging to his reign. David was as great a reformer in the church as in the state. The ecclesiastical system prevalent in Scotland almost up to his time differed in some points from that established in England and on the continent, bearing a great resemblance to that of Ireland, from which it was indeed derived. David established dioceses, encouraged the erection and endowment of parishes, provided for the maintenance of the clergy by means of tithes, and displacing the old Celtic monastic bodies, introduced the Benedictine and Augustinian orders.

David, though devoting his energies to the improvement of his subjects in the manner which has been mentioned, did not forget duties of a less agreeable kind. He knew that a Scottish king really held his crown by the tenure of the sword, and none of his fierce ancestors was a more intrepid warrior than the accomplished and saintly David. His skill and courage were shown, though without success, at the battle of the Standaard. As the representative through his mother of the ancient kings of England, he had many friends in that country; and had the Scottish army been successful, the history of the two kingdoms might in some respects have been different. As it was, he contented himself with maintaining the cause of his sister's child, the empress Matilda, against king Stephen.

David's grandson and successor, Malcolm IV., reigned for twelve years, and the next king was William the lion, Malcolm's brother, who ruled from 1165 to 1214. These princes pursued the policy of their grandfather with equal resolution, though sometimes with less success. They were embarrassed by their connection with the English king Henry II., who took advantage of his superior power and ability to impose unwise and unjust restraints on the independence of the Scottish sovereigns and their kingdom—a policy which laid the foundation of the unhappy national strife of after-years. This was averted for a time by the concessions of Richard I. in 1189: "For more than a century," says lord Hailes, "there was no national quarrel, no national war between the two kingdoms—a blessed period." That period was well employed by the next two kings, Alexander II. and Alexander III., the son and grandson of William the lion, to consolidate the institutions of their kingdom, and extend and confirm what had been begun by David. Alexander III. was one of the ablest and best of the Scottish kings. By a treaty with the king of Norway, he added to his kingdom Man and the other islands of the western sea, held by the Norwegians. His sudden death, in 1286, was one of the greatest calamities with which Scotland could have been afflicted. It closed a period of prosperity—a course of improvement—which the kingdom did not again enjoy for nearly

500 years. The history of this interesting period has yet to be written. The only modern account of any value is that in the accurate but meager annals of lord Hailes. Tytler begins his history with the reign of Alexander III.; and Robertson, in his narrative of two reigns—which in popular language is called the history of Scotland, just as lord Macaulay's similar work is called the history of England—speaks of what took place during the whole time from the union with the Picts to the death of Alexander III., as "events which may be slightly touched, but merit no particular or laborious inquiry."

On the death of the infant granddaughter and heiress of Alexander III., in 1290, the succession to the crown was disputed. The question between the two chief claimants, Baliol and Bruce (q.v.), was not free from doubt according to the customs of the time; and Edward I. of England, to whom the decision was referred, appears at first to have acted with good faith. But this great king, who had already subdued Wales, was now bent on uniting the British Islands under one scepter; and in the pursuit of that object he sacrificed humanity, honor, and justice. The results were most deplorable. The national spirit of the Scots was finally roused, and after a long struggle under Wallace and Bruce they secured their independence on the field of Bannockburn (q.v.). The battle of freedom was won; but it was at the expense of tranquillity and civilization. The border counties were continually wasted by the English; the central provinces were the scene of frequent warfare among the chief nobles; and the highland districts became more and more the seat of barbarism, the Celtic tribes re-acquiring something of their old ascendancy, just as they did in Ireland in the troubled times which followed the invasion of Edward Bruce. The strong arm of king Robert might have repressed these disorders, had his life been longer spared after the treaty of Northampton; but his death, and the accession of an infant son, again plunged the country into all the miseries of foreign and civil war. When that son, David II., grew up to manhood, he proved in every respect unworthy of his great father. His reign, and that of his successors Robert II. and Robert III., the two first princes of the house of Stewart, were the most wretched period of Scottish history. In the year 1411, half of the kingdom would have become absolutely barbarous, if the invasion of the lord of the Isles had not been repulsed at Harlaw (q.v.), by the skill of the earl of Mar, and the bravery of the lowland knights and burghesses.

A happier time began to dawn on the release of James I., in 1424, from his English captivity. The events of the following period are better known, and a brief notice of the most important will be sufficient. Reference may be made for details to the accounts of the particular kings. The vigorous rule of James I. had restored a tranquillity to which his kingdom had long been unaccustomed; but strife and discord were again brought back on his assassination. One of the most calamitous features of the time, was a succession of minorities in the sovereign. James himself had succeeded when a child and a captive; James II., James III., James IV., James V., Mary, and James VI., all succeeded while under age, and all, except James IV., when little more than infants. The courage and ability shown by almost all the Stewart princes were insufficient to repair the mischiefs done by others in the beginning of their reigns, and to abate the great curse of the country—the unlimited power and constant feuds of the nobles. The last addition to the Scottish kingdom was made in the reign of James III., when the islands of Orkney and Zetland were made over to him as the dowry of his queen, Margaret of Denmark. The marriage of James IV. with Margaret of England was far more important in its ultimate results, and brought about in the reign of his great-grandson that peaceful union with England which the death of the maiden of Norway had prevented in the 13th century. Many good laws were enacted during the reigns of the Jameses; but the wisdom of the Scottish legislature was more shown in framing them than the vigor of the government in enforcing them. Among the most important improvements of the period was the establishment of universities—the first of which, that of St. Andrews, was founded during the minority of James I.—and the institution of the college of justice in the reign of James V.

During the reign of the fifth James, religious discord added another element to the evils with which Scotland was afflicted. The practical corruptions of the church were greater than they were almost in any other country in Europe, and one of the consequences was, that the principles of the reformation were pushed further than elsewhere. The first great ecclesiastical struggle had hardly ceased, by the overthrow of the Roman Catholic system, when the strife began anew in the reformed communion in the shape of a contest between Episcopacy and Presbyterianism, the former being supported by the sovereign, the latter by the common people, the nobles throwing their weight into either scale as it suited their policy at the time. James VI. struggled hard to establish an absolute supremacy, both in church and state, in opposition to a powerful party, which admitted no royal authority whatever in the former, and very little in the latter. After his accession to the English crown, he was apparently successful in carrying out his designs, but during the reign of his son, Charles I., the contest again broke out with increased bitterness. The nobility, whose rapacity had been checked by the sovereign, joined the popular party. The opponents of the crown bound themselves together, first by the national covenant, and afterward in alliance with the English Puritans, by the solemn league and covenant. Their efforts were completely successful, but their success led to the utter overthrow of the monarchy by Cromwell.

The restoration of Charles II. was welcomed by all classes, wearied as they were of a foreign and military rule, but especially by the nobles and gentry, who had learned by bitter experience that the humiliation of the sovereign was necessarily followed by the degradation of their order. Had the government of Charles II. and James VII. been reasonably just and moderate, it could hardly have failed in securing general support; but unfortunately it was more oppressive and more corrupt than any which Scotland had experienced since the regencies in the minority of James VI. The natural result was the revolution, which seated William and Mary on the throne.

Hardly had the majority of the nation been successful in this, when many of them began to repent of what they had done, and Jacobitism became more popular than royalist principles had ever been when the house of Stewart was on the throne. The discontent was greatly increased by the fears entertained of English influence. The state of matters grew so threatening after the accession of queen Anne, that the ruling English statesmen became satisfied that nothing short of an incorporating union between the two kingdoms could avert the danger of a disputed succession to the throne, and of a civil war. Supported by some of the ablest and most influential persons in Scotland, they were successful in carrying through their design, though it was opposed by a majority of the Scottish people. The act of union was formally ratified by the parliament of Scotland on Jan. 16, 1707. It subsequently received the royal assent, and came into operation on May 1, of the same year. The union continued to be unpopular in Scotland for many years, and unpopularity increased by the corrupt means freely used to carry it through. But the discontent gradually ceased, and the ultimate consequences of the measure have been mostly beneficial to both kingdoms.

A few words may be added regarding the parliament of Scotland. That body was originally composed, like the English parliament, of three classes—the ecclesiastics (consisting of bishops, abbots, and priors), the barons, and the burgesses. The spiritual lords, during the establishment of episcopacy after the reformation, were composed of bishops only. When Presbyterianism was established at the time of the covenant, and when it was formally ratified by law at the revolution, the ecclesiastical estate ceased to have any place in parliament. The barons, or immediate vassals of the crown, at first sat in their own right, whether holding peerages or not; but afterward the peers alone sat, the others sending their representatives. The burgesses were the representatives of the burghs. All the three estates sat to the very last in one house, the sovereign presiding in person, or through a commissioner named by him.

It would be impossible within reasonable limits to give a complete account of the original authorities for the history of Scotland. The principal ones are the following. For the period before the accession of David I.—Venerable Bede, the *Early Lives of the Saints*, the *Irish Annals*, the brief *Scottish Chronicles* published by Innes and Pinkerton, and the ancient *English Chroniclers*. For the subsequent period down to the reformation—the *Chronicles of Melrose and Lanercost*, the *Scotichronicon* of Fordun and Bower, Winton's *Chronicle*, Leslie's and Buchanan's *Histories*, the *English Chroniclers*, and the *Ecclesiastical Chartularies*, and the *Acts of the Scottish Parliament*. For the period from the reformation to the union—Knox's, Calderwood's, Spottiswood's *Histories*, Baillie's *Letters*, Wodrow's and Burnet's *Histories*, the *Acts of Parliament*, and the *State Papers*. The chief modern authorities are Innes's *Critical Essay on the Ancient Inhabitants of Scotland*, Pinkerton's *Inquiry into the History of Scotland*, Chalmers's *Caledonia*, Hailes's *Annals*, and Tyler's, Robertson's, Laing's, and Burton's *Histories of Scotland*, the *Domestic Annals of Scotland*, by R. Chambers, and Skene's *Celtic Scotland*.

SCOTLAND, a co. in n.e. Missouri, adjoining Iowa; drained by the Wyaconda, the north Fabius, and the middle Fabius rivers; on the Missouri, Iowa, and Nebraska railroad; about 425 sq.m.; pop. '80, 12,507—12,238 of American birth. The surface is rolling and heavily wooded. The soil is fertile. The principal productions are corn, oats, hay, and live stock. Co. seat, Memphis.

SCOTLAND, CHURCH OF. An account has already been given of the conversion to Christianity of the early settlers of Scotland. See COLUMBA, CULDEES, NIXIAN, PICTS, SCOTLAND, *History*. The doctrines of the ancient Scottish church were precisely the same as those of the rest of western Christendom. In ritual there were some points of difference, but they were so slight that the most important related to the time of observing the Easter festival. In these, also, the Scots gradually conformed to the usage of the Roman and English churches. In one point, however, there continued for several centuries to be a marked distinction between the Scots and the Irish on the one hand, and the churches of England and the continent on the other. This was in reference to ecclesiastical government. The Scots recognized the same orders of the ministry, bishops, priests, and deacons, as other Christians did; and, like them, they held that ordination could be given only by bishops. But they acknowledged no such supremacy of jurisdiction in the episcopal order as was held by other churches. In Scotland, there were neither dioceses nor parishes; but there were numerous monasteries, in which the abbots, whether bishops or priests, bore the chief rule, all being in subordination to the successor of St. Columba, the presbyter-abbot of Iona, who, in virtue of that office, was primate of the Picts and Scots.

When Iona was desolated by the Northmen, the primacy seems to have been transferred in the middle of the 9th c. to the abbots of Dunkeld, and about fifty years afterward to the bishops of St. Andrews, who became known as *episcopi Scotorum*, the bishops of the Scots. Slowly at first, but gradually an assimilation to the English and continental practices began, a change rendered more easy by the Scottish dominion being extended over Lothian, in which the ecclesiastical system was the same as that of England. A great impulse was given in the same direction by the marriage of Malcolm III., king of the Scots, with Margaret, the sister of Edgar Atheling. The king and queen used their utmost efforts to introduce the English usages in ecclesiastical as in other matters; and Margaret herself held repeated conferences for that purpose with the chief Scottish ecclesiastics, at which her husband acted as interpreter. The principal points in which she attempted to bring about a reform were the commencement of the Lent fast, the superstitious infrequency of receiving the communion, and the lax observance of Sunday and of the Scriptural and canonical restrictions on marriage between relations.

The reform begun by Malcolm and Margaret was fully carried out by their youngest son, David I. These improvements were completed by his successors, and before the end of the 12th c. the ecclesiastical system of Scotland differed in no important point from that of the rest of Europe. Some Scottish writers have lamented the change, as being one from purity of belief and practice to superstition and immorality. This is undoubtedly a mistake. The Celtic church had become very corrupt, and the clergy were inferior both in learning and morals to their brethren in the south. King David was a reformer in the best sense of the word, and it does not detract from the character of his reformation, that as time went on the Scottish church became involved in those superstitions with which the rest of Christendom was overspread.

The ritual of the Scottish mediæval church was almost the same as that of England, the Salisbury missal and breviary being the models of the liturgies and office books used in Scotland. The external system of the church—cathedral, parochial, and monastic—was also in almost every point identical. The chief monastic orders were the Benedictine, and most important branches the Cluniac and Cistercian, the canons regular of St. Augustine, and the reformed premonstratensian canons. The Cluniacs and Cistercians were in strict subordination to the mother-houses of their orders at Cluny and Cîteaux. In the 13th c. the Dominican, Franciscan, and Carmelite friars were introduced into Scotland. The chapters of all the Scottish cathedrals, except those of St. Andrews and Whithorn, were composed of secular canons—the chief dignitaries being a dean, archdeacon, chancellor, precentor, and treasurer. The prior and canons regular of the Augustinian monastery at St. Andrews formed the chapter of that see, and the prior and premonstratensian canons of Whithorn formed the chapter of the cathedral of Galloway. There were twelve dioceses in the Scottish church, to which Orkney was added on the transference of those islands to the Scottish sovereign in the 15th century. The twelve dioceses were Caithness, Ross, Moray, Aberdeen, Brechin, Dunkeld, Dunblane, St. Andrews, Argyre, the Isles, Glasgow, and Galloway. The larger of these dioceses were divided, like the English dioceses, into rural deaneries. The single point in which the mediæval church down to the 15th c. differed from that of England and other churches of the west, was in its having no metropolitan. St. Andrews, and next to it Glasgow, had a certain precedence; the bishops of the former see, and failing them the bishops of the latter, having the privilege of crowning and anointing the sovereign. But they had no jurisdiction over the other sees, nor did their bishops bear the style of archbishop. This led to claims on the part of the archbishops of York to metropolitan authority in Scotland, which had no foundation except in regard to the southern portion of the diocese of St. Andrews, and the see of Galloway, the bishops of which were for several centuries suffragans of York. The court of Rome found it convenient, for the sake of its own privileges, to encourage this anomalous system; but to provide for the meetings of the Scottish bishops in provincial council, a bull of pope Honorius III., in 1225, authorized them to meet in synod. In virtue of this bull, the bishops, abbots, priors, and other chief ecclesiastics, with representatives of the capitular, collegiate, and conventual bodies, assembled annually in provincial synod, sitting in one house, under the presidency of a conservator chosen by and from the bishops. The chief government of the church under the pope thus devolved on these synods, and their elective presidents. This continued until the erection of St. Andrews into an archiepiscopal and metropolitan see, in virtue of a bull of pope Sixtus IV., in 1472. By this bull all the Scottish sees were made suffragans to that of St. Andrews, whose bishops were now to be styled archbishops.

In 1492 Glasgow was raised to the dignity of a metropolitan see by a bull of pope Innocent VIII., and the bishops of Dunkeld, Dunblane, Galloway, and Argyre were made suffragans to its archbishop, an arrangement which was soon afterward altered to some extent—Dunkeld and Dunblane being re-annexed to St. Andrews, and Glasgow having for its suffragan sees those of Galloway, Argyre, and the Isles. This last arrangement continued until the reformation; and afterward, during the establishment of Episcopacy—the two Scottish archbishops occupying toward each other precisely the same position as the archbishops of Canterbury and York, and being sometimes

involved in the same unseemly broils, in regard to jurisdiction and precedence, which long existed between the English metropolitans.

Scotland shared in all the errors of belief and superstitious practices in worship to which the rest of Christendom was subjected, and the ignorance and immorality of the clergy were far worse than they were in England, or perhaps anywhere in Europe, except in the Scandinavian churches. The desire for reformation which led to the proceedings of Huss and Wickliffe, produced similar effects in the Scottish kingdom. As early as the year 1406 or 1407, James Resby, an English priest, and a disciple of Wickliffe, was burned at Perth; and in 1433 Paul Crawar, a German Hussite, was burned at St. Andrews. The opinions of Wickliffe continued to be privately taught, particularly in the s.w. counties, where his followers were known by the name of the Lollards of Kyle. In the following century, the intercourse with the continent was frequent and close, and the effects of Luther's preaching and writings were soon felt in Scotland. In the year 1525 the importation of Lutheran books, and the propagation of the reformers' tenets, were forbidden by an act of the Scottish parliament; and in February, 1528, Patrick Hamilton, abbot of Ferne, was burned at St. Andrews for teaching and publishing Lutheran doctrines. The piety of Hamilton, and the patience with which he bore his sufferings, induced others to follow his teaching and example. Several persons, both ecclesiastical and laymen, were subsequently burned, and many more fled to England and the continent.

The persecution, though encouraged or permitted by the bishops, was disapproved of by some ecclesiastics of learning and influence, who were desirous of effecting a reform in the church without breaking off from communion with the hierarchy. The efforts of this school were unsuccessful, and the Scottish nation was gradually divided into two parties—one of which, headed by the bishops, and supported by the state, was determined to resist all change; and the other, composed of a considerable number of the clergy both regular and secular, of the gentry, and of the burgesses of the large towns, was disposed to carry its reforming principles far beyond what had been done by Luther and Melancthon. These two parties came into deadly conflict in 1546. On Feb. 28 in that year George Wishart, the most eloquent of the reforming preachers, was condemned to death by an ecclesiastical court—at which cardinal Beaton, archbishop of St. Andrews, presided—and was burned. On May 28 following, the cardinal was murdered by Norman Leslie and other adherents of the reforming party. The struggle continued during the regency of the earl of Arran and that of Mary of Lorraine, the mother of Mary, the young queen of Scots.

In the year 1559 the reformers became strong enough to set the regent at defiance. Various circumstances encouraged them to demand freedom for their opinions, particularly the death of Mary of England and the accession of Elizabeth. They were further animated at this time by the return from Geneva of their chief preacher, John Knox. The conflict was to be decided by other than spiritual weapons. The regent and the reformed, now known by the name of the Congregation, met in open warfare. The contest was carried on for a twelvemonth, and ended in the triumph of the Congregation. A parliament met at Edinburgh on Aug. 1, 1560. The reforming party had the complete ascendancy, and succeeded in passing several acts, by which the jurisdiction of the pope was abolished, the mass was proscribed, and a confession of faith, drawn up by Knox and his associates, was ratified, the spiritual lords making a faint resistance.

The new confession of faith adhered, in all essential articles of belief, to the ancient creeds of the church. In regard to the sacraments it differed entirely from the recent corrupt teaching of the western church; but its language, on the whole, was moderate and conciliatory. In reference to ceremonies and the details of church polity, it declared that such things were temporary in their nature, and not appointed for all times and places, and that they ought to be altered when they fostered superstition and ceased to be conducive to edification.

A book of discipline was soon afterward drawn up by the compilers of the confession, which was generally approved of, but did not receive the sanction of parliament. It followed out in detail the principles laid down in the confession. In regard to the office-bearers of the church various orders were mentioned, but three were specially of importance—ministers, elders, and deacons. Ministers were to be chosen by each several congregation, but were to be examined and admitted in public by the ministers and elders of the church. No other ceremony, such as imposition of hands, was to be used. The elders and deacons were to be chosen yearly in each congregation, and were not to receive any stipend, because their office was only to be from year to year, and because they were not to be debarred from attending to their own private occupations. In order to the better provision for the wants of the time, certain persons, called superintendents, were appointed in particular districts, with power to plant and erect churches, and to appoint ministers within the bounds of their jurisdiction.

The chief governing as well as legislative and judicial power in the reformed church was intrusted to a general assembly, which met half-yearly or yearly, and was composed of the superintendents, ministers, and lay commissioners, and which gradually, by the introduction of the system of representation, assumed the form and more than the power of a parliament.

The worship of the reformed church was modeled on that established by Calvin at

Geneva. It was embodied in a formulary called the book of common order, which for nearly a century continued to be generally used. It contained forms for the ordinary worship both on Sundays and week days, and for the administration of the sacraments, and for certain other occasions. The minister was not absolutely restricted to these forms. Except in the singing of psalms, the people took no direct part in ordinary worship, and there was no distinction of ecclesiastical seasons, all holydays whatever except Sunday being abolished.

The form of church government established at the reformation did not remain long undisturbed. Some of the most zealous Protestants thought the danger to which the church was exposed from state tyranny and aristocratical oppression could best be met by restoring the bishops to their ancient position both in the church and in the parliament; while others, of equal zeal and sincerity, saw in this only the commencement of a plan for bringing back all the errors of popery. A scheme of this kind was actually established for some time, and the sees were filled with Protestant bishops set apart for the office by their brethren of the ministry. It was almost immediately attacked by some of the ministers, who soon found a leader in Andrew Melville, a scholar of considerable eminence, who returned to Scotland in 1574, after a residence in Geneva, during which he had ardently embraced the new opinions as to ecclesiastical government maintained by Beza.

The struggle continued for some years, the bishops being encouraged by the sovereign and his advisers, whose support was frequently of little real advantage to them, and Melville receiving the zealous assistance of many of the ministers, and of the great body of the common people, who sympathized with him in his democratical theories of civil and ecclesiastical government. Melville was at last entirely successful. His opinions were embodied in what was called the second book of discipline, which received the formal sanction of the general assembly in 1581. This formulary differed very much from the first book. It laid down authoritatively those principles in regard to ecclesiastical authority which the English Puritans were vainly striving to establish in the southern kingdom, and was in reality an attempt to make the civil power subordinate to the ecclesiastical, even in matters secular. It recognized four orders of office-bearers in the church, the pastor, minister, or bishop, the doctor, the presbyter or elder, and the deacon. These were to be set apart by ordination, and the imposition of the hands of the eldership, but no one was to be intruded into any office contrary to the will of the congregation, or without the voice of the eldership. Four sorts of church courts, each rising above the other, were sanctioned; first, of particular congregations, one or more; second, of a province, or what was afterward called the provincial synod; third, of a whole nation; and fourth, of the universal church. What is generally regarded as the most essential feature of the Presbyterian system—the presbytery—was not yet introduced in its proper form, the lowest court being a combination of what were afterward known as the presbytery and the kirk-session. It was, however, introduced before the year 1592, when the privileges of general and provincial assemblies, presbyteries, and parochial sessions were ratified by parliament, though the book of discipline itself did not receive any formal sanction.

King James had agreed to the establishment of Presbyterianism, but personally, and as a sovereign, he disliked its discipline, and he soon endeavored to overthrow it. His accession to the crown of England enabled him to do this with more authority. He gradually obtained from the general assembly a recognition of the civil rights of the bishops, and this led to the restoration of their ecclesiastical privileges. His changes were sanctioned by a general assembly which met at Glasgow in 1610, and in the course of the same year Episcopacy was restored in reality, as well as in name, by the consecration of three Scottish prelates, by four of the English bishops, at London.

The king wished to assimilate the Scottish church, as far as possible, to that of England, and his next important movement was the establishment of what are called the Five Articles of Perth. See PERTH, THE FIVE ARTICLES OF.

These various changes excited great dissatisfaction in Scotland, particularly in the southern counties, but it gradually abated to a considerable extent, and might have altogether ceased, had not further innovations been attempted. It was the wish of James to introduce a prayer-book like that of the English church, in place of the book of Common Order, but he saw the danger with which the proposal was attended, and gave it up or postponed it. His son Charles was as inferior to his father in prudence, as he excelled him in conscientiousness and religious zeal. During his first visit to Scotland he added another bishopric—that of Edinburgh—to the dioceses of the Scottish church. Most unwisely, and most improperly, he endeavored by his royal authority to introduce into that church a book of canons and a liturgy framed on the model of those of England. The king had many loyal supporters in all parts of Scotland, and in the n. Episcopacy was preferred by the people to Presbyterianism. But the storm of popular indignation which was now roused swept everything before it. The king's opponents banded themselves together by the national covenant, and at a general assembly held at Glasgow abolished the Perth articles and Episcopacy, and re-established Presbyterianism. Charles attempted to maintain his claim by the sword, but was unsuccessful, and obliged to ratify in parliament all that had been done by his opponents.

Had the covenanters been satisfied with the victory which they had won, Presby-

terianism might have remained the established religion of the Scottish kingdom. But they could not resist the entreaties for aid from the English Puritans, or rather they yielded to the delusion of extending their own discipline over the churches of England and Ireland. They just attempted, in an opposite direction, what James and Charles had failed to accomplish. For a time their policy seemed to triumph. The solemn league and covenant of the three kingdoms, after having been approved by the general assembly in Scotland, was signed by the assembly of divines which the parliament had summoned to meet at Westminster, and by the parliament itself. The ecclesiastical documents which were afterward drawn up originated with the assembly of divines, but were sanctioned by the assembly in Scotland. The principal of these were a directory for public worship, a confession of faith, and a larger and shorter catechism. See ASSEMBLY OF DIVINES, and CREEDS AND CONFESSIONS. The first of these documents was intended to supersede the book of Common Prayer in England, and, indirectly, the book of Common Order in Scotland. It laid down certain general rules in regard to public worship and the administration of the sacraments, but left very much to the discretion of the particular ministers and congregations.

The union between the Scottish and English Puritans was dissolved by the ascendancy of the independents. Scotland, distracted by civil and ecclesiastical dissension, was unable to defend itself against Cromwell. It was conquered and kept thoroughly under subjection by the English army, which forbade the meetings of the general assembly, but left the other courts and the rest of the church system as they were before. At the restoration, the higher classes generally, who had suffered under the ecclesiastical tyranny of the ministers, were zealous for the re-establishment of Episcopacy. The greater part of the nation, except in the south-western provinces, was indifferent, and the king experienced no difficulty in restoring the bishops to their former rights both in church and state. But Episcopacy alone was restored; there was no attempt to introduce a liturgy, or even to enforce the observance of the Perth articles. The new primate, archbishop Sharp, was an able man, of good moral character, but ambitious and overbearing, and the covenanters never forgave his change from Presbyterianism, though he had always belonged to the more moderate of the two parties into which the church was divided. He was almost the only one of the bishops who enjoyed political influence; and, unfortunately for himself and the hierarchy, that influence was generally used to encourage, not to restrain, that severe measures of the government. When the primate was assassinated, the severity became a cruel tyranny, and many who had no predilection for any particular ecclesiastical opinions were ready to welcome the change which took place at the revolution.

When the Scottish estates met in 1689, to consider what course was to be adopted in the northern kingdom, the bishops declined to abandon king James. Whatever might have been the consequences had they taken an opposite course, this resolution was fatal to the Episcopal establishment. William and Mary were called to the throne, and prelacy was declared to be an insupportable grievance, and was abolished. In the following year Presbyterianism was re-established, and the Westminster Confession of Faith was ratified as the national standard of belief, and the right of patrons to nominate to ecclesiastical benefices was taken away. In the end of the same year a general assembly was held, the first which had been allowed to meet since its dissolution by the order of Cromwell. It was composed, as before, of ministers and elders from the various presbyteries, and of elders from the burghs and universities, and was presided over by a lay commissioner, named by the crown, and a minister elected by the members as moderator. With the exception of some years in the reign of William, the assembly has continued to meet annually since the revolution, and to transact business during the periods when it was not in session by a commission named by itself for the purpose. See ASSEMBLY, GENERAL. The other chief ecclesiastical events of William's reign were a series of vain attempts on the part of the sovereign to bring about a comprehension of the Episcopal clergy with those of the establishment, and the passing by the assembly in 1697 of what was called the "barrier act" (q.v.), which guarded against sudden legislation, by providing that no permanent act should be passed until it had received the approbation of the majority of the presbyteries.

During the reign of queen Anne, and in the year 1707, England and Scotland were united into one kingdom. A special statute was passed for the security of the Protestant religion and Presbyterian church government in the latter country; providing that these should continue without any alteration in time to come, and confirming the act of William and Mary, which ratified the confession of faith, and settled the Presbyterian form of church government.

In the year 1712, an act was passed by the British parliament which restored to patrons in Scotland their right of presentation to benefices. This statute excited great discontent among the members of the Established church, and for many years attempts were made to obtain a repeal of it. These attempts were unsuccessful, but its provisions were long practically disregarded. When at length the general assembly began to act upon it, the dissatisfaction increased among those who held the divine right of the people to choose their own ministers. The leader of the discontented party was a minister named Ebenezer Erskine, and he with his adherents, in the year 1733, finally separated from the Establishment, and formed a communion which took the title of the Associate

Presbytery, though its members were popularly known as the Seceders. The Seceders themselves were soon divided by a very absurd dispute into two bodies, called the Burgher and the Antiburgher Synods. In the year 1761, another secession from the Establishment took place in connection with the law of patronage; and the separated body assumed the name of the Presbytery of Relief.

There were no further secessions from the church; but its members were divided into two parties, known as the moderates and the Evangelicals (q.v.), the former of whom were favorable, the latter hostile to the law of patronage. For many years the Moderates, headed by Dr. Robertson the historian and others of his school, and supported by the influence of the government, maintained an ascendancy in the general assembly and throughout the country. In the latter years of George III., and during the reign of George IV., this ascendancy began to decrease. The political excitement which prevailed in the beginning of the reign of William IV. strongly affected the Scottish Establishment, which from its very constitution is peculiarly liable to be moved by the impulses of popular feeling. The two parties in the general assembly engaged in a struggle more fierce than any in which they had yet met; and the subject of dispute, as before, was immediately connected with the law of patronage. Dr. Chalmers, the most distinguished minister in Scotland, added the whole weight of his influence to the popular party, and in 1834 an interim act of assembly was passed, known as the Veto act, which declared it to be a fundamental law of the church that no pastor should be intruded on any congregation contrary to the will of the people, and laid down certain rules for carrying out this principle. The legality of this act was doubted; and in connection with a presentation to the parish of Auchterarder, the presentee, on being rejected by the presbytery in terms of the Veto act, appealed, with concurrence of the patron, to the court of session—the supreme civil court in Scotland. That court decided that the conduct of the presbytery in rejecting the presentee was illegal, and their judgment was affirmed by the house of lords. Other cases of a similar nature followed, and something like a conflict took place between the civil and ecclesiastical courts, the former enforcing their sentences by civil penalties, the latter suspending and deposing the ministers who obeyed the injunctions of the court of session. In the general assembly of 1843 the dispute came to a crisis. A large number of ministers and elders of the popular party left the assembly, and met apart in a similar body, of which Dr. Chalmers was chosen moderator. They formed themselves into a separate communion under the title of "The Free Church of Scotland," and gave up their benefices in the Established church, and all connection whatever with that body. The Free church carried off about one-half of the members of the Establishment, and became a rival communion in most of the parishes. See FREE CHURCH. By an act of parliament in 1874, patronage was abolished in the Established Church and the right of choosing the minister transferred to the congregation. See PATRONAGE.

In 1820 the Burgher and Antiburgher Seceders were united under the name of the Associate Synod of the Secession church; and in 1847 this associate synod and the relief synod were united under the name of "The United Presbyterian Church," (q.v.). The recent negotiations for a union of the United Presbyterian church and the Free church have led to no practical result.

A few remarks may be added on the history of Scottish episcopacy subsequently to the revolution. It is a common but erroneous opinion that almost all the Episcopal clergy were Jacobites from the time of the accession of William and Mary. The bishops were so; but a large number, probably a considerable majority of the clergy, had at first no objection to take the oath of allegiance to the new government. During the reign of queen Anne, the Episcopal clergy were well disposed to the government, knowing the queen's good wishes to their communion. They were frequently harassed by the courts of the Establishment; but all who were willing to take the oaths obtained an ample protection for their worship on the passing of the Toleration act of 1712. On the death of the queen, almost all the clergy, and most of the laity, were involved directly or indirectly in the attempts to overthrow the Hanoverian dynasty, and it was this which finally made the names of Episcopalian and Jacobite for many years to be convertible terms.

In the meantime, the succession of bishops had been kept up by new consecrations, and after some years the dioceses, though diminished in number, were regularly filled. An important change took place in the forms of worship. No longer trammelled by their connection with the state, they adopted liturgical forms similar to those in the English prayer-book, and in almost all cases identical, except that many of the congregations used an office for the communion modeled on that of the Scottish liturgy of King Charles I. The Episcopalians took no such open part in the insurrection of 1745 as they did in that of 1715 but their sympathies were known to be with the house of Stewart; and the government carried through parliament some intolerant acts, which were put in execution with great harshness, and which for many years suppressed all public worship in the Episcopal communion. It was only after the accession of George III. that these statutes ceased to be actively enforced; and it was not till 1793 that the Episcopalians, who from the death of prince Charles had acknowledged the reigning dynasty, were relieved from the penal laws. The act which gave this relief imposed restrictions on their clergy officiating in England, and prohibited their holding benefices

in the English church. In 1804, the bishops and clergy agreed to adopt the thirty-nine articles of the church of England, and in 1863, the prayer-book was adopted as the authorized service-book of the Episcopal church, permission being given in certain cases to use the Scottish communion office. The restrictions imposed on the Scottish clergy by the act of 1792 were modified by an act passed in 1840; and in 1864 they were entirely removed, the right being reserved to bishops in England and Ireland to refuse institution to a Scottish clergyman without assigning any reason, on his first presentation to a benefice in England or Ireland, but not after he should have once held such benefice.

The dioceses of the Scottish Episcopal church are seven in number, viz., Moray, Aberdeen, Brechin, Argyle, St. Andrews, Edinburgh, and Glasgow. The bishops are chosen by the clergy of the diocese, and by representatives of the lay communicants, a majority of both orders being necessary to a valid election. One of the bishops, under the name of *primus*, chosen by the other bishops, presides at all meetings of the bishops, and has certain other privileges, but possesses no metropolitan authority. The highest judicial body is the episcopal college, composed of all the bishops. The highest legislative body is a general synod, composed of two houses, the one of the bishops, the other of the deans and the representatives of the clergy.

The chief original authorities for the ecclesiastical history of Scotland down to the revolution are the same as those mentioned in the article on the civil history (q.v.). The chief modern authorities are: Cook's *History of the Reformation and History of the Church of Scotland*; Cunningham's *Church History of Scotland*; Grub's *Ecclesiastical History of Scotland*.

SCOTLAND, ROYAL ARMS OF. The arms of Scotland are—Or, a lion rampant gules, armed and langued azure, within a double tressure flory counterflory of fleur-de-lis of the second. Supporters—Two unicorns argent armed maned and unguled or, gorged with open crowns, with chains affixed thereto, and reflexed over the back of the last.

Crest—A lion sejant affronté gules crowned or, holding in the dexter paw a sword, and in the sinister a scepter, both erect proper.

The lion is first seen on the seal of Alexander II., and the tressure on that of Alexander III. The unicorn supporters do not appear on any of the royal seals of Scotland till the time of queen Mary, on whose first great seal (1550) they are represented as chained and gorged with crowns. They were, however, sculptured on Melrose abbey as early as 1505.

In 1603, in consequence of the union of the crowns of England and Scotland, the Scottish arms came to be quartered with those of England and Ireland, while one of the English lions was adopted as a supporter. Precedence was, however, given within

Royal Arms of Scotland, previous to the Union.

Scotland to the Scottish ensigns, which occupied the first and fourth quarters, and the unicorn also obtained the place of honor, being dexter supporter. From about the time of Charles I. to 1707, it became the practice to represent the unicorn as not merely gorged with an open crown, but crowned with an imperial crown. The treaty of union of 1707 declared (art. 1) that the ensigns of the United Kingdom should be in future such as her majesty should appoint "on all flags, banners, standards, and ensigns, both on sea and land;" the same mode of marshaling being adopted in England and Scotland. But art. 24 has been sometimes supposed to leave room for a different mode of marshaling on the seals in use in matters relating exclusively to Scotland, and on the great and other seals of Scotland. Since, as well as before the union, precedence has been given to Scotland. The question of the proper marshaling of the royal arms within Scotland was raised in 1853 by a petition to the queen by the magistrates of Brechin; a

reference was made by the home office in the first instance to Garter king-at-arms, and Garter's report was transmitted to the office of the lord Lyon, where it was returned with observations by the Lyon depute, who considered Scotland entitled to precedence on the judicial seals of the country; and his views have since continued to be acted on.

SCOT AND LOT VOTERS. The old legal phrase *scot* (Ang.-Sax. *scēat*, pay) and *lot* embraced all parochial assessments for the poor, the church, lighting, cleansing, and watching. Previously to the reform act the right of voting for members of parliament and for municipal officers was, in various English boroughs, exclusively vested in payers of scot and lot.

SCOTT, a co. in w. Arkansas, having a ridge of the Ozark mountains for its s. boundary; 860 sq.m.; pop. '80, 9,174—9,147 of American birth, 89 colored. It is drained by the Fourche la Pave and other small streams. The surface is mountainous except in the central portion where the river runs. It is nearly equally divided into prairie and woodland, forests of yellow pine and other building timber alternating with groves of tropical trees. Its soil is fertile, producing grain and providing excellent pasturage. Co. seat, Waldron.

SCOTT, a co. in w. Illinois, bounded on the w. by the Illinois river, watered by Sandy and Movestar creeks, traversed by the St. Louis, Rock Island and Chicago, and the Wabash, St. Louis and Pacific railroads; about 265 sq.m.; pop. '80, 10,745—9,835 of American birth. The surface is level and well wooded. The soil is fertile. The principal productions are corn, wheat, oats, rye, and live stock. Bituminous coal is found. There are saw-mills, manufactories of earthenware, of carriages, etc. Co. seat, Winchester.

SCOTT, a co. in s. Indiana, drained by Graham's fork; on the Ohio and Mississippi, and the Jeffersonville, Madison and Indianapolis railroads; about 195 sq.m.; pop. '80, 8,343—8,188 of American birth. The surface is level and heavily timbered. The soil is fertile. The principal productions are corn and pork. Co. seat, Scottsburg.

SCOTT, a co. in e. Iowa, adjoining Illinois; drained by the Mississippi and the Wapsipicon rivers; on the Chicago, Rock Island and Pacific, and the Davenport and St. Paul railroads; about 475 sq.m.; pop. '80, 41,370—28,474 of American birth. The surface is rolling. The soil is fertile. The principal productions are wheat, corn, barley, and cattle. Bituminous coal is found. Co. seat, Davenport.

SCOTT, a co. in w. Kansas, drained by branches of Walnut creek and of Smoky Hill river; about 700 sq.m.; pop. '80, 43—all of American birth. This county is unorganized.

SCOTT, a co. in n. Kentucky, intersected centrally by the Cincinnati Southern railroad, the Cincinnati and Lexington division touching the extreme s.; 300 sq.m.; pop. '80, 14,965—14,778 of American birth, 5,002 colored. It is drained by the North and South forks of Elkhorn creeks and branches of the Kentucky river. Its surface is uneven. Its soil produces grain, tobacco, and sorghum, and is adapted to stock raising and dairy products. It has an under stratum of blue Silurian limestone. Co. seat, Georgetown.

SCOTT, a co. in s.e. central Minnesota; bounded on the n. and n.w. by the Minnesota river; on the Hastings and Dakota and the St. Paul and Sioux City railroads; about 380 sq.m.; pop. '70, 11,042—6,625 of American birth. The surface is rolling. The soil is fertile. The principal productions are corn, wheat, and cattle. Co. seat, Shakopee.

SCOTT, a co. in central Mississippi, intersected by the Vicksburg and Meridian railroad; 550 sq.m.; pop. '80, 10,845—10,813 of American birth, 4,213 colored. It is drained by Strong and Long Warrior rivers, tributaries of the Pearl. Its surface is uneven, a large proportion covered with timber and thick groves of tulip trees, magnolia, etc. Its soil is a sandy loam; producing cotton and grain; and live stock is raised. Co. seat, Forest.

SCOTT, a co. in s.e. Missouri; adjoining Illinois, bounded on the e. by the Mississippi river; on the St. Louis, Iron Mountain and Southern railroad; about 380 sq.m.; pop. '80, 8,587—7,972 of American birth. The surface is uneven and heavily timbered. The soil is moderately fertile. The principal productions are corn and wheat. Co. seat, Commerce.

SCOTT, a co. in e. Tennessee, having the state line of Kentucky for its n. boundary; 400 sq.m., pop. '80, 6,021—5,974 of American birth, 157 colored. It is drained by the Big South fork of the Cumberland river, Little White Oak creek, and New rivers. Its surface is mountainous, and contains a portion of the elevation called the Cumberland table land. Its soil produces grain, tobacco, and the products of the dairy. Live stock is raised. Co. seat, Huntsville.

SCOTT, a co. in s.w. Virginia, having the state line of Tennessee for its s. boundary; 600 sq.m., pop. '80, 17,233—17,226 of American birth, 674 colored. It is drained by Clinch river, Copper creek, and other streams. It is crossed in the w. and s. by Clinch and Powell's mountains, is largely covered with forests of building timber; and by the river banks are groves of sugar-maple, tulip trees, etc. Its soil is fertile along the water

courses, producing grain, flax, sorghum, etc., and is suitable for pasturage. Its mineral products include bituminous coal, iron ore, and limestone. It contains a natural tunnel 400 ft. long, and 75 ft. high in the highest part of the arch. Co. seat, Estillville.

SCOTT, CHARLES, 1733-1813; b. Va.; on the field as a non-commissioned officer at Braddock's defeat, 1755; capt. of the first company in the revolutionary war which was raised s. of the James. He served with distinction at Trenton; brig. gen., 1777. He was with Wayne at Stony Point, 1779; prisoner at Charleston, S.C., 1780. At Monmouth he was the last on the battle field. In 1785 he removed to Kentucky. He shared the defeat of St. Clair in 1791, had charge of a successful expedition to the Wabash, and took part in the war with the Indians, 1791. In 1794 he was in command under Wayne at the battle of Fallen Timbers. He was governor of Kentucky, 1808-12. A co. and a town in Kentucky were named in his honor.

SCOTT, DAVID, a remarkable Scottish painter, was born in Edinburgh, Oct. 10, or 12, 1806. He may be said to have commenced his career as an artist by an apprenticeship to his father, who was a landscape engraver; but endowed as he was with a deep, stern, somber genius, it was soon visible to all who knew him that he was meant to be a painter. The first production that he ventured to send to the British institution, "Lot and his Daughters Fleeing from the Cities of the Plain," was returned as too large; but Scott was too "imperiously original" to take advice, and went on courageously painting pictures which, it has been said, "would have required a hall for their exhibition, and which the public would neither admire nor buy." In 1831 he exhibited the "Monograms of Man," a series of singularly suggestive sketches; and the first of his illustrations to Coleridge's *Ancient Mariner*, which are almost equal to the poem itself in weird and vivid beauty. In 1833, among others, "Sarpedon carried by Sleep and Death," a very fine work. In the autumn of the same year he set out for Rome, visiting most of the famous artistic cities on his way. Nothing, however, that he saw in Italy or France materially affected the bent of his genius, and his picture of "Discord, or the Household Gods Destroyed," painted there, exhibits all the peculiarities of his style and thought in a rampant and even repellent manner. In 1834 he returned to Edinburgh, and resumed his solitary brush. Passing over several interesting works, we may specially mention, as belonging to the year 1838, "Ariel and Caliban," and the "Alchemist," two of his best efforts in point of execution. Between 1840 and 1843 his chief productions were "Philoctetes," "Queen Elizabeth in the Globe Theater," "The Duke of Gloucester taken into the Water-gate of Calais," "Silenus praising Wine," "Richard III.;" his illustrations (40 in number) of *The Pilgrim's Progress*, in which, as in those of *The Ancient Mariner*, he rivals the genius of the author he illustrates. In 1847 he produced the masterpiece of his whole career, "Vasco da Gama Encountering the Spirit of the Cape." But Scott, always delicate, and even drooping in health, had now exhausted himself, and on March 5, 1849, he died, when fame was only beginning to encircle his name. Scott contributed some vigorous essays on "The Characteristics of the Great Masters" to *Blackwood's Magazine*. An unusually interesting *Memoir* by his brother, W. B. Scott, was published in 1850.

SCOTT, SIR GEORGE GILBERT, 1811-78; grandson of the rev. Thomas Scott, the biblical commentator, b. Buckinghamshire; studied architecture, and was employed in restoring many of the old English cathedrals, including Westminster abbey, and in building churches, secular edifices, and colleges. Among his later works may be mentioned Glasgow university buildings, the Indian, home, colonial, and foreign offices, London; and the national memorial to prince Albert in Kensington gardens, for which he was knighted, 1872.

SCOTT, GUSTAVUS HALL, b. Va., 1812; midshipman in U.S. navy, 1828; lieutenant, 1841; commander, 1856; capt., 1863; commodore, 1869; rear-admiral, 1873; retired, 1874. He commanded steamer *Keystone State*, on special service, 1861; steam-gunboat *Maratanza*, 1862-63; steamer *De Soto*, 1864; steam sloops *Canandaigua*, blockade squadron, 1865, and *Satanar*, Pacific squadron, 1866-67; and was light-house inspector, 1868.

SCOTT, JOHN MORIN, 1730-84; descendant of the baronial Scotts of Ancrum; b. New York; graduated at Yale college, 1746; studied law and married Helena Rutgers; was a determined opposer of colonial oppression, and because of his advanced sentiments failed of election to congress, 1774; was an active member of the general committee for New York, and of the provincial congress, 1775; appointed a brig. gen., 1776; and with his brigade, was in the battle of Long Island; secretary of the state of New York, 1777-79, and a member of congress, 1780-83.

SCOTT, LEVI, D.D., b. Del., 1802; was mainly self-educated; was principal of Dickinson grammar school, Carlisle, Penn., 1840-43; chosen bishop of the Methodist Episcopal church in 1852.

SCOTT, SIR MICHAEL, a mediæval scholar and philosopher of the 13th c., whose real history is not only obscure but positively unknown. Boece identifies him with a Michael Scott of Balweary, in the parish of Kirkealdy, in Fifeshire, who, along with sir Michael de Wemyss, was sent to Norway in 1290, by the Scottish estates, to bring home the "Maiden of Norway," and his death is fixed in the following year. But sir Robert Sibbald, in his *History of Fife and Kincross* (published in the reign of Charles II.), speaks

of a certain indenture, dated 1294, to which Scott's name was affixed, and in another part of the same book states that he went on a second embassy to Norway in 1310, to demand the cession of the Orkneys. If we may rely on sir Robert's statement, it is hardly possible that the Scotch "wizard" of European renown could have been the same person as Michael Scott of Balweary, because (as the story goes) after studying at Oxford or Paris, he went to the court of Frederic II., and wrote there some books at the request of that monarch. Now Frederic died in 1250, and supposing "the wizard" not more than 30 years old at that time, this would make him 70 when he went to Norway the first time to bring home the "Maiden," and 90 on his second visit to demand the cession of the Orkneys, neither of which things is likely. Hector Boece, it should be observed, is our sole authority for the identification of Michael Scott of Balweary with the wizard, while, on the other hand, Dempster, in his *Historia Ecclesiastica Gentis Scotorum* (Bologna, 1627), distinctly avers that the name *Scotus*, borne by the latter, was that of his nation and not of his family—Michael, "the Scot." It has been suggested that the ambassador may have been the son of the wizard, and that Boece may have confounded the two—a supposition probable enough in itself, but for which, in the absence of evidence, nothing can be said. The legend is further complicated by the fact that it appears to be English as well as Scottish. Cumberland claims the magic hero for herself. Camden, in his *Britannia* (1586), asserts that he was a monk of Ulme or Holme Cultram in that country, about 1290, "who applied himself so closely to the mathematics, and other abstract parts of learning, that he was generally looked on as a conjurer; and a vain credulous humor has handed down I know not what miracles done by him." He likewise states that Scott's "magic books" were preserved there, but adds that they were then moldering into dust; and Satchells (see his rhyming *History of the Right Honorable Name of Scott*) declares that he examined a huge tome which was held to be the wizard's, at Burgh-under-Bowness in 1629. According to the Scottish legend, he was buried in the abbey of Melrose, and the border was the scene of many of his most wonderful exploits, such as the cleaving of the Eildon hills into three separate cones, and his bridling of the river Tweed! Dante mentions him in his *Inferno* (some years before 1321), in a way that shows that already his fame as a magician had spread over the continent, and suggests the suspicion that he must have died sooner than is commonly believed. All, however, that any one who rationally looks at the legend can believe is that a certain Michael Scott, or Michael the Scot, flourished in the 13th c., and was mistaken by the common people of his country for a wizard or magician, probably on account of his skill as an experimentalist in natural philosophy. The writings attributed to him indicate that his studies lay in this direction.

SCOTT, ROBERT, D.D., b. England, 1811; graduated at Christ Church college, Oxford, in 1831; became a fellow and tutor; ordained and became rector of several parishes; was master of Balliol in 1854; professor of exegesis in 1861; dean of Rochester in 1870. He prepared with dean Liddell a *Greek Lexicon*, and translated several works of the fathers.

SCOTT, THOMAS, D.D., 1747-1821; b. England; ordained in 1772; became curate in Buckinghamshire; succeeded John Newton, curate of Olney, in 1780; was chaplain to the Lock hospital in 1785; rector of Aston Sandford in 1803. He published *Commentary on the Bible*, 6 vols.; *Defense of Calvinism*, against bishop Tomline; *Force of Truth*, which has been often reprinted; *Scriptural Doctrine of Civil Government and the Duties of Subjects*; *The Rights of God*; *Vindication of the Holy Scriptures*; *Signs of the Times*; *The Articles of the Synod of Dort*; *The Jews*. His commentary on the Bible, now little read, had immense circulation and influence in its day. Devoid of critical learning, it was strong in practical moral observations drawn from the text.

SCOTT, THOMAS A., 1825-81; b. Penn.; received a common school education, and in 1844 became a clerk in the office of the collector at Columbia, Penn., where he remained until 1847, being then transferred to the collector's office in Philadelphia. He left this office in 1850 to take a position in the Pennsylvania railroad service, and in two years was appointed superintendent of the western division, and in 1858 made general superintendent of the road. This rapid advancement was concluded by his appointment in 1860 to the vice-presidency, and shortly afterward to the position of president, which he continued to hold until 1880, when ill health forced his retirement. In 1861 president Lincoln appointed Mr. Scott assistant secretary of war, in which position it fell to his duty to supervise and organize the system of transportation for the northern armies, a most arduous and complicated task, which he accomplished with remarkable accuracy and completeness. Mr. Scott traveled for his health in 1878-79, visiting the principal countries of Europe, Egypt, etc.

SCOTT, Sir WALTER, the fourth child of Walter Scott, writer to the signet in Edinburgh, was born in that city on Aug. 15, 1771. He came of the old border family, the Scotts of Harden, an offshoot from the house of Buccleuch. Though he matured into a man of robust health, and of strength nearly herculean, as a child he was feeble and sickly, and very early he was smitten with a lameness which remained with him through life. His childhood was passed for the most part at Sandyknowe, the farm of his grandfather, in Roxburghshire. Here the foundations of his mind were laid; and his early and delighted familiarity with the ballads and legends then floating over all that part of the

country, probably did more than any other influence to determine the sphere and modes of his future literary activity. Between the years 1779 and 1783 he attended the high school of Edinburgh, where despite occasional flashes of talent, he shone considerably more on the play-ground as a bold, high-spirited, and indomitable little fellow, with an odd turn for story-telling, than within he did as a student. In 1783 he went to the university, and for three years he remained there, as it seemed, not greatly to his advantage. Afterward, in the height of his fame, he was wont to speak with deep regret of his neglect of his early opportunities. But though leaving college but scantily furnished with the knowledge formally taught there, in a desultory way of his own he had been hiving up stores of valuable though unassorted information. From his earliest childhood onward he was a ravenous and insatiable reader; his memory was of extraordinary range and tenacity, and of what he either read or observed he seems to have forgotten almost nothing. Of Latin he knew little, of Greek, less; but a serviceable, if somewhat inexact knowledge of French, Italian, Spanish, and German he had acquired, and he continued to retain. On the whole, for his special purposes, his education was perhaps as available as if he had been the pride of all his preceptors. In 1786 he was articled apprentice to his father, in whose office he worked as a clerk till 1792, in which year he was called to the bar. In his profession he had fair success, and in 1797 he was married to Charlotte Margaret Carpenter, a lady of French birth and parentage. Toward the end of 1799, through the interest of his friends Lord Melville and the duke of Buccleuch, he was made sheriff-depute of Selkirkshire, an appointment which brought him £300 a year, with not very much to do for it. Meantime, in a tentative and intermittent way, his leisure had been occupied with literature, which more and more distinctly announced itself as the main business of his life. His first publication, a translation of Bürger's ballads, *Lenore* and *The Wild Huntsman*, was issued in 1796. In 1798 appeared his translation of Goethe's drama of *Goetz von Berlichingen*; and in the year following he wrote the fine ballads, *Glenfinlas*, the *Ere of St. John*, and the *Grey Brother*. The year 1802 gave to the world the first two volumes of his *Border Minstrelsy*, which were followed in 1803 by a third and final one. This work, the fruit of those "raids"—as he called them—over the border counties, in which he had been wont to spend his vacations, was most favorably received by the public, and at once won for him a prominent place among the literary men of the time. In 1804 he issued an edition of the old poem *Sir Tristram*, admirably edited and elucidated by valuable dissertations. Meantime *The Lay of the Last Minstrel* had been in progress, and by its publication in 1805 Scott became at a bound the most popular author of his day. During the next ten years, besides a mass of miscellaneous work, the most important items of which were elaborate editions of Dryden (1808) and of Swift (1814), including in either case a *Life*, he gave to the world the poems *Marmion* (1808); *The Lady of the Lake* (1810); *The Vision of Don Roderick* (1811); *Rokeby* (1813); *The Bridal of Triermain*, anonymously published (1813); *The Lord of the Isles*; and *The Field of Waterloo*. The enthusiasm with which the earlier of these works were received somewhat began to abate as the series proceeded. The charm of novelty was no longer felt; moreover, a distinct deterioration in quality is not in the later poems to be denied; and in the bold outburst of Byron, with his deeper vein of sentiment and concentrated energy of passion, a formidable rival had appeared. All this Scott distinctly noted, and after what he felt as the comparative failure of *The Lord of the Isles* in 1815, with the trivial exception of the anonymous piece *Harold the Dauntless* (1817), he published no more poetry. But already in *Waverley*, which appeared without his name in 1814, he had achieved the first of a new and more splendid series of triumphs. *Guy Rannering*; *The Antiquary*; *The Black Dwarf*; *Old Mortality*; *Rob Roy*; and *The Heart of Midlothian* rapidly followed, and the "Great Unknown," as he was called (whom yet every one could very well guess to be no other than Walter Scott), became the idol of the hour. The rest of the famous series, known as the *Waverley* novels, it would be idle to mention in detail. From this time onward, for some years, Scott stood on such a pinnacle of fame and brilliant social prosperity as no other British man of letters has ever gone near to reach. He resided chiefly at Abbotsford, the "romance in stone" he had built himself in the border country which he loved, and thither, as "pilgrims of his genius," summer after summer repaired crowds of the noble and the distinguished, to partake the princely hospitalities of a man whom they found as delightful in the easy intercourse of his home, as before they had found him in his writings. In 1820, to set a seal upon all this distinction, a baronetcy was bestowed upon him as a special mark of the royal favor. But the stately fabric of his fortunes, secure as it seemed, was in secret built upon the shifting sands of commercial speculation, and in the disastrous crisis of the year 1826 a huge ruin smote it. In 1805 Scott's income, as calculated by his biographer, was something nigh £1000 a year, irrespective of what literature might bring him; a handsome competency, shortly by his appointment to a clerkship of the court of session, to have an increment at first of £800, subsequently of £1300. But what was ample for all prosaic needs, seemed poor to his imagination with its fond and glittering dreams. Already some such vision, as at Abbotsford was afterward realized, flitted before his mind's eye, and it was the darling ambition of his heart to re-create and leave behind him, in the founding of a family, some image of the olden glories which were the life of his literary inspirations. In the year above mentioned, lured by the prospect of profit, and without the knowledge of his friends, he joined James Ballantyne, an old schoolfellow, in the establishment of a large printing business in

Edinburgh. To this, a few years afterward, a publishing business was added, under the nominal conduct of John Ballantyne, a brother of James; Scott, in the new adventure, becoming as before a partner; Gradually the affairs of the two firms became complicated with those of the great house of Constable & Co., in the sudden collapse of which Scott found himself one forenoon a bankrupt, with personal liabilities to the extent of something like £150,000.

"In the reproof of chance
Lies the true proof of men"—

and now, in this challenge of adverse fate, Scott's manhood and proud integrity were most nobly approved. With his creditors, composition would have been easy; but this usual course he disclaimed. "God granting him time and health," he said, he would owe no man a penny. And somewhat declined as he now was from the first vigor and elasticity of his strength, he set himself by the labor of his pen to liquidate this enormous debt.

Breaking up his establishment at Abbotsford, where the wife whom he loved lay dying, he hired a lodging in Edinburgh, and there for some years, with stern and unflinching resolution, he toiled at his prodigious task. The stream of novels flowed as formerly; a *History of Napoleon*, in eight volumes, was undertaken and completed, with much other miscellaneous work; and within the space of two years, Scott had realized for his creditors the amazing sum of nearly £40,000. A new and annotated edition of the novels was issued with immense success, and there seemed every prospect that, within a reasonable period, Scott might again front the world, as he had pledged himself to do, not owing to any man a penny. In this hope he toiled on; but the limits of endurance had been reached, and the springs of the outworn brain broke in that stress of cruel and long-continued effort. In 1830 he was smitten down with paralysis, from which he never thoroughly rallied. It was hoped that the climate of Italy might benefit him; and by the government of the day a frigate was placed at his disposal in which to proceed thither. But in Italy he pined for the home to which he returned only to die. At Abbotsford, on Sept. 21, 1832, he died, with his children round him, and the murmur of the Tweed in his ears. On the 26th he was buried beside his wife in the old abbey of Dryburgh.

In estimate of Scott as an author, a few words must suffice. As regards his poetry, there is now little difference of opinion. Its merits, if somewhat superficial, are very genuine, and continue to secure for it some portion of the popular favor with which it was at first received. Deficient in certain of the higher and deeper qualities, and in those refinements of finish which we are of late accustomed to exact, it is admirable in its frank *abandon*, in its boldness and breadth of effect, its succession of clear pictures, its careless, rapid, easy narrative, unflinching life, spirit, vigorous and fiery movement. As a lyrist, Scott specially excelled; and scattered hither and thither in his works are to be found little snatches of ballad and song scarcely surpassed in the language. The rank of Scott as a writer of prose fiction it is not so easy to fix with anything like precision. So imposing to the mind is his immense *prestige* as a novelist, that even at this date it is difficult to *criticise* him coolly; but it is not without risk of awakening some undermurmur of dissent, that the absolute supremacy can now be assigned him which at one time, almost without question, used to be conceded as his due. Nor is the dissent without some just ground of reason. Scott, with the artistic instinct granted him in largest measure, had little of the artistic conscience. Writing with the haste of the *improvisatore*, he could exercise over his work, as it proceeded, no jealous rigor of supervision; and on its appearance he was amply pleased with it if the public paid him handsomely. Hence he is an exceedingly irregular writer; many of his works are in structure most lax and careless, and some of the very greatest of them are disgraced by occasional infusions of obviously inferior matter. Yet, all reasonable deductions made, it may be doubted whether in mass and stature he is quite reached by any other novelist who could be mentioned. To class him or even speak of him along with Shakespeare, is absurd; but it is scarcely absurd perhaps to say that, *since* Shakespeare, to no British man has such wealth in this kind been intrusted. If, as we believe, the final test of greatness in this field be the power to vitalize character, to enrich our experience by imaginative contact with beings ever after more intimately distinct and real for us than the men we daily shake hands with, very few writers can be held to surpass Scott. Further, he invented the historical novel, and in doing so, created a distinct literature, brought life into our conceptions of the past, and revolutionized our methods of writing history itself by a vivid infusion into them of picturesque and imaginative elements. On his *Scotch* novels his fame most securely rests; the others, for the most part, being obviously inferior. Scott's was essentially a great, sagacious, *practical* intelligence; on the speculative side he was entirely defective. See Lockhart's *Life of Sir Walter Scott* (1837); and the *Life* by Hutton (1878).

SCOTT, WINFIELD, American general, was b. at Petersburg, Va., of Scottish ancestry, Jan. 13, 1786, was educated at William and Mary college, and studied the profession of law; but in 1808, having a genius for military pursuits, he was appointed capt. of light artillery in gen. Wilkinson's division, stationed at Baton Rouge, Louisiana, but was suspended for having accused his general of complicity with the conspiracy of Aaron Burr. At the commencement of the war of 1812 he was appointed lieut.col., and

sent to the Canadian frontier. He crossed with his regiment at Queenston heights, where the American troops were at first successful; but on the British receiving re-enforcements, they were repulsed with heavy loss, and Scott was taken prisoner. The following year, having been exchanged, he was appointed adj. gen., and was wounded by the explosion which followed the assault on fort George. In 1814 as brig. gen. he established a camp of instruction, and from April to July drilled his raw levies in the French tactics with such effect, that on July 3 he took fort Erie, opposite Buffalo, by assault; and on the 5th fought a sharp drawn battle at Chippewa, and twenty days after the famous frontier battle of Lundy's Lane, in which he had two horses killed under him and was twice wounded, the last time severely. He was raised to the rank of maj. gen., and compiled the general regulations of the army, and translated and adapted from the French the system of infantry tactics, which has since been the text-book of the American army. In the Indian hostilities of the American frontier, in the excitement attending the threat of nullification in South Carolina, and in the Seminole war, gen. Scott manifested those qualities of wisdom and moderation which made him rather a pacificator than a warrior. During the Canadian revolt of 1837-38 he displayed great tact in allaying the excited passions of the frontier. In 1841 he was appointed commander-in-chief of the U. S. army, and in 1846 directed the military operations in the war against Mexico. Taking the field in person, he, Mar. 9, 1847, landed 12,000 men at Vera Cruz, and invested and bombarded the city, which capitulated on the 26th. April 18 he carried the heights of Cerro Gordo, on the 19th he took Jalapa, on the 22d Perote, and on May 15 Puebla, where, owing to his heavy losses, chiefly by diseases incident to the climate, he was obliged to wait for re-enforcements. On Aug. 10 he advanced, with 10,780 men, to encounter the larger forces and strong positions of gen. Santa Anna. He turned El Penon, and won the brilliant victories of Contreras and Churubusco. Santa Anna entered upon negotiations only to gain time and strengthen his defenses. These were followed by the sharp and sanguinary battles of Molino El Rey and Churubusco, Sept. 8, strong positions skillfully and bravely defended by superior numbers; and on the 14th Scott entered the city of Mexico at the head of less than 8,000 soldiers. Peace was negotiated with the cession of New Mexico and California to the United States, and the victorious gen. was welcomed home with the liveliest demonstrations. In 1852 gen. Scott was the candidate of the whig party for the presidency, but was defeated by one of his subordinate officers, gen. Franklin Pierce. In 1855 was created for him the office of lieutenant. At the beginning of the war of secession in 1861 he foresaw more than many others its extent and serious character, and advised the calling out a much larger force than was first brought into the field. He had even suggested the advisability of allowing the "wayward sisters to part in peace." Age and growing infirmities compelled him in Nov., 1861, to retire from active command. He subsequently visited Europe and published his *Memoirs* (Svo, 2 vols., New York, 1864). Scott died May 29, 1866.

SCOTTISH LANGUAGE AND LITERATURE. As the Scots were originally Irish Celts who settled in the western highlands of Alban, the phrase "Scottish language" ought to denote, and did originally denote, *Ersch*, or *Gaelic*; but the gradual extension of the authority of the Scottish kings, first over their Celtic neighbors the Picts, then over the Kymry or Cymry (q.v.) of Strathclyde, and the Angles of Lothian and the Merse, led to the name "Scottish" being given to the language of the last of these; though, in reality, the true old "Scottish"—i.e., the Gaelic, the speech of Kenneth MacAlpin and Malcolm Canmore, is further removed from the "Scottish" of Ramsay and Burns (which is simply a dialect of northern English) than the latter is from Russian or Sanskrit. On this point Mr. Murray remarks in a scholarly paper, or rather treatise, in the *Transactions of the Philological Society* for 1873, which bids fair to become a standard authority on the subject: "Ethnologically speaking, the Lowland Scotch dialects are forms of the Angle, or English, as spoken by those northern members of the Angle or English race who became subjects of the king of the Scots. . . . More particularly they are forms of the Northumbrian or northern English—the language of the Northin lede—which up to the war of independence was spoken as one language, from the Humber to the Forth, the Grampians, and the Moray firth; but which, since the final renunciation of attempts upon the independence of the kingdom, has had a history and culture of its own, has been influenced by legal institutions, an ecclesiastical system, a foreign connection, and a national life, altogether distinct from those which have operated upon the same language on the southern side of the border."

Using, then, the term "Scottish" to denote the dialect of English used n. of the Tweed, and omitting all consideration of anything written in Celtic, we may divide the history of *Scottish literature* into two periods; the first extending from the date of the earliest composition to the union of England and Scotland under one king, the second from that time to the present day.

A well-known brief lament for the death of Alexander III. preserved by Wyntoun, and marked by considerable beauty and pathos, is generally supposed to be one of the earliest specimens of Scottish poetry which has come down to us. The first Scottish poet—in the proper sense of the word—was John Barbour (q.v.), archdeacon of Aberdeen, who was born in the first half of the 14th c., and died in 1395. His great work is the poem of *The Brus*, in which he celebrates the struggles and final victory of the Scottish king, Robert I. It is superior to any composition by English writers of the same century, with the exception of Chaucer and Piers the Plowman. The language of

Barbour is even purer English than that used by the great author of the *Canterbury Tales*. There are editions of *The Brus* by Pinkerton and Jamieson, but the latest and best is that by Mr. Cosmo Innes, published in 1856.

The 15th c., during which England produced no poetical writer of eminence, was fertile in Scottish poets. First in rank, and hardly inferior to any in genius, was James I., king of Scotland, the author of *The Kingis Quhair*—i.e., *The King's Quire or Book*. Before him, in point of time, was Andrew Wyntoun, prior of Lochleven, who wrote a metrical chronicle, the *Orygynale Cronykil*, which was edited—so far as it treated of Scottish history—by David Macpherson in 1795. Another Scottish poet of this century was Henry the Minstrel, commonly called Blind Harry (q.v.), the author of a poem on the life of sir William Wallace, which in a modernized text was long a favorite in Scotland.

The closing years of this century, and the first half of the next, were distinguished by poets of still higher name. Foremost of these is William Dunbar (q.v.), author of *The Thirssill and the Reis*, *The Goldyn Targe*, and many smaller poems, both serious and satirical, of very high merit. The only complete edition of his works is that by Mr. David Laing, which was published in 1834. Gawin Douglas (q.v.), a son of the earl of Angus, and bishop of Duneld, was contemporary with Dunbar. He wrote several original poems, but his principal work is the translation in which he first gave "rude Scotland Virgil's page." A magnificent edition of Douglas has just been published under the editorship of Mr. Smill (Edinburgh: Paterson, 1874). The last remarkable writer of this age is sir David Lindsay (q.v.), who died in 1555, and whose poetical works were published in 1803 by George Chalmers, and again in 1871 by David Laing. The 16th c. also produced the first Scottish prose-writers. Among these is the anonymous author of *The Complaynt of Scotland*, recently edited by Mr. Murray, from whom we have quoted above; and John Bellenden, archdeacon of Moray, the translator of Boccaccio's *Sottorum Historia*, and of the first five books of Livy.

With Lindsay ceased that succession of poets writing in the Scottish dialect which had continued without interruption from the time of Barbour. It was more than a century and a half before another made his appearance. Most of the scholars of that time wrote in Latin; but for one vernacular prose work of great merit as a composition, *The History of the Reformation of Religion within the Realm of Scotland*, we are indebted to the leader of the movement, John Knox (q.v.).

We may close our account of this first period by the statement, that down to the period of the reformation every Lowland Scot knew that his language was "Inglish," and the only one who did not speak of it as such was Gawin Douglas. The accession of king James to the crown of England was unpropitious to the vernacular literature of Scotland. The parliament still met at Edinburgh, but the capital had ceased to be the residence of a court, and the language began to be looked upon as a vulgar dialect of the English. The best authors composed in the classic English of the south. It was in that language Drummond (q.v.) of Hawthornden wrote his verses, archbishop Spottiswood (q.v.) and bishop Burnet their histories, and archbishop Leighton (q.v.) and Henry Scougal their theological works, so far as they were not in Latin.

It might have been expected that the union of the kingdoms, by which Scotland was deprived of a legislature of her own, would have soon extinguished the cultivation of the native literature; but as a matter of fact, it turned out to be otherwise. There was a strong popular prejudice against the union, and this roused a deep feeling of nationality, apart from the old religious divisions. At this time appeared the first Scottish poet of true genius since the dark age of the country's literature set in—Allan Ramsay (q.v.), author of *The Gentle Shepherd*, which was published in 1725. Ramsay had also the merit of preserving some of those songs and ballads which have since become so famous, but whose authors are quite unknown. How far these works are the productions of an earlier age, and how far they are the composition of authors living in the 18th c., has been keenly discussed. Reference may be made to *The Romantic Scottish Ballads* of Mr. Robert Chambers on the one side, and to *The Lady Wardlaw Heresy* of Mr. Norval Clyne on the other.

To the deep attachment to the exiled line of kings cherished by a large party in Scotland, and to the interest awakened by the struggles in which this resulted, we owe the exquisite Jacobite songs.

While these feelings were dying away under the influence of the mild government of George III., the close of the century was made famous by the appearance of the most illustrious of Scottish poets. It is almost needless to say a word of Robert Burns (q.v.). Admired by all ranks, he continues to be the chosen classic of the peasantry of the Scottish Lowlands. It is as an English writer that sir Walter Scott (q.v.) is famous; but many of his lyrical pieces, and the dialogues in his novels, where the speakers use their own northern tongue, entitle him to be ranked as the last and greatest of Scottish writers.

There is, however, no doubt that in spite of the fine and various manifestation of literary genius in the Scottish dialect during the 18th and 19th centuries, that dialect has for the last 200 years been going through a process of uninterrupted decay. The introduction of southern English as the standard or classic form of speech after the union of the crowns, and still more after the union of the parliaments, slowly but surely ruined the old Anglian tongue of Scotland, till most of its peculiarities disappeared, and a jar-

gon grew up that was neither pure English nor pure Scotch, but of which nevertheless Scotchmen are curiously proud. Mr. Murray has happily characterized this jargon in which Ramsay, Fergusson, Burns, Scott, Hogg, and Tannahill wrote as "fancy Scotch."

See Craik's *History of English Literature and the English Language* (1864); David Irving's *History of Scottish Poetry* (Edin. 1861); Cosmo Innes's preface to his edition of Barbour's *Brus* (1856); and Murray's Essay in the *Transactions of the Philological Society* (1873).

SCOTTISH MUSIC. Scotland is famed for a class of national airs of a peculiar style and structure, possessing a wild, dignified, strongly marked, and expressive character. They are generally considered to be of great antiquity; the few notes on which the oldest of them turn, and the character of the modulation, lead to the inference that they originated at a time when the musical scale and musical instruments of the country were in a rude state; but there is a deficiency of evidence regarding their early history. No musical MS. of Scottish airs is now known to exist of an older date than 1627; and we have no knowledge when and by whom the early Scottish melodies were composed, or how long they continued to be handed down traditionally from generation to generation. They may not improbably have been committed to notation in the 15th and 16th centuries; and their disappearance is not wonderful, when we take into account, first, the strong measures resorted to, about 1530, by both civil and ecclesiastical authorities, to put down all ballads reflecting on the Roman Catholic hierarchy, and afterward the ill-will shown by the now dominant Presbyterians toward worldly amusements, including not a few that were entirely innocent. The most valuable of now existing early collections of Scotch melodies is the Skene MS., in the Advocates' library, noted down by sir John Skene of Hallyards about the year 1630. It contains a number of native airs, mixed with some foreign dance-tunes—upwards of a hundred in all. Many of the Scotch melodies differ considerably from the more modern versions, presenting in general a ruder outline; but often exhibiting beauties which the changes these airs have subsequently undergone have only tended to destroy.

Among the peculiarities which give its character to the music of Scotland, the most prominent is the prevalent omission of the fourth and seventh of the scale, and consequent absence of semitones, giving rise to such melodic forms as

Passages of this kind occur in all the airs of Scotland which have any claim to popularity, and form one of their most recognizable features. Another characteristic is the substitution of the descending for the ascending sixth and seventh in the minor scale, as at the beginning of the air called *Adeur, Dundee*, in the Skene MS.:

A very prevalent course of modulation is an alternation between the major key and its relative minor, the melody thus ever keeping true to the diatonic scale of the principal key, without the introduction of accidentals. An air will often begin in the major key, and end in the relative minor, or the reverse. The closing note is by no means necessarily the key-note, a peculiarity especially remarkable in the Highland airs, which, if in a major key, most frequently terminate in the second; if in a minor, on the seventh. Closes are also to be found on the third, fifth, and sixth. The peculiarities of modulation of the music of Scotland have something in common with the modes of ancient ecclesiastical music, to which it may be more correctly said to belong, than to the modern major and minor keys; and the avoidance of the fourth and seventh may have originated in the imperfection of the ancient wind instruments; yet these peculiarities are not to be found in the national airs of other countries where ecclesiastical music may be supposed to have had the same influence, and the early instruments to have been equally imperfect.

Among the more modern printed collections of Scottish melodies with words, the most important are George Thomson's collection, with symphonies and accompaniments by Pleyel, Koželuch, Haydn, Beethoven, Hummel, and Weber (vols. i.—iv., 1793–1805; vol. v. 1826; and vol. vi. 1841), one distinguishing feature of which was the appearance of Burns's words conjoined with the old melodies of the country; and a more recent collection in 3 vols., published by Messrs. Wood & Co., and edited, with historical, biographical, and critical notes, by Mr. G. F. Graham (1848–49).

On the subject of Scottish music generally, reference is made to Danney's *Ancient Scottish Melodies from a MS. of the Reign of King James VI., with an Introductory Inquiry Illustrative of the History of the Music of Scotland* (Edin. 1838).

SCOTUS AND SCOTISTS. See DUNS SCOTUS.

SCOU GAL, HENRY. 1650–78; b. Scotland; educated at the university of Edinburgh; appointed professor of philosophy in Aberdeen in 1669, and of divinity in 1674; was ordained and settled at Auchterless. In this retired place he wrote, in 1677, *The Life of God in the Soul of Man*, a work distinguished for its earnest piety and for the purity and elegance of its style. It was edited by bishop Burnet, and has been often reprinted.

SCOUT, a person sent out in the front or on the flank of an army to observe the force and movements of the enemy. He should be a keen observer, and withal fleet of foot or well mounted.

SCRANTON, a city in n.e. Pennsylvania, incorporated 1866; founded 1840 by a family of that name in Luzerne co., on the s.e. bank of the Lackawanna river; pop. '80, 45,850. It is 150 m. from New York, 105 m. n.w. of Philadelphia, 18 m. n.e. of Wilkes-barre. It is in a valley where the Roaring brook empties into the Lackawanna river, on the Delaware, Lackawanna and Western railroad, the terminus of the Delaware and Hudson, and the Lackawanna and Bloomsburg railroad. It is handsomely laid out, has gas-works, water supplied from two sources, and many substantial public buildings. It is in the coal region, and is the depot and shipping point for the product of the n. anthracite basin. Its trade in mining supplies and outfits is important, and its shipments are immense. It has extensive manufactories of iron, mining machinery, machine-shops, rolling-mills and steel-works, breweries and gunpowder works; other manufactures are coal screens, sieves, stoves, hollow ware, silk fabrics, leather, brass, etc.; and it has an extensive wholesale trade. It contains 12 banks—aggregate capital, \$1,351,450; a hospital, a home for friendless women and children, public schools, academies, and a valuable collection of Indian relics. It has a nunnery, an opera-house, 10 newspapers (2 German and 1 Welsh), 31 churches (5 German and 7 Welsh), a public library, a fire department, and an elegant public park.

SCRANTON, JOSEPH H. 1813-72; b. Conn.; removed to the coal region of the Lackawanna valley in 1847, and built up Scranton into a large city. He was long president of the Lackawanna coal company, and of many railroads, banks, and iron-manufacturing corporations. His brother, GEORGE W., 1811-61, was also in the iron business, president of several railroads, and member of congress from 1859 to his death.

SCRAP-METAL, a term applied to fragments of any kind of metal which are only of use for remelting. Copper and brass scrap consist of the turnings from the lathe, and all useless and worn pieces, whether old or new. They are readily remelted. Scrap-tin consists of the clippings and fragments of tinned iron and worn-out tinned vessels; these are frequently dipped into hydrochloric acid, to dissolve off the tin-coating from the iron; and the muriate of tin so formed is of commercial value for dyeing purposes. Scrap-iron consists of any waste pieces of iron, although the term is usually held to mean malleable iron only; and for many purposes it is particularly valuable, as it is found that a greater strength can be obtained by welding small fragments of iron together than is found in large masses, the fiber being much more twisted and interwoven, from the mingling of pieces in every imaginable direction.

SCREAMER, *Palamedea*, a genus of birds of the order *grallæ*, allied to the jacanas (q.v.). The bill is rather short, conical, curved at the extremity; there is a bare space around the eyes; the toes are long; each wing is furnished with two strong spurs. The HORNED SCREAMER, or KAMICHI (*P. cornuta*), inhabits swamps in Brazil and Guiana, and feeds on the leaves and seeds of aquatic plants. It is of a blackish-brown color, nearly as large as a turkey, and has somewhat the appearance of a gallinaceous bird. It receives its name from its loud and harsh cry. From the head, a little behind the bill, there rises a long, slender, movable horn, of which no use has been conjectured. The spurs of the wings are supposed to be useful in defense against snakes and other enemies.—Closely allied to this genus is the genus *chauna*, or *epistolophus*, to which belongs the CHAUNA, or CRESTED SCREAMER (*C.* or *O. chavaria*), a native of Brazil and Paraguay, the head of which has no horn, but is adorned with erectile feathers. The plumage is mostly lead-colored and blackish. The wings are armed with spurs. It is very capable of domestication, and is sometimes reared with flocks of geese and turkeys, to defend them from vultures, being a bold and powerful bird.

SCREEN, in architecture, an inclosure or partition of wood, stone, or metal work. It is of frequent use in churches, where it shuts off chapels from the nave, separates the nave from the choir, and frequently incloses the choir all round. Such screens are often much ornamented, the lower part being solid, and the upper very often perforated. The rood-screen (q.v.) is that on which most labor is usually bestowed. In England many beautifully carved screens in stone, enriched with pinnacles, niches, statues, etc., remain, such as those of York, Lincoln, Durham, etc.; and specimens in wood, carved and painted, are common in parish churches. In France the screen round the choir is sometimes the subject of beautiful sculptures, as at Amiens and Paris. In halls (q.v.) there was usually a wooden screen at one end to separate the entrance-door and a passage from the hall. Over this was a gallery. The term "screen of columns" is also applied to an open detached colonnade.

SCREW, one of the mechanical powers (q.v.), is a modification of the inclined plane (q.v.), as may be shown by wrapping a piece of paper in the form of an inclined plane round a cylinder. In the screw, the spiral line, formed by the length or slope of the plane, is raised up in a ridge, and a lever is attached for the purpose of working it, so that the screw is really a compound machine, combining the lever and the inclined plane. It may be used as an instrument for penetration, as in the auger, gimlet, etc., or as a means of producing pressure, the latter being its most important application as a mechanical power. For this purpose it is made to work in a "female screw" or *nut* (a hollow

cylinder grooved on the inside, so as to correspond to the threads of the screw); the nut is then firmly fixed in a massive frame, and the revolution within it of the screw causes the lower extremity of the latter to advance or recede. The principle of the screw's application is the same as that of an inclined plane pushed further and further under a heavy body so as to raise it up. Now in the inclined plane, P , the power or force, is to W , the weight raised or the pressure overcome, as the height of the plane to its base; that is, in the screw, as the distance between two threads is to the circumference of the cylinder. But as the twist is not applied at the circumference of the cylinder directly, but by means of a lever, it follows that the power applied, P , is to W , as the distance of two threads to the circumference described by P at the end of the lever. We see, then, that the power of the screw is increased by diminishing the distance between the threads; but as this cannot be effected without weakening the instrument, there is an evident limit to the increase of power in this way. The power can also be increased by lengthening the lever; but the best mode is that proposed by Mr. Hunter (in the *Phil. Trans.* vol. 17), in which are employed two screws of different fineness, the coarser of them hollow and grooved, to act as a nut for the other. The outer and coarser screw is the one to which the power is applied by a lever, and it is adjusted in the manner before described; the inner is so fastened as to be capable of vertical motion only. When the outer screw is turned so as to move its extremity downward, the inner screw moves upward, but not to the same amount; thus, if the outer screw have 6 threads to the inch, and the inner one 7, one turn of the outer screw depresses it $\frac{1}{6}$ of an inch, but as the inner one rises $\frac{1}{7}$ of an inch, the whole descent of the point which produces pressure is only $\frac{1}{6} - \frac{1}{7}$, or $\frac{1}{42}$ of an inch; hence the pressure applied is 7 times greater than could be given by the outer, 6 times greater than could be given by the inner screw, and equal to what would be given by a screw with 42 threads to the inch, with the same power applied. The advantage of Hunter's screw is that the threads may be any thickness, and consequently each screw any strength we please, provided the difference be small enough. The screw is one of the most powerful of the mechanical powers, but the friction generated by it amounts to about $\frac{1}{3}$ of the force applied.

SCREW (wte). The common screw indispensable for carpentry, fitted with a coarse thread for insertion in wood, is called the *wood-screw*. Machine screws, or otherwise fine-thread screws, are used in metals. Screws were little known or used before 1836, being rudely made by hand with imperfect tools. The head was forged or swedged up by a blacksmith; the thread and nick were formed by the use of hand dies and hack screws. In 1835 American ingenuity was directed to the subject, and the old hand tools were associated in machines having the capacity of imparting to each tool its proper motion. The swedge hammer became the heading machine, receiving the end of a coil of wire and regularly cutting the required length for a blank, which then received such a blow as to "set up" one end of the wire to form the head—the operation continuing automatically until the whole coil was made into blanks. These blanks were then handled in dividually and presented to organized machines, first for shaving the head, then for nicking, and lastly for cutting the thread. The above constitutes the second era in this manufacture; and such machinery, partly automatic, was all that was in use before 1846. Then a third era ensued, and an entire revolution was effected by constituting the machines entirely automatic. The blanks are by this system supplied in mass by the operator, the machine separating and handling each blank respectively as the nature of the operation demands, and producing with wonderful rapidity, regularity, and perfection. Chief among the inventors and constructors of this machinery was gen. Thomas W. Harvey (b. Vt., 1795; d. 1854), widely known for inventive genius in many directions. After him, perfecting and developing, were Sloan, Whipple, Rogers, and others; while the leading mind that organized this intricate business into probably the most successful manufacturing interest in this country was the late William G. Angell of Providence, R. I., president of the American screw company. Gen. Harvey was the first inventor of the partially automatic and of the entirely automatic machines. It is noticeable that though he produced gimlet-pointed screws in 1836, it was not till 1846 that any considerable market was found for them. His son, Hayward A. Harvey of Orange, N. J., likewise a skillful inventor in many departments, has made important improvements in the automatic machines, and this American invention is now in use throughout the world wherever screws are made. It is estimated that the consumption of screws throughout the world is not far from 100,000 gross per day—about 100 tons; and about 500 tons of iron are required for the daily production of machine and wood screws.

SCREW-DRIVER, a chisel-shaped tool, used for turning round, and so driving in or drawing out the common joiners' screw-nails, the heads of which have a cleft made to receive the edge of the screw-driver.

SCREW-PINE, *Pandanus*, a genus of plants of the natural order *pandanaceæ*, natives of the tropical parts of the east and of the South Sea islands. Many of them are remarkable for their adventitious roots, with large cup-like *spongiolæ*, which their branches send down to the ground, and which serve as props. Their leaves are sword-shaped, with spiny edges, and are spirally arranged in three rows. In general appearance, when

unbranched, they resemble gigantic plants of the pineapple, whence their popular name. *P. odoratissimus* is a widely diffused species, a spreading and branching tree of 25 ft. high, much used in India for hedges, although it takes up much ground. In the s. of India it is called the Kaldera bush. It grows readily in a poor soil, and is one of the first plants to appear on newly-formed islands in the Pacific. The male flowers are in long spikes, the female flowers in shorter branches. The flowers are frequently gathered before expanding and boiled with meat. Their delightful and very powerful fragrance has made the plant a favorite everywhere, and it is the subject of continual allusions in Sanskrit poetry under the name *Ketaka*. Oil impregnated with the odor of the flowers, and the distilled water of them, are highly esteemed East Indian perfumes. The seeds are eatable, and the fleshy part of the drupes, which grow together in large heads, is eaten in times of scarcity, as is the soft white base of the leaves. The terminal buds are eaten like those of palms. The spongy and juicy branches are cut into small pieces as food for cattle. The leaves are used for thatching, and for making a kind of umbrella common in India, and their tough longitudinal fibers for making mats and cordage. The roots are spindle shaped, and are composed of tough fibers; they are therefore split up by basket-makers and used for tying their work.—More valuable, however, as a fibrous plant is an allied species, *P. sativus* or *P. vacoa*, the *VACOA* of Mauritius, which if permitted grows to a height of about 30 ft., but from continual cropping of its leaves is usually dwarfed to 6 or 10 feet. The fibers of its leaves are used for making the *vacoa* bags, which constitute so considerable an article of export from Mauritius, rivaling in cheapness and usefulness the gunny bags of India. The leaves are cut every second year, and each plant yields enough to make two large bags. Immediately on being cut off the leaves are split into fillets, which are nearly an inch broad at the base, but taper to a point, and are 3 or 4 ft. long. One of these will support a bag of sugar of about 140 lbs. without breaking. The aerial roots of the *vacoa* are so fibrous as to be used for making paint-brushes for coarse purposes.

SCREW-PROPELLER, THE, is of the same construction as the common screw (q.v.), but with the narrow thread exaggerated into a broad, thin plate, and the cylinder diminished to a mere spindle.

FIG. 1.

One complete turn of such a screw is shown in fig. 1. Now if a screw of this form were turned round in an unyielding substance, as wood, it would for each turn advance as much as the center of the blade (or thread) had moved along the spindle in forming the screw, i.e., the distance *ab*. If, on the other hand, the screw itself were prevented from moving longitudinally, and the piece of wood *not* fixed, the latter would be compelled to advance along the screw the same distance *ab*. When the screw is fixed beneath a ship, and made to revolve in the water,

the case lies between the two just supposed, the screw moves forward, and with it the ship, and the water in which it has been working moves backward. The backward motion should only be small proportionately, and the ratio between it and the sum of the backward motion of the water and the forward motion of the ship is called the *slip*, which in well-designed vessels has a value of from 0.1 to 0.25.

It is obvious also that on the same spindle there may be more than one blade, provided that all the blades have the same pitch or rate of progression along the spindle (in fig. 1 *ab* is the *pitch* of the screw). Screws have thus been formed with two, three, four, and six blades or arms, but the form most commonly used is two blades for ships of war, and three or four blades in the merchant service.

If the screw be cut off before attaining the length *ab* of a whole convolution, as at *c*, the portion *ac* will still retain all the properties of the screw. In the earlier attempts

screws were tried of the length of a whole convolution, or even two whole turns; but experiment has since shown that this length is a disadvantage. The best results are obtained when the sum of the lengths, measured parallel to the center line of the shaft of all the blades, is equal to about 0.4 of the pitch. This holds equally good for two, three, or four bladed propellers, so that if *n* equals the number of blades, then the length of one blade, or *ac*, would be expressed by the equation $ac = \frac{0.4 ab}{n}$. A four-

bladed screw of this kind, and of a form very generally used in the merchant navy, is shown in fig. 2.

FIG. 2.

The following are the technical terms applied to the screw-propeller: The *shaft* is

the cylindrical axis on which the screw revolves, and is the medium for communicating to it the power of the steam-engine; the *blade* is the thread of the screw; the *pitch*, the length of shaft on which the blade would make one complete turn; the *diameter* is the distance between the tips of opposite blades; and the *length* is the distance from the front to the back edge of blade projected upon a fore and aft plane.

The application of the screw to the propulsion of a vessel through the water is not new. In 1802 Dr. Shorter, an English mechanic, produced motion by its agency; but his discovery was valueless, as the steam-engine had not then been practically applied to navigation. Those who first employed Watt's engine on board ship adopted the paddle-wheel, the success of which turned attention from the screw for nearly thirty years. At length, in 1832, Mr. B. Woodcroft patented a screw-propeller with an increasing pitch; and four years later, Mr. F. P. Smith patented a screw making two whole turns, which he reduced in 1839, to one whole turn. In 1837 he and cap. Ericsson, an American inventor, brought the matter practically forward on the Thames, where a small screw-steamer, 45 ft. long, 8 ft. broad, and of 27 in. draught, towed the *Toronto* of 630 tons against tide at $4\frac{1}{2}$ knots an hour. In 1839 an American gentleman had the *Robert Stockton* built for him by Messrs. Laird, with which he reached America. The British admiralty, however, refused any support to the new propeller, until the success of the *Archimedes*, built in 1838, of 232 tons and 80 horse-power, which was exhibited at the principal ports, rendered opposition no longer possible. The admiralty, then, as an experiment, constructed the *Rattler*, from the trials of which vessel many valuable data for the screw-propeller have been derived. Meanwhile, in 1838, Mr. James Lowe had shown that the length of the screw should not exceed $\frac{1}{4}$ th of the pitch; and after actual and successive trials, the screw of the *Rattler* was cut down from 5 ft. 9 in. to 1 ft. 3 inches. These experiments established the screw as a rival to the paddle-wheel; and its advantage for ships of war became incontestable, as, from the entire submergence of the propeller, and consequent lowness of its engines in the ship, the chances of injury from an enemy's shot were reduced almost to nothing. Some of the great steam-companies—notably the Peninsula and Oriental company—also patronized it, and it was found of great value as an auxiliary in sailing-vessels. The result is that, at this time, its use in the British navy is almost universal, except in cases where want of sufficient depth of water, or other special circumstance, causes the paddle-wheel still to be employed.

Several varieties of screw have been introduced, each finding many supporters. The one which was for many years used in the British navy was invented by Mr. R. Griffiths. In it the blades, in place of rising from a small boss, as in fig. 2, spring from a hollow sphere occupying $\frac{1}{2}$ the screw's diameter. This arrangement was adopted because experiment proved that the central portions of the blades of the ordinary screw absorb about 20 per cent of the propelling power, while they produce little useful effect, from the circumstance that at that part (especially in screws of a coarse pitch) the blade is nearly in a line with the shaft, and acts at right angles on the water, causing only a disturbance of that portion on which the outer and more powerful end of the blade operates. The globe, on the other hand, revolves with little friction. A further improvement was effected by bending the tips of the blades a little over backward, so that the face of the blade striking the water was partly convex. The older propellers had blades which increased in width uniformly from boss to tip. These were found to create much vibration in the ship, and the "leading" corner is therefore rounded away, as shown in fig. 2. This is also done in Griffiths's propeller, but he probably carries the principle to excess in cutting away also the "following" corner, and so lessening the effective surface of the blade. A propeller invented by Mr. Hirsch, and known by his name, has been lately successfully tried by the Admiralty, and may probably be much used by them in future.

One difficulty in the use of the screw as an auxiliary in sailing-ships is that in a good wind the screw seriously impedes the sailing. To prevent this, various devices are resorted to. In some cases, the screw is disconnected from the shaft, and left to revolve freely; in others, as in most ships of war, it is disconnected and hoisted altogether out of the water by means of an iron framework worked above the screw in a sort of well. Messrs. Maudslay have patented a "feathering-screw," which, by a simple apparatus, can, when the steam-power is not required, have the blades turned into a line with the ship's keel, and the screw (which must be two-bladed) fastened in a vertical position. When thus treated, the screw is out of danger, and forms no impediment to the ship's progress.

The usual position for the screw is immediately before the stern-post, the shaft on which it revolves passing, parallel to the keel, into the engine-room. Many vessels have been built, especially by Messrs. J. & W. Dudgeon, of London, with two screws, one under each quarter. These have independent action, and as one can therefore be reversed while the other goes ahead, great steering-power is imparted; so much so, that vessels constructed on this principle are said to be able to turn in their own length. For a given power, a twin-screw vessel draws less water, owing to the lessened diameter of the propellers, than an ordinary screw-steamer. As the action of the screw depends on the comparative immobility of the water in which it acts, it is necessary, for the development of its full power, that it should be completely immersed, and that there should be

nearly 2 ft. of water above the top of the upper blade. It follows from this that, *ceteris paribus*, the screw-vessel will draw more water than the paddle-steamer; for in large steamers the screw is from 15 to 18 ft. in diameter, and in the *Great Eastern* it reaches 24.

It now only remains to notice the comparative advantage of the paddle and screw. Under favorable circumstances, in ships of equal tonnage and power, there is little difference in speed or force. Before the wind, the paddle has a slight advantage; with the wind ahead, the resistance offered by the paddle-boxes transfers the advantage to the screw. Fastened stern to stern, the screw-ship drags the paddle-ship; but fastened bow to bow, the same result is not found. This is, however, rather to be attributed to the loss of power in a paddle ship when not in progress (see PADDLE WHEEL), than to any actual superiority of screw. In a long voyage, however, the gain is distinctly with the screw; because the weight of fuel borne at starting sinks the paddles too low in the water, and probably its exhaustion at the end of the voyage deprives them of their proper dip; whereas, with ordinary management, the screw will always be immersed. Again, rolling deprives the paddle of much power; while pitching deprives the screw of its proper matrix; but the balance of loss in tempestuous weather is in favor of the screw. It has been already shown that in men-of-war the screw is the most useful agent; and as an additional reason may be adduced the clear broadside which it allows for the guns. On the other hand, in point of comfort to the passengers, the advantage lies unquestionably with the paddle; for the rapid revolution of the heavy screw on a shaft extending half the ship's length, produces a continuous and very unpleasant vibration; while the lower position of the engines and screw gives the vessel a deep roll. For lakes and rivers, where the water is smooth and the voyage short, paddles are best, and more especially so when the water becomes often shallow or is choked with weeds, which would soon clog the screw.

In scientific language the motion of a vessel by means of a screw, is said to be due to the forward reaction of the water in which the propeller revolves upon the blades, and through them upon the whole vessel. In order that this useful reaction may bear the largest possible ratio to the work done by the engine, it is essential that the form of the ship aft should be such as will secure that plenty of water shall always have access to the forward side of the screw as the vessel goes along. This has been demonstrated by the experimental alterations in the after-body of the *Deaf* (1846), and still more strikingly by placing a disk of the same diameter as the propeller in front of it. If the propeller be worked in these circumstances, the vessel will not move forward at all, although the power given out by the engines remains as before.

SCREW-WRENCH, a tool used for grasping the flat sides of the heads of large screws, such as are used in engines and other large works. The heads are usually octagonal laterally, and the wrench is made of two portions like hammers sliding one upon the other, so that screw-heads can be grasped of different sizes, and the handle forms the lever by which they are turned round. The screw-key is only a more simple kind of wrench, which will only act upon screws of two sizes, fitting the jaws at each end.

SCRIBBLER. See SPINNING.

SCRIBE (Heb. *Sofar*; Gr. *Grammateus*, *Nomodidaskalos*), among the Jews, originally a kind of military officer, whose business appears to have been the recruiting and organizing of troops, the levying of water-taxes, and the like. At a later period, especially at the time of Christ, it had come to designate a learned man, a doctor of the law. Christ himself recognizes them as a legal authority (Matth. xxiii. 2); they were the preservers of traditions, and formed a kind of police in the temple and synagogues, together with the high-priests; and the people revered them, or were expected to reverence them, in an eminent degree. They were to be found all over the country of Palestine, and occupied the rank and profession of both lawyers and theologians. Their public field of action was thus probably threefold: they were either assessors of the sanhedrim, or public teachers, or administrators and lawyers. Many of these teachers had special class-rooms somewhere in the temple of Jerusalem, where the pupils destined to the calling of a Rabbi sat at their feet. The calling of a scribe being gratuitous, it was incumbent upon every one of them to learn and exercise some trade. Those scribes who were not eminent enough to rise to the higher branches of their profession, to enter the sanhedrim, to be practical lawyers, or to hold schools of their own, occupied themselves in copying the book of the law or the prophets, in writing phylacteries, contracts, letters of divorce, and the like. Their social position was naturally in accordance with their talents and their importance. The apostles, not learned enough, for the most part, to be scribes, are promised to become "scribes" of the kingdom of God, etc. See PHARISEES, HALACHA, HAGGADA, MIDRASH, MISHNA, TALMUD.

SCRIBE, AUGUSTIN EUGÈNE, a French dramatic writer, son of a wealthy silkmercer of Paris, was born in 1791. Educated for the legal profession, he soon deserted it for dramatic authorship. His first piece, *Les Derris*, written by him in conjunction with Germain Delavigne (brother of Casimir Delavigne), was played in 1811, but till 1816 he cannot be said to have achieved a decided success. Since that time, pieces, chiefly vaudevilles, from his pen have followed each other with the most astonishing rapidity;

and in such demand were they at the hand of theatrical managers, that Scribe established a sort of dramatic manufactory, in which numerous *collaborateurs* were constantly at work under his supervision. His plots are interesting, and his dialogue, light and sparkling; and not a few of his pieces have been adopted for the English stage. Scribe also wrote various novels, and composed the *libretti* for a considerable number of well-known operas, including *Masaniello*, *Fra Diavolo*, *Robert le Diable*, and *Les Huguenots*. He was admitted a member of the French academy in 1834, and died Feb. 20, 1861.

SCRIBING, in joinery, fitting the ends of pieces of wood together, so that the fibers may be at right angles, and the end cut away across the fibers.

SCRIBNER, CHARLES, 1821-71, b. New York; grandson of a Presbyterian minister; educated at the university of New York, and Princeton college, where he graduated in 1840. He studied for the bar, but on account of feeble health, did not begin practice. In 1846 he formed a partnership with Isaac D. Baker in the book-selling and publishing business in New York, and published the works of Headley, Willis, Mitchell ("Ik Marvel"), Dr. Holland, McCosh, Dr. Bushnell, etc. In 1857 the firm associated with it Mr. Charles Welford, and entered heavily into the importation of books from England; it also entered extensively into the manufacture of educational books, and in 1870 established *Scribner's Monthly*, which under the editorship of Dr. J. G. Holland, achieved great popularity. On the death of Mr. Scribner, in 1871, the firm was re-organized under the name Scribner, Armstrong & Co.

SCRIP is a certificate (usually about the size and appearance of a bank-note) of a person's share or shares in a joint-stock undertaking. It is issued on the party signing a contract of copartnership, and is retained by him until an act of the legislature, or some other formality, establishes the company, and authorizes the opening of regular books for entering the name of shareholders and the transfer of stock. In many instances scrip is unauthorizedly sold, and made an object of speculation; the party to whom it was assigned, however, remains bound by the contract which he has subscribed, until relieved of his obligations by transfer in the company's books.

SCRIVEN, a co. in e. Georgia, adjoining South Carolina; bounded on the e. by the Savannah river, on the s.w. by the Ogeechee river; crossed by the Central railroad of Georgia; about 780 sq.m.; pop. '70, 9,175—4,888 colored. The surface is level. The soil is sandy. The principal productions are corn and cotton. Co. seat, Sylvania.

SCRIVENER, FREDERICK HENRY AMBROSE, LL.D., b. England, 1813; graduated at Trinity college, Cambridge, 1835; became assistant-master of the King's school, Sherborne; curate of Sandford, Dorset, Somerset, in 1839; was appointed head master of Falmouth school in 1846; rector of Gerrans, Cornwall, in 1861; in 1870 one of the English company of revisers of the authorized version of the New Testament. He has published *A Supplement to the Authorized Version of the New Testament; A Collation of about Twenty Manuscripts of the Greek Testament deposited in England; Contributions to the Criticism of the New Testament, being the Introduction to the Codex Bezae Cantabrigiae and Fifty other Manuscripts; Novum Testamentum Graecum, text of Stephens of 1550, with Various Readings of Beza, Tischendorf, Tregelles, etc.; Plain Introduction to the Criticisms of the New Testament.*

SCRIVENER'S PALSY, or **WRITER'S CRAMP**. A nervous disorder whose location is in the motor nerves of that part of the hand usually engaged in holding the pen. It is accompanied by pain and by symptoms of paralysis, which in some cases it practically is. Under its influence the muscular movements of the thumb and forefinger become uncontrollable; and if the effort to write be continued, despite the warning symptoms, the writing is illegible, while the disorder is increased. Of late years it has become much the custom with those who are professional writers to hold the pen between the fore and middle fingers, thus avoiding the strain on the muscles and nerves of the thumb, and gaining a better support for the pen itself than is afforded by the old conventional method so tenaciously adhered to by writing-masters. The treatment of writer's cramp includes rest and a stimulating diet, tonics, especially iron, with sometimes the application of a galvanic current to the part involved, and sometimes the use of strychnine, by prescription.

SCROFULA, or **SCROPHULA**, was, until the last quarter of a century, regarded as consisting essentially of indolent glandular tumors, occurring frequently in the neck, suppurating slowly and imperfectly, and healing with difficulty. Recent pathologists, however, have given a more extended meaning to the word *scrofula*. According to them it signifies a certain disease or defect of the constitution, in which there is a tendency to the production and deposition of a substance called *tubercle* in various tissues and organs; and tubercle must thus be regarded as the essential element of scrofula. It does not follow, however, that a deposit of tubercle should actually occur in every case of scrofula. The *tendency* is present, and the absence or presence of the deposit depends upon the extent of the affection, and is determined by various causes.

Sir James Paget, one of our most eminent pathologists, very clearly sums up what is generally understood by scrofula in the following paragraph: "It is a state of constitution distinguished in some measure by peculiarities of appearance even during health,

but much more by peculiar liability to certain diseases, including pulmonary phthisis. The chief of these "scrofulous" diseases are various swellings of the lymphatic glands, arising from causes which would be inadequate to produce them in ordinary healthy persons. The swellings are due sometimes to mere enlargement, as from an increase of natural structure, sometimes to chronic inflammation, sometimes to an acute inflammation or abscess, sometimes to tuberculous disease of the glands. But besides these, it is usual to reckon as "scrofulous" affections certain chronic inflammations of the joints; slowly progressive "carious" ulcerations of bones; chronic and frequent ulcers of the cornea, ophthalmia (q.v.), attended with extreme intolerance of light, but with little, if any, of the ordinary consequences of inflammation; frequent chronic abscesses; pustules, or other cutaneous eruptions, frequently appearing upon slight affection of the health or local irritation; habitual swelling and catarrh of the mucous membrane of the nose; habitual swelling of the upper lip." It is obvious that although the above-named forms of disease are often more or less coincident, they have nothing sufficiently in common to justify the general appellation of *scrofulous*. They are certainly not all tuberculous diseases, and hence sir James Paget doubts whether the proposal to make *scrofulous* and *tuberculous* commensurate terms is practical, since the former, as generally employed, has a much wider significance than the latter.

The word is derived from the Lat. *scrofula*, a sow, it being supposed that this animal was especially liable to tumors such as occur in this disease. The Greek and Arabic names for the disease are similarly derived from the words signifying "swine" in these languages. While *scrofula* was the popular, *struma* (supposed to be derived from *struo*, I heap up) used by Celsus, Pliny, and other Latin writers, was the classical name for the disease. The vulgar English name, *the king's evil*, is derived from the long-cherished belief that scrofulous tumors and abscesses could be cured by the royal touch. Multitudes of patients were submitted to this treatment, and, as the old historians assert, with perfect success, from the time of Edward the Confessor to the reign of queen Anne. The writer of the article "scrofula" in *The English Cyclopædia*, mentions the curious historical facts that "the old Jacobites considered that this power did not descend to Mary, William, or Anne, as they did not possess a full hereditary title, or, in other words, did not reign by divine right. The kings of the house of Brunswick have, we believe, never put this power to the proof; and the office for the ceremony, which appears in our liturgy as late as 1719, has been silently omitted. The exiled princes of the house of Stuart were supposed to have inherited this virtue. Carte, in the well-known note to the first volume of his *History of England*, mentions the case of one Christopher Lowel, who, in 1716, went to Avignon, where the court was then held, and received a temporary cure; and when prince Charles Edward was at Holyroodhouse in Oct., 1745, he, although only claiming to be prince of Wales and regent, touched a female child for the king's evil, who in 21 days is said to have been perfectly cured." The practice was introduced by Henry VII. of presenting the patient with a small coin (gold or silver). The French kings also touched for the "evil," the practice being traced back to Clovis, 481 A.D. On Easter Sunday, 1686, Louis XIV. is said to have touched 1600 persons using the words: *Le roi te touche; Dieu te guérisse* (the king touches thee; may God cure thee). See Chambers's *Book of Days*, i. 82. The literature of this curious subject is somewhat extensive. The reader who wishes to pursue the inquiry further is referred to Tooker's *Charisma, sive Donum Sanctionis*, etc., 1597; Browne's *Charisma Davideum, or the Royal Gift of Healing Strumas*, etc., 1684; and Peckett's *Free and Impartial Inquiry into the Antiquity and Efficacy of Touching for the King's Evil*, 1722. The subject is also examined by bishop Douglas in his *Criterion, or Miracles Examined*, 1754; by Colquhoun, in his *Isis Revelata*, 1836 (who attributes the cure to animal magnetism); and by Howitt in his *History of the Supernatural in all Ages and Nations*, 1863.

Scrofula is a disease of early life, and when it does not exhibit any of its manifestations before the period of maturity it seldom shows itself afterward.

In all systematic descriptions of this disease, two varieties of the scrofulous habit or diathesis are given, viz., the *sanguine* or *serous*, and the *phlegmatic* or *melancholic*. In the *sanguine*, there is a general want of muscular development, the limbs being soft and flabby; the skin is fair and thin; the features are delicate, the rosy hue of the cheeks contrasting strongly with the surrounding paleness; the eyes are gray or blue, and the eye-lashes long and silken; the hair fine and light-colored or reddish; and the ends of the fingers broad and expanded, with convex nails bent over them; the intellect is lively and precocious, and there is often considerable beauty. In the *phlegmatic* variety the skin is pale or ruddy, dark, and often harsh; the general appearance dull and heavy; the hair dark and coarse; and the mind usually slow and torpid.

Children in whom the scrofulous constitution is strongly marked often present that narrow and projecting form of the chest to which the term "pigeon-breasted" is commonly given; moreover, the abdomen is enlarged, the limbs wasted, and the circulation languid, in consequence of which they are especially liable to chilblains. The digestive organs are so commonly affected—as is evidenced by irregular action of the bowels, fetid breath and evacuations, furred tongue, capricious appetite, etc.—that, in the opinion of the late Dr. Todd, "strumous dyspepsia presents a more characteristic feature of this habit of body than any physiognomical portrait that has been drawn of it." In the great majority of cases the scrofulous disposition is hereditary; indeed,

there is no disease which is nearly so often transmitted from parent to offspring as scrofula. There is, however, scarcely any doubt that it may be acquired under the action of various unfavorable exciting causes, which may be ranked together "as causes of debility." Among them may be especially noticed (1) Insufficient and improper food; (2) Impure air; (3) Insufficient exposure to direct sunlight; (4) Exposure to wet and cold, and to sudden changes of temperature, especially if the clothing be insufficient; (5) Excessive and continued fatigue, whether bodily or mental; and (6) Intense and prolonged anxiety or mental depression.

We shall first lay down the general principles of treatment to be adopted with the view of improving the health in the case of a person presenting either merely the general indications of a scrofulous habit of body, or some of its local manifestations, and we shall then conclude with a brief notice of a few of those particular forms of the disease which most frequently come under the attention of the medical practitioner.

The diet should be nutritious and sufficiently abundant, and animal food should be given at least twice daily. Dishes containing eggs and milk may usually be taken with advantage. If the patient is not very young, a little bitter ale taken at an early dinner will often promote digestion; if, however, it causes flushing or sleepiness, it must be discontinued. A mother with scrofula should always provide a healthy wet-nurse for her child, as suckling in such a case is injurious both to parent and offspring. Flannel should always (both in summer and winter) be worn next the skin during the day, and the clothing must always be sufficient to keep the extremities warm. Constant residence in pure and dry air should be enforced as far as possible. Unfortunately, the climate of Great Britain is by no means favorable to those possessing the scrofulous habit, and it is often very difficult for the physician to decide as to the choice of the most suitable residence. On this subject, Mr. Savory, in his essay on "Scrofula" in Holmes's *System of Surgery*, vol. i., 1860, remarks that "it is surely a mistake to suppose that a warm climate is the best adapted to all cases of scrofula. It is doubtless so in the great majority in which the disease [in the form of pulmonary consumption] is far advanced; but in many cases at an earlier stage, its further development is more satisfactorily arrested and the general health improved by a more bracing air. Children with tuberculous glands, but whose general health appears otherwise tolerably good, would perhaps profit less by transportation to Madeira or Egypt than by residence in the s.w. coast of England, where the atmospheric changes are less frequent and sudden than in other parts of the kingdom, and the winter is comparatively mild. Delicacy of constitution is sometimes increased, and mischief encouraged, by dread of exposure." Free exercise of the muscles and lungs in the open air should be insisted on in fine weather, and if this cannot be taken, the best substitute is friction over the surface of the body with the flesh-brush. Patients who can bear cold sea-bathing during the summer and autumn months will derive great advantage from it; but if a short immersion is not rapidly followed by a genial glow after drying the skin, such bathing is injurious, in which case warm salt-baths will be found useful. Too much stress cannot be laid upon the fact that in the case of children the mind should be cheerfully occupied, but not overtasked. The medicines most esteemed in the treatment of scrofula are iodine and its compounds, the salts of iron, bark, sarsaparilla, the alkalies and mineral acids, and, above all, cod-liver oil. As the choice of the individual remedy must be left to the physician, we will merely remark that iodine and iron may often be advantageously prescribed together either in the form of the syrup of the iodide of iron, or of a well-known French preparation known as Blancard's iodide of iron pills; and that to derive full benefit from cod-liver oil, it must be taken for a long time. As Mr. Savory remarks, the oil should be regarded as an article of diet rather than a medicine. A tablespoonful may be considered as a full dose for an adult; but this quantity should be gradually arrived at, the dose commencing with a teaspoonful. It is most easily taken when floating on a mixture of orange wine, or some other pleasant bitter fluid, with water. The lightest and clearest oil is probably the best, and in cold weather it should be slightly warmed before it is taken, for it is thus rendered more liquid and more easily swallowed. If what are commonly known as "bilious symptoms" supervene, the use of the oil should be suspended for a couple of days, and a few gentle aperients should be prescribed.

Excluding pulmonary consumption, in which the leading pathological feature is the deposit of scrofulous matter or tubercle in the lungs, one of the forms of scrofula which most frequently presents itself is in the *lymphatic glands*, especially of the neck. The gland or glands may first become enlarged, either from an attack of acute inflammation, or from an indolent and painless deposit of tubercle. They may remain in this state either stationary or slowly enlarging for years, till from some accidental local irritation, or from some constitutional disturbance, they inflame and suppurate. After the discharge of the matter, the ulcerated skin usually heals with an ugly puckered cicatrix, which generally remains as a disfiguring mark through life. The local treatment consists in attempting to disperse the tumor, if it is hard and painless, by painting it with tincture of iodine, or by the application of iodine ointment. If it is soft, and likely to suppurate, the process may be facilitated by the application of warm water dressing or emollient poultices. When there is undoubted fluctuation, indicating the presence of pus or matter, it is usually regarded as the best practice to open the abscess with a narrow-bladed bistoury; but some surgeons still prefer allowing the matter to make its own

way to the surface. The necessary internal treatment is that which has been already described. The *skin*, especially behind the ears, about the mouth, nostrils, and eyelids, and on the scalp, is liable to pustular diseases of a scrofulous origin. The free use of soap and water, followed by the application of black wash or zinc ointment, and proper constitutional treatment, will generally effect a cure, except in the horrible form of scrofulous ulceration of the skin of the face known as *lupus* (q.v.). Among other well-known and very serious scrofulous affections must be mentioned *acute hydrocephalus* and *mesenteric disease*, to which special articles are devoted. There is a peculiar and very intractable form of ulceration known as the *scrofulous ulcer*, which will be noticed in the article on ULCERS. The physical, chemical, and microscopical characters of the peculiar morbid deposit, to which reference has frequently been made in this article, will be found under the head of TUBERCLE and TUBERCULOSIS.

SCROFULOUS or tuberculous diseases are common among cattle, sheep, and pigs. In early life the tubercle is laid down in the mesenteric glands, and occasionally about the joints. Along the exposed eastern coasts of Britain, scrofulous swellings are also met with about the head and neck; in some of the great grazing districts, the mucous membrane of the bowels is affected, constituting dysentery; but, as in man, the lungs are the most common site of tubercle, which here gives rise to pulmonary consumption. Scrofula in all its forms is hereditary, hence animals with any such taint should be rejected as breeding stock. It is induced and fostered by "breeding in and in." It may be developed, and is always aggravated, by debilitating influences, such as bad food, or exposure to wet or cold. Prevention is induced by breeding only from healthy vigorous parents, and allowing the stock at all times adequate food and shelter.

SCROLL, an ornament of very common use in all styles of architecture. It consists of a band arranged in convolutions, like the end of a piece of paper rolled up. The Greeks used it in their Ionic and Corinthian styles (q.v.); the Romans in their composite; and in mediæval architecture, and all styles which closely copy nature, it is of constant occurrence as in nature itself.

SCROPHULARIACEÆ, or SCROPHULARIINÆ, a natural order of exogenous plants, consisting chiefly of herbaceous and half-shrubby plants. The calyx is inferior, persistent, divided into five (sometimes four) unequal divisions. The corolla is monopetalous, more or less irregular, often two-lipped, exhibiting great variety of form; in the bud it has five (sometimes four) segments. The stamens are usually four, two long and two short, sometimes two, rarely five. The ovary is two-celled, with many ovules; the style simple, the stigma generally two-lobed. The lobes of the stigma sometimes display much irritability. The fruit is a capsule, or rarely a berry.—This order is a very large one, containing almost 2,000 known species, which are distributed over the whole world, both in cold and warm climates. Acridity and bitterness are prevalent characteristics, and many species are poisonous. Some are root parasites. Some are admired and cultivated for their flowers; some are used medicinally. *Digitalis* or foxglove, *calceolaria*, *mirabilis*, mullein, *antirrhinum* or snapdragon, *gratiola*, *scrophularia* or figwort, *veronica* or speedwell, and *euphrasia* or eyebright, are familiar examples. Very different from these humble herbaceous plants is *paulownia imperialis*, a Japanese tree, 30 to 40 ft. high, with trunk 2 or 3 ft. in diameter, and flowers in panicles, about as large as those of the common foxglove.

SCRUPLE (Lat. *scrupulum*, *scriptum*, or *scrupulum*) was the lowest denomination of weight among the Romans, and with them denoted the 24th part of an ounce (*uncia*), or the 288th of a pound (*libra*). As a measure of surface it was also the 24th part of the *uncia*, and the 288th of an acre (*jugerum*); seeming, in fact, to be the 24th of the 12th part of any unit. In later Roman times it became the name of the 60th part of an hour, and corresponded to our "minute." The "minute" being the *scrupulum*, the 60th part of a minute was called a *scrupulum secundum* (whence the derivation of our word "second"), the 60th part of this a *scrupulum tertium*, and so on. Lexicographers define "scrupulum" to be a small pebble, such as would be likely to find its way between the sandal and the foot, whence the use of the term to signify a small difficulty or objection.—The term at the present time is a denomination in that modification of Troy weight which is used by apothecaries; it contains 20 Troy grains, is the third part of a drachm, the 24th of an ounce, and the 288th of a Troy pound.

SCUDDER, HORACE ELISHA, b. Boston, 1838; graduate of Williams college, 1853; resident of New York city, 1875; at present residing in Cambridge, Mass. He has contributed to a number of quarterlies and reviews, and edited the *Riverside Magazine*, for young people. He is author of *Little People and their Friends*, 1862-63; *Dream Children*; and *Life and Letters of David Coit Scudder*. Of recent works there are *The Dwellers in Five-Sisters' Court*; and of juvenile books, *Doings of the Bodley Family in Town and Country*, with 77 illustrations, and the Bodley series. He is exceedingly popular as a writer for the young.

SCUDDER, JOHN, 1793-1855; b. New Brunswick, N. J. He gave up a medical practice in New York, and the position of house surgeon of the city hospital, to go as a missionary physician to India. He reached his field of labor in Ceylon early in 1820. He was zealous in proclaiming the gospel to the heathen, and was ordained to the min-

istry by his brethren of the mission soon after his arrival. In 1839 he was removed to Madras as associate of Mr. Winslow. In 1842 he visited the United States and labored zealously in the churches to awaken interest in the heathen, especially among the young. He returned to Madras, and when on his way to America for the second time on account of ill health he died at the cape of Good Hope. His eight sons devoted themselves to the missionary work in Arcot. This family belonged to the Reformed (Dutch) church, which formerly conducted its foreign missions in connection with the American board (Congregational).

SCUDERY, MADELEINE DE, a once notable French novelist, was born at Havre in 1607. Left an orphan at the age of six, she, along with a brother named Georges, was carefully educated by one of her uncles. While still young, she left Normandy for Paris, was admitted to the hotel Rambouillet (see RAMBOUILLET), and soon became one of the oracles of the brilliant society that assembled there. It was in this famous but showy circle that Mlle. Scudery gathered that immense fund of watery sentimentalism, platonic gallantries, "polished" conversation; dull ceremonial incidents, affectations of moral purism, etc., which make up the tedious contents of her romances—*romans de longue haleine* (long-winded romances), as they have been felicitously nicknamed. Their popularity for a brief period was painfully wide. Everybody with the slightest pretensions to "taste," except the Port-royalists, Bossuet, and a few critics of the stricter sort, professed a boundless admiration for them. The bishops in general—as Camus, Mascaron, Huet, Godeau, Fléchier, Massillon—were in raptures, and studied the stately trash with an ardor that considerably diminishes our respect for their understanding. When the troubles of the Fronde had broken up the gatherings at the hotel Rambouillet, Mlle. Scudery organized a literary circle of her own, which met every Saturday at her house in the Rue de Beaunce. These "Saturdays" began very well; but gradually they degenerated and became ridiculous—pedantic and blue-stock-ingsish they had been from the very first. Nothing further in Mlle. Scudery's life calls for notice. She died at Paris, June 2, 1701, at the advanced age of 94, honored and respected to the last; and it is but fair to admit that she seems to have been worthy of the regard in which she was held, being herself a perfect pattern of those watery virtues and superfine excellences of demeanor that she loved to depict. Her principal works (never again to be read in this world) are: *Ibrahim, ou l'Illustre Bassa* (Par. 4 vols. 1641); *Artamène, ou le Grand Cyrus* (Par. 10 vols. 1649-53); *Clélie, Histoire Romaine* (Par. 10 vols. 1656); *Almahide, ou l'Eclaire Reine* (Par. 8 vols. 1660); *Les Femmes Illustres, ou les Histoires Léroïques* (Par. 1665); 10 vols. of *Conversations Nouvelles, Conversations Morales, and Entretiens de Morale* (1680-92); besides *Lettres*, and *Poésies légères*, etc.—See Victor Cousin's *La Société Française au Dix-septième Siècle*.

SCUDO (Ital. shield), an Italian silver coin, corresponding to the Spanish *piastre* (q.v.) the American dollar (q.v.), and the English crown (q.v.). It was so called from its bearing the heraldic shield of the prince by whose authority it was struck, and differed in value in the different states of Italy. In Rome, where it is called the *scudo Romano* or *scudo nuovo*, it is equal to 4s. 3d. sterling; and is subdivided into 10 *paoli* or 100 *lajochi*. The Venetian scudo, or *scudo della croce*, was of higher value than the Roman one; while, on the other hand, the old scudi of Bologna, Genoa, and Modena are inferior to it in value. Scudi are now gradually disappearing from the provinces of the kingdom of Italy before the new decimal coinage, but the name is sometimes given to the piece of 5 lire, equivalent to a 5 franc piece in the French coinage. Scudi of gold were also struck in Rome, the *scudo d'oro* being equivalent to 10 *scudi di argento*. See **PIASTRE**.

SCULL—SCULLING. A scull differs from an oar in size only. It is shorter, and less heavy. A man can only manage one oar; but he can pull with a pair of sculls, the ends of which lap over very little, or else do not meet, within the boat.

Sculling has two senses, a river sense and a sea sense. In its fresh-water acceptance, sculling is the act of propelling a boat by means of sculls in pairs. Among sea-faring men, however, to scull is to drive a boat onward with one oar, worked like a screw over the stern.

SCULPIN. See **BULLHEAD**.

SCULPTURE, the process of graving or cutting hard materials; from the Lat. *sculpo*, in Gr. *glypho*. Its common application is to artistic carving or cutting. Sculpture is the art of expressing ideas or images in solid materials. In this sense processes which do not, strictly speaking, involve the cutting of hard substances are included in the term. Sculpture, as an art, includes the molding of soft materials as well. Clay, and even wax, have been in all ages of the art employed, sometimes for the purpose of sketches or models for reproduction in marble or metal, sometimes as the material of the finished work. The art of sculpture is as old as any that has been handed down to us. The Scriptures allude to the working of brass and other metals in the beginning of human society, and we read of the images of Laban carried off by his daughter. The great nations of antiquity all practiced it, though only Nineveh and Egypt have left us anything like a fair representation of the state of the art in those early times. From the nature of this art its productions have proved more durable than those of painting, and

have come down to us, in more numerous instances even than works of architecture. While the latter have been destroyed, and their materials used up, works of sculpture, being smaller, have remained buried, and from time to time have been reproduced for the instruction and enjoyment of modern nations.

As an art, or means of recording facts and representing ideas, sculpture has many disadvantages as compared with painting, neither color nor picturesque backgrounds being properly admissible in sculpture. To this rule, however, we shall find exceptions in the works of Ghiberti in the 15th century.

Sculptures are distinguished by different terms, according to the nature and completeness of the work. Groups or figures completely represented are said to be "in the round." Those only partially detached from the mass or background are said to be "in relief." This, again, is called "high" or "low relief," according as the figure stands fully or slightly above the mass behind it. The ancient Egyptians employed another kind of relief, their figures being sunk below the surface, and only the prominent portions remaining level with it. In this case the background or unoccupied space is not cut away, but the figures are worked downward into it. Another process is called "intaglio," the whole figure being regularly designed and molded, but "cut into" the material and inverted. This is usually applied to the making of gems and seals. Another sculptural process is that used in the treatment of metals. As metals are both harder than stone and more valuable, it is not possible to cut or grave works out of masses of metal as is done in stone or gems. The metal is fused by heat, and the form is given it while in that state. This is done by first forming or molding the design in clay or other soft material. Round the model thus formed a mold is formed of sand, which is prepared and pressed round it in a wet state till it takes the complete form of the mold, which is then removed, and the liquefied metal poured in. It takes the exact shape of the model by this means. These are said to be "cast," because of the casting of the liquid metal into the mold. Other processes, however, have in the finer works to be applied. The metal retains the rough surface of the sand in which it has chilled. It is therefore worked over with a graving tool to give it a final surface, and express every delicacy of form intended by the artist. In some cases this "engraving" is in the form of ornamental design, such as dress, etc. Sometimes the whole design is engraved without any previous casting. In this case the metal has had its form given by "hammering" or "beating." The metal, hot in the case of iron or bronze, or cold in the case of silver and gold, softer metals, is beaten on the anvil into its form. A coarser and deeper method of engraving is called "chasing," where deeper sinkings and bolder prominence are given to the different parts of the design.

Of molding we have already spoken. We may now remark on the materials in use for these various purposes. In sculpturing, or cutting designs or figures, we generally find marbles have been employed, the most famous having been the "Parian," from the isle of Paros, and the Pentelic, from the mountain of that name in Attica. Besides these, the ancients used numerous marbles—white, and latterly colored; the late classical sculptors sometimes employing both white and black, or colored, in lumps on the same work, the colored marble being used for the dress or hair as it might be. The Egyptians, besides the use of these materials and various kinds of fine and coarse-grained stone, employed porphyry, purple and black, an exceedingly hard and difficult material to handle. The modern sculptors have used the white marble of Carrara in Italy, an excellent material, but liable to veins and discolorations, which are unfavorable to the art. "Terra cotta," or burnt clay, was extensively in use both in ancient and modern times; the clay being molded to the utmost delicacy while soft and then baked to a red color. Singularly fine reliefs remain to us from the Etruscans and Greeks, as well as from Egypt and elsewhere, as may be seen in the British museum. It has also been extensively used in modern times. The Egyptians modeled little figures in porcelain clay, and colored and enameled them after the fashion of porcelain, and vast numbers of such are in most of our museums. The word "toreutic," from the Greek word *toreuo*, to pierce or bore, is usually applied to sculpture in metal. For this the metal most appropriate and most generally used both in ancient and modern times, is "brouze," a mixture of copper and tin. It is also known as "brass." Other metals, in small quantities, were also introduced, and various kinds of bronze have resulted from this variety, as well as from the proportions of the two principal metals, the method of fusion, etc. Egina, Delos, and Corinth made different kinds of bronze, each of excellent quality. Besides this favorite metal, gold, silver, copper, and even lead, and mixtures of lead and tin, "pewter," have been used for artistic sculpture. In the celebrated period of Greek sculpture, gold and ivory were used together. These statues, two of which were made by Phidias, were called "chryselephantine," that is, of gold and ivory.

The ordinary modes of proceeding in sculpture have been very various; whether the more celebrated sculptors of ancient times cut out their designs at once without the previous rehearsal of a model, we do not know. It is, however, very probable. The Egyptian bas-reliefs may still be seen in some of their tombs, lined out, and corrected afterward by a master's hand previous to execution. Michael Angelo, the most powerful of modern sculptors, is known to have worked many of his statues, without

the use of any model, out of the blocks. Florence and the Louvre (Paris), contain marble sketches or unfinished figures thus roughed out. The length and size of the chisel-marks show how boldly this great master went to work to within one-eighth of an inch of his final surface. As, however, there can be no putting on of any of the substance of stone once reduced by inadvertence, the artist commonly makes his sketch or design, in small, in clay. This is subsequently enlarged and then studied from "the life;" that is, men, horses, draperies, etc., the most suitable to the artist's present purpose are selected, and with these before him he corrects his design and perfects it while the material is soft. A mold is then taken, as in the case already described, and with a plaster instead of a metal cast before him, the artist proceeds to work on his marble. The cast being placed on one block and the marble on one precisely similar, workmen proceed to place a needle on a measuring-rod, the rod resting against the block till it touches a point of the cast. The needle is then applied to the block on which the marble stands, and this is bored into till the needle touches it as it did the cast. In this way the distances of the various surfaces of the future figure from the outside of the unshaped marble are ascertained, and the workmen rough out the figure down to those measurements. The sculptor then gives the final and delicate touches that finish it himself. Finally, it is brought smooth with pumice-stone or sand. Michael Angelo and some of the ancients actually polished their statues. This, however, is generally objected to, as the sharp points of reflected light injure the general effect of the form.

We must notice one other question relative to sculpture before proceeding to a short review of the art historically, that is color. The ancients—that is, Egyptians, Ninevites, and others—did color their statues, intending, probably, to do so up to "life"—that is, to a direct imitation. The Greeks, too, employed color on their statues, certainly on their architecture. To what extent they colored their statues, is not very easy to determine. Partly, indeed, time has so altered, and partly so obliterated the coloring material, that we can only form an approximate judgment. It seems probable that the coloring was conventional, that is, that color was used to add to the splendor and distant effect of the work, rather than to attempt any positive imitation of real life. A head in the Elgin room of the British museum has been colored, the hair full red. The eyes are completely cut out, so as to show dark and shadowy hollows, even with the face colored. Gilding, too, was used for the hair. Color was extensively used in the middle ages. Many, if not most, interior sculptures were colored during that period. Quite in our own days Mr. Gibson has colored female statues. It is open to doubt whether they can be called successful as far as the color goes. Other means, however, were used to give color in late classic times, as may be seen in the Vatican, where a bust retains both enameled eyes and black eyelashes inserted into the marble. To the mixture of marbles to obtain the effect of color we have already alluded.

Speaking of sculpture generally, we may say that a great deal has come down to us. Of the best work known, that of Phidias, our readers will see notices under the head of the ELGIN MARBLES. The majority of portable works are statues. Of these, some calculations reckon as many as 60,000 of one kind and another.

Fragments of these have various terms applied to them. "Busts" are heads, or heads and chests; a "torso" is a figure without head or limbs. These are perhaps fragments. Horace, however, is supposed to allude to a recognized form of such pieces of sculpture in the words "*mediam minervam*." Statues are called "terminal" when they consist of a head only made out, the body being represented by a square post. These were set up as boundary marks, to invoke favorite deities for the owner's prosperity, and hence the name "terminal."

We now proceed to a very summary survey of the history of sculpture. We have said that ancient nations, both of profane and sacred history, were well used to sculpture. Of these, the Egyptian and the Ninevite are best known. The Egyptian sculpture goes back as far as 1700, or even, in the case of the pyramids, to 2,000 years before Christ (Gardner Wilkinson, *Ancient Egyptians*). Both sculptured the human form, the Egyptians with most knowledge and refinement; both were restricted by religious traditions from arriving at a full representation of the human form; both used mixed forms of man-headed bulls, or man-headed and ram-headed lions. Usually these were colossal. The Egyptians, besides this, covered the walls of their sepulchres and temples with spirited and amply detailed historical representations.

The next great nation of whose production we can judge was the Etruscan. They were of Greek origin. There is a great oriental influence or character in their work. It is also to some extent conventional, but often full of sublimity, and the figure quite correct in outline. This also is illustrated by their pottery, covered with figure designs, of which great abundance has been excavated in various parts of Italy. All these schools, including the Etruscan, are stiff and dry in execution—that is, wanting in the ease, fullness, and movement of the human form. They are called "archaic," meaning by that term unformed and undeveloped, belonging to an age uninstructed in technical knowledge.

Beginning with the early Egyptian times, this first period, called archaic, may be concluded with those of the Etruscans, and brings us down to about 600 B.C. From this time a rapid growth in the art took place; schools were formed in the great cities of Greece, Sicily, Eginæ, and Corinth; and we read of Callon, Onatas, Glaucias, and other

names, culminating in Ageladas of Argos. These men sculptured on a colossal scale, and we have already alluded to the bronze for which the Greek cities had long been famous. These schools produced the famous works known as the Egina marbles, found in 1812, as well as those of Selinus, in Sicily. Casts of the former may be seen in the British museum. The originals are at Munich.

The great period of sculpture began about 484, when Phidias was born. Ageladas was his master, as also of Polyclethus and Myron, of whose works copies are now in the Vatican and elsewhere, made by Greek artists in the times of the Roman empire.

Of the great work of Phidias we will not here treat, as it is described elsewhere. Pericles did much to encourage the arts both of sculpture and painting.

For a century and a half, or for two, sculpture continued very slowly to decline. This great school ended in Praxiteles, a sculptor of consummate powers. He carried the representation of the human form further than Phidias and his scholars, and draperies in his hands lost their severer character, and clung to the rounded limbs, which they no longer concealed. His work may be seen in the casts of the Nike Apteros, or sculptures of the temple of unwinged Victory, in the British and other museums. He is said to have been the first to represent the female form quite nude, and to have contributed by such sculptures to the enervation and gradual sensualizing of the art.

During the 5th and 4th centuries B.C., we have Agoracritus of Paros; Alcamenes of Athens; Scopas, the author of the famous Niobe group now at Florence; Lysippus of Sicyon, the favorite of Alexander; Chares, the author of the famous Colossus of Rhodes; Agasias, who sculptured the "Fighting Gladiator;" Glycon of the Farnese Hercules; and many others.

The Roman conquest of Corinth under Mummius in the 2d c., and afterward of Athens, brought this old art to an end. Thenceforth Greek artists were found all over the Roman empire, and the famous works of these former sculptors were reproduced by them for their new masters. The Roman sculpture, indeed, is included in this phase of Greek art—the last remarkable work that we shall notice of classic times being the famous column of Trajan, in the early part of the 2d c. A.D. This is, in fact, a tower over 100 ft. high, of white marble, entirely covered with bas-reliefs representing the Dacian wars of Trajan. We here see the expiring effort of classic art. Skillful and correct as the design is, it is, as a whole, graceless, stiff, and without beauty, compared with the old work.

Constantine, in the 4th c. of our era, carried off to Byzantium, his new seat of government, all the sculpture he could remove.

The art revived in Italy. As early as the 10th c., sculpture exhibited both design and grandeur, though wholly different from that of older times. Absolute freedom from old conventionalities, vigor, dignity, and child-like freshness of mind, distinguishes modern sculpture down to the 15th century. The most noted names we will mention here are those of Niccolo of Pisa, in the 13th c., who executed the bas-reliefs at Orvieto; after him, his son Giovanni. Andrea Pisano made one of the bronze gates of the baptistery of Florence. Ghiberti, the author of the more famous doors of the same baptistery, is next to be named; then Donato di Betto Bardi, or Donatello. Some of his works are in the church of Or san Michele, which the famous Orcagna, sculptor, painter, and architect, had built and decorated.

We begin the next period with Verocchio, in the 15th c., and the more famous Michael Angelo in the 16th. A host of great names followed: Cellini, Torregiano (who made the monument of Henry VII. at Westminster), Della Porta, Giovanni di Bologna, and Luca della Robbia, who also worked in enamelled terra-cotta on a large scale. These are Italian names. We may add Jean Goujon and Germain Pilon in France. In our own country, splendid mediæval works are to be seen in the noble sculptures of Wells's cathedral, and of that of Lincoln, coeval with those of the Pisani. Cibber, who sculptured in England, was a Dane; Thorwaldsen, a native of Iceland; Canova, an Italian; and lastly, Flaxman, bring us down to our own days. Of the latter, the finest work is perhaps the Wellington shield, after the Homeric description of that of Achilles. See the works of Winckelmann and Kugler, and Westmacott's *Handbook of Sculpture*.

SCULPTURED STONES. In Norway, Denmark, the Isle of Man, Wales, Ireland, and Scotland, a class of monuments is to be found decorated with rude sculpture, and belonging to the early periods of Christianity—sometimes, indeed, showing the symbols of paganism in conjunction with those of Christianity. By far the most remarkable stones of this description are those found in Scotland, which, with some points common to them with the rest, possess the distinguishing feature of a class of characters or symbols of mysterious origin, whose meaning yet remains an enigma to antiquaries, and which yet recur with such constancy in different combinations that it is impossible to suppose their form to be the work of chance. Along with these symbols the figure of the cross is often found on one side. Neither in Ireland, in Wales, nor anywhere else, are the symbols in question to be met with. These monuments all occur within a circumscribed part of Scotland. None are to be found either within the ancient Dalriada, or s. of the Forth; their limit seems to be the eastern lowlands from Dunrobin to Largo Law, or the part of Scotland inhabited by the Pictish race. From 150 to 200 of them are known to exist. The most interesting as well as the most numerous specimens are

in Strathmore, at Glammis, Meigle, and Aberlemno. Among the various theories which have been formed regarding these stones, one is, that they were boundary stones, the cross denoting the possession of the church, and the mysterious figures having reference to the lay lord; but those antiquaries who have devoted most attention to the subject, including Mr. John Stuart, have come to the conclusion that they are sepulchral. The practice of erecting stones to commemorate deceased persons of note, existed in Scotland in pagan times, and, like other pagan practices, it was turned to Christian purposes by the earliest preachers of Christianity. Most of these monuments are of unhewn stone, and more or less oblong in shape; a very few have the form of a cross. A sculptured cross is met with on about half of them, the class without crosses belonging chiefly to Aberdeenshire, though a few of them are to be found in the country n. of Spey. Among the symbols to which we have alluded, one of the most frequent, which has been likened to the letter Z, consists of a diagonal line, from whose extremities are drawn two parallel lines terminating in some sort of ornament. This Z symbol is often traversed with what has been called the *spectacle ornament*, consisting of two circles decorated within with foliated lines, and united by two reversed curves, or occasionally interwined with a serpent. Another prevalent symbol is a crescent, sometimes appearing by itself, more frequently with two lines drawn through it, diverging diagonally from a point below its center, and terminating in a floral or other ornament. A mirror and comb, a horse-shoe arch, a fish, and a figure like a fibula, are also all occasionally met with. Similar devices to the above have been found engraved on certain silver ornaments discovered on Norrie's Law, including a figure occurring on the Dunnichen stone, which had been taken by ingenious theorists for the high cap of the Egyptian Osiris, surmounted by a lotus, but which, as engraved on one of those silver relics, appears to be the head of a dog or some other animal.

The earlier of the Scottish sculptured stones, such as the Maiden stone in Aberdeenshire, and the older of the stones at Aberlemno, have no sculptures except of the class above described; the later combine these with devices of a more intelligible kind. An elephant is not unfrequent, represented in such a fashion, that it is obvious that the artist could never have seen one; and fabulous and grotesque figures abound, often drawn with considerable spirit. We have centaurs, lions, leopards, deer, beasts of chase, men shooting with a bow and arrow, men devoured by animals, processions with men and oxen, and priests in their robes with books. Many of these figures are highly interesting illustrations of the manners, customs, and dress of the period. On a stone near Glammis is a man with a crocodile's head. On the cross at St. Vigean, a hybrid, half-bird half-beast, appears in the midst of a border of entwining snakes and fantastic creatures. A stone of great interest at Meigle contains a representation of a chariot. At Farnell is a group of figures that seems to be meant for the temptation. In but two instances have inscriptions been known to accompany these sculptures; in the one case the letters are so worn away as to be undecipherable; in the other instance, at St. Vigean, a few letters can be traced of the same Celtic character which has been found on the earliest Irish monuments and the oldest tombs at Iona.

The general style of ornamentation of these stones, judging by a comparison with Anglo-Saxon illuminated MSS., has led to the conclusion that they were erected in the 8th or 9th c., a period when Christianity had but lately supplanted paganism among the Scottish Picts.

A stone differing in character from those described, now erected near the house of Newton in Aberdeenshire, in the same neighborhood in which it was found, has been a notable puzzle to archaeologists. It is not sculptured, but inscribed in a character which seems unique. Besides the principal inscription, there is another running along the edge, consisting of groups of short lines, and apparently in the Ogham (q.v.) character.

The crosses in Ireland are the likeliest to these Scottish monuments. They are chiefly found near churches and graveyards, and are generally cruciform, with a halo or circle binding the arms and stem together. They usually taper to the top, on which a conical capstone is fixed, and they are inserted in pedestals of stone, which are frequently covered with sculpture. Most of their subjects are from Scripture history, without anything like the Scotch symbols.

The Welsh crosses are, for the most part, in the form of a small cross within a circle, set on the top of a long shaft, the latter having at times interlaced ornaments in compartments. Many of them have inscriptions in the Romano-British character, relating to the persons in memory of whom they were erected.

The sculptured crosses of Scandinavia and Man somewhat resemble the Scotch monuments in their general style of ornamentation, though altogether destitute of the peculiar Scottish symbols. On some of them are Runic inscriptions. One inscription on a Manx cross indicates that Gaut (probably a Norwegian) made this cross and all on Man. Another is to the effect that ——— erected this cross to his father Ufag, but Gaut Bjornson made it. Professor Munch, from the character of the runes on these crosses, assigns them for date the middle or end of the 11th century. See RUNES.

A hundred and fifty of the sculptured stones of Scotland have been carefully engraved and described in a very valuable work contributed to the Spalding club by Mr. John Stuart. Some of those belonging to the county of Angus had been previously

illustrated by the late Mr. Chalmers of Auldbar, in a volume forming one of the Bannatyne club series.

SCUP, or SCUPPAUG. See PORGY.

SCUPPERS are holes, lined with lead, in a ship's side, intended to carry off rain or other water which may be shipped.

SCURVY, or SCORBU'TUS, is a disease which is characterized by a depraved condition of the blood. In consequence of this morbid state of the blood, there is great debility of the system at large, with a tendency to congestion, hemorrhage, etc., in various parts of the body, and especially in the gums. It is a disease that has probably existed from the earliest times, but the first distinct account of it is contained in the history of the crusade of Louis IX., in the 13th c., against the Saracens of Egypt, during which the French army suffered greatly from it. In the 16th c. it prevailed endemically in various parts of the n. of Europe, and it seems only to have abated about a century ago. It was in badly fed armies, in besieged cities, and on board ship, that its ravages were most appalling, and it is believed that more seamen perished from scurvy alone than from all other causes combined, whether sickness, tempest, or battle. Whole crews were prostrated by this scourge, as in the well-known case of Lord Anson's memorable voyage.

Scurvy so closely resembles purpura in its general symptoms that it will be sufficient for us to refer to the article on that disease, and here merely to indicate the leading points of difference between the two diseases, which, notwithstanding their similarity, are essentially different. Scurvy is caused by a privation, for a considerable time, of fresh succulent vegetables, while purpura often makes its appearance when there has been no deficiency of this food, or special abstinence from it. Scurvy is most common in winter or the early spring, while summer and autumn are the seasons for purpura. In scurvy the gums are invariably swelled and spongy, and bleed readily; in purpura this is not necessarily the case. In scurvy there is extreme debility and depression of spirits, venesection and mercury do positive harm, while a cure is rapidly effected by the administration of lemon-juice, or of fresh fruits and vegetables; whereas in purpura there is little or no mental or bodily depression, venesection and mercury often give relief, while no marked and certain relief follows the administration of the lemon-juice and fruits that are all powerful in scurvy.

Although the virtues of lemon-juice in scurvy were known in this country as far back as 1636, when John Woodhall, master in surgery, published *The Surgeon's Mate, or Military and Domestic Medicine*, this invaluable medicine was not made an essential element of nautical diet till 1795. The effect of this official act may be estimated from the following numbers. In 1780 the number of cases of scurvy received into Hasler hospital (a purely naval hospital) was 1457, while in 1806 there was only one case, and in 1807 only one case. Many naval surgeons of the present day have never seen a case of the disease. The potato possesses almost equally great antiscorbutic properties, and, fortunately, potatoes when cooked are as active as when taken raw. The late Dr. Baly, to whom we are indebted for this discovery, states that "in several prisons the occurrence of scurvy has wholly ceased on the addition of a few pounds of potatoes being made to the weekly dietary." The salutary action of potatoes is probably owing to their containing a considerable amount of tartaric acid, partly in combination with potash and lime, and partly free. In addition to the dietetic treatment, which should include easily digested animal food, potatoes, such ripe fruits as can be procured, and an abundance of lemonade, little further need be prescribed. If necessary, constipation must be relieved by mild laxatives, such as rhubarb and castor-oil; the appetite may be stimulated by bitter tonics, and opiates given to procure rest in case of pain or obstinate wakefulness. When the gums are very troublesome, solutions of tannin, chloride of lime, or of nitrate of silver, may be applied to them. For an excellent account of this disease, the reader is referred to the article "Scurvy" by Dr. Budd, in *The Library of Practical Medicine*.

SCURVY-GRASS, *Cochlearia*, a genus of plants of the natural order *cruciferae*, having small white flowers, and turgid many-seeded pouches; the cotyledons accumbent. The species are annual or biennial, rarely perennial, plants; of humble growth, with branched smooth stems, smooth simple leaves, and terminal racemes of flowers. They have an acrid biting taste, containing the same pungent volatile oil which is found in horse-radish, and are valued for their antiscorbutic properties. **COMMON SCURVY-GRASS** (*C. officinalis*) is sometimes a foot high; the root-leaves are stalked and heart-shaped; the pouches globose, ovate, or elliptical. It is a variable plant, and some of the other species described by botanists are probably not essentially different. They possess the same properties. Scurvy-grass is very common on the shores of Britain, growing both on rocks where there is little soil, and in muddy places. It is also found on high mountains. It is a very widely distributed plant, and being found on the shores of almost all parts of the world, has often been of the greatest benefit to sailors, in times when the modern precautions against sea scurvy were unknown.

SCUTAGE, or **ESCUAGE** (Lat. *scutum*, shield), a pecuniary fine or tax sometimes levied by the crown, in feudal times, as a substitute for the personal service of the vassal. No scutage seems at any time to have been levied in Scotland.

SCU TARI (Italian or Levantine form of the Turkish *Uskûdar*), a t. of Asiatic Turkey, on the eastern shore of the Bosphorus, immediately opposite Constantinople, of which it may be considered a suburb. It is built on the sides and summit of a hill, sloping irregularly upward from the water's edge, and bears, both externally and internally, a great resemblance to the Turkish capital. It contains several mosques, bazaars, and baths, a college of howling dervishes, manufactories of silks and cotton fabrics, corn warehouses, and *inuaerts* or kitchens for the poor. It has long been famed for its extensive cemeteries, adorned with magnificent cypresses, the chosen resting-place of many of the Turks of Constantinople, from attachment to the sacred soil of Asia, and the traditional belief that their race will one day be driven out of Europe. The population is variously estimated at from 40,000 to 60,000 or 100,000. This town accidentally acquired great notoriety in connection with the English army during the Russian war (1854-56), when the enormous barracks built by sultan Mahmud, on the southern outskirts of the town, were occupied as barracks and hospital by the English troops, and formed the scene of Miss Nightingale's labors. A little to the s. of the general hospital, on the cliffs bordering the sea of Marmora, is the densely-filled English burial-ground, where baron Marochetti's monument in honor of the troops has lately been erected.—Scutari is a place of considerable traffic, and is the rendezvous and starting-point of caravans and travelers trading with the interior of Asia. It occupies the site of the ancient *Chrysopolis*; and about 2 m. to the s. lies the village of Kadiköi, the ancient *Chalcedon*.

SCUTARI (Turkish *Iskandere*, the anc. *Scodra*), a considerable t. of European Turkey, in northern Albania, capital of a sanjak of the same name, situated at the southern end of the lake of Scutari, at the point where the Bojana, issuing from it, is joined by the Drinassi. The lake is about 20 m. long, and abounds in fish. Scutari is a fortified town, with a citadel on a commanding height. It has manufactories of arms and cotton goods, a bazaar, and yards for building coasting-vessels. It carries on a considerable trade. The population is estimated at about 40,000, of whom about one-half are Roman Catholics.

SCUTCH EON, in carpentry, is the small metal plate used to form the protection and ornament to the keyhole for locks; it is usually of brass, but in ornamental cabinet-work, is often of ivory, mother of pearl, etc. See **SHIELD**.

SCYLLA AND CHARYB'DIS. Scylla (Gr. *Skullaion*), a rocky cape on the w. coast of s. Italy, jutting out boldly into the sea so as to form a small peninsula just at the northern entrance to the straits of Messina. About the beginning of the 5th c. (B.C.), a fort was built upon the rock (which is about 200 ft. high, and much hollowed out below by the action of the waves), and in course of time a small town grew up, straggling down the slopes toward the sea. The navigation at this place was looked upon by the ancients as attended with immense danger, which, however, seems to have been much exaggerated, for at the present day the risk is not more than attends the doubling of any ordinary cape. The rock, according to the Homeric legend, was the abode of a monster called Scylla, possessing 12 feet, 6 long necks and mouths, each with 3 rows of sharp teeth, and who barked like a dog. There are other accounts of Scylla, one of which represents her as having once been a beautiful maiden, beloved by the sea-god Glaucus, but who, by the jealousy of Circe, was changed into a monster having the upper part of the body that of a woman, while the lower part consisted of the tail of a fish or serpent surrounded by dogs. The modern Scilla or Sciglio is a fortified town in the province of Reggio-Calabria, having large silk-works, the pop. being upward of 7,400, mostly sea-faring people.

Charybdis (modern name *Galofaro*), is a celebrated whirlpool in the straits of Messina, nearly opposite the entrance to the harbor of Messina in Sicily, and in ancient writings always mentioned in conjunction with Scylla. The navigation of this whirlpool is, even at the present day, considered to be very dangerous, and must have been exceedingly so to the open ships of the ancients. A modern writer describes it as being "an agitated water of from 70 to 90 fathoms in depth, circling in quick eddies." Homer places it immediately opposite to Scylla, probably taking advantage of the poetic license to exaggerate the danger of the navigation, although it is not improbable that the whirlpool may have changed its situation since his days. The myth connected with it is, that under a large fig-tree, which grew out of a rock opposite Scylla, dwelt the monster Charybdis, who thrice every day sucked down the water of the sea, and thrice threw it up again.

SCYTHE. See **REAPING**.

SCYTHIA, a name employed in ancient times to denote a vast, indefinite, and almost unknown territory n. and e. of the Black sea, the Caspian, and the sea of Aral. But the term is not so much *geographical* as *ethnological*, and the only interest attaching to the barren catalogue of tribes and nations, which we meet with in the classical writers, springs from the hope, of connecting these with a recognized race of modern times. Latham argues—successfully, as it appears to us—for the Scythians being the ancestors of the later *Turks*, and maintains their central and primitive abode to have been Independent Tartary, whence they spread w. round the Caspian into Russia, Transylvania,

and perhaps even eastern Hungary. Niebühr and Neumann favor the hypothesis of a Mongol origin for the Scythians; while others regard them as Finns or Circassians. In their mode of life they were mainly nomadic and pastoral, though we read of some trans-Danubian and Euxine tribes that followed agriculture. Many of them were *hippenolgi* ("mare-milkers").

SCYTHOPOLIS, the biblical Bethshan or Bethshean, belonging to the tribe of Manasseh; 2 m. w. of the Jordan, and 12 m. s. of the sea of Galilee. The name Scythopolis is not known at the present day, but the ancient town and name are found in the modern Beisan. It was once the seat of a Christian bishop, and during the crusades, of an archbishopric. It contains now but 60 or 70 houses. Extensive ruins of the ancient city are found.

SEA, in its general signification, denotes that large expanse of salt water which covers the more depressed portion of the earth's surface, fills up each hollow and rift to a certain uniform level, completing as far as possible the sphericity of the globe, and divides its surface into two great and innumerable smaller portions—the Old and New Worlds and their islands. This immense body of water is not distributed with the least approach to regularity, but here forms a huge basin, there becomes a long and tortuous inlet or strait, which narrows or widens as the configuration of the land-surface on each side permits; nor is it placed symmetrically to the earth's axis of rotation; for the hemisphere of which the s.w. corner of England is the center or pole contains the whole of the land-surface, if we except the triangular portion of South America, s. of Uruguay, Australia, New Zealand, the most of the East Indian islands, and the land around the s. pole (of unknown extent). The other hemisphere is, with these exceptions, wholly water. From this irregular distribution of the sea over the earth's surface, and from the specific gravity of water being about $\frac{1}{4}$ of that of the land, it necessarily follows that the center of gravity of the whole globe does not correspond accurately with its center of figure. The extent of sea surface is estimated at 144,712,350 English sq. m., or nearly $\frac{3}{4}$ of the whole of the earth's surface, and its mass, on the supposition of an average depth of 2 m., is about $\frac{1}{1000}$ of that of the whole globe; such estimates however, can be considered at best as only rough approximations. One of the most remarkable features of the sea is its continuity or oneness; for in spite of the fact that numerous large stretches of salt water, as the sea of Azof, Black, Mediterranean, and Baltic seas, the gulf of Mexico, and others, have barely avoided becoming detached lakes, very few such are found on the earth's surface; and with the exception of the Caspian and Aral seas, they are of small size.

Composition, Specific Gravity, and Temperature of the Sea.—The ocean consists of salt water, and from its continual motion, under the influence of currents and waves, preserves, generally speaking, uniform saltness. Under special circumstances, however, we find the saltness increased, as by the excess of evaporation over the fresh-water influx in the Mediterranean and Red seas, and about the northern and southern limits of the tropical belt; and decreased, by the contrary cause, in the sea of Azof, Black sea, Baltic sea, and in the polar regions. See **TRADE-WINDS**. The origin of the saltness of the sea is sufficiently accounted for when we consider that the chloride of sodium and other soluble salts which form constituent ingredients of the globe are being constantly washed out of the soil and rocks by rain and springs, and carried down by the rivers; and as the evaporation which feeds the rivers carries none of the dissolved matter back to the land, the tendency is to accumulate in the sea. The principal ingredients found in sea-water are chloride of sodium, or common salt, together with salts of magnesia and lime. A more exact analysis will be given under **WATER**. The average specific gravity of the sea, out of reach of the exceptional action of the melting of snow, rain, or river-water is (at 62° Fahr.) 1.02655. The slight variations in the saltness of the sea must necessarily produce corresponding changes in its specific gravity; accordingly, on the northern and southern limits of the torrid zone, the mean specific gravity of the sea is, in different longitudes, 1.02785, 1.02338; while at the equatorial calm belt it is 1.0252, 1.0267; and on the whole shows a tendency to diminish as the latitude increases, Beechey having found it to be 1.0258 in lats. 55° to 60° n. and s. in the Pacific, and King 1.0251 in the corresponding latitudes of the Atlantic. It is considerably diminished near the mouths of rivers, and in those inlets or semi-lacustrine arms which are the depositories of more river-water than compensates for their evaporation, as in the Black sea, where it is 1.0143, and in the Baltic, only 1.0086.

The temperature of the sea, where it is not affected by currents from a warmer or colder region, necessarily corresponds to the normal temperature of the latitude; but this is true only of the water at and near the surface, for it has been recently proved by the observations made on deep-sea temperature by Carpenter, Wyville Thomson, and others, that the temperature rapidly diminishes with the depth, particularly in tropical and temperate regions, till at great depths ice-cold water is everywhere found. Thus, from the extensive observations made by H. M. S. *Challenger* in the North Atlantic during 1873, it is shown that at the equator, where the surface temperature is about 80°, the decrease with the depth is so rapid, that at 60 fathoms from the surface the temperature is only 61°.5; at 150 fathoms it is 59°; at 700 fathoms, the temperature has fallen to 40°; at about 1600 fathoms, to 36°. Below this it diminishes at a much slower rate, till it falls nearly to

freezing at all great depths which are connected by under-currents with the Antarctic or Arctic seas. The sea-water of the upper 60 or 80 fathoms is affected by the solar heat. Immediately beneath this sun-heated upper stratum, it is remarkable that all the water in the North Atlantic, as far as lat. 40° , is warmer than that at the same depth under the equator. The mean temperature of the upper 1500 fathoms in the North Atlantic is $4^{\circ}.5$ warmer than the same upper stratum at the equator. As regards the temperature of the water at the bottom, at all stations between Bermuda and the equator on the e. side of the Atlantic, the temperature is remarkably uniform at $35^{\circ}.2$; in the bay of Biscay, to n.e. of this line, it is 1° warmer; s.w. of the same line, 1° colder; whereas, further s. at the equator, on the western side of the Atlantic, it is $32^{\circ}.4$, or $2^{\circ}.8$ colder. This last fact is of very great importance, since, from the circumstance that at the equator the bottom temperature is $32^{\circ}.4$, and that at all stations to n. of it the bottom temperature is warmer, it follows that the cold water at the bottom of the Atlantic as far n. as the Azores and bay of Biscay, equally with that at the equator, is derived from an Antarctic, and not from an Arctic source. This cold Antarctic current entering the North Atlantic is found between 1700 fathoms and the bottom, a total thickness of 700 fathoms. Ice-cold water has also been found at the bottom in the Arabian sea. In land-locked seas, such as the Mediterranean, whose deep water is not in communication with that of the Atlantic, owing to the shallowness of the sea at the straits of Gibraltar, the bottom temperature does not fall so low as that of the ocean. Thus the temperature of the Mediterranean at 1508 fathoms is 55° , whereas at this depth in the ocean it is so low as 36° . See ISOTHERMAL LINES. The highest surface-temperature does not correspond with the equator, but owing to the disturbing influence of currents in the following regions: Between Sumatra and the Zanzibar coast; e. of the Philippine islands, to long. 170° e.; e. of Cuba and Florida; and n.e. of cape St. Roque.

Color and Phosphorescence of the Sea.—The color of the ocean, when free from admixture of foreign substances, as animalcules, vegetable organisms, excessive rain, or the tinted waters of swollen rivers, is a pure deep blue, which becomes less marked where the water is of less depth. A "different" color of sea-water is due to the presence of some foreign substance; e.g., the red, brown, and white patches of the Pacific and Indian oceans to the presence of swarms of animalcules, and the colors of the Red and Yellow seas to matters of vegetable origin. The Rhone, at its emergence from the lake of Geneva, and the lake itself, exhibit an intensity of blue far surpassing that of any sea. The phosphorescence of the sea is due to the presence of myriads of invertebrata, especially rhizopoda, tunicata, etc. See LUMINOSITY OF ORGANIC BODIES.

Depth of the Sea.—Till very recently, it might be said that, with the exception of the more frequented strips along the coast, and such other portions as afforded anchorage ground, our knowledge of the depth of the ocean amounted to nothing. It is true that deep-sea soundings had been frequently made, but from the necessary defectiveness of the ordinary "lead" and inattention to the effect of under-currents in destroying the perpendicularity of the line, little dependence could be placed on the results obtained. It is chiefly in the Atlantic that the new and trustworthy method of sounding (q.v.) has been practiced, and the contours of its bottom may now be considered as fairly ascertained. The greatest depth measured by the *Challenger* (in n. lat. $19^{\circ} 41'$, w. long. $65^{\circ} 7'$, was 3,875 fathoms, or 23,250 ft. (about 4.4 miles). Over a great extent of the area the depth ranges between 2,000 and 3,000 fathoms. Along the middle runs an irregular ridge, on which the depth is less than 2,000 fathoms, and n. of 50° a plateau of similar depth extends, with little interruption, from Ireland to Newfoundland, on which the telegraph cables are laid. Nowhere round the British isles is the sea above 400 ft. deep. In the Pacific, several tracks of soundings were obtained during the *Challenger* expedition (1873-75). From the numerous islands which stud this ocean, one might be led to assume its comparative shallowness; but this is far from being the case, for the islands rise abruptly from the bottom, and very deep soundings have been obtained near their shores. Over a great part of the area, the depth is over 2,000 fathoms; in the deeper parts, it ranges from 3,000 to over 4,000 fathoms. The deepest sounding got was 4,475 fathoms (26,850 ft. or above 5 m.), in n. lat. $11^{\circ} 24'$, e. long. $143^{\circ} 16'$, near the Iadrene islands. From the remarkable gentleness of slope of the bed of the Arctic ocean to the n. of Siberia, the line giving only 14 to 15 fathoms at 150 m. from the shore, and from its configuration on the n. of America, it is generally concluded to be by far the shallowest of the oceans. Of the depth of the Antarctic ocean, little is known, but it is supposed to be deeper than its antipodal kinsman. Near the Antarctic circle, s.e. from Kerguelen, the *Challenger* took a few soundings varying from 1300 to 1975 fathoms. From all that has hitherto been observed, it would seem as if the land-surface under water were the counterpart as regards eminences and hollows, chasms, valleys, plateaus, etc., of the land-surface above.

Motion of the Sea.—The sea is in a state of perpetual restlessness, its motion being either a vertical oscillation, or an actual transference of its waters from one place to another. The first motion, which constitutes *waves*, is due either to the attraction of the sun and moon on such a mobile body as the sea (see TIDES), or to the impulsive action of the winds which blow over its surface (see WAVES); the second arises from the sun, which, directly through its heat, and indirectly by scorching dry winds, produces evaporation to a great extent, of the parts most exposed to its influence, and by its similar action on the

atmosphere (see **TRADE-WIND**), causes a transference of this vapor to remote latitudes, where it descends as rain, and, destroying the equilibrium of the sea, gives rise to *currents*. The nature of these currents is described under **GULF STREAM**, and the chief currents of each ocean are found under its own head. This constant motion of the sea is of great service in tending to equalize the temperature of different parts of the globe; it also produces remarkable changes in the form of coasts, eating into rocks, converting low-lying lands into shoals and sand-banks, or carrying away the earthy materials, and depositing them in some distant region. The erosive action of the sea is generally almost imperceptible during several years, but in course of two or three centuries the magnitude of the changes effected by it is almost incredible.

On the economic value of the sea as a purifier, and as a commercial highway, it is unnecessary to dilate. For some of the peculiar phenomena of the sea, see **ICEBERGS**, **AURORA BOREALIS**, **WHIRLPOOLS**, the five great oceans (q.v.), **CORAL**, etc.

The term *sea* is also applied in a more limited though indefinite sense to an offshoot of one of the oceans, as to the Black, Baltic, Okhotsk seas, to any portion of an ocean which from its position or configuration is considered deserving of a special name, and to the two great inland salt lakes of central Asia, the Caspian and Aral seas.

SEA, SOVEREIGNTY OF THE. Blackstone lays it down that the main or high seas are part of the realm of England, as the courts of admiralty have jurisdiction there; but adds that they are not subject to common law. But the law of nations, as now understood, recognizes no dominion in any one nation over the high seas, which are the highway of all nations, and governed by the public law of the civilized world. Such a right has, however, long been claimed over the four seas surrounding the British isles. It was strongly asserted by Selden, and denied by Grotius, and measures were taken to vindicate the right in the reign of Charles I. Every nation has undoubtedly a right to the exclusive dominion of the sea within a certain not very well-defined distance from the shore, depending on the usage of the country. This right of lordship includes the right to free navigation, to fishing, to taking wrecks, the forbidding passage to enemies, the right of flag, of jurisdiction, etc. By the law of England, the main sea begins at low-water mark; and between low and high water mark the common law and admiralty have a divided jurisdiction, one on land when left dry, the other on the water when it is full sea. By the law of Scotland, the sea-shore is not considered to extend beyond the point which the sea reaches in ordinary tides. See **BLOCKADE**, **NEUTRALS**.

SEA-ANEMONE. See **ACTINIA**, *ante*.

SEA-BEAR. See **OTARY**, *ante*.

SEABURY, SAMUEL, D.D., 1729-96; b. Conn.; graduated at Yale college in 1748; studied medicine and theology in Scotland; ordained in London in 1753; pastor of churches in New Brunswick, N. J.; Jamaica, Long Island; Westchester, N. Y., 1756-75; suspected of being the author of some tory pamphlets, was imprisoned for a while in New Haven; resided during the revolutionary war mostly in New York; went to England in 1784, and was consecrated bishop of Connecticut; chosen rector of St. James's church, New London, Conn.; took part in revising the Prayer-Book and preparing the constitution for the American Episcopal church which was adopted in 1789.

SEABURY, SAMUEL, D.D.; 1801-72; b. Conn.; ordained priest in the Protestant Episcopal church in 1827; was missionary on Long Island; professor of languages at Flushing institute, 1850-54; editor of *The Churchman*, 1824-49; rector of the church of the Annunciation, 1838-68; professor of biblical learning in the general theological seminary, 1862-72. He published *The Continuity of the Church of England in the 16th c.; Supremacy and Obligation of Conscience; The Theory and Use of the Church Calendar*.

SEA-CAT. See **CHIMÆRA**, *ante*.

SEA-COW. See **MANATEE**, or **LAMANTIN**, *ante*.

SEA CUCUMBER. See **HOLOTHURIA**.

SEA-DEVIL. See **ANGLER**, *ante*.

SEA-DUCK. See **SCOTER**, *ante*.

SEA-EAGLE. See **ERNE**, *ante*.

SEA-EGG, or SEA URCHIN. See **ECHINUS**.

SEA-ELEPHANT. See **ELEPHANT**, **SEA**, *ante*.

SEA-FAN. See **GORGONIA**, *ante*.

SEA-FOX. See **FOX-SHARK**, *ante*.

SEA-GRAPE, *Ephedra*, a genus of plants of the natural order *gnetaeæ*, a natural order consisting of a small number of species, closely allied in botanical characters to the *coniferae*, and by many botanists united with that order, although differing much in appearance. The *gnetaeæ* are small trees, or twiggy shrubs, with opposite or clustered branches and jointed stems, whence they are sometimes called **JOINT-FIRS**. They secrete not resinous but watery matter. The development of the ovule is very peculiar; it has a projecting process formed from the intimate covering of the nucleus.

SEAHAM HARBOR, a sea-port in the co. of Durham, 6 m. s. of Sunderland. Its excellent harbor is furnished with wharfs, quays, and jetties, and the town contains bot-

de-works, blast furnaces, an iron-foundry, and chemical works. It communicates by railway with collieries in the vicinity, and the principal articles of export are coals and agricultural produce. The population of this thriving little sea-port town was, in 1871, 7,132. The population in 1851 being 3,538, it has accordingly more than doubled meantime.

SEA-HOG. See PORPOISE, *ante*.

SEA-HORSE, in heraldry, a fabulous animal, consisting of the upper part of a horse with webbed feet, united to the tail of a fish. A scalloped fin is carried down the back. The arms of the town of Cambridge are supported by two sea-horses, proper finned and maned or.

SEA-HORSE. See HIPPOCAMPUS, *ante*.

SEA-HORSE or WALRUS. See MORSE, *ante*.

SEA-KALE, *Crambe maritima*; see CRAMBE, a perennial plant with large roundish sinuated sea-green leaves, found on the sea-shores in various parts of Europe, and in Britain. The blanched sprouts have become a very favorite esculent in Britain, although as yet little known on the continent. The common people, on some of the shores of England, have long been in the practice of watching them when they came through the sand, and using them as a pot-herb, but the cultivation of the plant in the kitchen garden became general only at a comparatively recent date. It requires a deep rich soil, and the care of the gardener is bestowed upon the blanching, without which the sprouts are not tender and agreeable, but even acrid. The blanching is accomplished in various ways, by earth, sand, boards, earthenware pots, etc. Sea-kale is generally raised from seed, although also sometimes propagated by offsets or by cuttings of the roots. The seedlings do not yield a crop till the third year; but a plantation of sea-kale remains productive for many years. It is planted in rows, four to six feet apart. It sends its tap-root very deep into the ground.

SEAL (Lat. *sigillum*, Fr. *sceau*), an impression on wax or other soft substance made from a die or matrix of metal, a gem, or some other material. The stamp which yields the impression is sometimes itself called the seal. In Egypt, seals were in use at an early period, the matrix generally forming part of a ring (see GEM, RING). Devices of a variety of sorts were in use at Rome, both by the earlier emperors and private individuals. The emperors, after the time of Constantine, introduced *bullæ* or leaden seals, and their use was continued after the fall of the western empire by the popes, who attached them to documents by cords or bands. On the earlier papal seals are monograms of the pope; afterward the great seal contained the name of the pope in full, and a cross between the heads of St. Peter and St. Paul, while the papal privy seal, impressed not on lead, but on wax, known as the *seal of the fisherman*, represented St. Peter fishing. In the 9th and 10th c. we find Charlemagne, the Byzantine emperors, and the Venetian doges, occasionally sealing with gold, and we have an instance as late as the 16th c. of a gold seal appended to the treaty of the Field of the Cloth of Gold, between Henry VIII. and Francis I.

Seals were not much used in England in Anglo-Saxon times, but they came into general use after the Norman conquest. On the royal great seals was the king in armor on a caparisoned horse galloping, his arms being shown on his shield after the period when arms came into use; and the reverse represented the king seated on a throne. The great seals of Scotland begin with Duncan II. in the end of the 11th c., and have also for subject the king on horseback; the counterseal, with the seated figure, being used first by Alexander I., and the earliest appearance of the arms of Scotland being on the seal of Alexander II. In both countries there were also the privy seals with the royal arms only.

Ecclesiastical seals first appear in the 9th c., and attained great beauty in the 13th and 14th. They are of the pointed oval form known as *vesica piscis*; and have for subjects, a figure of the bishop, sometimes of the Trinity, the Virgin, or a patron saint, seated under an elaborate architectural canopy. The arms of the bishop are often added.

Under the Norman monarchs of England, sealing became a legal formality, necessary to the authentication of a deed; and from the 13th c. onward, the seals of all persons of noble or gentle birth represented their armorial ensigns. The seal was generally appended to the document by passing a strip of parchment or a cord through a slit in its lower edge; and the ends being held together, the wax was pressed or molded round them a short distance from the extremity, and the matrix impressed on it. Occasionally the seal was not pendent, but the wax was spread on the deed. The colored wax with the impression was sometimes imbedded in a mass of white wax forming a protective border to it. In England, a seal is still an essential to all legal instruments by which real estate is conveyed; but since subscription has also become necessary, the practice of sealing has degenerated into a mere formality. The custom was gradually introduced of covering the wax with white paper, on which the impression was made, and latterly wafers have been considered a sufficient substitute for seals.

In Scotland, every freeholder was obliged by statutes of Robert III. and James I. to have his seal of arms, an impression of which was kept in the office of the clerk of court

of the shire; and among the Scottish armorial seals of the 14th and 15th centuries are some of wonderful beauty of execution. At 1540, c. 117, for the first time made subscription an essential formality to deeds; but sealing still continued to be necessary till 1584, when it was dispensed with in the case of deeds containing a clause of registration, and soon afterward the practice was altogether laid aside.

The use of corporate seals by towns and boroughs dates as far back as the 12th century. The earlier corporate seals bear the town gates, city walls, or some similar device; the use of corporate arms did not begin till the latter half of the 14th century.

The principal use of seals in the present day is in closing letters, and even for this purpose they have of late years been less used than formerly; owing to the fashion of using stamped adhesive envelopes.

The study of mediæval seals is of great importance and interest in connection with many branches of archaeology, including heraldic and genealogical investigations. See GREAT SEAL; PRIVY SEAL.

SEAL (*ante*), in law, is defined by Coke, as "wax with an impression," and such a seal was required at common law. In many of the states, a scroll, i.e., a mark or flourish with the pen has the validity of a seal. Courts take judicial notice of the seal of a notary public, and of superior courts, but not of foreign courts, except courts of maritime and admiralty jurisdiction. No proof need be made of the public seal of a foreign state, and all documents, decrees, etc., bearing such seal are presumed genuine. A contract with a seal affixed is called a specialty. The seal of the United States was adopted by congress June 20, 1782.

SEAL, *Phoca* a Linnæan genus of mammalia, now forming the family *phocidæ*, and including all that family except the morse (q.v.), or walrus. The name seal is from the Anglo-Saxon *seol*. The *Phocidæ* constitute, in Cuvier's system, a section of *carnivora* (q.v.) designated *amphibua*. Their structure is most perfectly adapted to an aquatic life, and they live chiefly in water, but spend part of their time on shore, reposing and basking in the sunshine on rocks, sand-banks, ice-fields, or beaches; and they bring forth their young on shore. The body is elongated, and tapers from the chest to the tail; the head somewhat resembles that of a dog, and in most of the species the brain is large; the feet are short, and little more than the paw projects beyond the skin of the body; all the feet are thoroughly webbed, and five-toed; the fore-feet are placed like those of other quadrupeds; but the hind-feet are directed backward, like a prolongation of the body, and between them is a short tail. The toes, particularly those of the hind-feet, are capable of being spread out very widely in swimming, so as to give great propulsive power. The movements of seals in the water are very rapid and graceful; on land, they are very peculiar; even the fore-feet being little used or not at all, but the body contracted by an upward bending of the spine, and so thrown forward by a succession of jerks; in which way, however, a seal makes its escape very rapidly from an assailant. The flexibility of the spine in seals is very remarkable, and depends on the very large intervertebral cartilages, formed of fibrous concentric rings. The muscles, which are connected with the spine on all sides, are of great strength.

The teeth differ considerably in the different genera, but in all are adapted for the seizure of slippery prey, the chief food of seals being fishes, although they do not reject other animal food, and are said even to feed in part on vegetable substances. Their incisors are either six in the upper jaw and four in the lower, or four in the upper and two in the lower; they all have large and strong canine teeth; and the molars, usually five or six on each side in each jaw, are either sharp-edged or conical, and beset with points. Seals have a remarkable habit of swallowing large stones, for which no probable reason has yet been conjectured. Their stomachs are very often found to be in part filled with stones. The stomach is quite simple; the gullet (*œsophagus*) enters it at the left extremity; the cæcum is short, the intestinal canal long.

The respiration of seals is extremely slow, about two minutes intervening between one breath and another, when the animal is on land and in full activity. A seal has been known to remain twenty-five minutes under water. Their slowness of respiration, and power of suspending it for a considerable time, is of great use, as enabling them to pursue their prey under water. The fur of seals is very smooth, and abundantly lubricated with an oily secretion. There is generally an inner coating of rich fur, through which grow long hairs, forming an outer covering. Another adaptation to aquatic life and cold climates appears in a layer of fat immediately under the skin—from which *seal oil* is obtained—serving not only for support when food is scarce, but for protection from cold, and at the same time rendering the whole body lighter. The nostrils are capable of being readily and completely closed, and are so while the seal is under water; and there is a similar provision for the ears; while the eye, which is large, exhibits remarkable peculiarities, supposed to be intended for its adaptation to use both in air and water. The face is provided with strong whiskers, connected at their base with large nerves.

Seals produce their young only once a year; sometimes one, sometimes two, at a birth. Not long after their birth, the young are conducted by the mother to the sea. Many, if not all, of the species are polygamous. Terrible fights occur among the males.

Seals are very much on their guard against the approach of man, where they have

been much molested; but where they have been subjected to no molestation, they are far from being shy, and approach very close to boats, or to men on shore, as if animated by curiosity. They are much affected by musical sounds. A flute is said to attract seals to a boat, where they have not learned caution from sore experience; and the ringing of the church bell at Hoy, in Orkney, has very often caused the appearance of numerous seals in the little bay. Seals possess all the five senses in perfection.

The common seal and some of the other species are very intelligent; but there is considerable difference in this respect among the species. The common seal and some others have often been tamed, and are capable of living long in domestication, if freely supplied with water. They become very familiar with those who attend to them, and are very fond of caresses and of notice, recognize their name like dogs, and readily learn many little tricks, of which advantage has been taken for exhibitions.

Seals are found in all the colder parts of the world, most abundantly in the arctic and antarctic regions; some of them also in temperate climates, as far s. as the Mediterranean, and as far n. as the La Plata. Some of them ascend rivers to some distance in pursuit of salmon and other fish. They are found in the Caspian sea, and even in the fresh water lake Baikal.

The species are numerous, but in no group of mammalia does more remain for further investigation. Seals are divided into two principal groups—*seals*, more strictly so called, and *otaries* (q.v.); the former distinguished by the complete want of external ears, which the latter possess, and by their dentition. The true seals have been further subdivided into genera, chiefly characterized by their dentition. In the restricted genus *phoca* or *caloccephalus*, the incisors are pointed and sharp-edged, six above and four below. The common seal (*phoca vitulina*) is found in the northern parts of the Atlantic ocean, and in the Arctic ocean. It is common on the wilder and more unfrequented parts of the British coast, particularly in the north. It is remarkably distinguished, even among its nearest congeners, by the oblique position of the molar teeth. The fur is yellowish, variously spotted, and marked with brown. The whole length is from 3 to 5 feet. Its love of salmon is so great that it has been known to haunt the neighborhood of a salmon-net for a long time, and to take the fish after they were entrapped in it. The common seal is generally seen in small herds. Its skin and oil are of considerable mercantile importance. The skin is dressed with the fur on, to make caps, etc., or is tanned and used as leather. The oil, when made before decay has begun, is colorless and nearly inodorous; it is much superior to whale-oil. The flesh is much used for food in very northern countries, as is that of all the other species which they produce. It is not easy to shoot a seal. While flint-locks were in use, the seal always dived so quickly on seeing the flash as generally to escape the ball. The popular name SEA-CALF, and the specific name *vitulina*, have reference to a supposed resemblance of the voice to that of a calf. The HARP SEAL (*P. Grælandica*) receives its popular name from a large, black, crescent-shaped mark on each side of the back. It is sometimes seen on the British coasts, but belongs chiefly to more northern regions. It is from 6 to 8 or even 9 ft. in length.—The GREAT SEAL, or BEARDED SEAL (*P. barbata*), also found on the British coasts, and plentiful on the coasts of Greenland, is generally about 9 or 10 ft. long, sometimes more.—The ROUGH or BRISTLED SEAL (*P. hispida*) frequents quiet bays on the coasts of Greenland, where many thousands are annually killed for their skins and oil. It is the smallest of the northern species.—The GRAY SEAL (*Halichærus griseus*), which has a very flat head, and attains a size nearly equal to the Great seal, occurs on the British coasts, but is much more common in more northern latitudes, and in the Baltic sea.—The CRESTED SEAL (*Stenomatopus cristatus*) is remarkable for the elevation of the septum of the nose of the adult male into a crest, which supports a hood covering the head, and capable of being distended and elevated or depressed at pleasure. The use of this appendage is not known. This seal is plentiful on the coasts of Greenland and the northern parts of North America.—The seals of the southern seas are quite distinct from those of the northern. One of them is the SEA LEOPARD, or LEOPARD SEAL (*Leptonyx Weddellii*), so called from its spotted fur. It is found on the South Orkneys and other very southern islands. By far the largest of all the seals is the ELEPHANT SEAL, or sea elephant of the southern seas.

Seals are to some extent migratory, although their migrations do not extend to very great distances, and are probably regulated by the abundance or scarcity of food. The time of the return of certain species to certain coasts, is very confidently reckoned upon by the natives of the n. and by seal-hunters.

Seal-hunting—or *fishing*, as it is often called—requires great patience and skill. Most of the seals, if not all, are gregarious, and one seems to be always placed on the watch, where danger is to be apprehended from bears or from hunters. They climb up through holes in the ice-fields of the polar seas, even when there is a height of several feet from the water, but it is difficult for the hunter to get between them and the hole. Nor is seal-hunting unattended with danger, an enraged seal being a formidable antagonist, at least to the inexperienced.

Seal-hunting is the great occupation of the Greenlanders, but it is also extensively prosecuted in other northern parts of the world; great numbers are taken on the coasts of Newfoundland and other northern parts of America; whale-fishers kill seals as they

find opportunity; and vessels are fitted out expressly for the purpose, from the northern parts of Europe and of America.

SEAL OF CONFESSION. See CONFESSION and CONFIDENTIALITY.

SEALING-WAX. A composition of hard resinous materials used for receiving and retaining the impressions of seals. Simple as it may appear, its manufacture is one of great importance, and formerly was far more so than at present—the use of gummed envelopes having to a great extent superseded it. Common beeswax was first used in this country and in Europe generally, being mixed with earthy materials to give it consistency. Nevertheless, it was difficult to preserve it, as a very small amount of heat softened it.

The Venetians, however, brought the Indian sealing-wax to Europe, and the Spaniards received it from the Venetians, and made it a very important branch of their commerce. The great value of the Indian wax consisted in the fact that it was made only of shell-lac, colored with vermilion or some other pigment, and this has been found superior to all other materials. In addition to the shell-lac and coloring material, there is always added to the wax made in Europe a portion of Venetian turpentine (see TURPENTINE), and of resin.

SEA-LION. See OTARY.

SEA-LION. in heraldry, a monster consisting of the upper part of a lion combined with the tail of a fish.

SEAL ISLANDS, or LOBOS ISLANDS. See PERU.

SEALKOTE, a t. in the Punjab, near the left bank of the Chenab, 65 m. n.n.e. from Lahore. It contains (1868) 25,337 inhabitants, and carries on the manufacture of paper. Sealkote was formerly a military station, and at the period of the outbreak of the Indian mutiny, there was a rifle-practice dépôt here. All the European troops had been removed in July, 1857, to repress disturbances that had broken out elsewhere, and on the 9th of that month the native troops fired on their officers. A considerable number of Europeans were killed, and the survivors suffered great privations until the sepoys, having plundered the station, started off in the direction of Delhi.

SEALSFIELD, CHARLES, 1793-1864; b. Moravia; the assumed name of Karl Postel. In early life he was secretary to a religious order at Prague, and afterward traveled extensively in the United States, Mexico, and Central America. He then settled at Solothurn, Switzerland, where he devoted himself to literature, writing among other books, *Transatlantic Traveling Sketches; Pictures of Life in both Hemispheres; North and South; The Viceroy and the Aristocracy.*

SEAMEN are technically those persons below the rank of officer, who are employed in navigating decked vessels on the high seas—men working on lakes and rivers being styled "watermen." Two opposite conditions are essential to the well-being of the vessel—first, the absolute subordination and perfect obedience of the crew to the master; and secondly, their protection against tyranny or caprice on his part. For this purpose the law of England is extremely minute in the rules laid down for both masters and seamen.

By an act of 1845, specially leveled against pimps and swindling agents, no person may hire seamen except the owner or master of a ship, and individuals licensed for that purpose by the board of trade. Under the mercantile marine act of 1850, a written agreement must be made when a man is engaged, setting forth the nature and length of voyage, the capacity in which the man is to be employed, wages, fines, provisions, punishments, etc. If the ship be going abroad, this agreement must be attested before a shipping-master, who has a power of periodical inspection over the agreements of all seamen in vessels in his port. Any clause in the agreement would be inoperative which deprives the sailor of a lien upon his ship, or of other recovery for his wages, or of rights of salvage. In virtue of this agreement the seaman is bound to do his utmost in the service of the vessel; and consequently, if a master of a ship in distress promise his men extra pay for extraordinary exertions, the men cannot compel him to fulfill his promise.

In the event of disobedience or insubordination the master may administer correction, the law holding him responsible that such correction is reasonable. Desertion from the ship is punishable by imprisonment; and deserters may be apprehended on the information of the master without warrant. In case of open mutiny, the master may adopt the most stringent measures.

The mariner's wages are not due in case of loss of the ship, unless he duly exerted himself, and only up to the date of loss. It is a misdemeanor for the master to leave a sailor on shore in foreign parts, unless through the man's wrongful act.

SEAMEN (ante), as a class supposed to be especially subject to imposition while on shore and subject to cruel treatment while at sea, are protected by statutes regulating the method of their employment, their rights as to pay, their treatment while at sea, and their return to this country after discharge. Sailors in the U. S. navy are of course governed by the rules of the service; mercantile seamen from their contract by signing a

written agreement called the shipping articles, which every master of a vessel is required to have. This must describe clearly, the voyage with the ports at either end, the rate of wages and all other matters necessary to a full understanding of the contract. Such articles are not beyond impeachment by parol evidence. Penalties for the violation of the contract on either side are provided. The master is bound to furnish a seaworthy vessel, a survey being allowed on application of one mate and a majority of the crew. Not only is he bound to furnish provisions but the amount is fixed by statute; and if they fall short he forfeits a day's pay to each man while on short allowance. The master is bound to pay the wages, but may deduct 40 cents a month for the marine hospital fund or declare all or part forfeited as punishment for insubordination. Other punishments are extra work, imprisonment, confinement in irons, etc.; flogging was abolished by the act of 1850, but it is held that this does not include blows struck in the heat of anger. If the seaman desert before the voyage, he may be seized on a warrant and confined until the ship sails, forfeiting double his advance wages. If he desert on the voyage he forfeits his entire wages and all property on board. But if compelled to desert by cruelty, this does not hold. Sailors have a wages lien on both ship and freight. Engineers, pilots, clerks, and stewards, are sailors as to their rights of wages, etc. The master must present his papers to the U.S. consul in all ports visited and must explain absences. If he discharge a man abroad he is bound to pay three months' wages beyond what is due. Of this one-third goes to a fund for the maintenance of our seamen in foreign countries and for bringing them home. If a sailor be discharged without cause and against his will in a foreign port, the master is liable to six months' imprisonment or a \$500 fine.

SEA-MOUSE, *Aphrodite*, a genus of dorsibranchiate annelida, of the family *aphroditidae*, to all of which the popular name is extended. They are readily distinguished by two longitudinal ranges of broad membranous scales covering the back, under which are the gills in the form of little fleshy crests. The scales move up and down as the animal respire; and are concealed by a substance resembling tow or felt, which permits the access of water but excludes mud and sand. The head is furnished with tentacles; some have two eyes and some four. The body is edged with spines. Besides all this, its sides are covered with flexible bristles or silky hairs, which give to these creatures a wonderful beauty of color, unsurpassed by that of humming birds or the most brilliant gems. Each hair, even when viewed singly, and moved about in the sunshine, reflects all the hues of the rainbow. Yet sea-mice are generally to be found concealed under stones, and dwell among the mud at the bottom of the sea. Storms frequently throw them on the beach in great numbers. A very beautiful species, *aphrodite aculeata*, of an oval form, about 6 or 8 inches long, and 2 or 3 broad, is the common sea-mouse of the British coasts.

SEA-NETTLE. See *ACALEPHAE*, *ante*.

SEA-PARROT. See *AUK*, *ante*.

SEA-PIE. See *OYSTER-CATCHER*, *ante*.

SEA-PIKE, *Centropomus undecimalis*, a fish, which, notwithstanding its popular name, belongs to the perch family. Its form, however, is elongated like that of the pike. The body is compressed; there are two dorsal fins; the mouth is not very large; and the teeth are numerous, small, and equal. The color is silvery-white, tinged with green on the back. It is found on the western coasts of tropical America. It attains a large size, and is a valuable fish. On the British coasts, the name sea-pike is sometimes given to the garfish.

SEA-PINK. See *THRIFT*.

SEA-PORCUPINE. See *DIDON*, *ante*.

SEA-RAVEN. See *BULLHEAD*.

SEARCH, RIGHT OF. See *INTERNATIONAL LAW*.

SEARCH OF INCUMBRANCES means the inquiry made by a purchaser or mortgagee of lands as to the burdens and state of the title, in order to see whether his purchase or investment is safe. Owing to the want of any general system of registration of deeds affecting land in England, it is not possible by any search to find out with certainty all these burdens; nevertheless, there are some special registers which are usually included in such searches, such as judgment debts, bankruptcies, disentailing deeds, annuity deeds, etc. The search usually goes back for 60 years. In Scotland, where all the deeds affecting land rights are registered, it is easy to discover the exact state of the title and burdens on the land. The usual search is made only for 40 years. The registers are subdivided into various kinds—as the general and particular register of Sasines, the record of Abbreviates of Adjudications, register of Inhibitions, etc. See *RECORDS*.

SEARCH WARRANT is an authority granted to a constable by a justice of the peace to enter the premises of a person suspected of secreting stolen goods, in order to discover, and if found, to seize the goods; and similar warrants are granted to discover property in respect of which other offenses are committed. Before such a warrant can be issued, a credible witness must on oath prove a reasonable cause to suspect that the party pro-

ceeded against has the property in his possession or in his premises. The name of the person whose premises are to be searched must be correctly described in the warrant.

SEARCH-WARRANT (*ante*). The 4th amendment to the U. S. constitution prohibits the "general warrants," which were at one time granted in England in behalf of the government, particularly in cases of alleged sedition or libel, upon suspicion solely, without specifications. The amendment in question provides that the right of the people to be secure in their persons, houses, papers, and effects, against unreasonable searches and seizures shall not be violated, and no warrants shall issue but upon probable cause, supported by oath or affirmation, and particularly describing the place to be searched, and the persons or things to be seized. Similar provisions are found in most of the state constitutions.

SEARCY, a co. in n. Arkansas; drained by a branch of Red river, and the Buffalo fork of White river; about 815 sq.m.; pop., 807,278—16 colored. The surface is hilly, and heavily timbered. The soil is moderately fertile. The principal productions are corn and cotton. Co. seat, Marshall.

SEARING, LAURA CATHERINE WALLER (REDDEN), "Howard Glyndon," b. Maryland, 1840; came by direct descent on the mother's side, from sir William Waller, of Osterly Park, Middlesex, England. Her family removed to St. Louis, her father being murdered in 1848. In 1851 she became totally deaf from illness, and soon after lost her speech. She began writing for publication in 1855, and became assistant editor of the St. Louis *Presbyterian* a few years later. In 1860-62 she was Washington correspondent of the *Missouri Republican*, and published *Notable Men of the 37th Congress*, and *Idyls of Battle* a collection of war poems. In 1865 she visited Europe, corresponding with the *Missouri Republican* and *New York Times*. She continued to contribute to the press after her return in 1867, and in 1874, published *Sounds from Secret Chambers*, a volume of poems. In 1871 she entered the articulation school at Northampton, Mass.; where, and at a similar school in Mystic, Conn., and for a time with Prof. A. Graham Bell, she studied the new system for teaching the dumb to talk; and with such success that she regained intelligible speech in 1873-74. In 1876 she was married to Edward W. Searing, a lawyer of New York, by whom she had two children, one of whom died; a daughter, born 1880, still living. Since 1874 she has contributed poems to the leading magazines and newspapers, but has published nothing in book form. She is a versatile writer, spirited and graphic in prose, and graceful and earnest in verse.

SEARLE, JAMES, 1730-97, b. New York; a merchant in Madeira, who settled in Philadelphia in 1763. He was a signer of the non-importation agreement of 1765; a member of the navy board in 1778; a delegate to congress 1777-80, and then chairman of the commercial committee. He was in Europe, 1780-82, endeavoring, but unsuccessfully, to negotiate a state loan for Pennsylvania.

SEA-RODIN. See GURNARD, *ante*.

SEARS, BARNAS, D.D., LL.D., 1802-1880; b. Sandisfield, Mass., graduate of Brown university, 1825; studied theology at Newton, was settled over the First Baptist church in Hartford, Conn. In 1829 he was prof. in Madison university, New York, formerly the Hamilton literary and theological seminary. He went to Germany in 1833, studied at Halle, Leipsic, and Berlin. On his return he was appointed prof. of theology at Newton seminary, subsequently president—residing there 12 years. He was at one time secretary and agent of the Massachusetts board of education; succeeding Horace Mann. In 1855-67, he was pres. of Brown university, resigning to become general agent of the Peabody education fund for advancing education in the southern states. He edited the *Christian Review* and contributed to the *Bibliotheca Sacra*, and published among other works, *Ciceroniana or the Prussian mode of Instruction in Latin* (1844); *Select Treatises of Martin Luther in the Oriental German* (1846); *a revised edition of Roget's Thesaurus* (1854); *A Discourse on the Completion of the First Century of Brown University* (1864). He had high scholarship, and an admirable organizing capacity.

SEARS, EDMUND HAMILTON, D.D., 1810-76; b. Mass.; graduated at Union college in 1834, and Harvard divinity school in 1837; pastor of the First Unitarian church, Wayland, Mass., 1839-40; at Lancaster, 1840-47; at Weston, Mass., in 1865. He published *Regeneration Pictures of the Olden Time: Athanasia: Fore-gleams of Immortality; the Fourth Gospel; the Heart of Christ; Christian Lyrics; Sermons and Songs of the Christian Life*. He edited for several years with the rev. Rufus Ellis the *Monthly Religious Magazine*, Boston. He was a man of eminently devout and spiritual mind, an evangelical believer, a graceful and vigorous writer.

SEARS, ISAAC, 1729-86; b. Conn.; commanded a privateer and cruised against the French, 1758-61, but lost his vessel by shipwreck. He then engaged in the European and West India trade. After the passage of the stamp-act he was the foremost of the sons of liberty in New York, and was active during the war; was a member of the N. Y. provincial congress and of the assembly in 1783.

SEA-SERPENT, the name given to gigantic animals, presumed of serpentine form, which are believed by many naturalists to exist in the sea-depths, especially in tropical oceans. The question of the existence of a sea-serpent has long formed one of the knotty

problems of zoological science. But it seems reasonable to conclude that there exists a certain basis for the supposition that undescribed marine forms do exist in the sea-depths, and that the most reliable tales of sea-serpents take origin from appearances of such animals. Of such tales, possessing a warrantable basis of fact, and emanating from authoritative sources, that of capt. M'Quhae is one of the best known. This account was published in 1843. Capt. M'Quhae commanded H.M.S. *Dedalus*, and encountered the serpentine form in lat. $21^{\circ} 44'$ s., and long. $9^{\circ} 20'$ e., and therefore in the s. Atlantic ocean, near the tropic of Capricorn, and not very far from the coast of Africa. It was not, as in other cases, in bright and fine weather, but in dark and cloudy weather, and with a long ocean swell. The animal was swimming rapidly, and with its head and neck above water. Capt. M'Quhae, in his report to the admiralty, describes it with confidence as "an enormous serpent, with head and shoulders kept about 4 ft. constantly above the surface of the sea;" and he adds: "As nearly as we could approximate by comparing it with the length of what our maintopsail-yard would show in the water, there was at the very least 60 ft. of the animal *à fleur d'eau*, no portion of which was, to our perception, used in propelling it through the water, either by vertical or horizontal undulation. It passed rapidly, but so close under our lee-quarter, that had it been a man of my acquaintance, I should have easily recognized his features with the naked eye; and it did not, either in approaching the ship or after it had passed our wake, deviate in the slightest degree from its course to the s.w., which it held on at the pace of from 12 to 15 m. per hour, apparently on some determined purpose. The diameter of the serpent was about 15 or 16 in. behind the head, which was, without any doubt, that of a snake; and it was never, during the 20 minutes that it continued in sight of our glasses, once below the surface of the water; its color a dark-brown, with yellowish-white about the throat. It had no fins, but something like the mane of a horse, or rather a bunch of sea-weed, washed about its back." Regret has been very naturally expressed that capt. M'Quhae did not bestow a shot on it. Figures prepared from a sketch by him were published in the *Illustrated London News*, Oct. 28, 1848. About the same time, the testimony of another witness, lieut. Drummond, appeared, and was found to differ in some important points from the account of the animal given by capt. M'Quhae, and the figures published with his approbation, particularly in ascribing a more elongated form to the head, in the mention of a back fin, whereas capt. M'Quhae expressly says that no fins were seen; and in a lower estimate of the length of the portion of the animal visible. Lieut. Drummond's words are: "The appearance of its head, which, with the back fin, was the only portion of the animal visible, was long, pointed, and flattened at the top, perhaps 10 ft. in length; the upper jaw projecting considerably; the fin was, perhaps, 20 ft. in the rear of the head, and visible occasionally; the capt. also asserted that he saw the tail, or another fin about the same distance behind it; the upper part of the head and shoulders appeared of a dark-brown color, and beneath the under jaw a brownish-white. It pursued a steady and undeviating course, keeping its head horizontal with the water, and in rather a raised position, disappearing occasionally beneath a wave for a very brief interval, and not apparently for the purposes of respiration. It was going at the rate of perhaps from 12 to 14 m. an hour, and when nearest was perhaps 100 yards distant. In fact, it gave one quite the idea of a large snake or eel." Lieut. Drummond's account is the more worthy of regard, as it is derived from his log-book, and so gives the exact impressions of the hour, while capt. M'Quhae's was written from memory after his arrival in England. Into the discussion which arose concerning this case, it is out of our power to enter.

In 1875 a battle between a sea-serpent and a whale was viewed from the deck of the good ship *Pauline* of London, capt. Drevar, when proceeding with a cargo of coals from Shields to Zanzibar, destined for her majesty's ship *London*. When the *Pauline* reached the region of the trade-winds and equatorial currents, she was carried out of her course, and after a severe storm, found herself off cape Roque, where several sperm-whales were seen playing about her. While the crew were watching them, they suddenly beheld a sight that filled every man on board with terror. Starting straight from the bosom of the deep, a gigantic serpent rose and wound itself twice in two mighty coils round the largest of the whales, which it proceeded to crush in genuine boa-constrictor fashion. In vain did the hapless whale struggle, lash the water into foam, and even bellow, for all its efforts were as nothing against the supernatural powers of its dreadful adversary: whose strength may be further imagined, from the fact that the ribs of the ill-fated fish were distinctly heard cracking one after the other with a report like that of a small cannon.

Of no less a ship than her majesty's yacht the *Osborne*, the capt. and officers, in June, 1877, forwarded an official report to the admiralty containing an account of a sea-serpent's appearance off the coast of Sicily on the 2d of that month. "The time was five o'clock in the afternoon. The sea was exceptionally smooth, and the officers were provided with good telescopes. The monster had a smooth skin, devoid of scales, a bullet-shaped head, and a face like an alligator. It was of immense length, and along the back was a ridge of fins about fifteen ft. in length and six ft. apart. It moved slowly, and was seen by all the ship's officers."

This account was further supplemented by a sketch, from the pencil of lieut. W. P. Hynes of the *Osborne*, who to the above description adds, that the fins were of irregular

height, and about 40 ft. in extent, and "as we were passing through the water at ten and a half knots, I could only get a view of it 'end on.'" It was about 15 or 20 ft. broad at the shoulders, with flappers or fins that seemed to have a semi-revolving motion. "From the top of the head to the part of the back where it became immersed, I should consider about 50 ft., and that seemed about a third of the whole length. All this part was smooth, resembling a seal."

These instances are but examples of the many cases, in which narratives of the most circumstantial character have been recorded, regarding the appearance of serpentine animals, usually in tropical seas.

As will readily be admitted, the chief point at issue is that of the zoological determination of the forms reported to have been seen. Gigantic cuttle-fishes, now proved to have a veritable existence, might in many cases imitate an elongated marine form swimming near the surface of the sea. Certain fishes, such as the basking shark (*selache maxima*) would also under certain circumstances appear as unusual marine forms; and as Dr. Andrew Wilson, of the Edinburgh medical school, has pointed out, the well-known tape fishes (*gymnetrus Bonksii*) would very accurately reproduce the features of a marine snake, especially when these fishes, as is well known, are developed to an immense size. The marine snakes or *hydrophide* of the Indian ocean would also serve to personate the "great unknown," if largely developed; and indeed, as Dr. Wilson has pointed out, in the idea of the immense development of ordinary marine animals may be found a probable clue to the sea-serpent mystery. Cases of mere serpentine appearances assumed by certain animals are not to be confused with cases in which a single animal has presented a serpentine aspect. Flocks of shags swimming close to the water's edge might personate a sea-serpent swimming along the top of the water (see *Nature*, Sept., 1878); but a flock of birds would have been readily detected by capt. McQuhae, and by many other observers who have beheld the unknown form from a near distance. The reader who wishes for a full discussion of the scientific aspects of this question may consult a paper entitled "The Sea-Serpents of Science," in Dr. Andrew Wilson's volume, *Leisure Time Studies* (Chatto & Windus, London, 1878).

SEA-SHORE, or land bordering on the sea, belongs partly to the crown, and the public have certain rights in relation thereto. The soil or property in the sea-shore is vested in the crown, and the limit on the land side is defined to be the medium line of high-water of all the tides in the course of the year, or the height of the medium tides in each quarter of a lunar revolution during the whole year. But though the crown is *prima facie* the owner of the sea-shore, the owner of the adjoining manor has sometimes a grant of it, and he proves this grant by ancient use—such as gathering sea-weed, etc. The public have a right to walk on that part of the shore vested in the crown, which holds it as a trustee for them. But the public have no right to trespass on the adjacent lands in order to get at the shore, so that it is only where a highway leads to the shore, or the public land from seaward, that the right can be made available. Thus it has been decided that the public have no legal right to trespass on the adjoining lands in order to get to the shore for purpose of bathing. The public have a right to fish on the sea-shore if they get legal access to it, and may take all floating fish, but not oysters or mussels which adhere to the rock, if the soil belongs to an individual. The public have no right to gather sea-weed or shells, though, as regards the latter, it is of so little consequence that nobody prevents them. Nor have fishermen a right to go on that part of the sea-shore which is private property to dig sand for ballast, or to dry their nets, or similar purposes, though in a few cases local customs permitting this have been held valid. In Scotland the right to the sea-shore is also vested in the crown, but when a crown grant gives land bounded by the sea-shore, this is held to give to the grantee the fore-shore also.

SEA-SICKNESS is a variety of vomiting deserving of special notice. It is often preceded by premonitory symptoms, which appear almost immediately after a susceptible person is exposed to the motion of rolling water in a vessel or boat, and are as distressing as the vomiting itself. Amongst these symptoms may be mentioned vertigo and headache, with a peculiar feeling of sinking and distress about the pit of the stomach. Vomiting, however, in general, soon comes on, accompanied with convulsive heaving of the stomach, and such an indescribable feeling of prostration as to render the patient utterly regardless of what is going on around him, and almost indifferent to life. Moreover, a deadly pallor, a profuse cold sweat, and diarrhea, are more or less commonly present. The susceptibility to this troublesome affection varies extremely in different persons. Some never suffer from it, others only on their first voyage, and others, again, in every voyage they undertake; with some it continues but a few hours, while others suffer almost continuously throughout a long voyage. In the great majority of cases the sickness disappears in a few days, unless the weather be very boisterous. It almost always ceases on landing, although more or less giddiness may prevail for some hours, the patient when walking feeling as if the earth were rising up under his feet. Infants and aged persons are supposed to possess a comparative immunity from sea-sickness, while, as a general rule, women suffer more than men. According to Dr. Althaus, persons with a strong heart and a slow pulse generally suffer little from sea-sickness; while irritable people, with a quick pulse and a tendency to palpitation, are

more liable to be affected; and he thus accounts for different liability of different nations to this affection; "for, as a rule, the French and Italians, being of a more irritable temper, suffer most from the disorder, the Germans less, and the English least." ("On Sea-sickness as a form of Hyperæsthesia," in *Proceedings of the Medico-Chirurgical Society*, vol. v. p. 23.)

The primary cause (or rather condition) of sea-sickness is the motion of the ship; and the *pitching* of a vessel, or alternate rising and falling of the bow and stern, is especially apt to produce it. It is less felt in large and heavily ballasted vessels, because the movements referred to are least perceptible in them. How this cause operates is a subject regarding which there has been much discussion; and, without entering into the history of the views of different physicians on this subject, we may state that the most recent is that of Dr. Chapman, who holds that the motions of the vessel cause the accumulation of an undue amount of "blood in the nervous centers along the back, and especially in those segments of the spinal cord related to the stomach, and the muscles concerned in vomiting." This condition is induced, as he maintains, in three different ways, viz., (1.) by the movements of the brain, which are much greater in a pitching vessel than on land; (2.) by the corresponding movements of the spinal cord; and (3.) by the excessive movements of the viscera within the abdominal and pelvic cavities. In one person the brain may be mainly responsible in causing that preternatural afflux of blood in the spinal cord, on which (according to Dr. Chapman's hypothesis) sea-sickness depends; in another, the spinal cord may be the main agent; and in a third, the abdominal viscera; although each is always concurrent in some degree. Hence, the only scientific and really effective remedy for this disorder must be one which has the power of lessening the amount of blood in the whole of the nervous centers along the back, and this can be done by lowering the temperature of the spinal region by the local application of ice. For a description of Dr. Chapman's "spinal ice-bags" (which may be obtained from any respectable surgical instrument-maker), and for the method of applying them, we must refer to his work *On Sea-sickness; its Nature and Treatment*, p. 37 (Lond. 1864). He gives the details of 17 cases in which the ice-bags were of greater or less benefit; in most of the cases the result was perfectly successful. Besides Dr. Chapman's evidence we have that of capt. White, commander of one of the Newhaven and Dieppe boats, who states that "in ordinary weather it [Dr. Chapman's remedy] is a success. I had some difficulty in persuading passengers to try it, but those who did were benefited." Mr. Bradley, surgeon in the Cunard service, in a letter to *The Lancet*, Dec. 3, 1864, writes as follows: "I have tried this remedy in severe cases when other remedies have failed (chloroform, iced champagne, effervescing draughts, fresh air, etc.), and have very generally found it do great good. In no case does it do harm, but in the great majority of instances it soothes the nervous irritability which so commonly accompanies severe sea-sickness, induces sleep, and consequently relieves exhaustion." We are permitted to publish the following extract of a letter from Dr. Hayle of Rochdale, to Dr. Chapman, dated June 3, 1865: "I recommended a patient about to cross the Atlantic, to try one of your ice-bags for sea-sickness. The result was most satisfactory. He was never sick when wearing the bag. Once he went without it, and then, and then only, was he sick. His friend, who had no ice-bag, was frequently sick." As an ancillary remedy, the drinking of iced water, or the swallowing of small lumps of ice, may be recommended. Dr. Chapman prefers the ice, which, "brought in contact with the peripheral ends of the nerves of the stomach, will act on the same principle as it does when applied to the spinal region."

Those who are susceptible to this distressing affection, and have not the opportunity of trying the ice-bags, may, at all events, diminish the severity of the vomiting by assuming, and as long as possible retaining, the horizontal position, as nearly as possible in the center of the ship's movement, and keeping the eyes closed. The compression of the abdomen, by means of a broad tight belt, sometimes gives relief. A few drops of chloroform on a lump of white sugar will sometimes check the tendency to vomiting in persons who only suffer slightly. A little arrowroot, flavored with brandy or sherry, is usually a kind of food that will most easily remain on the stomach, when the severity of the symptoms is abating. Dr. Wood, one of the most eminent of the American physicians of the present day, asserts that he has "found nothing under such circumstances so acceptable to the stomach as raw salt oysters."

SEA-SIDE GRAPE, *Coccoloba uvifera*, a small tree of the natural order *polygonææ*, a native of the West Indies. It grows on the sea-coasts; has orbicular, cordate, leathery, shining, entire leaves, and a pleasant, subacid, eatable fruit, somewhat resembling a currant, formed of the pulpy calyx investing a bony nut. The extract of the wood is extremely astringent, and is sometimes called JAMAICA KINO. The wood itself is heavy, hard, durable, and beautifully veined.

SEA-SLUG. See HOLOTHURIA.

SEA-SNIPE. See TRUMPET FISH, *ante*.

SEASONING, a term in cookery for the materials used to add flavor to food. They are chiefly salt, the spices, and pot-herbs. Salt is the most important, for it not only increases the sapidity of most kinds of food, but also adds to their wholesomeness.

SEASONS. In the article **EARTH** the motions of the earth on which the changes of the seasons ultimately depend are explained. The chief cause of the greater heat of summer and cold of winter is that the rays of the sun fall more obliquely on the earth in the latter season than in the former. See **CLIMATE**. Another concurrent cause is the greater length of the day in summer, and of the night in winter. Within the tropics the sun's rays have at no time so much obliquity as to make one part of the year very sensibly colder than another. There are, therefore, either no marked seasons, or they have other causes altogether, and are distinguished as the *wet* and *dry* seasons. This is explained in the article **RAIN**. But in all the temperate parts of the globe the year is naturally divided into four seasons—*spring, summer, autumn, and winter*. In the arctic and antarctic regions, spring and autumn are very brief, and the natural division of the year is simply into summer and winter, the winter being long and the summer short; and this is very much the case also in regions of the temperate zones lying near the arctic and antarctic circles. In subtropical regions the distinction of four seasons is in like manner very imperfectly marked. This distinction is everywhere arbitrary as to the periods of the year included in each season, which really vary according to latitude, and partly according to the other causes which influence climate; the seasons passing one into another more or less gradually, and their commencement and close not being determined by precise astronomical or other phenomena. The greatest heat of summer is never reached till a considerable time after the summer solstice, when the sun's rays are most nearly vertical, and the day is longest; the greatest cold of winter is in like manner after the winter solstice, when the day is shortest, and the sun's rays are most oblique; the reason in the former case being that as summer advances the earth itself becomes more heated by the continued action of the sun's rays; in the latter, that it retains a portion of the heat which it has imbibed during summer, just as the warmest part of the day is somewhat after midday, and the coldest part of the night is toward morning. The four seasons of temperate regions are distinguished by the phenomena of nature which characterize them, and which are of the greatest importance in relation to the wants and labors of man. But the renewal of vegetative activity in spring is not to be ascribed entirely to the increasing warmth of the sun's rays. Plants are so constituted that a period of rest is followed by new activity, and this new activity very generally begins in the fresh circulation of sap and enlargement of buds while the cold of winter still continues unabated, or before it has reached its greatest intensity. A similar remark may be made with regard to some of the phenomena of animal life, which may as well be said to herald the approach of spring as to attend its first days of genial weather.

SEA-SPIDER, or SPIDER CRAB. See **CRAB**, *ante*.

SEA-SQUIRT. See **ASCIDIA**, *ante*.

SEA-SWALLOW. See **TERN**, *ante*.

SEATON, WILLIAM WINSTON, 1785-1866; b. Va.; educated under private tutors and in a printing office; edited papers in Petersburg, Va., and Raleigh, N. C.; removed to Washington, 1812, and with his brother-in-law Joseph Gales published the *National Intelligencer*, which for 50 years made their names honorably known throughout the United States. They were also public printers for many years. Mr. Seaton was frequently elected mayor of the city, and held other offices there; was a regent of the Smithsonian institution; and was highly esteemed for personal merit as well as editorial power.

SEATTLE, a t. and capital of King co., Washington territory, 60 m. n.e. of Olympia, on the Seattle and Walla Walla railroad; it is near the mouth of Dwamish river on Puget's sound; pop. '70, 1107. Seattle is the seat of the territorial university, founded in 1872. A large trade is done with the mining and lumber camps and fisheries. Lumber is the chief export.

SEBASTIAN, a co. in w. Arkansas, bounded on the n. by the Arkansas river; about 590 sq. m.; pop. '80, 19,560—1587 colored. The surface is hilly and heavily wooded. The soil on the prairies is fertile. The principal productions are corn and cotton. Bituminous coal is found. Co. seat, Greenwood.

SEBASTIAN, SAINT, a very celebrated martyr of the early church, whose memory is venerated in both branches of the church, east as well as west (although the scene of his martyrdom was the city of Rome), and whose story has formed one of the most popular themes of Christian artists from the earliest times. His history is contained in the so-called acts of his martyrdom, which, although partaking of the legendary tone, are regarded as authentic, not only by Baronius and the Bollandists, but also by Tillemont and others of the more stringently critical schools of ecclesiastical history. Sebastian, according to this narrative, was born at Narbonne and educated at Milan. Although a Christian, he entered the Roman army, without, however, revealing his religion, and with the view of being enabled, by his position, to assist and protect the Christians in

the persecution. In this way he supported and comforted many of the martyrs in Rome; and he even converted Nicostratus, the keeper of the prison in which the martyrs were confined, and his wife, Zoe, to whom he miraculously restored the use of her speech, after she had been dumb for six years. Still unrecognized as a Christian, Sebastian rose to high favor under Diocletian, while at the same time the grateful pontiff, Caius, named him "Defender of the Church." At length came the time for his open profession of his faith. Diocletian used every effort to induce him to renounce the Christian creed, but in vain; and in the end he was condemned to be put to death by a troop of Mauritanian archers, who transfixed him with numberless arrows, and left him as dead. But a Christian lady, Irene, finding that life was not extinct, had the body removed to her house, where life was restored; and although the Christian community desired to conceal his recovery, Sebastian again appeared in public before the emperor, to profess his faith in Christianity. Diocletian condemned him to be beaten to death with clubs in the amphitheater; and his body was flung into one of the sewers of the city, in which it was discovered, according to the *Acts of Martyrdom*, by means of an apparition, and carried by a Christian lady, Lucia, to the catacomb, which is still called by his name. The date of his martyrdom was January 20, 288. By the Greeks the feast is held on the 20th of December. The festival was celebrated with great solemnity in Milan as early as the time of St. Ambrose; and it was observed in the African church in the 4th century. There is another saint of the same name, who is said to have suffered martyrdom in Armenia.

SEBASTIAN, Dom, 1554-78; b. Lisbon; came to the throne of Portugal in 1557. In 1574 he led a successful expedition against Tangier. In 1578, with a fleet and a force of some 20,000 men, he sailed to Morocco to support Muley-Mohammed against his uncle Muley-Malek, in the contest for the throne of Morocco. Sebastian and Muley-Mohammed were defeated by Muley-Malek, and all three died. The Portuguese refused to believe in his death, and numerous impostors appeared, pretending to be Dom Sebastian.

SEBASTIANI, FRANCOIS-HORACE-BASTION, Marshal of France, was b. Nov. 10, 1772, at Porta d'Ampugnano, a village near Bastia, in Corsica. He was the son of a tailor, but his extreme vanity led him to declare himself of noble descent and a distant relative of the Bonapartes. He entered the army as a sub-lieut. of infantry, Aug. 27, 1789. His rise, due to his bravery in the field, was no doubt somewhat aided by his splendid physique, graceful manner, and facile diction. He became *chef d'escadron* in 1797, and brigadier in 1799, and was one of Napoleon's most devoted partisans. He fought at Marengo, executed some important diplomatic service in Turkey in 1802-03, after which he became gen. of brigade (Aug. 1803), and was wounded at Austerlitz. On May 2, 1806, he was again deputed to Turkey, this time to break the alliance of the Porte with Russia and England; and before he had been seven months at Constantinople, his mission had obtained complete success, and war was declared. The English fleet forced a passage through the Dardanelles, and cast anchor before Constantinople, their presence causing such terror among the sultan's ministers that a total reversal of foreign policy was imminent, but Sebastiani, coming to the rescue, revived with his seducing eloquence their failing resolution, and assuming an authoritative superintendence of the preparations for defending the coast, put the batteries in a state fit for action. In five days he had the coast batteries manned with 600 guns, 100 small gunboats afloat, a line of vessels laid along shore, each with a broad-side ready to be discharged on the English fleet, which at last gallantly ran the gantlet, losing two ships and 700 men. But the death of the sultan, and the treaty of Tilsit, put an end to the French intrigues in Turkey, and Sebastiani was recalled, June 1807, and decorated with the grand cordon of the legion of honor. He subsequently commanded the fourth corps-d'armée in Spain. He distinguished himself in the Russian campaign of 1812, and at Leipsic. On the exile of Napoleon to Elba, he gave in his adherence to the Bourbon government, but joined his old master on his return. After the revolution of 1830, he held for brief periods the portfolios of naval (1830) and foreign affairs, and the embassies to Naples (April, 1833) and London (Jan., 1835); but was more distinguished for his elegance and graceful demeanor in the Parisian salons, than as a politician or administrator. He died at Paris, July 20, 1851.

SEBASTIANIS TAS, the name given in Portugal and Brazil to persons who believe in the future return to earth of the king Dom Sebastian, who fell in the battle of Alcazar-quebir, 1578 A. D., while leading on his army against the Moors. This belief has continued to be entertained by many in Portugal; but the Sebastianistas are said to be now most numerous in Brazil. On the return of Dom Sebastian, they expect Brazil to enjoy the most perfect prosperity and happiness.

SEBASTOPOL. See SEVASTOPOL, *ante*.

SEBENICO, a small port on the coast of Dalmatia, 42 m. s.e. of Zara. It is built on a steep slope, and rises in terraces, and was formerly defended by walls and towers. Its cathedral, a fine edifice, with a bold dome, was built 1443-1536. Its excellent harbor is defended by several forts. Pop. 14,238.

SEBES'TEN, **SEBESTAN**, **SEPISTAN**, or **S. PLUM**, the fruit of the *cordia myxa*, a tree of the natural order *cordiaceæ*, a native of the East Indies. The tree has ovate leaves, and an egg-shaped fruit, which is succulent, mucilaginous, and emollient, with some astringency, and was formerly an article of the European materia medica, being employed for the preparation of a lenitive electuary and of a pectoral medicine. It is believed to be the *perseæ* of Dioscorides. It has a sweetish taste, and is eaten by the natives of the northern Circars of India, where it grows.

SE'CANT. See TRIGONOMETRY.

SECCHI, **PIETRO ANGELO**, 1818-78; b. Italy; joined the Jesuits in 1833. He became director of the observatory of the Roman college in 1850, and was permitted to remain in that position after the expulsion of the Jesuits, 1870-73. His discoveries in the departments of solar physics and spectroscopic analysis were numerous and important. Among his works are *Catalogo delle Stelle* (1867); *Noi Ricerchi sulle Protuberanze Solari* (1869); *Fisica Solare* (1869); and *Le Solari* (1870).

SECE'DERS AND SECESSION KIRK. See UNITED PRESBYTERIAN CHURCH.

SECESSION—SECEDED STATES See REBELLION, WAR OF THE.

SE-CHUEN', a province in China, drained by the Yang-tse-Kiang river; about 166,000 sq. m.; pop. 21,435,678. Capital, Ching-Too-Foo.

SECKENDORF, an old and noble family of Franconia.—**VEIT LUDWIG**, 1626-92; b. near Erlangen; studied at the gymnasia of Coburg in 1638, and at Gotha, under the patronage of Ernest, duke of Gotha. In 1643-46 he studied in the university of Strasbourg, and traveled in the Netherlands. He rose through successive grades of office till he became privy-councilor and chancellor in 1664. In that year he left the duke's service to enter that of Moritz, duke of Zeit, and was appointed to similar offices, resigning on the duke's death, and retiring to his country-house near Altenburg. In 1691 he entered the service of Frederick III., elector of Brandenburg, as privy-councilor at Berlin, and chancellor of the university of Halle. He published several works in Latin and German; also theological and historical works, discourses, and hymns.—**FRIEDRICH HEINRICH**, 1673-1763; b. Königsberg; grandson of Joachim Ludwig, entered the English and Dutch service in 1693, fought against the Turks in the war of the Spanish succession under prince Eugene; maj. gen. in the army of Augustus II. of Poland, and Saxony. He was Polish ambassador to the Hague (1713), in the negotiations for the peace of Utrecht. He became count of the empire in 1719, gov. of Leipsic in 1721, ambassador to Berlin in 1726. He concluded the treaty of Wusterhausen. He incurred the displeasure of Frederick the great by the means he used to consummate the royal marriage with the princess Elizabeth. He defeated the French at Klausen, 1735; was imprisoned three years in the castle of Gratz. He commanded the troops of the elector Charles Albert of Bavaria in 1744, and restored Munich to that prince, then Charles VII. of Germany. In 1745 he was imprisoned at Magdeburg by Frederick the great, and released after six months' confinement on paying 10,000 thalers.

SECKER, **THOMAS, D.D.**, 1693-1768; b. England; studied for the dissenting ministry, but doubting concerning some of the doctrines of Christianity, he resolved to study medicine; went to London and Paris; was persuaded by Joseph Butler, an intimate friend, to enter the church of England. After some deliberation he complied; went in 1721 to Leyden, took his degree of M.D.; returned to England; became rector of Houghton-le-Spring in 1723; prebendary of Durham and rector of Ryton in 1727; chaplain to the king in 1732, rector of St. James in 1733; was made bishop of Bristol in 1735, of Oxford in 1737; dean of St. Paul's in 1750, and archbishop of Canterbury in 1758.

SECLU'SION (OF THE INSANE). This term has recently been narrowed so as to apply to the removal of the violent insane from the ordinary wards and fellowship of an asylum to an airing court, gallery, or room so situate and furnished that its solitary occupant can neither injure himself, nor injure nor disturb others. Since the abolition of physical restraint by chains and strait-jackets seclusion has become a favored and useful mode of repression and treatment. That it should be resorted to exclusively as a remedial agent, and by the medical attendant, are now received as axioms. In 1854 the commissioners in lunacy in England ascertained, by circular, the opinions of almost all those entrusted with the care of the insane in that country, as to the employment of such means of cure; when it appeared that it was generally considered beneficial, if used for short periods, and during paroxysms of epileptic and violent mania. Even when not absolutely required for the tranquillization of the individual, seclusion may become expedient in order to secure the quiet, comfort, or safety of the patients with whom he is associated. That such an instrument may be abused and adopted from the parsimony, timidity, or ignorance of those around, is obvious. One of the lunatics liberated by Pinel in 1792 had been incarcerated or *secluded* in his dark cell for forty years; and occasionally even now the duration of the isolation may be unduly prolonged even under medical sanction; but the instances of gross and cruel seclusion in garrets and cellars, and outhouses, are now chiefly to be found in private families, and where, as in the "Flushing case," no better course is known to be practicable.—*Eighth Report of Commis-*

sioners in Lunacy to Lord Chancellor, App. C, p. 123; Bucknill and Tuke, *Psychological Medicine*, p. 562; Browne, *What Asylums Were, Are, and Ought to be*, p. 137.

SECOND (for the derivation of which see **SCRUPLE**) is the sixtieth part of a minute, whether of time or of angular magnitude. See **MINUTE**. In old treatises we find seconds distinguished as *minutæ secunde*, from minutes, or *minutæ primæ*. The sixteenth part of a second was called a third, but instead of this and succeeding subdivisions, decimal fractions of seconds are now employed.

SECONDARY, in geology, is the designation given to that large section of the fossiliferous strata which includes the triassic, oolitic, and cretaceous rocks. It is synonymous with mesozoic. The strata grouped under this title are separated from the inferior and superior deposits more by their organic contents than their petrological structure, and this separation is more evident between them and the older rocks than between them and the newer; and yet recent discoveries have shown that the St. Cassian beds form a connecting link between the Permian and triassic epochs. They contain a series of fossils which are partly paleozoic and partly mesozoic in their facies.

The appearance of the great types of all subsequent organisms in the secondary rocks has suggested the grouping of the fossiliferous strata in respect of their fossils into only two great divisions—viz., the paleozoic, and the neo-zoic—this last term including the secondary and tertiary periods.

SECONDDING is a temporary retirement to which officers of royal artillery and royal engineers are subjected when they accept civil employment under the crown. After six months of such employment the officer is seconded, by which he loses military pay, but retains his rank, seniority, and promotion in his corps. After being seconded for ten years he must elect to return to military duty, or to retire altogether.

SECOND SIGHT, a superstition or belief once common in the Scottish highlands and isles, where it is known by the Gaelic appellation *taibhsearachd*, signifying a spectral or shadowy appearance. Certain persons, called seers or wizards, were supposed to possess a supernatural gift, by which they involuntarily foresaw future events, and perceived distant objects as if they were present:

As the sun,
Ere it is risen, sometimes paints its image
In the atmosphere, so often do the spirits
Of great events stride on before the events,
And in to-day already walks to-morrow.

WALLENSTEIN.

This is to depict the lofty and poetical view of the subject, as illustrated in classic fable and early history. The highland seer, however, was chiefly conversant with the scenes and occurrences of ordinary life. "A man on a journey far from home falls from a horse; another who perhaps is at work about the house, sees him bleeding on the ground, commonly with a landscape of the place where the accident befalls him. Another seer, driving home his cattle, or wandering in idleness, or musing in the sunshine, is suddenly surprised by the appearance of a bridal ceremony or funeral procession, and counts the mourners or attendants, of whom, if he knows them, he relates the names, if he knows them not he can describe the dresses. Things distant are seen at the instant when they happen" (Johnson's *Journey to the Hebrides*). With respect to things future, Johnson thought there was no rule for determining the time between the sight and the event; but Martin, whose account of the western islands was first published in 1703, furnishes data of this kind in his classification of the visions. If an object was seen early in the morning, the event would be accomplished a few hours afterward; if at noon, the same day; and if at night the accomplishment would take place weeks, months, and sometimes years afterward; according to the time of night the vision was beheld. The appearance of a shroud was an infallible prognostic of death, and the nearness or remoteness of the event was judged by the amount of the body that was covered by the ghastly sheet; if it was not seen above the middle, a delay of a twelvemonth might be hoped for, but if it ascended high toward the head, the mortal hour was close at hand. "The vision makes such a lively impression upon the seers," says Martin, "that they neither see nor think of anything else except the vision, as long as it continues; the eyelids of the seer are erected, and the eyes continue staring until the object vanish." The power of the seer was involuntary and painful—it was no source of gain. The gradation of symbolical appearances we have mentioned, strikes the imagination and gives something like a system to the supernatural phenomena. But if we turn to the cases described by the historians of the second sight, we do not find such regular order and exactness. The evidence is vague and confused, and the incidents are often of the most trivial character. The revelations, indeed, were commonly made to poor illiterate men, predisposed from the very nature of the country—wild, dreary, and remote—and from their half-idle, solitary life, to melancholy and superstition. These causes must have led very early to belief in the second sight. We find it coloring portions of the story of Wallace and Bruce, and associated with the tragic fate of the accomplished James I. of Scotland. A Scottish seer is said to have foretold the unhappy career of Charles I., and another the violent death of Villiers, duke of Buckingham. In 1652 a Scottish lawyer, sir George Mackenzie, afterward lord Tarbat, when driven to the highlands by fear of the govern-

ment of Cromwell, engaged himself in making inquiries concerning this supposed supernatural faculty, and wrote a minute account of its manifestations addressed to the celebrated Robert Boyle, which, with other relations on the same subject, is published in the correspondence of Samuel Pepys. Next came Martin's copious description; then a highland minister, the rev. John Fraser of Tyree, collected *Authentic Instances*, which were printed in 1707; and in 1763, appeared the ambitious treatise of *Theophilus Instutus*, or Macleod of Hamir, which contained the narratives of Fraser, of Aubrey, the English antiquary, and other authorities, with the addition of a great number of cases—nearly a hundred—gathered by himself from various sources, and also numerous letters from highland ministers. This work exhausted the subject, but the wretched vanity, credulity and weakness of Theophilus covered it with ridicule. A fresh revival took place after the memorable *Journey to the Hebrides* by Dr. Johnson, whose work was published in 1775. The second sight was sure to interest a melancholy, meditative "rambler" like Johnson. He had read of it in his youth in Martin's history. He was naturally superstitious. He had a stout courageous heart and strong nerves in all mundane matters and positions, but he had a morbid fear of death, and an almost childish eagerness to pierce the darkness of futurity, and to believe in the possibility of messages from the other world. Johnson anxiously questioned the clergy and others respecting the supernatural communications made to the seers, and would gladly have believed them real. The evidence, however, was not complete or invincible; and with that love of truth, which was one of the strongest virtues of the sage of Bolt court, he confessed that he never could "advance his curiosity to conviction, but came away at last only willing to believe." On one occasion we find Johnson enunciating the true doctrine in such cases. He observed, as Boswell reports, that "we could have no certainty of the truth of supernatural appearances unless something was told us which we could not know by ordinary means, or something done which could not be done but by supernatural power; that Pharaoh, in reason and justice, required such evidence from Moses; nay, that our Saviour said: 'If I had not done among them the works which none other man did, they had not had sin.'" Undoubtedly works or facts, not merely appearances, are required for conviction. Spectral sights may be caused by dreams or disease (see APPARITIONS), by accidental optical illusions, or by the workings of a vivid imagination. It seems degrading to the idea of divine power to suppose that special miracles were wrought to announce the marriage or death of a highland peasant, the wreck of a boat, or the arrival of a stranger in a remote island of the Hebrides. Ignorance is a great ally of superstition, as solitude is of gloomy egotism and melancholy; and since education has penetrated into the highlands and isles, and intercourse with other parts of the kingdom has been facilitated by increasing trade and improved means of communication—to say nothing of the effects of that passion for highland scenery and sport which every year takes crowds of visitors to the country—the belief in second sight, as in astrology and witchcraft, has almost wholly disappeared from the land. It never had the cruel, hard, and revolting features of witchcraft—formerly prevalent in the lowlands when scarcely known in the Hebrides—and it still seems picturesque enough to serve for the purposes of poetry and romance.

SECRET (Lat. *secreta*, i.e., *oratio*, the secret prayer), one of the prayers of the mass (q.v.), of the same general form with the "collect," but recited by the priest in so low a voice as not to be heard by the people, whence the name *secreta* is derived. It follows immediately after the oblation of the eucharistic bread and wine. This use of silent prayer in the public service is one of the subjects of controversy between Catholics and Protestants.

SECRET, DISCIPLINE OF THE (Lat. *Arcani Disciplina*), a discipline of the early church, founded upon the words of Christ, "give not that which is holy to dogs," Matt. vii. 6, in virtue of which Christians fully initiated in the doctrine and practice of the church withheld from pagans and catechumens in the preparatory stage the knowledge of certain doctrines, and the liberty of presence at certain rites connected with the most solemn mysteries of the Christian religion. This practice originated in the obloquy which was drawn upon the doctrines of the church from the false and monstrous conceptions of these doctrines which were circulated among pagans. Against these calumnious misconceptions the earliest of the so-called "apologies" are addressed; and it seems certain that at the time at which Justin wrote his first apology, the middle of the 2d c., no objection existed against speaking openly of the mystery of the eucharist. —(See *Justin's Apol.* i. 66.) Very soon after this, however, the "secret" is clearly traceable. The first reason for its adoption was that assigned above—namely, to guard the more sacred and mysterious doctrines from popular misconception and blasphemy among the pagans. This precaution of concealment was extended to catechumens, partly in order to avoid shocking too suddenly their half-formed convictions by the more startling improbabilities of Christian belief; partly also, no doubt, to guard against the danger of the betrayal of these mysterious doctrines to pagan spies approaching in the false garb of catechumens. The discipline of the secret appears in several forms—(1.) Both unbelievers and catechumens were removed from the church at the commencement of that portion of the liturgy which specially relates to the celebration of the eucharist—the so-called *Missa Fidelium*. See MASS. (2.) The lectures addressed by the

presiding teacher to the great body of the catechumens in general were confined to the general doctrines of Christianity. The more mysterious doctrines, those which regarded the sacraments of baptism and the eucharist, called "mystagogic," were only communicated at the close, and to those only who had undergone the preliminary probation. (3.) The eucharist, if referred to at all in the presence of the uninitiated, was spoken of in words so conceived as to conceal its nature. Many curious examples of this concealment might be cited. Origen, alluding to the eucharist (Hom. 8, in Exod. 4), says merely: "The initiated know what I mean." When Chrysostom was writing to pope Innocent I. an account of a tumult in the church at Constantinople, in which the sacred cup was upset, and the consecrated elements spilled, he says, without reserve, "The blood of Christ was spilled." But Palladius, the deacon, in his life of Chrysostom, which was designed for the pagans as well as for the Christians, takes the precaution to use the words "the symbols which are known to the faithful." Still more curiously, Epiphanius, in citing the well-known words of the eucharistic formula, "This is my body," suppresses the word under which the mysterious idea is contained, and writes, "This is my *that thing*," *Touto mou esti tode*. A very curious example of this amphibological language regarding the eucharist will be seen in a Greek inscription discovered some years since at Autun, in France.—(See *Edin. Rev.*, July, 1864.)

There is some uncertainty as to the period during which this discipline lasted in the church. It commenced most probably in the time of Justin, as his contemporary, the heretic Marcion, is known to have protested against it as an innovation (Neander's *Kirchen-geschichte*, i. 540). It is even thought not impossible by some that Justin's mode of writing was an exceptional one, and that the secret may have been in use before his time. On the other hand, it is certain that it outlived the period out of the condition of which it arose, and was maintained long after the ages of persecution. The traces of it had not entirely disappeared in the 6th century.—(See Schelstrate, *Diss. de Discip. Arcani*, 1685; Schollmer, *Diss. de Discip. Arcani*, 1756; and on the Protestant side, Tenzel, *De Discip. Arcani* (in reply to Schelstrate); Rothe, *De Disc. Arcani*, Heidelberg, 1831.)

SECRETARY, **SECRETARY FALCON**, **SECRETARY BIRD**, or **SERPENT-EATER**, *Gypogeryon*, a genus of birds of prey, which has been variously placed by naturalists among the *falconide* and the *vulturide*, and has been also constituted into a distinct family, *gypogeryonide*. The legs are very long, as in the *gralle*, to which, however, there is no other resemblance. The *tibiæ* are completely feathered, but the *tarsi* and toes are destitute of feathers. The *tarsi* are covered in front with long, large scales. The toes are armed with sharp claws; but they are short, and the feet are not formed for grasping. The hind toe is very short. The neck is much longer, and the whole form of the bird more slender than in the *falconide*. The wings are long, and armed with a blunt spur at the shoulder. The tail is very long. The best-known species is an inhabitant of the arid plains of South Africa. It is about 3 ft. in length; the plumage bluish-gray. It has an occipital crest of feathers without barbs at the base, which can be raised or depressed at pleasure, and the name secretary was given to it by the colonists at the cape of Good Hope from their fancied resemblance to pens stuck behind the ear. It feeds chiefly on reptiles of all kinds, which it devours in great numbers, and is so highly valued on account of the constant war which it wages against serpents, that a fine is inflicted in the Cape Colony for shooting it. It fearlessly attacks the most venomous serpents, stunning them with blows of its wing, also seizing and carrying them into the air to such a height that they are killed by the fall. It uses its feet also to overpower its prey, striking violent blows with them. Small serpents are swallowed entire: the larger ones are torn to pieces. The secretary is most frequently seen in pairs, or solitary. It is tamed as a protector of poultry-yards; but if not sufficiently fed, is apt to help itself to a chicken or duckling. An attempt has been made to introduce this bird into Martinique, in order to reduce the number of venomous serpents in that island.—Another species of secretary appears to exist in more northern parts of Africa, as about the Gambia; and a third, more widely different, in the Philippine islands.

SECRETARY. The chiefs of the executive departments of the United States government, forming the cabinet, are termed secretaries, except in the case of the post-office department and the department of justice. They are the secretary of state, whose charge is the foreign relations of the government; the secretary of the treasury, who has charge of the national finances, including the customs revenue; the secretary of war, who has in charge the U. S. army and controls its disposition—under the direction of the president, who is commander-in-chief of the army and navy—and who has charge of all forts and all military movements; the secretary of the navy, who bears a similar relation to the naval force; and the secretary of the interior, in whose charge are the Indian tribes, government lands, pensions, the patent office, and bureau of education. These officials are appointed by the president and confirmed by the senate. They report annually, and as much oftener as required, to the president, who lays their reports before congress. The salary of each of the heads of departments is \$8,000 per annum. Each is subject to removal by the president, whenever in the judgment of the latter the interest of the government shall so demand. During the administration of president Johnson the power of removal was taken from him by what was known as the tenure-

of-office act, which was applied in the case of secretary-of-war Stanton, whom the president had removed from office. The difficulty resulted in the impeachment of the president and his acquittal; when secretary Stanton resigned. See MINISTER—MINISTRY.

SECRETARY OF EMBASSY or of LEGATION, the principal of the persons belonging to the suite of an ambassador or envoy. Secretaries of embassy or legation hold their commission immediately from the sovereign, who nominates them in general only to ministers of the first and second rank. They are therefore considered a species of public minister; and independently of their attachment to an ambassador's suite, they enjoy in their own name all the privileges and protections of the diplomatic character. They are generally presented in person to the foreign sovereign at whose court they are accredited. The functions of a secretary of embassy or legation consist principally in assisting the chief in the business of the embassy. Moser (*Versuch Th. iii. p. 94*) says: "An ambassador is often only like the hands of a watch, while his secretary resembles the works." Secretaries of embassy and legation occupy the post of ambassadors and envoys during the absence of their ministers. A secretary of embassy or legation must not be confounded with the private secretary of an ambassador appointed and paid by him, who has none of the privileges and immunities above mentioned.

SECRETARY OF LEGATION. The title of the second diplomatic official accompanying full missions to foreign courts, and who fulfills the duties of the minister in his absence. Such officials are sent by the United States to the courts of Great Britain, Russia, France, Spain, Germany, Austria-Hungary, Italy, Japan, China, Mexico, Brazil, and Turkey; at the last-named court, supplying also the functions of consul-general. The foreign countries having secretaries of legation at Washington are: Argentine republic, Austria-Hungary, Belgium, Brazil, Chili, Colombia, France, Great Britain, Hayti, Mexico, Peru, Russia, Spain, Sweden and Norway, Turkey, China, Japan.

SECRETARY OF THE NAVY is the conventional title of the parliamentary secretary to the board of admiralty. This post is conferred on a ministerial supporter, in the house of commons, in which, when the first lord of the admiralty is a peer, he is the exponent of naval policy. He changes of course with the ministry, of which he is a subordinate member; and receives a salary of £2,000 a year. There is also a permanent secretary, who holds office for life, and receives £1700 a year. He is responsible for the discipline of the admiralty office. This appointment is of long standing, and was held by the celebrated Mr. Secretary Pepys.

SECRETARY OF THE SENATE. This official is elected by the U. S. senate, and his duties are those which usually appertain to the secretary of any organized body: viz., to keep the journal of the senate, communicate messages to the house of representatives and the president, etc. From the first session of congress in 1789 to 1850, there were but four secretaries: Samuel Alyné Otis, who served more than 25 years; Charles Cutts, who served 11 years; Walter Lowrie, who served 11 years; and Asbury Dickens, who served 14 years. Col. John W. Forney was secretary of the senate 1861–69, when he resigned and was succeeded by George C. Gorham. The present incumbent (1881) is John C. Burch.

SECRETARY OF STATE, an ancient and important office in the government of England. The oldest record of its existence is in the reign of Henry III., when John Maunsell is described as "secretarius noster." Prior to the restoration, the holder of this office was generally styled the "king's chief" or "principal secretary;" he had the custody of the king's signet, and discharged his duties with the assistance of four clerks. Two secretaries are said to have been first appointed toward the close of the reign of Henry VIII. The office, always one of influence, gradually grew in importance. On the union of 1707, Anne added a third secretary of state for Scotland, which office, however, was soon done away with. In the reign of George III. there were at first but two secretaries; for a time there was a third for America, but his office was abolished by statute in 1782. While the secretaries were two in number, both equally directed home affairs; to the one were committed the foreign affairs of the northern, to the other of the southern department. Irish affairs belonged to the province of the elder secretary.

There are now five principal secretaries of state, who are respectively appointed for home affairs, foreign affairs, war, the colonies, and India. They are all appointed by the sovereign by the mere delivery of the seals of office, without patent, and are always members of the privy council and of the cabinet. Though each has his own department, he is considered capable of discharging the duties of the others; a member of the house of commons, if removed from one secretaryship to another, does not thereby vacate his seat.

The secretary of state for the home department has the charge of the maintenance of the internal peace of the United Kingdom, the security of the laws, and the administration of justice, so far as the royal prerogative is involved in it. He directs the disposal and employment of the regular troops at home, and provides for the suppression of riots. The militia, yeomanry, and volunteers are entirely under his control. He has the ultimate supervision of all that relates to prisons and criminals; and numerous statutory powers have been given him regarding police, sanitary matters, the regulation of labor, etc. All patents, licenses, dispensations, charters of incorporation, commissions of the

peace and of inquiry, pass through his office. He recommends persons to the sovereign for civil knighthood, and is empowered to grant certificates of naturalization (q.v.) to foreigners. He is the organ of communication between the cabinet and the viceregal government of Ireland, for which he is responsible, and is informed of and advises all the graver measures adopted in that country. His patronage is very considerable, including the nomination to a large number of judicial offices. Among the powers of the secretary of state is that of committing persons on suspicion of treason, a function which, though its legality has been called in question, has been often exercised.

The secretary of state for foreign affairs is the responsible adviser of the crown in all communications between the government and foreign powers. He negotiates treaties, either directly with the foreign ministers resident in the country, or through the British ministers abroad. It is his duty to inquire into the complaints of British subjects residing in foreign countries, to afford them protection, and to demand redress for their grievances. The foreign secretary recommends to the sovereign all ambassadors, ministers, and consuls to represent this country abroad. He grants passports (q.v.) to British subjects and naturalized foreigners.

The secretary for the colonial department has the supervision of the laws and customs of the colonies, watches over their interests, directs their government, apportions the troops necessary for their defense or police, appoints the governors of the colonies, and sanctions or disallows the measures of the colonial governments; rarely, however, prescribing measures for their adoption.

Each of these four secretaries of state is assisted by two under secretaries of state nominated by himself—one usually permanent, while the other is dependent on the administration in power.

The secretary of state for India, whose office dates from the abolition in 1858, of the double government of India by the court of East India directors and board of control, has the same control over the government of India which was formerly exercised by these bodies, and countersigns all warrants and orders under the sign-manual relating to India. He is assisted by an under-secretary, who is also a member of the legislature, and loses office with the cabinet, and by a permanent under-secretary and assistant-secretary, as also by a council of fifteen members, over whom he presides. Every order sent to India must be signed by the secretary, and all dispatches from governments and presidencies in India must be addressed to the secretary.

There is also a chief secretary for Ireland, resident in Dublin, except during the sitting of parliament, and under the authority of the lord-lieutenant. His office resembles that of a secretary of state, but he is generally called secretary to the lord-lieutenant. He is assisted by an under-secretary.

The secretary of state for war (see SECRETARY-AT-WAR) has the superintendence of all matters connected with the army, assisted by the commander-in-chief, and is responsible for the amount of the military establishment. He prepares for the royal signature and countersigns commissions in the army, and recommends to the sovereign for the order of knighthood of the bath.

SECRETARY AT WAR, formerly a high officer of the British ministry, had the control of the financial arrangements of the army, and was the responsible medium for parliamentary supervision in military affairs. In the times of the Tudors, the war business of the country appears to have been transacted by the department of the secretary of state. The formation of a war office proper took place about 1620. The office rose in importance as the army increased; but was limited to financial authority, neither the commander-in-chief nor master-gen. of the ordnance being subject to it. At length, during the Russian war, the evils of this divided authority led to the creation of a secretary of state for war, to control all the military departments. The secretaryship-at-war was merged in this superior office in 1855, and though for some years preserved technically as a separate appointment held by the secretary of state, was abolished by act of parliament in 1863.

SECRETION is the term employed in physiology to designate the process of *separation* of those matters from the nutritious fluids of the body which are destined not to be directly applied to the nutrition and renovation of its organized fabric, but (1) to be either at once removed as injurious to its welfare, or (2) to be employed for some ulterior purpose in the chemical or physical processes of the economy itself, or to exert some kind of action upon other beings. For this definition of secretion considered as a process we are indebted to Dr. Carpenter; but the reader must bear in mind that the term is also very commonly used in another sense—namely, to designate the *products* which are thus secreted. In this latter sense, it is customary to speak of the biliary, urinary, or cutaneous secretion, when the bile, urine, and sweat are indicated.

Although it is impossible to divide with strictness the secreted products (as many physiologists have attempted to do) into the *excrementitious* and the *recrementitious*—that is to say, into (1) those which have no further function to discharge in the animal body, and which, if not excreted, would act as poisons, and (2) those which are subservient to further uses in the system—yet we may group them according to the preponderance of their excrementitious or recrementitious character. Dr. Carpenter approves of this mode of arrangement, and proposes that those secretory processes should be arranged in the first division in

which the depuration of the blood is obviously the chief end, while those should be classed under the second in which the ulterior purpose of the separated fluid would seem to be the principal occasion of its production; and he further suggests a subdivision of this second group, according as this ulterior purpose is connected with the operations of the economy itself, as in the case of the tears, and the saliva, the gastric juice, etc., or is destined to act on some other organism, as is the case with the secretion of the testes, the milk, etc. The organs which yield the various secretions are termed glands (q.v.); but neither the form nor the internal arrangement of the parts of a gland have any essential connection with the nature of its product; the true process of secretion, under whatever form it may present itself, being always performed by the intervention of cells (q.v.). For a notice of the mode in which the cells are arranged in various glandular structures, the reader is referred to the articles GLAND, LIVER, KIDNEY, MUCCOUS MEMBRANE, etc.

We shall now briefly notice the causes which render the due performance of the functions of secretion essential to the well-being of every animal. 1. Nearly all the solids and fluids of the body are liable to continuous decomposition and decay in consequence of their peculiar chemical composition. There is an obvious necessity that the products of incipient decomposition should be carried off and replaced by newly-organized matter. 2. The exercise of the various animal functions is essentially destructive to the structures by which they are accomplished; every operation of the muscular or nervous system appearing to require, as a necessary condition, a disintegration or breaking up of a certain portion of their tissues, probably by an act of oxidation. Hence, for the due preservation of health, the disintegrated or effete matters must be removed and their place supplied. 3. When more food is taken than the wants of the system require, all that is not appropriated to the reparation of the waste, or to the increase in the weight of the body, must be thrown off by the excretory organs without ever having become converted into organic tissue. If this excess were not speedily removed by the excretory organs, the current of the blood would speedily become poisoned.

The following may be regarded as a tolerably complete list of the substances which are produced within the organisms of man and the lower animals by the disintegration of its various tissues, and which are met with in one or other of the products of secretion: 1. Products of secreting processes, including *a*, the biliary acids and the products of their disintegration; *b*, the pigments of the bile; *c*, pigments allied to those of the bile and blood, viz., hæmatoidin and melanin; *d*, cholesterolin and its allies; *e*, the sugars and allied bodies. 2. Products of the actual regressive metamorphosis of tissues—*a*, nitrogenous amide-like bodies, such as leucine, tyrosine, creatine, creatinine, allantoin, cystin, guanine, sarcine, xanthin, and urea; *b*, nitrogenous acids, as hippuric, uric, and cyuric acids; *c*, indifferent nitrogenous bodies, such as the pigments occurring in the urine; and excretine; and *d*, non-nitrogenous acids, as acetic, benzoic, butyric, carbonic, formic, lactic, oxalic, succinic, and valerianic acids. Some of these products, however, only occur in the secretions in cases of disease.

SECRETIONS, VEGETABLE. In the vegetable kingdom the term *secretion* has a wider application than in the animal kingdom, and all substances which have been formed by the action of cells upon the compounds taken up as food (such as carbonic acid, water, and ammonia)—whether these substances form a part of the tissues of the plant, or are thrown out upon its surface—are equally considered as secretions. All the important vegetable secretions are compounds of carbon, hydrogen, oxygen, and nitrogen; sulphur being also present in some cases; and according to their functions they may be classed in two great divisions—viz., (1) nutritive or assimilable secretions, and (2) non-assimilable or special secretions.

1. The *nutritive* secretions are those substances which, having been formed within the plant, are used in forming its structures and constructing its general mass. The chief substances in this class are cellulose, the varieties of starch, the varieties of sugar, the oils, and the so-called protein or albuminous bodies. The composition of these substances is extremely varied; thus many of the volatile oils or essences contain only carbon and hydrogen; the sugars, starches, and cellulose contain carbon, hydrogen, and oxygen, and are named ternary compounds; while the protein bodies contain carbon, hydrogen, oxygen, and nitrogen, and in some cases sulphur.

2. The *non assimilable* secretions are only found in certain parts of the plant, and they receive their name from their never being converted into the nutritive secretions. The principal members of this class are the coloring matter of plants (chlorophylle and its modifications); the substances which, when extracted from plants, are of service as dye-stuffs (the *chromogens* or color-formers of recent chemists); the organic acids, which constitute a somewhat numerous group, and of which oxalic acid (occurring in rhubarb, sorrel, etc.), tartaric and racemic acids (in the grape), malic acid (in the apple and gooseberry), citric acid (in the orange, lemon, lime, and red currant), gallic acid (in the seeds of the mango), meconic acid (in the opium poppy), and tannic acid (in the bark of the oak, elm, etc.), may be taken as well-known examples; the vegetable alkalies or alkaloïds, such as morphia, strychnia, quinia, etc.; the volatile oils; and the resins.

SECRET SERVICE, under the U. S. government, a department or bureau, not created by law, nor recognized by specific appropriation for its cost. Its duties are not

defined, and vary with the necessities of the occasion which may create them. During the war of the rebellion this service was largely extended; its chief was a soldier with the rank of a brig.-gen. of volunteers, and its power and authority—under the government—were practically unlimited. This service is, since the close of the war, represented by the bureau of special agents of the revenue department of the U. S. treasury. These officials are charged with the investigation of suspected frauds in the collection of the revenue, either through fraudulent invoices, undervaluation, or false appraisement. They are authorized to inspect invoices and other records in the various custom-houses; and to investigate the books of mercantile houses, and require them to be brought into court for examination, on suspicion of fraudulent importation of goods.

SECRET WRITING, or SYMPATHETIC INK. See **INK.**

SECRÖLE, a small t. of British India, in the n.w. provinces, 3 m. n.w. of Benares, contains most of the civil establishments, the military cantonments, and the residences of most of the British population connected with Benares. The residences or bungalows are handsome and substantial, but are scattered about among the groves and gardens which surround the military cantonments. The latter, which are capable of containing three or four regiments, are traversed by a small stream, the Burnah Nuddee. Among the public buildings are a Christian church and chapel, a court of justice, the treasury, the jail, and a mint. Secrole, which may be considered as the British quarter of Benares, was the headquarters of the Benares division of the Bengal army, and here, on June 4, 1857, the 37th Bengal Native infantry, the 13th Irregular cavalry, and a portion of the Loodianah Sikhs, in all 2,000 men, mutinied; but being charged by col. (afterward brig.-gen.) Neill at the head of 240 men of the Madras and Queen's armies, and a few faithful Sikhs and Irregulars, they were compelled to take to flight with the loss of about 200 men, after killing two of their own British officers and two privates of Neill's force.

SECTION, in architecture, the delineation of buildings on a vertical plane through any part of them—as a *plan* is the horizontal projection. Sections are of great use in practice in showing the thickness of walls, the construction of floors, roofs, etc., and the forms and dimensions of every part of the interiors of buildings. Sections may also be used to show the furniture, drapery, etc. of rooms. These are called furnished sections. All moldings, cornices, etc., are drawn in section or profile, full size, for the guidance of the workmen.

SECTOR, in *geometry*, is a portion of a circle included between two radii and the intercepted arc of the circumference. The area of a sector is equal to that of a triangle whose base is equal in length to the intercepted arc, and whose perpendicular height is equal to the length of the radius.

SECTOR, in *practical mechanics*, an instrument of considerable utility in rough mathematical drawing, consists of two strips of wood, ivory, or metal jointed together like a carpenter's foot-rule. It is absolutely necessary for the correctness of the instrument that the center of the axle of the joint should be accurately at the inner corner of each slip, so that it will always be the vertex of a triangle of which the inner edges (and consequently any of the corresponding pairs of lines drawn from the joint obliquely along the rule) form the two sides. These oblique lines, which are drawn on both sides of the instrument, and converge from the extremities of the two strips to the center of the joint, are graduated in different ways, so as to give, on each limb, a line of equal parts, a scale of chords, scales of sines, tangents, and secants, a line of polygons, etc. (all of which are graduated from the center of the hinge, which is their zero point), besides a number of common scales on the blank portions of the sector. The special use of this instrument is in the finding of a fourth proportional to three given quantities, and the operation is performed as follows: If the fourth proportional to 18, 16, and 81 is required, find the graduation indicating 18 on each limb; then obtain, by means of a pair of compasses, the length from 0 to 16, and open out the instrument till the two 18 points are as far apart as the distance given by the compasses; then, by measuring with the compasses the distance of the two graduations indicating 81, and applying the compasses to the scale, we obtain the fourth proportional required. It will be seen that this instrument merely supplies a mechanical mode of constructing two similar isosceles triangles, one of which has all its sides, and the other has only its equal sides given, the other side or base, which is formed by the sector, and read off by aid of the compasses and scale, being, from the very nature of similar triangles, the fourth proportion required. This instrument becomes more inaccurate as the angle formed by the limbs increases. The sector is said to have been invented by Guido Ubaldo about 1568, though Gaspar Mordente of Antwerp describes it in 1584, and attributes its invention to his brother Fabricius in 1554. It was described by several German and English writers in the same century, and again by Galileo, who claimed to have invented it in 1604.

SECULAR CLERGY. See **CLERGY.**

SECULAR GAMES, a Roman festival held at distant but indefinite periods, and deriving the name from the word *saeculum* (an age). They were also called *ludi Tarentini*, from Tarentum, a place in the Campus Martius, where the games were held. Proserpina and Dis were the divinities in whose honor the festival was instituted; but the

worship was not confined to them. It is said that the *ludi sæculares* were celebrated only eight times under both the republic and the empire.

SECULARISM is the term applied to a system of ethical principles begun to be advocated about 1846 by G. J. Holyoake. As the system has a considerable number of adherents, and comes not seldom into public notice, a brief account of its leading doctrines is here given. As in similar cases, we allow a believer in the doctrines to speak for himself.

The secular is defined as that which pertains to this life, and is treated as a thing apart; as independent of, rather than as necessarily opposed to, any other mode of thought and duty. Secularism, as regards opponents, claims that to ignore is not to deny. As the geometrician ignores chemistry or metaphysics, without a thought of denying them, so secularism, which concerns itself with this world, refuses to be held as conflicting with that "other-worldliness," which, if demonstrable, must be based on an experience to which secularism makes no pretension, and toward which it considers itself to incur no responsibility. Secularism commences by laying down the proposition that intelligent sincerity is sinless. It does not maintain that even intelligent sincerity is errorless, but that it is without conscious guilt, even when it is, as it may be dangerously mistaken. The conscience thus educated, thought may be intrusted to inquiry, and the search for truth may be begun.

Secularism takes the term free thought as expressing the central idea which it inculcates. It defines free thought as the unrestricted application of the powers of the intellect to any subject—the absence of any threat or penalty, legal, spiritual, or social, for the exercise of thought. The free thought it inculcates is not lawless thought; it is guided by methods of logic, limited by evidence checked at every step by experience, which is omnipresent, and corrected by the results of science. Free thought is not the rebellion but the judicial action of the understanding. Reason—the faculty of following the pathway of facts—does not despise intuition, nor instinct, nor the voice of nature, nor authority; it uses, but revises them; it does not pretend to be infallible, but to be the best arbiter we have. To the conception of free thought is also necessary the free publication of opinion, for no one could profit by the thought of other minds unless it was freely communicated. Hence the diffusion of thought becomes an obligation on each thinker, and silence or supineness a social crime. Again, free thought that would command respect must be submitted to free criticism. Thought is often foolish, often mischievous, and sometimes wicked, and he alone who submits it to free criticism gives guaranties to society that he means well, since by criticism comes the exposure of false or foolish opinions; and the right of criticism is the sole protection of the public from error. Free thought must end in the free action of opinion, since he thinks to no purpose whose thought is inapplicable to conduct, and he withholds the sign of his own sincerity who does not unite his thought with action. Such is that education in free thought which secularism attempts.

It holds that skepticism is the pathway to affirmative truth. So far from being a crime, skepticism is scrutiny. So far from being the end, it is the beginning of inquiry—the first condition for the recognition of unknown truth. He who would be master of his own mind, and know what is in it, and who would have no principles there but those which are pure, true, and reliable, must refuse to believe anything until he is compelled to believe it; it being no more safe to keep one's mind open to all notions, than to keep one's door open to all comers. It is clear that the use of free thought may be a nuisance, a terror, or an outrage, unless courtesy takes care of it. Therefore secularism provides that advocacy shall be directed to the exposure of error and the elucidation of truth, without moral imputation upon those whose opinions are controverted; and contends that all advocacy, wanting in consideration toward others, shall be regarded as a crime against free thought. The quality of the thought, and not the motive of it, is the proper and sufficient subject of discussion.

Secularism further imposes upon the action of free thought the limit that every one shall concede to others the liberty he claims for himself, and shall permit to others, and shall recognize in each individual, "liberty of action in all things by which others are neither injured nor damaged." Secularism, regarding the one object of all free thought as the attainment of truth, finds in the study of nature its immediate sphere of exercise. Free thought is prompted by a desire to fathom the knowable; and nature and human life are the immediate sources of truth and duty, which it most concerns man to master. Therefore, respect for this life, respect for pure physical conditions, respect for the moral capacity of human nature, are conditions of secular belief. Secularism is not committed to denying that there is other good—it does not meddle with that question; it says whether there be other good or not, the good of the present life is good, and it is good to seek that good. It holds that the secular is sacred, and seeks "to find that material condition in which it shall be impossible for man to be deprived or poor." It does not say that all things are material, or that there are no spiritual agencies; it does not enter upon these propositions, but confines itself to showing that there are material agencies in this life, whatever else there may be, and that these, as far as they can be discovered, are the calculable forces of the world, which cannot be neglected without folly or hurt, and that it is wisdom, mercy, and duty to attend to them. — Without enter—

ing upon the question of the interference of Providence, secularism contends that science is practically the providence of life; that conscience is higher than consequence; that deliverance from calamity is more merciful than any system of consolation which only acts when calamity has occurred; and that it is not the pursuit of happiness, but the performance of duty, which is the end of life. Secularism proceeds in the path of positive philosophy, not seeking for errors but for truth; not busying itself with negations but with affirmations. In sacred writ it seeks for guiding truth and thought which commends itself to reason and experience, accepting the intrinsically true, without entering upon the vexed questions of inspiration or authenticity. Whatever principles secularism inculcates they are affirmative in their nature, relate to the welfare of humanity, and are determined by considerations purely human.

There is unquestionably a vast outlying class in every European country, and especially in our Indian territories, who are without the pale of Christianity. They reject it, they dislike it, or they do not understand it. Secularism is intended for these, and for all who find theology indefinite, or inadequate, or deem it unreliable. The object of secularism is to afford these classes a knowledge of principles addressed to their common reason and intelligence, by an appeal to principles of a secular nature, common to humanity in every state and clime. It may be a misfortune that the principles of theism, or the acceptance of the Bible, cannot be rendered promptly acceptable to them. Since, however, this is not the case, it must be of advantage to interest them in rules calculated for the moral guidance of their conduct. Upon these, Christianity may be, if shown to be tenable, subsequently superinduced. The principles of secularism are intended to constitute an education of the working classes, which begins with their reason, grows with their intelligence, and ends only with death.

Secularism is not an argument against Christianity, it is one independent of it. It does not question the pretensions of Christianity; it advances others. Secularism does not say there is no light or guidance elsewhere, but maintains that there is light and guidance in secular truth, whose conditions and sanctions exist independently, act independently, and act forever. Secular knowledge is manifestly that kind of knowledge which is founded in this life, which relates to the conduct of this life, conduces to the welfare of this life, and is capable of being tested by the experience of this life. Geometry, algebra, botany, chemistry, navigation, political economy, ethics, are secular subjects of instruction (distinct albeit from secularism, which includes the education of the conscience). They are founded in nature, they relate to the uses of this life, promote the enjoyment of this life, and can be tested by personal experience. That which is secular can be tested in time; that which is theological is only provable after death. If a sum in arithmetic is wrong, it can be proved by a new way of working it; if a medical recipe is wrong the effect is discoverable on the health; if a political law is wrong, it is sooner or later apparent in the disaster it brings with it; if a theorem in navigation is erroneous, delay or shipwreck warns the mariner of the mistake; if an insane moralist teaches that adherence to the truth is wrong, men can try the effects of lying, when the disgrace and distrust which ensue soon convince them of the fallacy; but if a theological belief is wrong, we must die to find it out.

The standard of secularism is utilitarian. Utility is made the test of right, not the utility which is sensual and selfish, but that which takes into account the highest attributes and noblest aspirations of humanity (see UTILITARIANISM). It is not the agent's own happiness, but the happiness of others which the utilitarian is bound to promote. The adoption of this rule makes intelligence a necessity. Secularism is not skeptical. It seeks everywhere positive truth, and regards doubt as a difficulty and a danger. It is not infidel, for that is a state of mind treacherous to the truth, and truth is the first thing to which secularism teaches allegiance. It is not atheistic, atheism being alien to secularism, which concerns itself with the affirmative. Secularism might call itself religious, if it were allowable to use the term without including some distinctive theory of theism, which is equally excluded from the subject-matter of secularism, as not coming within the region of positive knowledge. Nothing in secular morals can be insisted upon with effect, save those statements which appeal to the common experience, and with which you can dare the judgment of mankind; but if that may be called religious, which appeals to demonstrative intelligence, which addresses itself to the conscience, which inculcates love, and truth, and justice; which claims service and endurance from all men; which places happiness in duty, and makes the service of humanity the one object of life, and the source of consolation in death, then secularism may be so defined, and in this sense it has been described in the following definitions:

Secularism is the religion of the present life: it teaches men to seek morality in nature, and happiness in duty; guiding the conduct and educating the conscience of those who do not know, or who, from conscientious conviction, stand apart from Christianity. Secularism teaches a man to acquit himself well in this world as the purest act of worship, to study the truth, to judge by reason, to regulate human interests by considerations purely human, and to act on that rule of utility which conduces to the greatest good of others; thus endeavoring to deserve another life by the unceasing, unrelenting pursuit of duty in this.

SECUNDERABAD (more correctly Sikandarábád), a large t., and an important British military cantonment in the Nizam's dominions, India, 6 m. n. of Haiderábád. On the

n.e. are two singular granite hills, large, hemispherical in shape, completely isolated, and having on their summits the tombs of fakirs, which are visited by a great number of pilgrims each year. The cantonment consists of a curved, irregular street, 3 m. in length, with the officers' houses ranged on either side. There are numerous barracks, and good hospital accommodation. There are numerous tanks in the vicinity, and the water is good. The mean annual temperature is $81^{\circ} 30'$, and the climate is unhealthy—though less so now than formerly—during the rainy season. Pop. of Secunderabad, 40,000.

SECURITY, in law, means some deed affecting real or personal estate, the object of which is to secure the payment of a primary debt. Such are bonds (q.v.) and mortgages (q.v.).

SEDA'LIA, a city in central Missouri, co. seat of Pettis co.; pop. about 9,000. It is 40 m. s. of the Missouri river, 189 m. w. of St. Louis; at the junction of the Missouri Pacific railroad, the Lexington branch, and the Kansas and Texas railroads. It is on the level prairie, is adorned with trees, and has a court-house, a brick high-school building, erected at a cost of \$40,000, 11 churches, 3 banks, and 7 newspapers. It contains a public library, a gymnasium, and reading-room, several hotels, an opera house; is lighted by gas and supplied with water by the Holly system, at a cost, for the works, of \$125,000. It has two banks with an aggregate capital of \$500,000, and a grain elevator. Among the manufactories are railway-car and machine-shops, iron-foundries, and factories for the manufacture of agricultural implements, machinery and wagons, flour and woolen goods, and brooms. It is the center of a fertile region, and has an important and constantly increasing trade. In the vicinity are rich coal mines.

SEDAN, a manufacturing t. and frontier fortress of France, in the dep. of Ardennes; pop. in '76, 15,862. In 1645 Colbert founded here the first of his famous cloth-factories; and the fabrics of Sedan have now a European reputation, and employ many hands. There is also extensive industry in various branches of metallurgy; and there are coal and iron mines in the vicinity. The fortress of Sedan has played a considerable part in military history; and it has recently become noted as the place where (Sept. 2, 1870), Napoleon III. and an army of 90,000 men surrendered to the Prussians.

SEDAN CHAIR, a portable covered vehicle for carrying a single person, borne on two poles by two men. The name is derived from the town of Sedan, in the n. of France, where this species of conveyance is said to have been invented. It is said that the duke of Buckingham was in the practice of using one in the reign of James I., a proceeding which gave general offense, it being made matter of public remark that this royal favorite used his fellow-countrymen to do the work of beasts. The general introduction of sedan chairs into England dates from 1634, about the same period that hackney coaches came into use. Sedan chairs were largely used during the greater part of last century, being found very well adapted for transporting persons, in full dress, to public and private entertainments. Not only were there numerous public conveyances of this kind in London and all considerable towns, but the owner of every large mansion had his private sedan handsomely fitted up. In Edinburgh, a century ago, sedan chairs were far more numerous than hackney coaches, and were almost all in the hands of Highlanders. Sedans are now seldom seen except for the transport of the sick.

SEDATIVES are medicines which exert a direct or primary depressing action upon the vital powers, without inducing any subsequent excitement. The disease in which sedatives are employed are chiefly those of over excitement of the nervous and circulating systems; and as some of the members of this class (hemlock, for example) act directly on the nervous system, while others (foxglove, for example) more immediately act upon the heart, it is necessary to be able to determine the kind of sedative suitable for each individual case. Inflammatory fever presents all the conditions in which sedatives are likely to be of service. "The excited heart, elevated temperature, hard and unyielding pulse, and the disordered state of the special nerves call for the administration of remedies fitted to appease their excited energy, and the great improvement which, in such a case, follows the use of *blood-letting*, *tartar emetic*, and *digitalis* bears evidence to the correctness of our practice." (Ballard and Garrod's *Elements of Materia Medica*, p. 11.) The following are the most important members of this class: aconite, carbonic acid (applied locally in cases of irritable bladder or womb, or to painful ulcers), chloroform (especially when inhaled), conium, digitalis, hydrocyanic acid, and tobacco.

SEEDGE. See CAREX.

SEDGWICK, a co. in s. Kansas; drained by the Arkansas, Little Arkansas, and Ninne Seah rivers; on a branch of the Atchison, Topeka, and Santa Fé railroads; about 1000 sq.m.; pop. '80, 18,753—17,176 of American birth. The surface is level. The soil is fertile. The principal productions are wheat, corn, and cattle. Co. seat, Wichita.

SEDGWICK, an American family, distinguished in politics, law, and literature.—THEODORE SEDGWICK, statesman and jurist, was b. at Hartford, Conn., May, 1746. He was descended from Robert Sedgwick, a maj.gen. of the army of Cromwell. Educated at Yale college, he adopted the profession of law, and removed to the western part of Massachusetts, where he was a member of the colonial assembly. Though a loyalist in

feeling, at the outbreak of the American revolution he took the part of his country, and served as an aid-de-camp to gen. Thomas in the unfortunate expedition to Canada. In 1785 he settled at Stockbridge, Mass., where his descendants now reside, became a member of the continental congress, and took an active part in suppressing Shay's rebellion. He remained in congress as representative or senator until 1799, and in 1802 was appointed judge of the supreme court of Massachusetts, and was a prominent member of the old federalist party, and an early opponent of slavery. He died at Boston, Jan. 24, 1813.—THEODORE SEDGWICK, American lawyer and writer, son of the preceding, was b. at Sheffield, Mass., Dec., 1780. Like his father he was bred to the legal profession, and in 1801 settled at Albany, N. Y., where he remained in successful practice until 1821, when he retired to Stockbridge, advocating, as a popular speaker, the interests of a scientific agriculture, free trade, temperance, and antislavery, and wrote *Public and Private Economy, Illustrated by Observations made in Europe in 1836-37* (3 vols. 12mo, New York, 1838). He died of a stroke of paralysis, after making a public speech at Pittsfield, Mass., Nov. 7, 1839.—SUSAN RIDLEY SEDGWICK, wife of the preceding, descended from an old English border family, and proud of her relationship to bishop Ridley, was a daughter of William Livingston, governor of New Jersey. She is the author of *The Morals of Pleasure* (1829); *The Young Emigrants*, and *The Children's Week* (1830); *Allan Prescott*, a novel (1834); *Alida* (1844); and *Walter Thornby*, a novel, written in 1859, when she was more than 70 years old.—CATHERINE MARIA SEDGWICK, American authoress, daughter of judge Theodore Sedgwick, and sister of the second Theodore Sedgwick, was b. at Stockbridge, near the close of the eighteenth century. In 1822 she published *A New England Tale*, which was followed, in 1824, by *Ridwood*, a novel, so popular that it was reprinted in England, and translated into several of the continental languages. This was followed by *Hope Leslie*, or *Early Times in America* (1827); *Clarence*, a *Tale of our Own Times* (1830); *Le Bossu*, and *The Lincolns* (1835); and these by a series of popular stories, illustrating morals and domestic economy, entitled *The Poor Rich Man and the Rich Poor Man; Live and let Live; Means and Ends; Home*, etc., and contributed a "Life of Lucretia Maria Davidson," to Sparks's *American Biographies*. In 1841, on her return from Europe, she published *Letters from Abroad to Kinred at Home*; in 1845 *Wilton Harvey and other Tales*; followed by *The Morals of Manners*, and *Married and Single*. She also edited and was an active contributor to some of the leading American periodicals. Died July 31, 1867.—THEODORE SEDGWICK, an American lawyer, son of the second Theodore Sedgwick, was b. at Albany Jan. 27, 1811, was educated at Columbia college, and admitted to the bar in 1833; and, excepting three years spent at Paris, as secretary of the American legation, continued in successful legal practice until 1850, when he again visited and made an extensive tour in Europe. He steadily declined to engage in politics, and refused all offices tendered him, until, in 1858, he accepted that of United States attorney for the southern district of New York. Among his writings are, a standard *Treatise on the Measure of Damages*; a work on *The Interpretation and Application of Statutory and Constitutional Law*; the *Memoirs of William Livingston*, his grandfather; *The Life and Works of William Leggett*, and various occasional addresses. He died at Stockbridge, Dec. 9, 1859.

SEDGWICK, ADAM, LL.D., 1785-1813; b. England; educated at Cambridge, where he became professor of geology in 1818. He made a geological trip through Scotland in 1827; and in 1829 through the continent with Murchinson, with whom he afterward had a sharp dispute in regard to the use of the words Cambrian and Silurian. He was an opponent of the theory of evolution. Among his works are *Discourse of the Studies of the University of Cambridge* (1850); and *A Synopsis of the Classification of the Paleozoic Rocks* (1855).

SEDGWICK, JOHN, 1813-64; b. Cornwall, Conn.; graduate of West Point, 1837; brevetted capt. for service in the Mexican war, and brevetted maj. for the attack on the San Cosme gate. He rose through successive grades to maj.gen. of volunteers, 1862. In 1737-38 he was in the Florida war, and engaged in the Cheyenne, Utah, Kiowa, and Comanche expeditions. In 1862 (war of the rebellion) he was assigned to duty on the upper Potomac, distinguished himself at Fair Oaks and Glendale; was wounded at the latter, and at Antietam, and on his recovery was placed in command of the 9th army corps. He led the 6th corps in the Chancellorsville campaign, carried the heights at Fredericksburg, and did good work at Gettysburg. In 1863 he was thanked in a general order for the capture of a confederate division at the Rapidan. He went through the hard fights of the Wilderness at the head of his corps, and was fatally shot at Spottsylvania.

SEDGWICK, ROBERT, d. 1656; b. England; settled at Charlestown, Mass., 1635, and for many years represented that town in the legislature. With John Winthrop, jr., he established, 1643-44, the first furnace in this country. Under authority from Cromwell, who afterward made him maj.gen., he drove the French from Penobscot in 1654, and accompanied the expedition which captured Jamaica.

SEDITION (Lat. *seditio*, from *se*, apart, and *ire*, to go), a general name given to such offenses against the state as fall short of treason. In the law of England it is not a strictly technical word. Writing, publishing, or uttering words tending to excite subjects to insurrection, though not urging them to rebellion or total subversion of the government, come under this denomination. There are various English statutes (as 39

Geo. III. c. 70; 57 Geo. III. c. 19; and 60 Geo. III. and 1 Geo. IV. c. 8) directed against particular acts of sedition, such as seditious libels, and seditious meetings or assemblies, which are punishable as misdemeanors. Act 36 Geo. III., directed against all seditious practices and attempts tending to high treason, is extended to Ireland by 11 Vict., and additional provisions are added to it. By this latter act the compassing or devising, either to depose the queen; to levy war against the queen, for the purpose of changing her majesty's measures, or constraining or overawing parliament; or to move any foreigner to invade the queen's dominions, is made felony, punishable by transportation for life, or for a period not less than seven years, and that even though the facts should amount to treason.

In Scotland sedition is distinguished from leasing-making (q. v.), in so far as the object of the latter is to disparage the private character of the sovereign, while the former crime is directed against the order and tranquillity of the state. The punishment of sedition, formerly arbitrary, is now restricted to fine and imprisonment.

SEDLEY, Sir CHARLES, 1639-1701; b. England; went to London after the restoration, and stood high in the favor of Charles II. He was a town wit whose chief poetical pieces are brief amatory poems. He was a man of dissolute habits, and was once fined £500 for making a speech uaked to a mob from a balcony. He opposed James II., it is said, on account of the intrigue of the latter with his daughter.

SEDUCTION, in point of law, is the taking of an unmarried woman's chastity without marriage, and under circumstances of fraud. It is not a criminal offense unless violence is used, and resistance overcome, or the age of the female is under 21, in which cases the offense is rape (q. v.) or abduction (q. v.). In England, where no force has been used, no action at law can be maintained by the female seduced, however deceitfully the man may have acted. But if the female is a servant, either to her father or mother or a third party, then the master or mistress can sue the seducer, provided any loss of service has been caused by the seduction, such as her absence when lying-in of a child. Though, strictly speaking, the damages recovered by the master or mistress, in such a case, should be measured solely by the pecuniary value of the services lost, yet it is an inveterate practice for juries to give damages greatly beyond that amount, especially where the father or mother sues, and the conduct of the man has been base and heartless. In Scotland the woman can sue in her own right for damages if deceit has been used, but the difficulty of establishing that the deceit was the sole cause of the injury prevents such actions from being common. The remedy there more frequently resolves itself into an action for breach of promise of marriage, or for declarator of marriage, or for filiation and aliment.

SEDUCTION (*ante*). The common-law principles enunciated in the preceding article are in most states followed, but far less strictly than in the English courts. It is universally admitted that the requirement as to actual service is arbitrary and mischievous, and very slight evidence of such actual service is taken as affording a good ground on which to base the action (see PARENT AND CHILD, *ante*). Some states have done away entirely with the old distinction by enacting statutes making seduction an offense against the purity and happiness of the family relation, and giving a right of action to the head of the family, and, in a few cases, to the woman herself who has been seduced. An action lies by a husband against the seducer of his wife.

SEDUM, a genus of plants of the natural order *crassulacæ*, having the calyx in 4 to 8 (usually 5) deep segments, which often resemble the leaves, the same number of spreading petals, twice as many stamens, and 4 to 8 (usually 5) germens, each with a nectariferous scale at the base. The species are numerous, with succulent, often roundish, leaves; and pretty, star-like flowers. Many of them grow on rocks, whence the English name **STONE-CROP**. They are natives of the temperate and cold parts of the northern hemisphere; some are British. They have no important uses; some are refrigerant, others are acrid. Among the British species is *S. telephium*, popularly called **ORPINE**, sometimes used as a diuretic; and *S. aere*, the most common, whose brilliant yellow flowers adorn the tops of old walls, the débris around quarries, etc.

SEE (Lat. *sedes*, a seat), in ecclesiastical use, properly signifies the seat or chair (*cathedra*), sometimes also called "throne," of a bishop. Popularly, however, and indeed by universal usage, it is employed to designate the city, and thence, at least in popular language, the entire diocese, in which the seat of the bishop is placed, and over which, consequently, his episcopal jurisdiction extends. Sees have always been fixed, at least in their primitive establishment, in some city or considerable town; and it is to be observed that the name of a see is always taken not from the district governed by the bishop, but from the city or town. Sees *in partibus infidelium* (q. v.) still retain their ancient names, although in very many cases not merely the cities themselves, but even all traces of the Christian religion, in the sites upon which they anciently stood, have disappeared. In the Roman church the pope alone establishes sees, and alters their distribution and their local limits and boundaries; but these changes are not made except in extreme cases (such as that of the French revolution) without the consent of the actual bishop. In the Anglican church this is done by the authority of the legislature.

SEEBACH, MARIE, b. Riga, 1835; daughter of an actor; was educated at Cologne for the opera. She appeared in vaudevilles at Nuremberg and Cassel; and made a great success at Hamburg as Gretchen in Goethe's *Faust*, and as Clärchen in *Egmont*. She performed at Hanover, 1856-65. In 1866 she removed to Berlin with her husband, Albert Niemann, and in 1870 visited the United States.

SEED, in phanerogamous plants, that part which may in some measure be regarded as corresponding to the perfectly developed impregnated ovum of animals, and which is the utmost effort made by the plant for the reproduction of its species. It is the perfectly developed ovule (q.v.). While one cell of the interior of the nucleus (see OVULE) greatly enlarges, the other cells are forced back; the interior of the nucleus thus becomes a cavity (the embryo sac), and fecundation (q.v.) now taking place by means of the pollen, the primary cell is formed, which grows to form the *embryo*. As the fertilized ovule is developed into the ripe seed, the *foramen* (see OVULE) or *micropyle* closes completely; but its place is commonly marked in ripe seeds by a little cicatrix. In the ripe seed the integuments of the ovule, more fully developed, form the covering (*spermoderm*); while the *nucleus* is either entirely converted into the embryo (q.v.), or also into an inorganic cellular mass called the albumen (q.v.), which is, in an economical point of view, the most important part of many seeds, as of those of the cereal grasses. The embryo, which, with respect to the reproduction of the plant, is the most essential part of the seed, is developed to various degrees in different plants—which is also the case in different animals, and even in those of the same class, as in mammalia; but in general, the *radicle* may be distinguished in it—the beginning of the root or descending axis of the new plant, and the *plumule* or *gemmule*—the beginning of the stem or ascending axis, as well as the *cotyledon* or cotyledons, provided for the nourishment of the new plant in its youngest stage. When the embryo is accompanied with albumen, it is sometimes completely inclosed in it; sometimes it lies at the side of the albumen; and sometimes it surrounds the albumen like a ring, or even completely. Sometimes, but rarely, the embryo is not well developed in ripe seeds, so that its parts cannot be distinguished, as in the *orchideæ*, in which it appears as a roundish or oval, uniform, little cellular mass. In germination the embryo breaks through the covering of the seed, and develops itself into the new plant.

Seeds are either *sessile* or *stalked*. The stalk is of various length, and is formed of the *funiculus* or *umbilical cord*; the place at the base of the seed, by which it is affixed to the inside of the fruit, or to the end of the *funiculus*, being called the *umbilicus* or *hilum*. When the seed is perfectly ripe, it has no further need of connection with the parent plant, and the *funiculus* dries up, leaving the *hilum* a mere scar.

Besides being inclosed in a capsule, or in a succulent fruit, etc., the most essential parts of the seed have coverings of their own, which are reckoned as belonging to the seed itself. Its general covering is called the *spermoderm* (Gr. *sperma*, seed, *derma*, covering), which consists of an external membrane, the *testa* (Gr. shell) or *epispERM* (Gr. *epi*, upon) and an internal membrane, the *endopleura* (Gr. *endon*, within, *pleura*, side). Sometimes there is within the epispERM a fleshy layer, called the *sarcosperm* (Gr. *sarz*, flesh). The aril (q.v.) is a comparatively rare additional covering.

The seeds of phanerogamous plants afford characters which distinguish two great classes as *monocotyledonous* and *dicotyledonous* (see COTYLEDON). Very few plants have more than two cotyledons (seed lobes). It is the case, however, with some of the *coniferae*. Cryptogamous plants are also designated *acotyledonous*, as having no seed-lobes; and the name *spore* (q.v.) is distinctively given to their seeds.

Seeds retain their vitality very long; but the time seems to be very various with the seeds of different plants, and in different circumstances. The grains, or seeds of cereal grasses, are probably excelled in this respect by none; grains of maize found in the tombs of the Incas have been made to vegetate; and also, it is said, grains of wheat taken from Egyptian mummies, although of this there is some doubt. After the great fire of London in 1666, plants not previously common sprang up abundantly on the waste ground; certain plants previously unknown there are sure to appear after a fire in the American forests; and instances are constantly occurring of a deep trenching of land or a turning up of soil by railway or other operations, producing a crop of some kind of plant previously unknown or rare in the locality. Thus the writer of this article has seen plants of the milk thistle appear on rubbish thrown out from the foundation of a house in Peeblesshire, where there was no other milk thistle in the neighborhood. And in Paisley Moss, in Renfrewshire, willows spring up in the ditches which are cut for drainage, from the surface of the soil which underlies the moss or peat. It is difficult to conjecture how long the seeds, in such cases, may have retained their vitality.

Exposed to the air, however, seeds generally lose their vitality in a few years. Some kinds retain it much longer than others. Seeds which abound in fixed oil seem to lose it more quickly than others.

In conveying seeds from one part of the world to another, and through great diversities of climate, it is desirable to have them as closely secured from the air as possible. But it has been found that of seeds brought from the botanic garden at Calcutta to Scotland, round the cape of Good Hope, with no other care than would be used in sending a parcel from a seed-shop to a neighboring garden, the greater part readily vegetated.

SEE LAND (Dan. *Sjælland*), the largest and most important island of Denmark, lies between the Cattegat and the Baltic, and is separated by the sound from Sweden, and by the Great Belt from Fünen. Length, 78 m.; extreme breadth, 70 m.; area, 2,672 sq. m.; pop. '70 (including the two small islands Möen and Samsøe), 637,711. The surface is almost flat; the coasts, which are rock-bound on the s.e., are indented by bays and fiords, the chief of which is the Roeskilde-fjord in the north. The rivers are small, the largest being only 50 m. long; there are several lakes, and all the waters abound in fish. The island contains several beech-forests, is exceedingly fruitful in corn, and breeds excellent horses and cattle. Agriculture and cattle-breeding are the principal employments of the inhabitants. The chief place is Copenhagen (q.v.), the capital of the country, on the e. coast, and from this city lines of railway traverse the island to Elsinore in the n., and to Korsør in the s.w., on the coast.

SEELEY, JOHN ROBERT, b. London, 1834; educated at Cambridge. In 1863 he was appointed professor of Latin in University college, London, and in 1869 professor of modern history at Cambridge. His *Ecce Homo* published anonymously in 1865, excited great interest and called forth much discussion and many replies. Among his other works are an edition of Livy, *Roman Imperialism*, and a *Life of Stein*.

SEELYE, JULIUS HAWLEY, S.T.D., LL.D., b. Conn., 1824; graduated at Amherst college, 1849; studied theology at Auburn seminary and Halle, Germany; was ordained and became pastor of the First Reformed church, Schenectady, N. Y., in 1853. In 1858 he was elected professor of mental and moral philosophy in Amherst college. In 1872 he visited India and lectured to educated Hindus on the truths of Christianity. The lectures were published in Bombay, and also in Boston in a volume entitled *The Way, The Truth and The Life*. He has published also *Christian Missions*; also *Sermons and Addresses*, among them, a Massachusetts "Election Sermon;" contributed articles for reviews, and translated Schwegler's *History of Philosophy*. In 1874 he was elected a representative to congress as a candidate independent of both political parties, and was a zealous advocate of reform in the civil service and in the mode of dealing with the Indian tribes. In 1876 he was elected president of Amherst college, still retaining his professorship. He is a faithful worker in education, and an earnest and powerful preacher.

SEELYE, LAURENCE CLARK, D.D., b. Conn., 1837; graduated at Union college in 1857; studied theology at Andover seminary, 1857-59; at Berlin and Heidelberg, 1860-62. After traveling in Europe, Palestine, and Egypt, he was ordained and settled pastor of the North Congregational church, Springfield, Mass., in 1863; was elected professor of Greek and Latin in Amherst college in 1865; became president of Smith college for young women at Northampton in 1874, which position he still fills. He has contributed to several periodicals.

SEEMANN, BERTHOLD, PH.D., 1825-71; b. Hanover, Germany; became a distinguished naturalist, and in 1846 sailed with an English expedition which made the tour of the world and was absent for nearly five years. In this tour and in explorations of the Feejee islands and Nicaragua, 1860, he made many scientific discoveries of value. He published an account of the voyage of the *Herald*, and of three arctic cruises in search of Franklin; *Botanical Researches* (1852-57); and several other volumes.

SEER. See PROPHECY.

SEETZEN, ULRIC JASPER, 1767-1811; b. Holland; educated at the university of Göttingen, and in 1802, with the aid of the duke of Gotha, set out for the exploration of Asia and Africa. He spent 15 months at Aleppo learning Arabic, and traveled through Syria and Palestine, making valuable scientific collections. In 1805 he explored Lebanon and the country e. of the Dead sea. After exploring upper Egypt, and securing a collection of MSS. for the museum of Gotha, he visited Mecca in the disguise of a Mohammedan. He reached Mocha in 1810, and is said to have been poisoned in 1811. His diary and maps, recovered in 1815, were published in 3 vols. (Berlin, 1854).

SEGGAR, a vessel used by potters to protect delicate articles from the too fierce action of the fire in the kiln. See POTTERY.

SEGMENT (Lat. *segmentum*, a part cut off), is, in geometry, a portion cut off from a circle by a line, or from a sphere by a plane. When the angle subtended at the center of a circle by the segment, and the radius, or when the chord of the segment and its height, are known, the length of the arc of the segment and its area can be determined with as much accuracy as the circumference and area of the whole circle. See SPHERE.

SEGNO (Ital. *sign*), a word used in musical notation in connection with the marks of repetition. When a part is to be repeated, not from the beginning, but from some other point, the mark *sg* is placed over the point where the repetition is to commence, and the words *Dal Segno* (or *d. s.*) are written at the close of the part to be repeated.

SE'GO, an important t. of western Africa, capital of the state of Bambarra, stands on the Nigar, here called the Joliba, in lat. 13° 5' n., long. 7° west. Its streets, which are winding, have a breadth of from 24 to 26 ft., and are extremely clean. The palace of the king is large enough to accommodate 2,000 men and 500 horses. The houses are built of clay, and are flat roofed, and the royal residence differs from the other dwellings

only in size. The country in the vicinity is well cultivated, and the town is the seat of considerable traffic. Mungo Park, from whom we derive almost all the knowledge we possess of Segó, here first beheld the Joliba. Pop. estimated at 20,000.

SEGORBE, a small t. of Spain, in the modern province of Castellon, on the right bank of the Pañancia, in a valley renowned for the beauty of its scenery and for its amazing fertility, 20 m. n.w. of Murviedro. It stands on a hill between two castles, and contains stately houses, numerous churches, and a cathedral. Brandy distilling is carried on to a great extent, and there are flower and paper mills. Pop. 6,200.

SEGO VIA, an interesting city of Spain, capital of the modern province of the same name (see CASTILE), stands on the Eresma, by which it is nearly encircled, 47 m. n.w. of Madrid. It occupies the top of a rocky knoll, 3,300 ft. above sea-level, is surrounded by picturesque walls with round towers, and consists of narrow uneven streets, with old, quaint, and stately houses, 24 parish churches, and 21 convents. The Alcazar, or castle, is perched on the w. extremity of the rocky height, and was originally Moorish, but repaired magnificently in 1452-58. The cathedral of Segovia, a noble specimen of florid Gothic, is one of the finest in Spain. The present building was begun in 1525. The square cupola-crowned tower is 330 ft. high, and the prospect from this elevation is superb. The grand aqueduct of Segovia, supposed to have been built in the time of Trajan, is believed to be the most important Roman structure in Spain. It consists of two rows of arches, the one resting upon the other, from 2,500 to 3,000 ft. long, and 102 ft. high. There is a mint here for coining copper money. Wool-scouring and the manufacture of woollen fabrics are languidly carried on. Pop. 13,100.

Segovia was a place of importance during the time of the Romans; was the seat of immense cloth-manufactures in the time of the Moors, and was frequently the residence of the kings of Castile and Leon. Charles I. of England lodged at the Alcazar, Sept. 13, 1623, and supped on "certain trouts of extraordinary greatness." The unceasing town was sacked in 1808 by the French, under Frère.

The province of Segovia has an area of 3,460 sq. m., and a pop. '70. of 150,812.

SEGUIN, LEOCARD, 1812-80; b. France; educated at the colleges of Auxerre and St. Louis in Paris; studied medicine and surgery under Itard (q.v.), and was afterward associated with Esquirol. At Itard's suggestion Dr. Seguin, soon after graduating in medicine, undertook the training of a few idiot children. See IDIOCY. In 1846 he published a treatise entitled *Traitement moral, Hygiène et Education des Idiots et des autres Enfants arriérés*, which has always been the standard text-book on the subject. After the revolution of 1848, Dr. Seguin came to the United States, visiting the idiot school in South Boston and the institution for feeble-minded youth at Barre, Mass., and then went to Albany, where Dr. Willbur was organizing an experimental school which developed into the New York state idiot asylum at Syracuse, and rendered valuable assistance. He then went to France, and returned with his family in 1851, settling at Portsmouth, Ohio, to practice medicine. But he visited and taught at various idiot institutions in Connecticut, Ohio, Pennsylvania, and New York, and for a time was at the head of the Pennsylvania institution. He again went to France in 1858; returned to the United States again in 1859, and settled in practice at Mount Vernon, N. Y., from whence he removed to New York city in 1863, publishing *Idiocy and its Treatment by the Physiological Method* in 1866. He has also published *Théorie et Pratique de l'Education des Idiots* (Paris, 1842); *Hygiène et Education des Idiots* (Paris, 1843); *Images graduées à l'Usage des Enfants arriérés et Idiots* (Paris, 1846); *P. R. Periere, premier Instituteur des Sourds et Muets en France* (Paris, 1847); *Historical Notice of the Origin and Progress of the Treatment of Idiots* (translated by J. S. Newberry, M.D., 1852); *New Facts and Remarks Concerning Idiocy* (1869); an edition of *Wunderlich's Medical Thermometry*, with large additions (1871). He invented a physiological thermometer, which is in use among physicians.

SEGUR, the name of a French family, distinguished both in arms and letters. It is of Limousin origin, and was known there, it is said, as far back as the 9th century. The first, however, that specially merits notice was HENRI FRANÇOIS, comte de Segur (born 1689, died 1751), an able French gen. in the war of the Austrian succession. His son, PHILIPPE HENRI, marquis de Segur (born 1724, died 1801), fought in the seven years' war, obtained the dignity of *maréchal de France* in 1785, and retired in his retirement the stormy scenes of the revolution. The eldest son of this Philippe Henri was LOUIS PHILIPPE, comte de Segur (born 1753, died 1830), a vivid dashing sort of man, for some years ambassador at the court of St. Petersburg, and a great favorite with Catharine II. Of impressionable fancy, full of enthusiasm for the "philosophers," the "reign of reason," and the "new ideas" generally, he hailed the great revolution with delight, but took no prominent part in it. His public career during the empire was respectable, but not brilliant; but one notices with satisfaction that he retained in extreme old age that love of liberty that marked his early years; the last act of his life being an eulogium on the revolution of July. As a writer, Segur has in wonderful perfection the national graces of style and spirit. Among his numerous writings are: *Pensées Politiques* (Par. 1795); *Histoire de Frédéric Guillaume II.* (Par. 1800); *Contes, Fables, Chansons et Vers* (Par. 1801); and *Mémoires ou Souvenirs et Anecdotes* (Par. 1824). He left two sons, OCTAVE and PAUL PHILIPPE, the latter of whom (who was born in 1780)

was a gen. of the first empire, took part in the fatal expedition to Russia in 1812, and wrote the story of the campaign, *Histoire de Napoléon et de la Grande Armée pendant l'année 1812* (Par. 2 vols., 1824). The work has had an immense success, and has been translated into almost all the languages of Europe. Other works of the comte Paul Philippe de Segur are: *Lettre sur la Campagne du Général Macdonald dans les Grisons* (Par. 1822); *Histoire de Russie et de Pierre le Grand* (Par. 1829); *Histoire de Charles VIII., Roi de France* (Par. 1834); etc.

SEGURA, a river in the s.e. of Spain, rises in the Sierra Seca, and after an e.s.e. course of about 180 m., enters the Mediterranean 27 m. below Orihuela. Ships unload at its mouth.

SEICENTISTI, a name given to the Italian authors of the 17th c.; and, as that century was a period of literary decadence, the name has become a type for bad taste.

SEIDLITZ POWDERS are composed of 120 grains of tartrate of soda and potash, and 40 grains of bicarbonate of soda reduced to powder, mixed and inclosed in a blue paper, and 35 grains of powdered tartaric acid in a white paper. The contents of the blue paper are dissolved in from half a tumbler to a tumbler of water, and those of the white paper are then stirred in. The mixture should be taken while the effervescence from the liberation of the carbonic acid is still going on. These powders act as an agreeable and mild cooling aperient. If a stronger dose is required, either an increased quantity of the powder may be used, or a little sulphate of magnesia (about a dram) may be added.

SEIGNIOR, GRAND, a name sometimes given to the sultan (q.v.) of Turkey.

SEINE (anc. *Sequana*), one of the most important rivers of France, rises near Mont Tasselot, in the middle of the dep. of Côte-d'Or, and after leaving the northern boundary of that dep., flows w.n.v. through the deps. of Aube, Seine-et-Marne, Seine, Seine-et-Oise, Eure, and Seine-Inférieure, to the English channel, which it reaches at Havre, after a course of 479 miles. It passes the towns of Troyes, Mèry—where, 350 m. from its mouth, it becomes navigable—Corbeil, Paris, Elbeuf, Rouen, and Havre. The source of the river is about 1420 ft. above the level of the sea; but below Paris its current is slow, and its course to Rouen is marked by numerous windings. Its lower course also is marked by steep hills, which, while they are picturesque, are everywhere cultivated. The principal affluents are, from the right, the Aube, Marne, and Oise; from the left, the Yonne, Loing, Essonne, and Eure.

SEINE, the metropolitan dep. of France, completely inclosed by the dep. of Seine-et-Oise, is a portion of the former province of Île-de-France, and derives its name from that of its principal river (see *Seine*, river). It is at once the smallest and the most populous dep. in the empire; its area is 183 sq.m.; its pop. '76, 2,410,849, or 13,174 to the sq. mile. From s.e. to n.w., the dep. is traversed a distance of 37 m. by the winding Seine, which receives the navigable Marne at Charenton, and the Bièvre at Paris. The surface is marked by undulations and low hills, the highest of which, Mont-Valérien, is only 446 ft. above sea level. The climate is pleasant and healthy. The scenery—of which the woods of Verrières, Meudon, and Saint Cloud, together with those of Vincennes and Boulogne, transformed into parks, and watered by artificial rivers and lakes, are perhaps the most striking features—is remarkably pleasing. A net-work of canals and railways, the latter converging in the capital, afford easy means of transit in any direction. The soil is calcareous, and in the greater part, naturally infertile, but, owing to the skill of the farmers and gardeners, who obtain abundant supplies of manure from the metropolis, the country around Paris (q.v.) and its suburbs has been rendered remarkably productive. The culture of vegetables and fruits for the markets of Paris is one of the most important branches of husbandry. Enormous quantities of mushrooms are cultivated in the ancient quarries of Paris near Montrouge. Quarries abound and are productive.

SEINE-ET-MARNE, an inland department in the n. of France, is bounded on the e. by the department of Seine-et-Oise, and forms a portion of that wide basin in the middle of which stands Paris. Area, 2,214 sq.m.; pop. '76, 347,323. The department owes its name to the two chief streams that water it, and of which the Seine flows through the southern, and the Marne through the northern part. There are no mountains, but ridges of low hills separate the fertile and extensive though not deep valleys. Timber is grown in every part; and among the forests is that of Fontainebleau. The soil is generally fertile. Of cereals wheat is the principal crop. Vegetables and fruits are also largely grown, and the meadows and pastures, natural and artificial, are extensive and productive. The wines are mediocre in quality, but the grapes for the table, called the *Chasselas de Fontainebleau*, have a European reputation. The capital is Melun, and the arrondissements are Melun, Coulommiers, Fontainebleau, Meaux, and Provins.

SEINE-ET-OISE, a department in the n. of France, incloses the metropolitan department of Seine (q.v.). Area, 2,163 sq.m.; pop. '76, 561,990. The great rivers are the Seine and Oise, which have numerous affluents. Extensive plains occupy the southern districts; but in the n. the country is much broken, and picturesque valleys and great forests occur. The soil is not in general very fertile; but owing to the vicinity of the capital the amount of produce is great. Among the minerals are several fine varieties of

stone and fine clays. In addition to the usual branches of manufacture, porcelain is largely made at the famous Sèvres (q.v.) factories. The department is divided into the arrondissements of Versailles, Corbeil, Étampes, Mantes, Pontoise, and Rambouillet, and the capital is Versailles.

SEINE-INFÉRIEURE, a maritime department of France, bounded on the n.w. by the English channel, and on the s. by the department of Eure. Area, 2,328 sq.m.; pop. '76, 798,414. The Seine flows through the southern districts; but a number of important though small streams flow n.w. across the department and fall into the channel. The range of the hills of Caux extends from e. to w., and to the s. of it are rich pasture-lands, watered by the Seine and its affluents. Husbandry flourishes chiefly in the middle and in the e. districts. The coasts are formed of chalk-cliffs, varying in height from 200 to 650 feet. The arrondissements are Dieppe, Le Havre, Rouen, Neufchâtel, and Yvetot. The capital is Rouen, which communicates with Dieppe by a direct line of railway.

SEIR-FISH, *Cyprum guttatum*, a fish of the family *seombridae*, having finlets, and the sides of the tail keeled, the teeth compressed and sharp. It inhabits the seas of the East Indies, and is one of their most valuable fishes. In size and form it is very similar to the salmon, which its flesh resembles also in firmness and flavor, although of a white color.

SEI SIN. See SASINE.

SEISS, JOSEPH AUGUSTUS, D.D., b. Md., 1823; pastor of a Lutheran church in Baltimore; in 1869 became pastor of St. John's church, Philadelphia. He is an earnest advocate of Millenarianism, and a vigorous and copious writer; has published *Lectures on Hebrews; The Last Times; Threatening Ruin; The Baptist System Examined; The Gospel in Leviticus; Day of the Lord; A Miracle in Stone, or the Great Pyramid of Egypt; Voices from Babylon, or the Records of Daniel the Prophet*. He is one of the editors of the *Lutheran and Missionary*, and *The Prophetic Times*.

SEISTAN', a province in s.w. Afghanistan, drained by the Helmund, Khash-Rud, Harut, and other rivers flowing into the lake of Seistan or Hamoon; about 950 sq.m.; pop. about 50,000. About half the population are Seistanis; the rest Belooches or Afghans. Much of the surface is a fertile plain. The principal productions are wheat and barley. The chief town is Charkansur. Capital, Sekuha.

SEISTAN or HAMOON LAKE (anc. *Aria Palus*), a large, irregularly-shaped, shallow lake of Afghanistan, bordered with plantations of tamarisk and other trees, and inclosed by the province of Seistan. It is 25 parasangs (a parasang = 3.45 English m.) in length, and it varies from 6 to 12 parasangs in breadth. It is difficult to fix accurately the form and position of the lake, but the most recent explorations seem to confirm gen. Ferrier, who says that it is in lat. about 31° to 32° n., and that it lies obliquely from 60° long. in the n. to 59° long. in the south. It was visited in 1872 by maj. Lovett and sir Richard Pollock. Of the rivers which feed the lake, none, except the Helmund, contribute any waters during the summer, as they are then diverted for the irrigation of the land. The lake, which has no outlet, overflows its boundaries and fertilizes large tracts of country. It is only about 4 ft. deep, and the depth in various parts is constantly altering from the shifting nature of the bottom. Its waters are black and disagreeable to the taste. Seistan is a corruption of Saghistan—i.e., the country of the saghis, a kind of wood which grows here in abundance, and is largely used as fuel.—See Ferrier's *Caravan Travels* (Lond. Murray, 1856).

SE JANT, or Assis (Fr.), in heraldry, is the term of blazon applied to a beast in his usual sitting posture. A lion borne in full face, with his fore-paws extended sideways, is blazoned sejant affronté, as in the crest of Scotland.

SEJA NUS. See TIBERIUS.

SELA'CHIANS. See PLAGIOTOMI, *ante*.

SELBY, a market t. and river-port in the West Riding of Yorkshire, on the right bank of the Ouse, 12 m. s. of York by railway. The ancient Gothic cross which adorns the market-place, and the character of the architecture of the houses attest the age of the town. The magnificent parish church, 300 ft. long by 60 ft. wide, is part of an abbey founded by the Conqueror in 1068. The movable bridge across the river offers a passage to shipping, and the river is navigable to Selby for vessels of 200 tons. Means of communication by railway and canal are abundant. There are iron and brass foundries, and slips for building river-craft; and the manufactures include sail-cloth, ropes, etc. Pop. '71, 6,193.

SELDEN, JOHN, an illustrious English scholar and lawyer, was b. Dec. 16, 1584, near Worthing, in Sussex; studied at Hart Hall, Oxford, for three years, and then removed, first to Clifford's inn, London, and afterward to the inner temple, for the pursuit of law. It was here that his great learning began to attract attention, and won for him the friendship of Camden, Usher, sir Robert Cotton, and sir Henry Spelman. Selden wrote his first treatise which related to the civil government of Britain previous to the Norman conquest, and was entitled *Analecton Anglo-Britannicon*, in 1606, when only 22 years of age, though it was not published till nine years later. In 1610 appeared his *Jani Anglorum Pactes Altera* (English translation, 1683), giving an account of the common and

statute law of English Brittany to the death of Henry II.; and in 1614 was published his *Titles of Honour*, a work still regarded as of high authority on the subject of which it treats. Three years later appeared an erudite, but, judging from what Le Clerc says, not a very critical or well-digested, work on the Syrian gods, especially in their connection with the Old Testament, entitled *De Diis Syriis, Syntagma Duo*. Next year, however, he excited great indignation among the clergy by his *Treatise of Tythes*, in which he endeavored to prove that tithes are not due by divine right under Christianity, but solely because the law has imposed them. Selden was assailed with diatribes, animadversions, additional animadversions, historical vindications of the *jus dicinum* of tithes, etc.; but it does not appear that the arguments were very convincing to Selden. In 1621 he suffered a brief imprisonment for advising the parliament to repudiate king James's doctrine that their privileges were originally royal grants; in 1623 he was elected member for Lancaster, and from this period till his death he took a considerable part in public affairs, yet not such as to materially interfere with the continuance of scholarly pursuits. Selden's political position is somewhat difficult to define. There is no doubt that he was sincerely attached to the cause of the parliament, and as sincerely opposed to the views of the court party and the king. But he was above all things a constitutional lawyer, and derived his ideas of the rights of the subject from the history of the nation, and not from religious fanaticism or metaphysical considerations. Still, he "loved his ease," according to Clarendon (who has painted Selden's portrait in his usual fine style), and so let things be done without protest, of which he did not approve. Personally, he was rather a favorite with king Charles, on account of his learning and moderation. In 1630 he was committed to the tower for his activity in opposing the policy of the court, and remained a prisoner for four years, when he was released through the favor of archbishop Laud and the lord treasurer; in 1640 he was chosen member for the university of Oxford; and now, when the struggle between the king and the nation began to grow dead-earnest, he was occasionally suspected of not being zealous enough by such as were themselves perhaps over-zealous. He threw the weight of his learning and argument into the scale against the bishops (toward whom, like Milton and other lay-champions of freedom, he felt a peculiarly strong antipathy), when the question came up as to their tenure of seats in parliament; he was one of those who drew up the articles of impeachment against Laud; he sat as a lay-member in the assembly of divines at Westminster, 1643, and perplexed his clerical colleagues sadly. In 1644 he was elected one of the twelve commissioners of the admiralty; in 1646 the sum of £5,000 was voted to him by parliament, in consideration of his services and sufferings; in 1647 he was appointed one of the university "visitors," and always used his influence to moderate the tyranny of his fanatical colleagues. After the execution of Charles (of which it is certain he strongly disapproved, as both unlawful and inexpedient), he took little share in public matters; and when requested by Cromwell to answer the *Eikon Basilike*, he refused. His death occurred Nov. 30, 1654, in the house of Elizabeth, dowager-countess of Kent, with whom he had long lived in such intimacy that people said they were married. The principal writings of Selden, besides those already mentioned, are: *Marmora Arundelliana* (1629); *De Successionibus in Bona Defuncti secundum Leges Hebræorum* (1634); *De Successione in Pontificatum Hebræorum, Libri Duo* (Leyd., 1638); *De Jure Naturali et Gentium, juxta Disciplinam Hebræorum* (1640); a work more learned than critical (like most of Selden's biblical productions, who thought far too much of the opinions of the Rabbins); and *Uxor Hebraica*; *Mare Clausum* (1635), a reply to Grotius's *Mare Liberum* (treatises which originated in a dispute between the English and Dutch concerning the herring-fishery upon the British coast, to which the Dutch laid claim); *De Anno Civili et Calendario Judaico* (1646); *De Syndrhis et Præfecturis Hebræorum* (1650 *et seq.*); besides a great variety of posthumous works, of which the most famous, and also the most valuable, is his *Table-talk* (recorded and published by his amanuensis, Richard Milward, in 1689), of which Coleridge says (with considerable exaggeration, however): "There is more weighty bullion sense in this book than I can find in the same number of pages of any uninspired writer." Selden was highly esteemed by all his great contemporaries, both royalist and parliamentarian, on account of his integrity, candor, and vast erudition; but his moral courage or enthusiasm was not remarkable (except when tilting at the bishops—then, like Erasmus on the monks, he was quite heroic); and, on the whole, as compared with Milton, he occupies the level which Erasmus did in relation to Luther. Selden's works were collected and published at London in three folio volumes (1726).

SEL D'OR, a salt employed in photography, originally to aid in fixing and improving the image on a daguerreotype-plate, and more recently for toning positive paper-proofs. It is a double hyposulphite of gold and sodium, the constitution of which is expressed by the formula $\text{AuO.S}_2\text{O}_2 + 3\text{NaO.S}_2\text{O}_2 + 4\text{Ho}$. It is formed when 1 part of chloride of gold in solution is added to 3 parts of hyposulphite of soda, also in solution. The hyposulphite of soda should be always in excess during the mixture, a condition which is secured by adding the chloride of gold to the hyposulphite of soda, and not *vice versâ*. The salt so formed is precipitated in fine, white, crystalline needles on the addition of alcohol to the above mixed solutions; these are collected on bibulous paper, and gently dried for use. Adulterations in the commercial article, which are unfortunately only

too common, may be ascertained by precipitating, igniting, and weighing the gold contained in the sample it is desired to test. Nitric acid free from chlorine will decompose this salt and precipitate its contained gold in the metallic form.

SELENĒ, the Greek name of the goddess of the moon; called also *Mene*, and in Latin, *Luna*. Her myth is differently told, but the most common account makes her a daughter of Hyperion and Theia, and sister of Helios (the sun) and Eos (the dawn); as sister of Helios, also called *Phœbos* (the shining one), she had the name of *Phæbe*, and latterly was identified with Artemis (see *DIANA*), though the identification was never quite exact, as Artemis always retained her reputation for chastity, while Selenē had 50 daughters by her lover Endymion, and several by Zeus, one of whom was called *Erse* ("the dew"), indicating the original physical character of the myth. In art the two are always distinct. Selenē is represented by the poets with long wings and a golden diadem riding across the heavens in a chariot drawn by two white horses, cows, or mules.

SELENITE (Gr. *Selēnē*, the moon), a transparent and beautiful variety of gypsum (q. v.), white, or tinged with green, gray, or yellow. It receives its name from its peculiar moon-like luster. It is often crystallized in six-sided prisms, sometimes in lenses, and twin crystals and quadruple crystals occur. It is found in common gypsum, in rock-salt, in the blue clay of the s. of England, etc. There is in the British museum a splendid group of crystals of selenite presented by the late prince Albert. Selenite is easily cut, and is capable of being split into extremely thin plates, which are flexible, although not elastic. It was used by the ancients for some of the purposes for which we use glass. The Romans imported it from Spain, Cyprus, Cappadocia, and Africa. The hot-houses of Tiberius were covered with it, and Pliny mentions that it was used in the construction of beehives by those who wished to watch the operation of the bees. It is used for making the finest kind of stucco, and the most delicate pastel colors. When burned, and perfectly dry, its powder is used for cleansing and polishing articles of gold and silver, precious stones, and pearls.

SELENIUM (symb. Se, equiv. 39.5—new system, 70—and sp. gr. 4.28) is one of the metalloïd elements. At ordinary temperature, it occurs as a solid of a dark-brown color, and when broken, presents a conchoidal vitreous fracture; thin splinters of it are, however, of a dark-red tint when seen by transmitted light. It is tasteless and inodorous, a non-conductor of electricity; and like sulphur, to which it presents a remarkable analogy, it may be obtained in all three forms of atomic aggregation, being solid up to 392°, when it fuses into a fluid, which boils at 650°, emitting an inodorous vapor of a deep yellow tint. When heated in the air, selenium does not very readily take fire, but it is combustible, and burns with a blue flame, while a portion of it is volatilized in red fumes which emit an odor resembling that of bisulphide of carbon or garlic. The products of combustion are oxide of selenium and selenious acid, the peculiar odor being probably due to the former.

Selenium is of rare occurrence in nature; it is chiefly found as a selenide in combination with lead, silver, copper, or iron; but it has also been discovered in the sulphur from the Lipari isles, and in certain sulphides of iron, which accounts for its detection in sulphuric acid. It is unnecessary to enter into any description of the mode of isolating it; nor need we do more than simply mention that it forms three compounds with oxygen—SeO, oxide of selenium; SeO₂, selenious acid; and SeO₃, selenic acid; while with hydrogen it forms HSe, seleniureted hydrogen, or hydroselenic acid, a colorless gas, which resembles, but is more offensive than sulphureted hydrogen. Berzelius found that by the application of the nose to a bubble of it not larger than a pea, he was deprived of the sense of smell for several hours. It is prepared in the same way as the corresponding sulphur gas. As it is soluble in water, it should be collected over mercury.

Selenium was discovered in 1817 by Berzelius, who named it from *Selēnē*, the Gr. for "the moon," because it was associated with tellurium, which is named from *Tellus*, the Lat. for "the earth."

SELEUCIA, the name of seven ancient cities of Asia, situated in Syria, Pisidia, Pamphylia, Cilicia, Caria, and Mesopotamia, and founded during the earlier existence of the dynasty of the *Seleucidæ* (q. v.). The most distinguished of these were: 1. **SELEUCIA PIERIA**, founded by Seleucus Nicator, on the sea-shore, about 4 m. n. of the mouth of the Orontes, and strongly fortified. It was the sea-port of Antioch, and became of great importance during the wars between the Seleucidæ and the Ptolemies for the possession of Syria. It rapidly declined under the Roman dominion. The ruins have been fully explored and described in modern times by Pococke (*Observations on Syria*) and Chesney (*Royal Geographical Society's Journal*, vol. viii.). Its once magnificent port is in such an extremely good state of preservation as to require few repairs to render it serviceable; and the remarkable tunnel of 1088 yards in length, which was excavated out of the solid rock, and formed the only communication between the city and the sea; and the remains of its triple line of walls, of its citadel, temples, amphitheater, necropolis, etc., all attest the former importance and splendor of the city.—2. **SELEUCIA ON THE TIGRIS**, was also built by Seleucus Nicator, on the w. bank of the Tigris, 40 m. (according to Strabo 23) n.e. of Babylon, which was despoiled to supply materials for the construction of the new city. Situated in a district of great fertility, commanding the great

trading routes of Assyria, Babylonia, and western Persia, it rapidly rose to great wealth, and splendor, supplanted Babylon as the capital of the eastern portion of the Seleucide monarchy, and when in the acme of its greatness, contained a population of more than 600,000. Even in Strabo's time, it was larger than Antioch in Syria, the greatest commercial emporium of Asia; and down to the period of its final destruction, the number of its inhabitants is said to have never fallen below half a million. During the decline of the Seleucide monarchy, it became independent, and formed, from its wealth and splendor, an irresistible bait to the robber-tribes of southern Armenia and Media, who partially plundered it on more than one occasion. But its position on the confines of Persia, which gave it its greatness, was also the cause of its destruction; for when the Seleucide monarchy was swallowed up by the Romans, and the long and desolating struggle between the latter and Persia had commenced, Seleucia placed between two fires, was speedily brought to ruin. It was burned by Trajan (116 A.D.), and a few years afterward, by Lucius Verus; and when visited by Septimius Severus was as desolate as the mighty city it had supplanted. The emperor Julian, on his expedition to the east, found the whole country round it converted into a vast marsh, the haunt of innumerable beasts of chase and wild-fowl, and the city itself completely deserted.

SELEUCIDÆ, the dynasty of kings to whom fell that portion of Alexander the great's immense and ill-compacted monarchy which included Syria, a large portion of Asia Minor, and the whole of the eastern provinces.

SELEUCUS I., surnamed **Nicator**, the first of this line, was the son of Antiochus, a distinguished officer in the service of Philip of Macedon, and was born about 358 B.C. He was one of the conspirators against Perdiccas, and in the second partition of the provinces of Alexander the great's kingdom, obtained Babylonia, to which with the aid of Antigonus, he subsequently added Susiana; but a misunderstanding with that powerful chief having arisen, Seleucus took refuge in Egypt (316 B.C.). The victory gained by Ptolemy over Antigonus's son, Demetrius, at Gaza having laid open the route to the east, Seleucus returned to his satrapy, amid the joyous congratulations of his subjects (312 B.C.). From Oct. 1. of this year (the date of Seleucus's return to Babylon) commences the *era of the Seleucide*. Having next recovered Susiana, he conquered Media, and extended his power to the Oxus and Indus. Of his campaign against Sandrocottus (q.v.), there are few details extant. In 306 B.C. he assumed the regal title; and four years afterward joined the confederacy of Ptolemy, Lysimachus, and Cassander, against the now formidable Antigonus, deciding the battle of Ipsus (301 B.C.) chiefly by his cavalry and elephants. Being now, after Antigonus's death, the most powerful of Alexander's successors, he obtained the largest share in the conquered kingdom, a great part of Asia Minor and the whole of Syria falling to him. Toward the close of his reign, war broke out with Demetrius (now his father-in-law), and afterward with Lysimachus, king of Thrace and the other part of Asia Minor, both contests terminating in the defeat and death of his opponents, and being followed by the acquisition of the rest of Asia Minor. He was assassinated (280 B.C.) by Ptolemy Ceraunus. Of Seleucus's personal character, little can be gathered from the fragments of his history which remain to us; according to Pausanias, he was the most upright of Alexander's successors, unstained by those crimes which have foully blotted the characters of the others; but of his consummate generalship and great political talents we have sufficient proof. He pursued with great zeal the plan of "Hellenizing" the east, by founding numerous Greek and Macedonian colonies in various parts of his dominions; he also built numerous cities, several of which—as Antioch in Syria, and Seleucia on the Tigris—rose to be among the most populous and wealthy in the world.—After the reign of **ANTIOCHUS I.** (q.v.), and **ANTIOCHUS II.** (q.v.), **SELEUCUS II.** (246–226), surnamed **CALLINICUS**, obtained the throne; but having, at the instigation of his mother Laodice, murdered his step-mother Berenice, an Egyptian princess, he was driven from his kingdom by Ptolemy Euergetes (q.v.). However, he recovered his throne on Ptolemy's withdrawal; and though defeated in a great battle with the Egyptians, he succeeded in maintaining his hold of Syria and most of Asia Minor against both the Egyptians and his younger brother Antiochus, who exercised independent authority over part of Asia Minor. Antiochus was at a later period wholly defeated in Mesopotamia, and soon after murdered by robbers. Seleucus undertook a great expedition against the revolted provinces of Parthia and Bactria, but was totally routed by Arsaces I., king of Parthia; while, on the n.w., several provinces were wrested from him by Attalus, the king of Pergamus.—His sons, **SELEUCUS III.** (226–223), surnamed **CERAUNUS**, and **ANTIOCHUS III.** (q.v.), "the great," were his successors, the latter being the first of the dynasty who came into collision with the Romans.—**SELEUCUS IV.** (187–175), surnamed **PHILOPATOR**, was eager to dispossess the king of Pergamus of the provinces which he had taken from the Syrian monarchy, but fear of the Romans prevented him from carrying out his design.—**ANTIOCHUS IV.** (q.v.), **EPIPHANES** (I.) ("the illustrious"), conquered Cœle-Syria and Palestine from the Egyptians, to whom they had been given by his father, but retired from Egypt at the bidding of the Romans. He practiced the most atrocious cruelties on the Jews, whose religion he endeavored to root out, and introduce the Greek religion; but the heroic resistance of the Maccabees (q.v.) completely foiled his project. He died

in a state of raving madness, which was attributed to his sacrilegious crimes by his subjects, who, in derision, converted his surname into *EPIMANES* ("the madman").—The succeeding names of the dynasty were *ANTIOCHUS V.*, *EUPATOR* (164-162); *DEMETRIUS I.*, *SOTER* (162-150), who regained Babylon, lost Judea, and was defeated and slain by the impostor *Alexander Balas* (150-146); *DEMETRIUS II.*, *NICATOR* (146-138, 128-125), who overthrew the impostor, and was himself taken prisoner by the Parthians, Syria having been already seized by *Diodotus*, surnamed *Tryphon*, who set up the puppet *ANTIOCHUS VI.*, *THEOS* (144-142), and afterward ascended the throne himself (142-137); *ANTIOCHUS VII.*, *SIDETES* (137-128), who restored the royal line of the *Seleucidae*; *ANTIOCHUS VIII.*, *GRYPUS* (125-96), who was compelled to share his dominions with his half-brother, *ANTIOCHUS IX.*, *CYZICENUS* (111-95); *SELEUCUS V.* or *VI.*, *EPIPHANES* (96-94), and *ANTIOCHUS X.*, *EUSEBES* (95-83), who continued the division till 94 B.C., when the latter was victorious in a pitched battle and seized the whole kingdom; for which, however, he was forced to fight with *Philip*, and *ANTIOCHUS XI.*, *EPIPHANES* (II.), the younger brother of *Seleucus*; and *DEMETRIUS III.*, *EUCERUS* (84-88), a third brother of *Seleucus*, who, with *Philip*, next claimed the sovereignty, which was taken from them by *Tigranes* (83-69), king of *Armenia*, at the solicitation of the *Syrians*; *ANTIOCHUS XII.*, *DIONYSUS*, a fourth brother of *Seleucus*, and *ANTIOCHUS XIII.*, (69-65), *AEATICSUS*. The short-lived prosperity of this dynasty, for it had begun to decline during the reign of *SELEUCUS II.*, 80 years after its foundation, is principally owing to the fatal principle on which it was founded—viz., that of establishing a *Græco-Macedonian* power in a foreign country, instead of conciliating the attachment of the native populations, and governing them more in accordance with the eastern method; the consequences were the successive revolts of the natives, the foundation of the independent and hostile kingdoms of *Bactria*, *Parthia*, *Armenia*, *Judea*, and the ultimate conversion of the small remnant into a *Roman province* by *Cneius Pompeius*, 65 B.C.

SELF-DEFENSE, in law, defense of one's person or property from injury. A person upon whom violence is inflicted may defend himself by so much counter-violence as is necessary for his protection and no more. If assaulted by blows, he may defend himself by blows. A man may defend himself, even to the extent of committing homicide, to prevent any violent crime, whose perpetration would constitute a felony. He may return force with force in defense of his person or property against an attempt at forcible felony; and he need not retreat, but may even follow his assailant. Where there is no threatened or intended felony, a man may defend himself in a mutual fight caused by a sudden quarrel, or where without a mutual fight the assailant attempts or commits an assault and battery; and the assailed person, where an attempt to strike him is made and his assailant is near enough to be able to strike him, need not wait to be struck first.

SELF-DENYING ORDINANCE, a measure carried through parliament in 1645 by the influence of *Cromwell* and the *Independents*, with the view of removing *Essex* and the *Presbyterians* from the command of the army. It was moved by a fanatic of the name of *Zouch Tate*, who on the ground that "there is but one way of ending so many evils, which is, that every one of us freely renounce himself," proposed, that "no member of either house shall, during this war, enjoy or execute any office or command, civil or military, and that an ordinance be brought in accordingly." The ordinance, which was clearly intended to take the executive power out of the hands of the more moderate politicians, and form an army independent of parliament, was the subject of violent and protracted debate, but eventually passed in both houses, and became law. The consequence was that *Essex*, *Warwick*, *Manchester*, and others gave in their resignation, and the conduct of the war was intrusted to *Fairfax*; *Cromwell*, to whom, as a member of the lower house, the self-denying ordinance extended, as much as to *Essex* and the rest, had the duration of his commission prolonged by the commons on account of his invaluable services as a leader of cavalry, and by his brilliant achievements soon surpassed his commander in reputation.

SELIM I., Sultan of Turkey, son of *Bajazet II.*, was b. in 1467, dethroned his father by the aid of the *Janizaries*, April 25, 1512, and ascended the throne. To secure himself in his elevation, he caused his father, brothers, and nephews to be put to death, thus beginning a policy which he pursued inflexibly through the whole of his subsequent career, viz., to destroy without scruple every actual or possible obstacle to the accomplishment of his own ends. Urged on by a devouring appetite for conquest, and by the warlike fanaticism of the *Janizaries*, he declared war (1514) against *shah Ismail* of *Persia*, and marched eastward with an army of 250,000 men, massacring on the way 40,000 *Shiites*. He encountered *Ismail* at *Calderoon*, and defeated him with immense loss; but a spirit of disaffection breaking out in his army, he was compelled to content himself with this success, which gave him possession of *Diarbekir* and *Kurdistan*. In the following year, he overran *Armenia*; and leaving his lieutenants to complete this conquest, he marched against the *Mameluke* sultan of *Egypt*, whom he had previously endeavored to detach from intimate alliance with the *Persian* monarch. *Kansu-ghori*, the *Egyptian* sultan, was totally defeated (1516) at *Marjabit* by *Selim*, and *Syria* became the prize of the victor; and *Kansu's* successor, *Touman-Bey*, was still more unfortunate, his army being almost extirpated (1517) at the battles of *Gaza* and *Rudania*. The victorious Turks then entered *Cairo* without opposition; *Touman-Bey* and his chief sup-

porters were put to death, and Egypt incorporated with the Ottoman empire. The last lineal descendant of the Abbaside caliph, who was then resident in Egypt, transmitted to Selim the religious prestige which had devolved upon himself by descent, and at the same time bestowed upon him the title of "Imaum," and the standard of the prophet. In consequence of this gift, the Ottoman sultan became the chief of Islam, as the representative of Mohammed; and the sacred cities of Mecca and Medina, along with the chief Arabian tribes, in consequence acknowledged his supremacy. Thus, in less than four years, Selim did more to extend the Ottoman empire than any of his most renowned predecessors during a whole reign. He also laid the foundation of a regular marine, constructed the arsenal of Pera, chastised the insolence of the Janizaries with savage severity, and labored to ameliorate, by improved institutions, the condition of the various peoples he had conquered. He died Sept. 22, 1520, while planning fresh campaigns against both Persians and Christians. This prince, who in a sense merited his title of *Yavuz* (the ferocious), was nevertheless a lover and encourager of literature, and even himself cultivated the poetic art. Selim was succeeded by his son, Solyman the magnificent (q.v.).

SELIM III., Sultan of Turkey, the only son of Mustapha III., was b. Dec. 14, 1761, and ascended the throne on the death of his uncle, Abdul-Hamid, in 1789. Seeing clearly the causes of the decadence of the empire, and the proper remedies, he inaugurated a policy of renovation and progression; but the war with Russia, in which his newly raised army of 150,000 men was totally defeated, first by the prince of Coburg, and next by Suwarof, put a stop for a time to his schemes of reform. He was compelled, in 1791, to cede Choczim to Austria, and in the following year, all his possessions beyond the Dniester to Russia. About this time, his good harmony with Napoleon was troubled by the expedition of the French to Egypt, and subsequently by the question of the recognition of the French empire, but on the whole, Selim continued the faithful ally of France; and at every opportunity pursued with ardor his various reforms, establishing cannon-foundries, and organizing a body of troops ("the Nizun-Djedit"), armed, clothed, and disciplined in the European fashion; but this last reform stirred up against him (1805) all the fanatic bigotry of his subjects. The priests of Islam even preached revolt in different parts of the empire, and accused their sovereign of despising the holy injunctions of the Koran, so that Selim felt compelled to adopt a more cautious policy. At length, a formidable rebellion broke out, and the Nizun-Djedit, who attempted to suppress it, were overpowered, their commander put to death, and the rebels marched into Constantinople, their ranks being swelled at every step by bodies of disaffected Janizaries. All those who had favored or forwarded the sultan's schemes were seized and put to death, and Selim was compelled to issue a decree suppressing the new institutions. But the malignant enmity of the mufti and his coadjutors was not thus to be satisfied, and Selim saw himself forced to resign the throne (1807) to his cousin, *Mustapha IV.* (1807-8).

On the news of this insurrection being conveyed to Mustapha-Bairaktar, the pasha of Rustchuk, and one of the sultan's chief advisers, this energetic and able soldier marched upon Constantinople, with a view to reinstate Selim on the throne, but on his arrival the unfortunate monarch was strangled, and his body cast at the feet of Bairaktar. See **BAIRAKTAR**. Thus perished Selim, and with him the first attempt at reformation in Turkey; the effects of which, however, were not wholly lost, for manufactures had begun to flourish, thousands of silk and other looms were now in vigorous operation, a printing press had been established in Scutari, and many other improvements calculated to foster the prosperity and happiness of his subjects, had been inaugurated; though these advantages, the natural result of Selim's enlightened patriotism, were neither understood nor appreciated by the great majority of his ignorant and fanatical subjects.

SELIM NO, a manufacturing t. of European Turkey, in eastern Roumelia, at the southern base of the Balkan mountains, 78 m. n. of Adrianople. Owing to its far inland position, there is little communication between the town and the coast, and consequently the annual fair held here is of very great importance. Arms, cloth, and attar of roses are manufactured. Pop. 15,000.

SELINUS, an ancient Greek colony in s.w. Sicily, at the mouth of the Selinus river; founded in the 7th c. B.C.; destroyed by the Carthaginians in 409. It was rebuilt, but never regained its former prosperity. Among its ruins are many portions of ancient temples.

SELJUKS, or **SELJUK-TURKS**, were an offshoot of the Hœi-He or Hœi-Hu, a collection of tribes of Turkish race, who, being driven south-westward from the Chinese wall, had, in 744, A.D., overwhelmed that Turkish empire of Kiptchak which had given so much annoyance to the Sassanide (q.v.) during their reign in Persia. The Hœi-Hu rapidly extended their power from the Caspian sea as far as the Hoang-ho, and, at the time when the Seljuks separated themselves from them, were ruled by a chief named Bigû Khan. Seljuk, from whom the Seljuks derived their name, was the chief of a small tribe which had gained possession of Bokhara and the surrounding country. His sons, attracted by the beauty and fertility of Khorassan, began about 1027, to migrate to that country, and after some struggles with the Ghiznevide sultans, established them-

selves in northern Khorassan, with TOGRUL BEG, the eldest grandson of Seljuk, as their chief, and Nishapur as their capital. Togrul, leaving his brother in Khorassan, set out on his conquering march, subdued Balkh and Khwarezm in 1041, Irak-Ajemi in 1043, subsequently adding to these Kerman and Pars. He then advanced to Bagdad, which he took in 1055, dethroning the last vizier of the Dilemite (see SAMANI) dynasty, and being invested by the reigning caliph with the vacant office; after which he completed his conquest of Persia by the reduction of Irak-Arabi and Mosul about 1061. The Seljuks were zealous Mohammedans, and Togrul Beg seems to have been a vigorous promoter of the faith which he professed, for he built numerous mosques, subsidized pious and learned men, and treated the caliph—his spiritual chief—with profound respect. After his death in 1063, his nephew Alp-Arslan (q.v.) succeeded to supreme power, and became one of the most renowned monarchs of Asia. His son MELEK SHAH (1073-93), the most powerful monarch of this dynasty, added, by means of his generals, Arabia, Asia Minor, Armenia, Syria and Palestine, and Transoxiana to his empire, which now extended from the Hellespont to the borders of Chinese Tartary; and even the ruler of Cashgar acknowledged his authority. This empire, though extensive and ill-compacted, was preserved in the highest order and prosperity by his able minister, the virtuous Nizam-ul-Mulk, under whose, firm, just, and wise government the rights of all classes were maintained, religion promoted, and learning encouraged, till the Persians who had dreaded the conquest of their country by the Turks as the worst of evils, were forced to confess that it had proved the greatest of blessings. In 1092 Melek Shah, lending an ear to the misrepresentations of Nizam-ul-Mulk's enemies, deprived him of his office; and the aged minister was soon afterward assassinated by one of the followers of Hussun Subah, the chief of the assassins (q.v.), and the mortal enemy of the good ex-vizier. Hospitals, caravansaries, bridges, roads, and canals attest the zeal with which the commercial interests of the empire were furthered; while the colleges of Basora, Ispahan, and Herat, the law college of Bagdad, and the observatory (the first in Asia) of the same city indicate the care bestowed on the promotion of literature and science. Melek Shah, under whom the empire of the Seljuks had attained the height of its power and splendor, laid a sure foundation for its rapid decline by subdividing it into a number of separate principalities, all professedly subject to the central state of Iran or Bagdad. The chief of these principalities were: 1. The central state of the *Seljuks of Iran*, whose ruler was the vizier of the caliph, and exercised direct authority over northern and western Persia to the borders of the Arabian desert. The chief monarchs of this branch were Mohammed Shah, whose generals warred with the crusaders in Palestine, and sultan Sanjar, one of the most celebrated of the Seljuk princes, great both in success and misfortune. This branch was annihilated in 1194 by the shah of Khwarezm. 2. *The Seljuks of Kerman*, who were annihilated in 1191 by the Ghuz Turkomans. 3. *The Seljuks of Iconium*, who ruled over Asia Minor, and whose founder was Soliman, a great-grandson of Seljuk. This branch endured for 224 years—from 1075 to 1299—and during that period was engaged in numerous wars with the Byzantines and with the crusaders, both of whom learned to dread its power. During its last years it was tributary to the Mongols; and in 1299 the present Turkish empire rose on the ruins of its power (see OTTOMAN). 4. *The Seljuks of Aleppo*, who ruled from 1079 till their extinction in 1141. 5. *The Seljuks of Mosul*, who were speedily supplanted by *atabegs*, or independent governors, of whom Zenghi, and his renowned son, Noureddin (q.v.), were the most celebrated. 6. *The Seljuks of Damascus*, an offshoot (1096) from the Aleppo principality, which lasted till 1155, when it was put an end to by Noureddin. 7. *The Seljuks of Mardein*, who only appear in common history as the allies of the Seljuks of Iconium, Mosul, Aleppo, and Damascus, against the mighty crusading armies of western Europe. And 8. *The Seljuks of Khwarezm (Khitra)*, who founded a great empire, including the whole of the country within the Jaxartes, the Bolor mountains, the Indus, the sea of Oman, and the Persian gulf; but the last monarch, Allah-ed-din Mohammed Shah, having wantonly put to death some Mongol merchants who were pursuing their avocations within his dominions, was doomed to destruction by the terrible Genghis Khan (q.v.), who crossed the Sir-Daria, conquered Transoxiana, defeated Mohammed's armies, and drove the shah himself to take refuge in an island of the Caspian, where he died. The advance of the Mongols was gallantly opposed by Mohammed's celebrated son, Jelal-ed-din, who twice defeated them; but being totally routed (1221), on the w. bank of the Indus, by Genghis himself, he plunged his horse into the Indus, and safely reached the opposite bank, none of his enemies daring to follow him. The whole of this extensive empire now fell under Mongol domination.

SELKIRK, ALEXANDER. See JUAN FERNANDEZ.

SELKIRK, a Scottish royal burgh, capital of the county of the same name, on an eminence overlooking Etrick water and the famous field of Philiphaugh, where gen. David Leslie defeated Montrose and crushed the cause of king Charles in Scotland, 40 m. by the North British railway s.e. of Edinburgh. The county buildings (opened 1870), the old town-hall, with a spire 110 ft. high, and the monuments to sir Walter Scott and to Mungo Park are the principal architectural features. Selkirk has large woolen-mills. Tweed, hosiery, and blankets are the chief articles of manufacture. Pop. '71, 4,640. Selkirk joins with Hawick and Galashiels in sending one member to parliament.

Selkirk commands a splendid view across the valley or haugh in which the Ettrick and Yarrow meet. It is within a few miles of many of the most famous localities in Scotland, and is a favorite starting-point for tourists desirous of exploring the "Scott" country, the "forest," the Yarrow, and St. Mary's loch. Upward of a hundred fighting men went from Selkirk to join king James in his fatal march to Flodden; of these, only four returned, but they proudly bore a standard taken from the enemy on that occasion. The manufacture of "single-soled shoon" long flourished here, and the "Souters of Selkirk" are commemorated in song and story.

SELKIRKSHIRE, in ancient times called Ettrick Forest, is bounded by the counties of Midlothian, Roxburgh, Dumfries, and Peebles, on the n., e., s., and w. respectively. It extends in length from n. to s. about 28 m., and from e. to w. 16 to 18 m., and consists mainly of the two parallel valleys through which flow the rivers Ettrick and Yarrow. Its area is 260 sq. m., or 166,534 acres. Selkirkshire contains three entire parishes, and parts of other seven. It is in a great measure a pastoral county, and some of the hills are of considerable altitude, being upward of 2,600 ft. in height. The hills are rounded at the top instead of peaked, and are covered generally with grass, affording excellent pasturage, but in some places with heather. The arable land, situated from nearly 300 to 800 ft. above sea-level, and bearing the proportion of about one-eighth of the area, is, in general, of a light soil, and produces the ordinary crops in abundance. Besides the Ettrick and Yarrow, the Tweed, Gala, and Caddon flow through parts of the county. The banks of several of these are beautifully wooded; but the extensive woods from which the county originally took its name of the Forest, have disappeared. According to the agricultural returns for 1876, the acreage under permanent pasturage (exclusive of heath and mountain land) was 6,526; that of corn crops was 5,325, including 22 acres of wheat, 660 acres of barley, and 4,636 acres of oats; that of green crops was 3,454, embracing 2,990 acres of turnips, 180 acres of potatoes, and 227 acres of cabbage, kohlrabi, and rape. The acreage under hay and grass, not included under permanent pasturage, was 7,676. The average of produce is above that of most of the other counties. Of horses there were 568; of cattle, 2,572; of sheep, 162,719; of swine, 447—total stock, 166,306. The old valued rent was £6,692. The new valuation, including the burgh, is about £110,000. This county contains some historical scenes, among which is the field of Philiphaugh, where the marquis of Montrose was defeated by the Covenanters under gen. Leslie. Oakwood Castle, in ruins, was the residence of the famous wizard, Michael Scott; and Newark, also in ruins, was the residence of Anne, duchess of Buccleuch, where the *Lady of the Last Minstrel* is represented by Scott as having been sung. Selkirkshire is pretty well appointed for roads. The Hawick line of the North British railway runs for a short distance along its border, from which, at Galashiels, there is a branch to Selkirk; and the North British line from Edinburgh to Peebles passes through its northern end from Innerleithen to Galashiels, a distance of about 12 miles. There are several places of worship, belonging to the Establishment, the Free church, and various other dissenting bodies. There is no coal, or lime, or sandstone. The Douglas family, four centuries ago, were the principal proprietors. The duke of Buccleuch now holds about two-thirds of it. The population in 1871 was 14,005, the inhabited houses 1741. Selkirkshire and Peeblesshire conjoined return one member to parliament.

SELTERS WATER (commonly but incorrectly written *seltzer water*), takes its name from the village of Lower Selters near Lahnburg, in the duchy of Nassau, where several springs united, in one basin, yield 5,000 cubic ft. an hour of this sparkling and effervescing mineral water. Its chief ingredients are carbonic acid, carbonate of soda, and common salt. It acts as a mild stimulant of the mucous membranes and as a diuretic; and is applied in chronic disorders of the digestive, respiratory, and urinary organs. It is much recommended as a beverage, either alone or with sugar, to those suffering from liver complaint, and in hot climates and seasons. More than 1½ millions of jars or bottles of this famous water are exported yearly to all quarters of the world, affording to the state a revenue of above £6,000. The spring was discovered early in the 16th c., but was at first so little prized, that in the middle of the 18th c. it was rented for 4s. The water is little drunk at the spring. Artificial selters water is extensively manufactured both on a large scale and for domestic use. See AERATED WATERS.

SELMA, a city in Alabama; co. seat of Dallas co., on the n. bank of the Alabama river; pop. '70, 6,484. It is on elevated land far above the bed of the river, which flows at the base of a steep bluff; and is on the Selma and Gulf railroad, and the New Orleans and Selma, the s. terminus of the Alabama Central, making connections here with the Western railroad, and the Selma, Marion and Memphis. It is 160 m. from Mobile by the river, 44 m. direct. It has 16 churches, 2 banks—1 national, 2 public schools, 2 academies, a court-house, 5 newspapers, and is lighted by gas. During the late war it supplied the confederates with shot and shell, having factories for the manufacture, niter works, artillery works, an arsenal, and a navy-yard. It is the depot for a large exportation of cotton, more than 80,000 bales being shipped from here annually. Among the manufactories are cotton-mills, iron-works, oil-works, steam lumber-mills, manufactories of car-wheels, railroad and machine-shops, a steam cotton-press; and it has 6 cotton warehouses.

SELWYN, GEORGE AUGUSTUS, D.D.; b. England, 1809; educated at St. John's college, Cambridge; tutor at Eton, and for a while rector at Windsor; consecrated in 1841 bishop of New Zealand, where he labored for many years. In 1867 he was appointed bishop of Lichfield. In 1874 he visited the United States and Canada. His published works are: *Are Cathedral Institutions Useless? Sermons*; *Tribal Analysis of the Bible*; *The Work of Christ in the World*. His brother William, 1806-75, was professor of divinity at Cambridge in 1855, and one of the English revisers of the authorized version of the Old Testament.

SEMAPHORE (from *sēma*, a sign, and *pherō*, I bear) was the name applied to the system of telegraphy in use before the application of the electric current. Semaphores were first established by the French in 1794, as a plan for conveying intelligence from the capital to the armies on the frontier. In the following year, lord George Murray introduced them in England; and by their means the board of admiralty were placed within a few minutes of Deal, Portsmouth, or Plymouth. These semaphores consisted of towers built at intervals of from 5 to 10 m., on commanding sites. On the top of each tower was the telegraph apparatus, which at first comprised 6 shutters arranged in 2 frames, by the opening and shutting of which, in various combinations, 63 distinct signals could be formed. In 1816 sir Home Popham substituted a mast with 2 arms, similar to many of the present railway signals. The arms were worked from within the tower by winches in the look-out room, where a powerful telescope in either direction constantly commanded the mast of the next station. If a fog set in at any point on the route, the message was delayed; otherwise, when a sharp look-out was kept, the transmission was very rapid. For instance, the hour of one by Greenwich time was always communicated to Portsmouth when the ball fell at Greenwich; the semaphores were ready for the message, and it commonly passed from London to Portsmouth and the acknowledgment back to London within three quarters of a minute. Each station was in the charge of a naval officer—usually a lieutenant—with one or two men under him. To save the cost of this establishment, the Deal and Plymouth lines fell into disuse soon after the peace of 1815; and the superior advantages of the electric telegraph being incontestable, the Portsmouth line sent its last message Dec. 31, 1847, and, on land at least, the semaphore closed its career of usefulness for ever. In calm weather, when flags will not extend, semaphores are employed on board ship as a means of signaling from vessel to vessel, or to the shore; in such a case, the post containing the arms is movable, and can be readily shipped or unshipped near the stern. See also **SIGNALS**.

SEMÉ, in heraldry. When a charge is repeated an indefinite number of times so as to produce the appearance of a pattern, the term *semé* (sometimes *aspered* or *powdered*) is applied to it. When a field is *semé*, it is treated as if it were cut out of a larger extent of surface, some of the charges being divided by the outline of the shield. The term *crusilly* denotes *semé* of cross crosslets, and *billetty semé* of billets.

SEMECARPUS, a genus of trees of the natural order *anacardiaceæ*. The **MARKING NUT** of India is *S. anacardium*, a tree 50 ft. high, growing on mountains. The swollen receptacle of the flower becomes a succulent fruit, eatable when roasted, but astringent and acrid when raw. On the receptacle is seated the nut, which is heart-shaped and black, consisting of a kernel—not unwholesome, although rarely eaten—surrounded by two skins, between which is a black acrid juice. This juice is used in medicine as an external application to heal rheumatism, etc. It is also in general use in India for marking cotton cloth; and the color is improved, and running prevented, by the addition of a little quicklime and water. The wood of the tree contains so much acrid juice that it is dangerous to work upon.

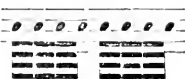

SEMELE. See **BACCHUS**.

-SE MENCINE, SEMEN CINÆ, and SEMEN CONTRA. See **ARTEMISIA**.

SEMENDRIA, a frontier fortress of the principality of Servia (q.v.), stands amid romantic scenery on the right bank of the Danube, 28 m. s.e. of Belgrade. The inhabitants, about 12,000 in number, are employed principally in the wine-culture, in breeding hogs, and in general trade. It was at one time the seat of the Servian kings; and it has been frequently stormed by the nations who have contended for the Danube from the middle ages to the present century.

SEMI-BREVE, in music, a note of half the duration of the breve of old ecclesiastical music, but the longest note in use in modern music. It is represented by a character circular or elliptical in form  and is adopted as the integer or measure-note, the other notes—minim, crotchet, quaver, etc.—being proportional parts of it.

SEMI-DEMI-SEMIQUAVER, a musical note, of which 8 are equivalent to a quaver, 32 to a minim, and 64 to a semibreve. It is represented thus,  or in groups

thus, 

SEMINOLES, a tribe of American Indians, originally a vagrant branch of the Creeks, whose name, Seminole, signifies wild or reckless. In 1705 they aided in driving the Appalachians from Florida; and in 1817 they joined with the Creeks and some negroes who had taken refuge with them, ravaged the white settlements in Georgia, plundering plantations, and carrying off slaves, whom they refused to surrender. Gen. Jackson, sent to punish them, took at the same time several Spanish forts, and hastened the negotiations which ended in the cession of Florida to the United States. At this cession in 1823, the Seminoles engaged to retire into the interior, and not molest the settlers; but as the negroes continued to take refuge with them, a treaty was made with some of the chiefs, in 1832, for the removal of the whole tribe west of the Mississippi. This treaty was repudiated by the tribe, at the instigation of Osceola (q. v.), one of their chiefs; and a war commenced against a handful of savages, which lasted eight years, and cost thousands of lives, and ten millions of dollars. In the end, the remains of the tribe were removed to the Indian territory on the borders of Arkansas.

SEMPALATINSK, an extensive Russian territory in central Asia, is bounded on the e. and s. by Tomsk, the Chinese empire, and Turkestan. Area, 170,000 sq. m.; pop. '70, 510,163. It is separated from Turkestan on the south by the Alexandrian mountains in lat. 42° 30' n., and it is traversed by several other mountain chains. The chief rivers are the Irtysh, Ili, and Chmi; and among the lakes are those of Issik-Kul, Ala-Kul, and Balkash. The country abounds in pasture, and cattle form almost the sole wealth of the inhabitants, although the precious metals, together with lead and copper, are found. Steamers ply on the great rivers and lakes.—Semipalatinsk, the capital, stands on the left bank of the Irtysh, in lat. about 50° 15' north. It is the seat of an important transit trade, and contains (1867) 14,135 inhabitants.

SEMI-PELAGIANISM, a modification, as the name implies, of the doctrine of the Pelagians as to the powers of the human will, and as to the effects to be attributed to the action of the supernatural grace of God, and of the divine decree for the predestination of the elect. The Pelagians (q. v.), discarding altogether the doctrine of the fall of Adam, and the idea that the powers of the human will had been weakened through original sin, taught that man, without any supernatural gift from God, is able, by his own natural powers, to fulfill the entire law, and to do every act which is necessary for the attainment of eternal life. The condemnation of this doctrine by the several councils held in the early part of the 5th c. is capable of various constructions, and has been urged by some to the extreme of denying altogether the liberty of man, and converting the human will into a merely passive instrument, whether of divine grace upon the one hand, or of sinful concupiscence upon the other. The writings of St. Augustine on this controversy have been differently construed by the different Christian communions (see PELAGIANS); and the same diversity of opinion existed in his own day. Among those who, dissenting from the extreme view of Pelagius, at the same time did not go to the full length of the Augustinian writings in opposition to Pelagius, were some monks of the southern provinces of Gaul, and especially of Marseilles, whence their school was called Massilian, from the Latin name (*Massilia*) of that city. Of these leaders, the chief was a priest named Cassian, who had been a deacon at Constantinople. Of the system which he propounded, without going into the details, although many of them are exceedingly curious and interesting, it will be enough to say that it upheld the sufficiency of man's natural powers only so far as regards the first act of conversion to God and the initial act of man's repentance for sin. Every man naturally possesses the capability of beginning the work of self-conversion; but for all ulterior acts, as well as for the completion of justification, the assistance of God's grace is indispensable. The Semi-Pelagian doctrine is often confounded with that of the Molinistic (see MOLINA) school of Roman Catholic theology; but there is one essential difference, viz., that the latter persistently maintain the necessity of grace for all supernatural acts, even for the beginning of conversion, although they are generally represented as agreeing with the Semi-Pelagians as to the mode of explaining the freedom of the human will acting under the influence of divine grace. The chief writers in the controversy were Prosper, Hilary, and Fulgentius; and the question was referred to Celestine, bishop of Rome in 431. It continued, however, to be agitated in the west for a considerable time. Faustus, bishop of Riez, toward the end of the 5th c., revived the error, and it was condemned in a council held at Arles in 475, and still later in a synod (the second) held at Orange (Arausio) in 529, and again in the third council of Valence in 530.

SEMI-PEL'NA PROBATIO, in Scotch law, is that kind of half-proof, half-suspicion, which was usually given in cases of affiliating a bastard, as well as in a few other cases. It was a species of *prima facie* evidence; and when considered by the court sufficient, it was eked out by the oath of the party, called an oath in supplement. The practical effect of the admission of parties as witnesses, under 16 Vict. c. 20, has been to do away with oaths in supplement, the parties being usually the principal witnesses, and the court deciding from a consideration of the balance of credibility between them

SEMIQUAVER, a musical note, represented thus,

or in groups thus,

 equivalent in value to $\frac{1}{2}$ of a quaver, $\frac{1}{4}$ of a crotchet, $\frac{1}{8}$ of a minim, or $\frac{1}{16}$ of

a semibreve.

SEMI-QUIETISM, a form of mystical asceticism which, while it adopts the theoretical principle that the most perfect state of the soul is that of passive contemplation, and denies, in certain conditions of the soul, the necessity of prayer or other active manifestations of virtue, yet maintains the incompatibility of this passive contemplation with any external sinful or sensual action. The Semi-Quicists thus differed from the grosser sectaries referred to under **QUIETISM**.

SEMIRAMIS. See **ASSYRIA**.

SEMITIC. See **SHEMITIC**.

SEMITONE, in music. The name given to the smaller intervals in the diatonic scale, as E F or B C, in which the ratio is as 15 to 16.—In the pianoforte, the interval between any two notes between which no other note is interposed, as C to C \sharp or E \flat to B, is a semitone.

SEMLER, JOHANN SALOMO, one of the most influential German theologians of the 18th c., was born Dec. 18, 1725, at Saalfeld, where his father was archdeacon; educated at Halle, and in 1749 went to Coburg as professor at the gymnasium. In 1751 he was appointed a professor of theology at Halle, where he taught with great success; and six years later, became director of the theological seminary there. He died Mar. 14, 1791. Semler was, in the early part of his student-career, somewhat of a Pietist, but the prelections of Sigm. Jak. Baumgarten may be said to have revolutionized his religious convictions, and swung him round to rationalism, of which he was the first systematic exponent. Semler's rationalism, however, was always moderate in degree, though definite enough in kind. As a thinker, he was deficient in philosophical consistency and breadth of view; and as a writer he possessed no literary skill or grace; but his works are valuable for the spirit of historical criticism by which they are pervaded. The principal are: *Apparatus ad liberalem Veteris Testamenti Interpretationem* (Halle, 1773), *Abhandlung von der Untersuchung des Kanons* (4 vols., Halle, 1771-75), *De Dæmoniis* (Halle, 1766), *Umständliche Untersuchung der Dæmonischen Laute* (Halle, 1762), *Versuch einer Biblischen Dæmonologie* (Halle, 1776), *Selecta Capita Historiæ Ecclesiasticæ* (3 vols., Halle, 1767-69), *Commentationes Historicæ de Antiquo Christianorum Statu* (2 vols., Halle 1771-72), *Versuch Christlicher Jahrbücher oder ausführliche Tabellen über die Kirchengeschichte bis aufs Jahr. 1500* (2 vols., Halle, 1783-86), *Observationes novæ, quibus Historia Christianorum usque ad Constantinum Magnum illustratur* (Halle, 1784).—See his *Lebensbeschreibung von ihm selbst verfasst* (Halle, 1781-82), Wolf *Ueber Semler's letzte Lebensstage* (Halle, 1791), H. Schmid, *Theologie Semler's* (1858), and Tholuck in his *Vermeinte Schriften*.

SEMLIN, a frontier t. of Austria, in the military frontier, stands on a tongue of land at the junction of the Save and Danube, on the right bank of the latter, opposite Belgrade. Within recent years the town has been much improved, though even yet a suburb consisting of mud huts thatched with reeds stretches along the Danube. The only noteworthy edifices are the churches, the German theater, and the lazaretto (*Contumaz*), the chief quarantine station in the whole of the military frontier. At this institution, travelers crossing from Turkey are compelled to remain a greater or less time—sometimes 40 days—in proportion to the violence and proximity of the plague. The reason why the principal lazaretto is here is that Semlin is the great seat of the Turco-Austrian transit-trade, and the principal ferry for passengers from Christendom to the land of the Moslem. Pop. '69, 8,915.—For a graphic notice of Semlin, see Kinglake's *Editha*.

SEMMERING, a mountain on the borders of Styria and Austria, and 44 English m. s.w. by w. from Vienna, is 4,416 ft. above the level of the sea. The Vienna, Grätz, and Trieste Railway has been carried across this mountain by a series of ingenious engineering contrivances. See **GLOGGNITZ**.

SEMMES, RAPHAEL, American naval officer, was b. in Maryland about 1810, in 1828 entered as midshipman in the sloop of war *Lorington*, and was employed in the service as passed midshipman and lieutenant until 1855, when he attained the rank of commander. In 1858 he was appointed secretary to the lighthouse board; but resigned Mar. 26, 1861, joined the naval service of the confederate states, and was appointed to the command of the war steamer, *Sumter*. The career of captain Semmes until the sinking of his famous ship, the *Alabama*, by the American war-steamer *Kearsarge*, is described at length in the article **ALABAMA**. Captain Semmes, with 13 of his officers and most of his men, was rescued from drowning by the yacht *Teerhound*, and brought to England, where he expected to take command of one of two rams built at Liverpool for the confederates, but which were seized by the British government. He returned to America, was included in the surrender, and was elected judge of probate at Mobile, Alabama; but being prohibited by the federal authorities, he was, in 1866, appointed professor of moral philosophy in a southern university. He published the *Cruise of the Alabama and the Sumter*, in 1864; and *My Adventures Afloat* in 1869.

SEMNOPI THE' CUS, a genus of monkeys, natives of the east, having a very long, slender, powerfully muscular, although not prehensile tail. The canine teeth are long, but the molar teeth are more tuberculous than in Gibbons (q.v.) and other allied monkeys, indicating a greater aptitude for vegetable food. With this the structure of the stomach corresponds, which is very remarkable, and different from that of all other animals; consisting of a cardiac pouch, slightly bifid at the extremity; a very wide middle portion, formed of numerous pouches or sacs; and a very long canal, furnished with sacs at its commencement, but simple toward its termination. Professor Owen has been careful, however, to point out that these three portions do not correspond to any of the parts of the stomach of a ruminant animal, not exhibiting any such diversities in their internal surface. The species are numerous. The entellus (q.v.) monkey is one of them. Another is the negro monkey (*S. maurus*) of Java, remarkable for its jet-black color and long silky hair.

SEMOLINA (Semola or Semoule), an article of food much used in France and Italy, and to a small extent in Britain, and other countries. It consists of particles of wheat varying in size from grains of sand to small millet. Only the hard-grained wheats of Spain, Odessa, and southern Italy are adapted for making it; these hard wheats are not easily reduced to flour, and small particles escape being crushed by the mill-stones, and will not pass through the sieves—these constitute semolina. In France more attention is paid to this article than in any other country; and as it fetches a higher price than flour, the skillful miller so adjusts his mill-stones as to produce a considerable quantity. The granules of semolina are of various sizes, and they are carefully separated by sieves, the openings of which are from fine to coarse. A favorite kind of bread made of the coarser kinds of semolina (the semole of the French) is sold in Paris under the name of *grutu*. In Italy it is used in making polenta, in common with maize, meal, and millet; and in Britain it is used for puddings.

SEMPACH, a small t. of Switzerland, in the canton of Lucerne, an l 9 m. by railway n.w. of the town of that name, stands on the e. shore of the lake of Sempach. It is surrounded with walls, now in a ruinous condition, has a population of a little over 1000, and was one of the outposts of the confederate cantons against their Sraubim and Austrian assailants in the 14th century. Under the walls of Sempach took place the second great conflict of the confederated Swiss cantons with Austria. Leopold's army of 4,000 horse and 1400 foot arrived before Sempach on July 9, 1333, and found itself unexpectedly opposed by the confederated Swiss to the number of 1300. The nature of the ground being unfitted for the action of cavalry, the knights dismounted, and formed themselves into a solid and compact body, which was at once charged by the Lucerners; but the wall of steel was impenetrable, and not a man of the Austrians was even wounded, while 60 of the bravest of Lucerne, with their banner, fell. The mountaineers were beginning to despair of making an impression on their apparently invulnerable opponents, when Arnold von Winkelried, a knight of Unterwalden, seized with a noble inspiration, rushed forward, grasped with outstretched arms as many pikes as he could reach, buried them in his bosom, and bore them by his weight to the earth. His companions rushed over his body into the breach thus made, slaughtered the armor-enumbered knights like sheep, and threw the remainder into the utmost confusion and dismay. The conflict continued in an irregular manner for some time longer, but the result was a decisive victory for the Swiss, who had lost only 200 men; while the loss of the Austrians was ten times as great, including 600 counts, barons, and knights. The body of duke Leopold, who had throughout displayed the most obstinate valor, was found next day buried among a heap of slain. The anniversary of this great victory is still celebrated by prayer and thanksgiving on the field of battle.

SEMPER, GOTTFRIED, 1804-79; b. Hamburg; studied architecture in Italy and Greece; professor at the academy of art in Dresden, and at the school of architecture 1834-49; became involved in political difficulties and went to London. He taught at the Royal academy for a few years, and in 1856 went to Zurich as teacher in the polytechnic institute. His greatest works are the observatory at Zurich, the festtheater at Munich, the new theaters at Dresden and Darmstadt, and the museum and imperial palace in Vienna. He published *Die vier Elemente der Baukunst* (1851), and *Der Styl in den Technischen und Tektonischen Künsten*, 2 vols. (1860-65).

SEMPERVIVUM. See HOUSE-LEEK.

SENATE. See ROME.

SENATE, UNITED STATES, the upper house of congress; composed of twice as many members as there are states in the union, the two members from each state being elected by the respective state legislatures, to hold office for six years. The senators are held to represent the local sovereignty of their respective states. All bills in congress must pass both houses to become laws; though these may originate in either house. Of special functions, the senate possesses that of ratifying treaties with foreign powers; of confirming nominations to office made by the president, and of sitting as a high court of impeachment in case of the trial of public officials. The different states have each an upper house corresponding in its duties and powers with the United States senate.

SENATUS ACADEMICUS, one of the governing bodies in the Scottish universities, consisting of the principal and professors. It is charged with the superintendence and regulation of discipline, and the administration of the university property and revenues, which last function, since the universities Scotland act of 1858, the senatus exercises subject to the control and review of the university court. Degrees are conferred by the senatus through the chancellor or vice-chancellor. The principal is president, and, besides his deliberative vote, has a casting vote. In his absence, the senior professor present acts as chairman, who has also a double vote. One-third of the senatus is required to form a quorum.

SENDOMIR or **SANDOMIR MOUNTAINS**. See **RADOM**.

SENECA, a co. in central New York, having Cayuga lake and Seneca river on the e., Seneca lake forming two-thirds of its w. boundary; 325 sq. m.; pop. '80, 29,279—25,315 of American birth, 247 colored. It is drained by the Seneca and Clyde rivers. Its surface is hilly; its soil fertile, producing grain, potatoes, flax, dairy products, and live stock. It is intersected by the New York Central, the Geneva, Ithaca and Athens railroads, and the Erie, Cayuga and Seneca canal. Its manufactures consist of carriages, wagons, fire-engines, iron castings, machinery, woolen goods, malt, leather, ale and beer, etc. Co. seats, Ovid and Waterloo.

SENECA, a co. in n. Ohio, intersected by the Lake Erie and Western, the Cincinnati, Sandusky and Cleveland, the Baltimore and Ohio railroads, and the Northwestern Ohio which terminates at Tiffin; 540 sq. m.; pop. '80, 36,955—33,184 of American birth, 141 colored. It is drained by the Sandusky river, Honey Rock and Green creeks. Its surface is level, largely covered with forests of live oak, hickory, ash, and building timber, with occasional groves of beech and sugar-maple. Its agricultural products are grain, potatoes, wool, fruit, butter, etc. Stock-raising is one of the most important industries, and the manufactures are agricultural implements, carriages, wagons, iron castings, woolens, etc. Co. seat, Tiffin.

SENECA, M. ANNÆUS, the rhetorician, was born at Corduba (Cordova) in Spain. The time of his birth is doubtful, probably about 61 B.C. He seems to have been in Rome during the early period of the power of Augustus. He was rich, belonged to the equestrian order, and enjoyed the friendship of many distinguished Romans. From Rome he returned to Spain, where he married Helvia, and had by her three sons. The time of his death is uncertain; but he probably lived till the close of the reign of Tiberius, and died in Rome or Italy. His extant works are *Controversiarum Libri X.*, and *Suasorium Liber*, neither of which is complete. They are elaborately rhetorical in style, but do little to support the fame of their author, who is more remembered for his prodigious memory than for anything else.

SENECA, L. ANNÆUS, son of M. ANNÆUS, and a celebrated philosopher, was also born at Corduba, a few years B.C. When a child, he was brought by his father to Rome, where he was initiated in the study of eloquence. He cared more, however, for philosophy, in which his first teacher was the Pythagorean Sotion, whom he afterward left to follow Attalus the Stoic. He traveled in Greece and Egypt; and, in obedience to his father's wishes, he pleaded in courts of law; but, notwithstanding his forensic triumphs, he left the bar from fear of Caligula's jealousy. On entering into public life, he filled the office of quæstor, and had already risen high in the favor of the emperor Claudius, when he was accused of an adulterous connection with Julia, the daughter of Germanicus, and wife of Vinicius. He was exiled to Corsica, where he remained for eight years, deriving from philosophy what consolation he could, while incessantly complaining with a by no means philosophic querulousness, and appealing to the emperor for pardon. When Claudius married his second wife, Agrippina, Seneca was recalled by her influence, raised to the pretorship, and appointed instructor of her son Nero. On the death of his governor and military tutor, Burrus, Nero gave way to his depraved passions with a force which Seneca could not control. All his influence over his pupil was lost, but he profited by his extravagant bounty to such a degree that his accumulated wealth amounted to 300,000 sester tia, or to £2,421,870 of our money. Nero soon began to look with envious eyes on this fortune; and Seneca, to avert dangerous consequences, offered, with much tact, to refund to the emperor his gifts, and begged leave to retire on a small allowance. This Nero declined; and Seneca, under pretense of illness, shut himself up, and refused to appear in public. Nero then attempted to have him poisoned, but failed. A short time afterward, Antonius Natalis, when on his trial for participating in the conspiracy of Piso, implicated Seneca as one of the conspirators. This was quite enough to fix Seneca's guilt. He was sentenced to put himself to death. His wife, Paullina, declared her resolution to die with him, and, in spite of his remonstrances, accompanied him into the bath in which, according to his own choice, he was to be bled to death. The emperor, however, would not allow Paullina to die, but removed her from her husband, who gradually expired, 65 A.D. Seneca's extant writing are mainly on moral subjects, and consist of Epistles, and of Treatises on Anger, Consolation, Providence, Tranquillity of Mind, Philosophical Constancy, Clemency, The Shortness of Life, A Happy Life, Philosophical Retirement, and Benefits. He also speculated on physical phenomena, and wrote seven books entitled *Questiones Naturales*, in which he is thought

to have anticipated some notions regarded as principles in modern physics. Ten tragedies, ascribed to him by Quintilian, and generally included in editions of his works, have also come down to us; but whether he is really their author remains still a dubious and debated point. Some allege that they were the work of his father, Seneca the rhetorician; some that they must be attributed to another Seneca. They were not intended, and are certainly not adapted, for the stage. They are overcharged with declamation; and, if rich in moral sentiments, are wanting in dramatic life. Of his genuine prose writings, modern opinion takes a divided view; some critics praising his practical sagacity, others finding him wanting in speculative reach. It is perhaps a significant fact, that he is admired by French scholars and disparaged by German. One of the best editions of the prose works is the Bipontine, 1809; of the tragedies, that of Bothe, 1819.

SENECA FALLS, a village in Seneca township, Seneca co., N. Y., on the Seneca river or creek, and 16 m. w. of Auburn; on the N. Y. Central railroad, near lake Cayuga; pop. '70, 5,890. There is a fall of about 50 feet in the river, from which the village is named, which furnishes water-power for manufactories of pumps, fire-engines, blinds, sashes, flouring and saw mills, etc. There are 3 banks, 2 weekly papers, and 7 churches.

SENECA LAKE, one of a range of narrow lakes in the western part of the state of New York. It is 37 m. from n. to s., and from 2 to 4 m. in width, 441 ft. above the Atlantic, 630 ft. deep, and was never known to be frozen over until Mar., 1856. It is navigated by steamboats from its head to the pretty village of Geneva at its mouth, and empties itself by the Seneca and Oswego rivers into lake Ontario. It takes its name from the Seneca Indians, one of the Six nations.

SENECAS, a tribe of Indians, of the Six Nations, living in the state of New York w. of Seneca lake. Their tribal name is Tsonnundawagon, or "people of the great hill," receiving the name of Senecas from Dutch settlers who called them Sinnckaas. The tribe was originally divided into eight families, the Turtle, Snipe, Hawk, Bear, Beaver, Wolf, Deer, and Heron; and they gained from conquered tribes the Scannonaenrat (Hurons), and a majority of the Neuters, the Erics, and Susquehannas. They were visited by missionaries in the 17th c.—Chaumonot in 1657, and Fremin in 1668. La Salle built a block-house at Niagara without molestation, and the French built a fort there in 1712; but the Indians were hostile from time to time, and left the confederation of the Six Nations to join Pontiac in his league against the English, destroying Vauango and making an assault on fort Niagara in 1763. They were on the side of England during the revolution, and in 1779 their villages were destroyed by gen. Sullivan. They joined in the fort Stanwix treaty in 1784, selling most of their lands in the Genesee valley, and moved to lake Erie and the Alleghany river. In 1812 they joined with the Americans, and rendered valuable service on the frontier. A number living at Sandusky and Stony creek, Ohio, were hostile; but in 1815 they joined in a friendly treaty at Spring Valley, ceding all but a reservation with the Shawnees in 1818, selling that also in 1831, to go to the Indian territory on the Neesho. The New York Senecas occupy 66,000 acres of reservation called the Alleghany, Cattaraugus, and Tonawanda, and near them are several large towns. They numbered in '70, 3,660 in New York, in the Indian territory 206, and 200 with the Mohawks on the Grand reservation in Canada. The society of Friends has done much to improve the condition of these tribes, and missions of different sects have been established since 1805. Each clan speaks a different dialect of the same language. The rev. Ashur Wright, missionary, 1802-75, prepared a grammar and dictionary of their language, translated a portion of the Bible into it, and arranged a hymn-book. Red Jacket and Corn-planter were their most distinguished chiefs. They have prospered in agriculture and in religious and secular education, and have largely increased since 1812.

SENECIO, a genus of plants of the natural order *compositæ*, suborder *corymbifera*, having a hairy pappus, a naked receptacle, and a cylindrical involucre of linear equal scales, with a few smaller scales at their base. The species are very numerous; annual, perennial, and half-shrubby plants, natives chiefly of the temperate and cold parts of the world, the half-shrubby species being from the warmer latitudes. Eleven species are reckoned as British, and commonly known as groundsel (q.v.) and ragwort (q.v.). *S. jacobæus*, probably not a true native of Britain, but introduced in the middle ages, has undivided lanceolate leaves, and was once in repute as a vulnerary. The FIREWEED of North America is *S. hieracifolius*. It receives its popular name from its appearing abundantly wherever a part of the forest has been consumed by fire. Many species of *senecio* have a strong disagreeable smell. A few are rather ornamental as flowers.

SENEFELDER, ALOYS, 1771-1834; b. Prague; studied law, and was afterward an unsuccessful playwright and actor. By accident he discovered lithography, for which he obtained a patent. In 1809 he became director of the royal lithographing establishment at Munich. His *Lehrbuch der Lithographie* appeared in 1819. See LITHOGRAPHY.

SENEFFE, or **SENEF**, a t. in the province of Hainault, Belgium, about 11 m. n.w. of Charleroi, has a pop. of between 3,000 and 4,000, and is the center of a district in which manufactures of pottery and glass are extensively carried on. Seneffe, how-

ever, is chiefly notable for its proximity to the battlefield on which William of Orange (III. of England), at the head of the force of the coalition against France, was defeated, after a bloody contest, by the great Condé Aug. 11, 1674. In William's army there were four lieutenants—Montecuculi (q.v.), duke Charles of Lorraine, the prince of Waldeck, and the prince of Vaudemont, the first three of whom subsequently attained prominence as military commanders. Of the allied forces of 60,000 men, the Dutch lost from 5,000 to 6,000 men, the Spaniards 3,000, and the Imperialists 600; while the French army, which entered into the conflict 30,000 strong, could scarcely muster 20,000 after their victory.—Under the walls of Seneffe, Moreau in 1794 defeated the Austrians.

SENEGA, or **SNAKE ROOT**, is the dried root of *polygala senega*. The following are its characters: "A knobby root-stock, with a branched tap-root of about the thickness of a quill, twisted and keeled; bark, yellowish-brown, sweetish, afterward pungent, causing salivation; interior, woody, tasteless, inert." Senega is a powerful and trust-worthy stimulating expectorant, and may be advantageously prescribed in the advanced stages of chronic bronchitis and pneumonia, especially when occurring in aged or very debilitated patients. It is also a valuable remedy in prolonged whooping-cough, and in the latter stages of croup and of bronchitis in young children. The preparations are the infusion and the tincture; the average dose of the former being an ounce and a half, of the latter a drachm. For children, the powdered root in doses of 10 grains is the best form. See **POLYGALA**.

SENEGAL (called by the natives *Senaga*), a large river in western Africa, rises in Mt. Cooro, in lat. 10° 30' n., long. 10° 40' w., flows first n.w. and then w., and falls into the Atlantic after a course of 1000 m., for the last 740 of which it is navigable for flat-bottomed boats. Here and there, throughout the whole course, the navigation is interrupted by cataracts, shoals, and rocks. In the lower course the river forms numerous large, cultivated, and very fertile islands, and its banks are green and productive, and in part clothed with wood. The entrance is difficult on account of breakers and a bar which, in the dry season, is covered by only 8 to 9 ft. of water.

SENEGAL, the name of the French possessions on the river Senegal in Senegambia (q.v.).

SENEGAM BIA, a large maritime tract of country in western Africa, in lat. about 10° to 18° n., long. about 4° to 17° 30' e., is bounded on the n. and w. by the Sahara and Soudan, on the s. by the colony of Sierra Leone, and on the w. by the Atlantic. Area about 400,000 sq.m.; pop. estimated at about 12,000,000. The country takes its name from its two principal rivers, the Senegal and the Gambia. Between these two rivers, which are 250 m. apart, there are no water-courses of any importance, and from the Gambia s. to the frontier of Sierra Leone, the only considerable stream is the Rio Grande. The coast is deeply indented by arms of the sea, which resemble the estuaries of rivers. The country forms the western and northern declivity of the plateau of Kong, and part of it is still unexplored. The soil is of two kinds, that of the coasts and that of the interior; the former consisting in part of low flat alluvial plains, and partly of an undulating country, which broadens toward the n. until, on the northern frontier, it merges into the Sahara; while the plateau of the interior rises from the coast plains in mountainous terraces until it loses itself in the Kong mountains. Its loftiest elevations are only about 3,250 ft. high. Senegambia is divided into three districts—High, Middle, and Low Senegambia. The first comprises the country to the n. of the Senegal, and is inhabited by Moors, who, of course, profess Islamism. Middle Senegambia comprises the country bordering the Senegal, having an area of 1350 sq.m., and is inhabited by negroes, who divide themselves into numerous tribes. Of this tract the climate is extremely hot, and is unhealthy in the marshy districts. The soil is generally fertile, and yields the crops usually produced in the hot regions of Africa. Low Senegambia comprises the countries bordering the Gambia, and extends s. to Nunez. Of the coast regions of Senegambia, France possesses on the banks and around the estuary of the Senegal about 1440 sq.m. of territory; the Portuguese a tract of 35,437 sq.m. on and around the estuary of the Rio Grande; and the English some little territory on the Gambia, with a pop. of 14,190.

SENESCHAL (Tenton, *senescale*, senior servant?), in the origin of the office, probably an attendant of the servile class who had the superintendence of the household of the Frankish kings. In the course of time, however, the seneschalship rose to be a position of dignity, held no longer by persons of servile race, but by military commanders, who were also invested with judicial authority. The lieutenants of the great feudatories often took the title of seneschal. A similar office in England and Scotland was designated steward, but is rendered into Latin as *senescallus*.

SENIOR, **NASSAU WILLIAM**, political economist, b. 1790, eldest son of rev. J. R. Senior, vicar of Durnford, Wilts; was educated at Eton and Magdalen college, Oxford, where he graduated in 1811, taking a distinguished first-class in classics. In 1819 he was called to the bar at Lincoln's inn. In 1825 he was elected to the professorship of political economy at Oxford, founded by the late Henry Drummond, M.P. He held it for the statutory term of five years, and was succeeded by Mr. Whately, afterward archbishop of Dublin. In 1832 the enormous evils of the poor-law administration in England led

to the appointment of a commission of inquiry. Senior was one of the commissioners; and the portion of the report in which the abuses of the existing system were detailed was drawn up by him. This report encouraged the whig government to bring in the poor-law amendment act of 1834. See Poor and Poor-Laws. In 1836 he received the appointment of master in chancery; and in 1847 was re-elected to his former professorship for another term of five years. More recently he was nominated one of the commissioners of national education, under the presidency of the late duke of Newcastle. His publications, which are numerous, comprise various excellent treatises on political economy, some of which were delivered in the form of lectures at Oxford, and several pamphlets on social and political questions. He also contributed numerous articles to the *Edinburgh Review*, and other leading periodicals. He has left some interesting journals of his visits to Turkey and Greece, and observations on the political and social condition of these countries. His *Essays on Fiction* contributed to the chief reviews between the years 1821 and 1857, and republished in 1864, relate principally to the novels of Scott, Bulwer-Lytton, and Thackeray. He analyzes the plots, and classifies the characters of the Waverley novels with curious felicity, and devotes a masterly essay to Thackeray, whom he regards as the greatest novelist of his day. The intellect of Senior was clear and penetrating, and the perspicuity of his style made him an able expositor of the truths of political and social science. His article on "Political Economy" in the *Encyclopædia Metropolitana*, and his remarks on some definitions in this science, published in the appendix to Dr. Whately's treatise on *Logic*, may be consulted with advantage. He died June 4, 1864.

SEN. KESHUB CHUNDER, Babu, first became known through his connection with a society in Calcutta called the Brahma Somaj, which he joined in 1857. The Somaj was then under the leadership of Debendra Nath Tagore, and aimed at the abolition of caste and the maintenance of a divine worship. Chunder Sen became the leader of a party of the younger portion of the Somaj, who wished to advance more rapidly than the others were willing to follow. In 1865 he presented to Nath Tagore three propositions, intimating that if rejected a separation would ensue. These were: 1. That the external signs of caste distinction, as the Brahmanical thread, should be no longer used. 2. That none but Brahmas of fair ability and good, moral, pure lives should be allowed to conduct the services of the Somaj. 3. That no word should be uttered in the Somaj in contempt or hatred of other Somajes. The first was rejected as too radical. A division resulted; Tagore and the minority calling themselves the Adi (original) Somaj, the majority becoming known as the "progressive Somaj," of which Chunder Sen is the acknowledged leader. Recently he delivered a lecture in Calcutta, in which he used the following expressions: "My love of Christ constrains me to speak of him. The Christ who is advancing in all directions has touched India, and hence the question she asks, Who is Christ? Though often defied and persecuted by the world, I have found sweetness and joy unutterable in my master Jesus. I fell at his feet, saying, Blessed child of God, when shall others see the light that is in thee?" From this one would suppose him a Christian in doctrine as well as in heart. But his utterances vary as to doctrine; and in a lecture on great men a few months after the former one, he seemed to place Christ on a level with other benefactors of the race. At times he addresses Christ and speaks of him in terms which exalt him into perfect divine sovereignty, and always his faith and zeal seem characteristically Christian. He does not accept the organized ecclesiastical Christianity of Europe and America, demanding for India a Christ presented in oriental forms for the Hindu mind. His work is interesting, and fitted to secure sympathy from Christians, who will be liable to misjudge his position if they forget the natural mysticism, transcendentalism, and fervor of eastern thought and language, unfitted to respond to the hard, clear, logical, dogmatic standards of the Anglo-Saxon.

SENILIS, a very ancient t. of France, dep. of Oise, 33 m. n.e. of Paris. Its older portion is surrounded by walls, flanked with 16 towers, which are all that remain out of the 28 towers of early times. The cathedral, a small edifice, is a beautiful example of early Gothic. Manufactures of cloth, lace, and thread are actively carried on. Pop. '76, 6,537.

SENNA is one of the most important purgatives contained in our materia medica. Two sorts of senna are recognized in the pharmacopœia—viz., Alexandrian senna and Tinnevely senna. The Alexandrian senna leaves are chiefly obtained from *Cassia lanceolata*, while the Tinnevely senna leaves are yielded by *Cassia elongata*. *Alexandrian senna* is chiefly grown in Nubia and Upper Egypt, and is imported in large bales from Alexandria. It is apt to be adulterated largely with the flowers, pods, and leaves of *Cynanchum argel* and *Tephrosia apollina*. *Tinnevely* or *East Indian senna* in odor and taste entirely resembles Alexandrian senna. The leaflets are, however, "about 2 in. long, lanceolate, acute, unequally oblique at the base, flexible, entire, green, without any admixture."

Senna is, as Dr. Christison observes in his *Dispensatory*, "so certain, so manageable, and so convenient a purgative, that few remedies of its class are held in equal estimation. In point of energy, it holds a middle place between the mild laxatives and drastic cathartics. It acts chiefly on the small intestines, increasing their mucous secretion, as well as their peristaltic motion, and producing loose brown evacuations." The

drawbacks to its more universal administration are its disagreeable taste, and its tendency to produce nausea, griping, and flatulence; the means of correcting which are subsequently noticed. The only circumstance positively contra-indicating its employment is an inflammatory state of the intestinal mucus membrane. Although senna has been frequently submitted to chemical analysis, its active principle is not known; but whatever the cathartic principle may be, it is obviously absorbed into the circulation before it begins to operate, since this drug imparts a purgative property to the milk of nurses.

The following are the most important preparations of this medicine:

1. *Infusion of Senna*, which is obtained by infusing for one hour, and then straining, half an ounce of senna and half a dram of sliced ginger in half a pint of boiling water. The taste of this infusion is much concealed by the addition of some black tea, or what Neligan finds "still better, coffee, and it may be sweetened with sugar, and milk added; it is in this way readily taken by children." The addition of neutral laxative salts checks the griping, which is often caused by senna alone, and at the same time increases its activity. The ordinary *black draught* is commonly prepared by adding one ounce of sulphate of magnesia to four ounces of infusion of senna. Two or three ounces of this mixture, to which a dram each of the tinctures of senna and of cardamoms may be added, usually act as a very useful aperient.

2. *Tincture of Senna*, composed of senna, raisins, caraway seeds, and coriander seeds macerated in proof-spirit, and formerly known as *elixir salutis*, or the *elixir of health*, is seldom given alone. Christison recommends a mixture of an ounce of the tincture of senna with an ounce and a half of sulphate of magnesia, dissolved in four ounces of water, and as much infusion of roses. "A wine glassful of this given every hour seldom fails to act with energy, and without sickness or tormina, and is an excellent combination for most febrile disorders." The tincture is, however, most commonly prescribed in doses of one or two drams, as an adjunct to other cathartic mixtures, to correct their griping properties.

3. *Confection of Senna*, commonly known as *lenitive electuary*, is a pulpy mixture of powdered senna with powdered coriander seeds, figs, tamarinds, cassia pulp, prunes, extract of liquorice and sugar; all of which substances are, under certain specified conditions, combined by the action of boiling water. When properly prepared, which is often not the case, it forms a mild aperient, well suited for persons suffering from piles.

In the above preparations, it is immaterial whether Alexandrian or East Indian senna is employed.

The senna leaves of commerce and of medicine are the produce of several species of *Cassia* (q.v.), natives of India, Arabia, Syria, and the n. of Africa. *Cassia obovata* is a perennial herbaceous plant 1 to 2 ft. high, having smooth leaves, 6 or 7 pair of obovate obtuse leaflets, racemes of yellow flowers, and curved, compressed pods, with an interrupted ridge along the middle of each valve. It is found in Egypt and Nubia, and is now also cultivated in Italy, Spain, the West Indies, etc. *C. acutifolia* is a half-shrubby plant, about 2 ft. high, with racemes of yellow flowers, lanceolate acute leaves, and flat elliptical pods, somewhat swollen by the seeds. It grows in the deserts near Assoum, and the leaves are collected by the Arabs, and carried by merchants to Cairo for sale.—*C. elongata* is an annual with erect, smooth stem; narrow leaves, with 4 to 8 pair of lanceolate leaflets, which are rather downy beneath; racemes of yellow flowers; and oblong pods, quite straight, rounded at the apex, and tapering to the base. It grows in India.—*C. althiopica* is about 18 in. high, with 3 to 5 pair of oval-lanceolate, downy leaflets; the pods flat and smooth. It grows in the n. of Africa.—*C. lanceolata* is an Arabian species, differing from the others in its erect pods.—All these seem to furnish the officinal senna. Linnaeus, not aware of the diversity of species, assigned it to one which he named *C. senna*, but it would be hard to say which has a preferable claim to this name. All the species have the leaflets unequal-sided, by which they are readily distinguished from other leaflets often used for the adulteration of senna, as those of *argel* (q.v.) and *badier senna*. The commercial names of the different kinds of senna do not seem in general to correspond with differences of species, but rather to refer to the countries or ports from which they are brought.

BLADDER SENNA (*Colutea*) is a genus of shrubs of the natural order *leguminosæ*, sub-order *papilionacæ*, having pinnated leaves, red or yellow flowers, and remarkably inflated pods, whence the English name. One species (*C. arborescens*) is common in shrubberies in Britain. It is a native of the s. of Europe, and is found on the ascent of the crater of Mt. Vesuvius—almost the only plant that exists there.

SENNAAR, lately a negro state, is now an Egyptian pashalik in the s. of Nubia. The town from which it is named, *Sennaar*, near the Bahr-el-Azrek, and 160 m. s.s.e. of Khartoum, was once a most important city, but is still a trading center of some consequence. Pop. about 10,000.

SENNACHERIB, an Assyrian king, son of Sargon, reigned 702–680 B.C. The interest attaching to his name is principally due to the extraordinary and incomprehensible disaster that befell his army, either at Libnah or at Pelusium, when no fewer than 185,000 Assyrians are said to have been slain by the "angel of the Lord" (see **HEZEKIAH**). The

Egyptian account of this mysterious affair (reported by Herodotus, book ii. 141), and that of Berosus the Chaldean, quoted by Josephus (*Antiq. of Jews*, book x. chap. 1), as well as the scriptural narrative (2 Kings, chap. 18) justify us in believing that Sennacherib at least sustained a sudden, unexpected, and terrible overthrow, which forced him to retreat in hurried confusion to his own country. All that we know of his subsequent history is, that he was assassinated by his sons while worshipping his favorite god. The discrepancies, both as regards dates and names in the life of Sennacherib, between the writer of Kings and profane historians, are felt, even by strenuous apologists like the rev. George Rawlinson, to be almost, if not altogether, irreconcilable. Sennacherib belongs to that showy class of eastern monarchs whose rule is commonly described as "magnificent"—i.e., he built great palaces, and erected monuments in the different parts of his empire, and everywhere left an impression of his grandeur. In Scripture, in Herodotus, in Josephus, Sennacherib is the "great king." His most imperial work was the palace at Koyunjik, which covered a space of more than 8 acres, and was richly adorned with sculpture.

SENS, an old t. of France, in the department of Yonne, 70 m. s.e. of Paris, stands amid pleasing scenery on the right bank of the Yonne. The town proper is surrounded by walls, chiefly of Roman construction, and in the vicinity the remains of ancient roads and of Roman camps abound. The spacious and handsome Gothic cathedral is the principal edifice. An active trade in wines, grain, hemp, wool, and timber is carried on. Pop. '76, 12,251.

SENSATION (in physiology) may be defined to be "the perception by the mind of a change wrought in the body." According to this definition, which is borrowed from Dr. Todd, sensation involves—first, a bodily change from some cause, whether inherent or external; and secondly, a mental change, whereby the perception of the bodily change is accomplished. The true organ of sensation is the brain, and especially that portion of it which (to use the words of the above-named eminent physiologist) constitutes the center of sensation, and extends into the spinal cord, forming the posterior horns of its gray matter. See SPINAL MARROW. Physiologists distinguish between *common* and *special* sensation. Common sensation exists in the skin, and in all parts of the body to which ordinary sensory nerves are distributed, and is excited by ordinary mechanical or chemical stimuli; while special sensation is exemplified in the special senses of vision, hearing, etc. For the due action of the latter there are organs of special sensation, which, by the peculiar character of the nerves with which they are supplied, become the recipients of impressions of a particular kind; thus, the eye is sensible to light, the ear to sound, etc.; and if the special nerves going to these organs be irritated, instead of pain being excited, as in the case of an ordinary sensory nerve, there is a feeling closely allied to that which would be excited by the application of the normal stimulus, as light, sound, etc. Any *ordinary* sensibility those organs (the eye, ear, etc.) possess is dependent on ordinary sensory nerves, and is quite independent of the nerves of special sense.

In works on the physiology of the nervous system, we often meet with the phrases *objective sensation*, *subjective sensation*, and *reflex sensation*. We shall conclude this article by a brief description of the meaning of these terms. "In the ordinary mode of exciting sensations," says Dr. Todd, "the presence of an object is necessary. This object creates an impression on the peripheral parts of the sensitive nerves; and the change caused by this impression being duly propagated to the center of sensation, is perceived by the mind." This, which is the ordinary form of sensation, is termed an *objective* sensation, in opposition to a so-called *subjective* sensation, in which a mental act can develop a sensation independently of any present object. These subjective sensations are sometimes excited by the mind recalling, more or less exactly, the presence of an object; but in many cases they are caused by physical changes in the nerves themselves, owing to an excess or deficiency of blood, or some other pathological causes. Thus disordered conditions of the retina or optic nerve may give rise to motes or flashes of light; disturbance of the auditory nerve occasions singing in the ears, the sound of distant bells, etc.

To understand the mode in which *reflex* sensations are brought about, an acquaintance with *reflex action*, described in the article NERVES AND NERVOUS SYSTEM, is requisite. As examples of this form of sensation may be mentioned the facts, that the irritation of a calculus in the bladder will give rise to pain in the thighs; that diseased liver often excites pain in the shoulder-joint; and that ice or iced drinks suddenly introduced into the stomach occasion intense pain in the forehead. For further information on the subject, the reader is referred to Dr. Todd's article "Sensation," in the 4th vol. of his *Cyclopædia of Anatomy and Physiology*.

SENSATION, a name of great import in the philosophy of mind, as well as familiar in ordinary speech. In the mental process so named, there is a concurrence of many contrasting phenomena, rendering the word ambiguous, and occasioning verbal disputes.

1. In sensation there is a combination or concurrence of physical facts with a mental fact, and the name is apt to be employed in expressing either side. Thus, in sight, the physical processes are known to be—the action of light upon the globe and retina of

the eye, a series of nerve-currents in the brain, and a certain outgoing influence to muscles and viscera; these are accompanied by the totally different phenomenon termed the feeling, or the mental consciousness of light. It is to the last fact, the mental fact, that the name sensation is most correctly applied; but there is a natural liability to make it include those physical adjuncts which are inseparable from the mental manifestations.

2. In the still more comprehensive contrast of mind and the external or extended world, both members may be designated under sensation. One and the same situation on our part may contain a strictly mental or *subjective* experience—pleasure or pain, for example—and an *objective* experience, or a recognition of the extended world, as distinct from mind. In looking at a fine prospect, both facts concur in fluctuating proportions; we have a feeling of pleasure (mind or subject) and a knowledge of the outspread or extended world (object), which is what affects us in the same way at all times, and affects all minds alike. As before, sensation is most properly used to express the strictly mental or subjective experience, the pleasure or the pain, while the “perception” should be applied to express the objective experience. See PERCEPTION.

3. In sensation, a past experience recovered by memory is inextricably woven with the present impression, a circumstance which confuses the boundary-line between sense and intellect. The sensation that the full moon gives rise to is not solely owing to the present effect of the moon's rays on the organs of vision; the present effect revives or restores the total ingrained impression of the moon consequent on all the occasions when we have observed it. Again, it is impossible for us to have a sensation without a more or less complex feeling of difference or discrimination, which property is a fundamental fact of intellect. Our sensation of the moon supposes a contrast of the white light with the adjoining blue, of the round form with other forms, of the broad disk with a starry point, and so on. Thus, in sensation we have a concurrence of all three processes of the intellect—retentiveness, agreement, and difference. Sensation without intellect is a mere abstraction; it is never realized in fact.

This last remark has important bearings upon the question as to the origin of our knowledge. It has been disputed whether or not our ideas are wholly derived from sense. Now, seeing that there is no such thing as sense to the exclusion of intellect, the question ought to be enlarged and put in this form, Are our ideas wholly derived through sense in conjunction with the intellectual processes, or are there any ideas that are not or cannot be so derived? When it is alleged by Cudworth, Price, and others, by way of maintaining the doctrine of innate ideas, that likeness, unlikeness, equality, proportion, etc., are not obtained from sense, the answer is, that their origin may in all probability be accounted for by sense co-operating with the well-known powers of the intellect, and that, until the conjunction of the two is proved insufficient, the theory of an intuitive origin is not called for.

SENSES. Referring for an account of the several senses to their respective designations, we will here endeavor to state what faculties or sensibilities of the mind are properly included under the name.

The common reckoning includes the five senses—taste, smell, touch, hearing, sight—but this is not now considered exhaustive or complete.

For example, the feelings of hunger, thirst, suffocation, internal warmth and chillness, etc., have all the characters implied in an ordinary sensation; they are the result of some external agent acting on a distinct bodily organ, and giving rise to feeling, sometimes pleasurable and sometimes painful. In order that these states, related to the sensibility of the different viscera, may find a place among the senses, they have been grouped under one general head, and designated “sensations of organic life.” They are of great importance as regards our enjoyments and our sufferings, although not contributing much to our knowledge or intelligence. They approach nearest to taste and smell, the more emotional senses, and are at the furthest remove from the intellectual senses—touch, hearing, and sight.

Again, the feelings connected with our activity, or with the exercise of the muscular organs—as the pleasures of exercise and rest, the pains of fatigue, the sensibility to weight, resistance, etc.—were, until lately, overlooked in the philosophy of the mind. When they began to be recognized it was common to treat them as a sixth sense, called the muscular sense. But this does not represent their true position. They do not arise from external agents operating on a sensitive part, but from internal impulses proceeding outward to stimulate the muscular energies, and to bring about movements; they are thus the contrast of the senses generally. Sense is associated with the *in-going* nerve-currents, movement with the *out-going*. The contrast is vital and fundamental; and accordingly the feelings of movement and muscular strain should be considered as a genus distinct from the genus sense, and not as a species of that genus.

The classification of the fundamental sensibilities of the mind would then stand thus: I. Feelings of muscular energy. II. Sensations of the senses: 1. Organic life; 2. Taste; 3. Smell—emotional; 4. Touch; 5. Hearing; 6. Sight—intellectual.

SENSIBILITY is a term somewhat vaguely used by physiologists. Until a comparatively recent period it was often confounded with irritability, although Haller, more than a century ago, very clearly laid down the distinction between these two properties of tissues. We not unfrequently find it applied to nerves to signify their power of evolu-

ing nervous force, but excitability (as Dr. Todd observes) more exactly implies what is meant in this case. The term should be limited to signify the power which any part of the body possesses of causing changes, inherent or excited in it, to be perceived by the mind; and the greater this power is, the greater is the sensibility of the part. The degree of sensibility of different parts of the outer surface of the body is very various. The relative sensibility has been ascertained by Weber by touching the surface with the points of a pair of compasses tipped with cork, and then (the subject's eyes being closed) approximating the points until they were brought within the smallest distance at which they could be felt to be separate. The following are a few of his results: Point of tongue, $\frac{1}{2}$ a line; tips of fingers, 1 line; red surface of lips, 2 lines; palmar surface of 2d phalanx, 2 lines; palmar surface of metacarpus, 3 lines; tip of the nose, 3 lines; palm of the hand, 5 lines; dorsum of the hand, 8 lines; vertex, 15 lines; skin over the spine and the middle of the thigh, each 30 lines; so that the sensibility of the skin is at least sixty times greater in some parts than in others.

SENSITIVE PLANT, a name commonly given to certain species of *mimosa*, (see *MIMOSEÆ*), on account of the peculiar phenomena of irritability (q.v.) which their leaves exhibit in their collapse when touched or shaken. Numerous species of *mimosa* possess this property, and, indeed, most of the species in a greater or less degree; but those in which it is most conspicuous are humble herbaceous or half-shrubby plants. They have leaves beautifully divided, again and again pinnate, with a great number of small leaflets, of which the pairs close upward when touched. On repeated or rougher touchings the leaflets of the neighboring *pinnæ* also close together, and all the *pinnæ* sink down; and at last the leaf-stalk itself sinks down, and the whole leaf hangs as if withered. If the stem is shaken, all the leaves exhibit the same phenomena. After a short time the leaf-stalk rises, and the leaflets expand again. On account of this curious and interesting property, some of the sensitive plants are frequently cultivated in our hot-houses. They are generally treated as annuals, although capable of longer life. *M. sensitica*, one of the best-known species, is a native of Brazil, with prickly stems and leaf stalks, and small heads of rose-colored flowers. *M. pudica* has a herbaceous stem, bristly but not prickly. *M. casta*, *M. pubibunda*, *M. palapitans*, and *M. Vera* are also among the most sensitive species.

SENSO RIUM. This term is applied by physiologists to a series of ganglionic centers, each of which has the power of communicating to the mind the impressions derived from the organ with which it is connected, and of exciting automatic or involuntary muscular movements in response to these sensations. (See Carpenter *On the Functions of the Nervous System in Human Physiology*, 6th ed. p. 545.) These ganglionic centers, which lie at the base of the brain in man, are in direct connection with the nerves of sensation, and appear to differ entirely in their functions from the other parts of the encephalon. Anterior, there are the *olfactive* ganglia, or what are termed the bulbs of the olfactive nerves. The ganglionic nature of these structures is more evident in many of the lower mammals, in whom the organ of smell is highly developed, than it is in man, although even in the human subject these masses contain gray or vesicular nervous matter, indicating their true ganglionic nature. Behind these, we have the *optic* ganglia, commonly known as the corpora quadrigemina, small in man, but comparatively large in many of the lower mammals. The *auditory* ganglia do not form distinct projecting masses, but are represented by small masses of vesicular matter, into which the auditory nerves may be traced, and which are imbedded in the medulla oblongata. In fishes there is a well-developed and distinct auditory ganglion. The *gustatory* ganglion is the least distinct of any, but it is supposed to be represented by a mass of vesicular matter imbedded, like the preceding ganglion, in the medulla oblongata, and into which the nerves of taste may be traced. On examining a progressive series of brains from man to the lowest mammals, we find a continuous diminution of the Lemisphere and a corresponding development of these ganglia, or, at all events, of the olfactory and optic ganglia; while, if we continue the investigation to the brains of birds, reptiles, and fishes, we find the same law in force, till finally, in reptiles and fishes, those ganglia form the greatest part of the brain.

It was long attempted to determine some one point in the brain where the soul is more especially located or centralized, and to this ideal point the name of Sensorium was applied in the older psychological speculations. The fancy of Descartes made it a small body near the base of the brain, called the "pineal gland." The recent views of the nervous system repudiate the idea of a central point of this nature; in consciousness the brain generally is active, although under different impressions and ideas the currents may be presumed to follow different nerve tracks. Consequently no meaning is now attached to a sensorium in psychology, as distinct from the cerebrum at large.

SENTENCE. A sentence is the form of words in which a thought or a proposition (q.v.) is expressed. A mere phrase or group of words, such as "A very high mountain," which only conveys a meaning or calls up an idea, but does not make an affirmation, is not a sentence. Since speech is the expression of thought, the sentence is the proper unit or integer of speech, and thus forms the starting-point in the study of language.

Every single sentence is made up of two parts—the one naming the subject, or the something that is spoken about; the other the predicate, or the something that is said

of it—as “The sun—shines;” “Those who have the greatest gifts, and are of the greatest usefulness—are the most humble.” Every sentence must contain a finite verb, as it is the function of the verb (q.v.) to make affirmations. “The sun shines,” is an example of a sentence in its barest form, containing merely the subject “sun,” and the predicate “shines,” which are called the *principal* elements. The enlargement or development of the sentence takes place by means of adjuncts, or *secondary* elements tacked on to the principal elements—as “*Young birds build nests without experience.*” Sentences may be divided into simple, compound, and complex.

1. A simple sentence has only one subject and one finite verb. Reduced to its essentials, it is of the form, “The sun shines;” “The day is cold.” 2. A compound sentence consists of two or more simple sentences combined—as, “The sun gives light by day, and the moon by night;” which contains two affirmations or sentences, “The sun gives light by day,” and “The moon gives light by night.” 3. A complex sentence consists of one principal sentence together with one or more dependent sentences. In the compound sentence given above, there are two distinct statements, and as both are put on the same footing they are said to be *co-ordinate* sentences. But when we say “The moon rose as the sun went down,” the going down of the sun is not mentioned on its own account; the only thing directly affirmed is that the moon rose at a certain time, and the going down of the sun is only introduced as marking that time. Such clauses are called *subordinate* sentences (see CONJUNCTIONS). The subordinate clauses of complex sentences may be considered as transformations of the elements of the simple sentence; and according to the nature of the element which has been transformed, they might be called noun-sentences, adjective-sentences, or adverbial sentences—e.g., “*The existence of God is denied by none*” = “*That God exists, is denied by none.*” “*Benevolent men are happy*” = “*Men who seek the good of others are happy.*” “*The moon rose at sunset*” = “*The moon rose as the sun went down.*” Further, the nouns, adjectives, and adverbs that enter into a subordinate sentence, may, one and all of them, be transformed in their turn into sentences, which will thus be subordinate in a still higher degree—e.g., “*Europe rejoiced that Greece was delivered from that oppressive power*” = “*Europe rejoiced that Greece was delivered from the power that had oppressed her.*” Here the adjective *oppressive* in the first sentence has in the second been converted into a sentence which is directly dependent, not on the principal sentence (Europe rejoiced), but on the subordinate, and is therefore subordinate in the second degree. Subordination is seldom carried beyond the second or third degree, as it becomes perplexing, and weakens the force of the principal assertion. The same sentence is often compound, as containing two or more co-ordinate sentences, and at the same time complex, as containing one or more subordinate sentences in addition; and to discriminate all these and point out their relations is to give the syntactical analysis of the sentence.

SENTER, ISAAC, 1755-99; b. N. H.; educated at Yale college. He was a surgeon in the continental army, and afterward the head of the medical profession in Rhode Island.

SENTINEL—SENTRY (from the Lat. *sentire*, to feel or perceive, through the Ital. *sentinella*), a private soldier, marine, or sailor posted at a point of trust, with the duty of watching the approach of an enemy or any person suspected of hostile intentions. Sentries mount guard over depots of arms, the tents of commanding officers, etc. During the night each sentry is intrusted with the “word,” or countersign; and no person, however exalted in position, may attempt to approach or pass him without giving that as a signal. In such case the sentry is bound to arrest the intruder, and, if necessary, to shoot him. It has happened before now that the commander-in-chief of an army has been a prisoner in the hands of one of his own sentries. When an army is in the field the sentries are its eyes, for they guard the approaches in every direction some distance in front of the main body of troops. In the event of attack they give the alarm and retire slowly on their supports. There is usually an agreement, tacit or expressed, between commanders that their outlying sentries shall not fire upon one another, which would only be productive of useless bloodshed. Under martial law death is the penalty to a sentry for sleeping on guard.

SENZA SORDINO (Ital. without the mute, or without the damper), a musical term which, when applied to the violin or violoncello, denotes that the mute (q.v.) is to be removed. In pianoforte music it means that the performer must press down the pedal which takes off the dampers.

SEPAL. See CALYX.

SEPARATE ESTATE is the legal term denoting the property of a married woman, which she holds independently of her husband's interference and control. Where a marriage is about to be entered into, and the lady has property, it is usual, before the marriage, for her to assign and convey to trustees all or part of her property, so that it may continue to be vested in them for her exclusive benefit, and so that she may be able to deal with it in much the same manner as if she were not married. The deed in that case entirely regulates the extent of her rights. Where the deed has been properly executed she can draw the interest, and do what she pleases with it. A third party who bequeaths property to a married woman may also so give it as to make it separate estate.

If there is no clause in the deed or will prohibiting alienation or anticipation, she will be able to dispose of her life-interest. She can, in general, alienate her separate estate without her husband's consent; and she is not bound out of it to maintain the husband, even though he may be destitute; nor is she bound to maintain her children, unless the latter would otherwise be chargeable to the parish. When a wife incurs debts and liabilities, her separate estate will become chargeable with these unless she was at the time acting only as the agent of the husband, such as ordering necessities for the house. In Scotland a wife is bound out of her separate estate to maintain a destitute husband, and the husband's consent is necessary to her alienation of the separate estate.

SEPARATE LUTHERANS are those followers of Luther who in Prussia refuse to unite with the state church. In 1817 Frederick William III. formed a plan for uniting the Reformed and the Lutheran churches; but many zealous Lutherans were opposed to it, and found a leader in Johann Gottfried Scheibel, professor of theology at the university of Breslau. In 1830 two cabinet orders, designed to further the scheme, caused an open breach. Several distinguished men, many ministers, and nearly 300 families, joined Scheibel. He was soon driven into exile, and died at Nuremberg in 1842. His followers adhered to their principles. The government employed against them both policemen and soldiers. Ministers were imprisoned, laymen fined, and religious meetings dispersed. Many families emigrated to America, but the enthusiasm of the rest increased. In 1840 Frederick William IV. released the ministers from prison, allowed the congregations to organize themselves, and in 1845 recognized their right to unite under their own officers free from the control of the state church. The official acts of their ministers were to be acknowledged in law, and their church registers to be received in evidence. Under these provisions a high consistory was constituted as the supreme ecclesiastical authority for separate Lutherans in Prussia. It consists of 4 members, and has charge of the spiritual welfare of the church, of receiving new congregations, of parochial relations, the appointments of clergymen, the ritual, censures, complaints, and the calling of synods. The processes of discipline are admonition, requisition of apologies, and excommunication. The church service is conducted according to the received forms; preaching on free texts requires permission from the high consistory, and the Lord's supper is an essential part of the chief service. Lutherans are not compelled to send their children to the united schools. In 1847 the high consistory had under its charge 21 congregations with 19,000 members. A very large number of Lutherans, influenced by the king's concessions, remained in the state church. The great political movement of 1848 gave a powerful impulse to the separate Lutherans; but as it also encouraged their brethren in the state church to strive within it, rather than out of it, for greater independence, the alienation between the two parties was increased. In later years the separate Lutherans have been divided among themselves. In 1861 two parties were formed, the one conservative and the other radical, between which friendly intercourse ceased.

SEPARATION of married persons is either judicial or voluntary. If the parties enter into a deed, or other arrangement, to live separate, this is called a voluntary separation, and, in general, the legal rights of the parties are not altered, except that if the wife is provided with maintenance, she has no longer an implied authority to bind the husband. And though voluntary separation is not encouraged by courts of law, yet effect will be given frequently to deliberate contracts of this kind entered into between the parties. See **JUDICIAL SEPARATION**.

SEPARATISTS. See **QUAKERS**, **OATH**.

SEPIA AND SEPIADÆ. See **CUTTLE-FISH**.

SEPIA, a pigment used as a water-color. It is prepared from the secretion of a peculiar organ called the ink-bag, found in the dibranchiate *cephalopoda*, or cuttle-fishes. This secretion is black at first, and insoluble in water, but extremely diffusible through it; it is therefore agitated in water to wash it, and then allowed slowly to subside, after which the water is poured off, and the sediment, when dry enough, is formed into cakes or sticks. In this state it is called "India ink." If, however, it is dissolved in a solution of caustic potash, it becomes brown, and is then boiled and filtered, after which the alkali is neutralized with an acid, and the brown pigment is precipitated and dried: this constitutes the proper sepia. It is usually prepared in Italy, great numbers of the species which yields it most abundantly, *sepia officinalis*, being found in the Mediterranean. The black kind, called India ink, is prepared in China, Japan, and India, and forms the common writing-ink of those countries.

SEPOY, corrupted from the Indian word *sipahi*, a soldier. This word sipahi, in its more familiar form of *spahce*, is known in most eastern armies; and is itself derived from *sip*, a bow and arrow, the ordinary armament of an Indian soldier in ancient times. The word sepoy now denotes a native Hindu soldier in the British army in India. See **EAST INDIA ARMY**. The present sepoy force numbers about 140,000.

SEPS. See **SKINK**.

SEPTARIA are ovate flattened nodules of argillaceous limestone, internally divided into numerous angular fragments by reticulating fissures radiating from the center to the circumference, which are filled with some mineral substance, as carbonate of lime

or sulphate of barytes, that has been infiltrated subsequent to their formation. The fissures have been produced by the cracking of the nodule when drying. They are largest and most numerous in the center, and gradually decrease outward, showing that the external crust had first become indurated, and so, preventing any alteration in the size of the whole mass, produced wider rents as the interior contracted. The radiating figure, and the striking contrast between the dark body of argillaceous limestone and the more or less transparent sparry veins, when the nodule is cut and polished, has caused them to be manufactured into small tables and similar objects. They are, however, most extensively employed in the manufacture of cement. As they are composed of clay, lime, and iron, they form a cement which hardens under water, and which is known commercially as Roman cement, because of its properties being the same as a famous hydraulic cement made of ferruginous volcanic ash brought from Rome. Septaria occur in layers in clay deposits, and are quarried for economical purposes in the clays of the London basin. Large numbers are also dredged up off Harwich, which have been washed out of the shore-cliffs by the waves. The nodules generally contain a scale, shell, plant, fruit, coprolite, or some other organic substance, forming the nucleus that has apparently excited the metamorphic action which withdrew from the surrounding clay the calcareous and ferruginous materials scattered through it, and aggregated them around itself.

SEPTEMBER (Lat. *septem*, seven) was the 7th month of the Roman calendar, but is the 9th according to our reckoning, though we preserve the original name. Various Roman emperors, following the example of Augustus, who changed "Sextilis," the 6th month of the Roman calendar, into "Augustus" (August), attempted to substitute other names for this month, but the ancient appellation continued to hold its ground. The Saxons called it *gerst-monath*, or barley-month, because barley, their chief cereal crop, was generally harvested during this month. It has always contained 30 days.

SEPTEMBRISTS—SEPTEMBRISERS (Fr. *Septembriseurs*), the name given to the frantic executioners in what are known as the "September massacres" in Paris. The particular causes of this ferocious outburst were twofold—mad fear of domestic traitors and of foreign despots. The news came pouring into Paris, ever more and more maddening, of Prussian and Austrian hordes marching victorious over the frontiers; insolent royalists obtruding themselves in the van of the invading armies, and breathing threatenings and slaughter; while numerous *aristocrates* (i.e., favorers of the king and court) were believed to be making preparations to receive them in Paris. At the very same moment broke out the royalist insurrection in *La Vendée*, rendering France still further delirious, whereupon Danton, "minister of justice," got a decree passed, Aug. 28, 1792, ordering domiciliary visits for the arrest of all suspected persons, and for the seizure of arms of which patriotic France stood much in need. Upward of 2,000 stand of arms were got in this way, and 400 head of new prisoners. On the morning of Sept. 2 the news of the capture of Verdun by the Prussians arrived. The mingled rage and panic of the people cannot be described. All the bells in Paris were set a-clanging; men and women hurried in myriads to the *Champ de Mars* to get themselves enrolled as volunteers. Danton entered the legislature—"the black brows clouded, the colossus-figure tramping heavy, grim energy looking from all features of the rugged man"—and made that famous speech, ending: "*Pour les vaincre, pour les atterrir, que faut-il? De l'audace, encore de l'audace, et toujours de l'audace.*" The effect was electrical. He obtained from the assembly a decree condemning to death all "who refused to march to the frontiers or to take up arms." But patriotism against foreigners was not enough. Were not the traitors at home deserving of death? Marat thought so: multitudes of ardent frantic men and women shared his conviction; but it is not proved that either Marat or Danton formally ordered the massacres, or, indeed, that anybody ordered them. They were rather the spontaneous outburst of patriotic insanity, beholding aristocratic treachery and plots everywhere. Priests, Swiss soldiers, aged and infirm paupers, women both reputable and disreputable, and criminals, were mercilessly cut down or shot. From Sunday afternoon till Thursday evening the wild butchery went on at the Bicêtre, the Abbaye, the convent of the Carmelites, the Conciergerie du Palais, the Grand Châtelet, St. Firmin, La Force, and the Salpêtrière. One gathers a glimpse of the savage sincerity of the Septembriseurs when one reads that the gold rings, watches, money, etc., found on the persons of the massacred were all religiously brought to the town-hall; not a single thing was stolen or furtively appropriated until after the essential work was done. Then the roughs or blackguards ("sons of darkness," as Carlyle calls them) sallied out into the streets like Mohawks or Alsatians, and commenced to plunder, but were speedily suppressed and forced back into their dens.

Great misapprehension prevails as to the numbers who perished in these fearful scenes. Royalist pamphleteers and others, trusting mainly to fantasy (according to Carlyle, *Fr. Rev.*, vol. ii. p. 158) reckon the victims at 3,000, 6,000, and even 12,000; but the accurate advocate Maton (who was in the thick of the horrors, and narrowly escaped the guillotine) reduces the number, by "arithmetical ciphers and lists," to 1089, which, he it observed, included numbers of forgers of assignats, and other criminals. It was a sad and horrible affair, as all massacres are; but it is above all things desirable to know

exactly the *dimensions* of, and the motives that stirred the actors in, so execrable a tragedy.

SEPTIMOLE, in music. When a note is divided into 7 instead of 4 parts—for example, a minim into 7 quavers, or a crotchet into 6 semiquavers—the group is called a septimole,

and the figure 7 is generally placed over it. A septimole

may also occur in a $\frac{3}{4}$ measure, in which case the 7 notes are collectively of the value, not of 4, but of 6.

SEPTUAGESIMA SUNDAY (Lat. *Septuagesima*, "the seventieth"), the third Sunday before *Leut* (q.v.), so called, like "Sexagesima" and "Quinquagesima," from its distance (reckoned in round numbers) before Easter.

SEPTUAGINT (Gr. *Hoi tōn O*, or *hoi O*; Lat. *Septuaginta*; Seventy, LXX., Alexandrine version, etc.), the most ancient Greek translation of the Old Testament that has come down to us, and the one commonly in use among the Jews at the time of Christ. Its origin is shrouded in deep obscurity. The principal myth about it—repeated by Philo, Josephus, the Talmud, and the church fathers (Justin, Clement of Alexandria, Epiphanius, and the rest), with individual variations—is contained in a letter purporting to be written by a Greek, Aristeas, to his brother, Philokrates, during the reign of Ptolemy Philadelphus (284–247 B.C.). This king, it is stated, anxious to embody in a collection the laws of all nations on which he was engaged, also those of the Jews, invited, by the advice of his librarian, Demetrius Phalereus, 72 men of learning and eminence from Palestine, who performed the task of translation (on the isle of Pharos) in 72 days. The facts upon which this legend—utterly rejected now as a piece of history—rests, cannot well be ascertained now. So much, however, seems clear from another anterior testimony (Aristobulus), that Ptolemy, aided by Demetrius, did cause a Greek version of the Pentateuch to be executed, probably during the time of his being coregent of Ptolemy Lagi. That the translator or translators, however, were not Palestinian but Egyptian Jews, appears equally clear both from the state of the text from which the translation must have been made, and from the intimate acquaintance with Egyptian manners and customs which it evinces. This text differs, especially in the Pentateuch, considerably from our received text, but agrees in many instances with the Samaritan (q.v.). The question of the number of translators has been much and warmly discussed, but with little positive result. So much only seems certain, that different hands were employed in the rendering of the different parts of the Pentateuch, upon which infinite care was bestowed, as well as of the other books of the Old Testament, which, indeed, do not seem to have been done at the same time. In some instances, it would appear as if the translation had been made before the non-pentateuchal books were united with the others into one canon. This seems particularly evident in the case of the book of Jeremiah, which, in the translation, appears in a more primitive form than in the state in which we possess it now. In a less degree does this discrepancy appear in Job, the Proverbs, Daniel, and Esther; of these, however, our canon probably contains the original form, while the LXX. shows later variants. It is, however, in neither of these books to be decided now whether the discrepancies observable are due to an already altered text upon which the translators worked, or whether they were their own emendations; or even whether many of them are not due to a much later period. The translation of the book of Daniel is the most flagrant instance of subsequently introduced "corrections" and additions. Apart from the apocryphal pieces attached to it, its obscure passages were "emended" to such an extent by both Jews and Christians, that it was by the authority of the early church utterly rejected, and replaced by the version of Theodotion. The translator of Job, though less arbitrary, has yet altered, added to, and abbreviated considerably, his text. Esther has many apocryphal additions, which owe their origin probably to the Alexandrine period, and never existed in Hebrew. Of exaggerated literalness is the version of Ecclesiastes and the Psalms. Among the most successful books are to be mentioned the Psalms and Ezekiel. But, on the whole, there is to be noticed throughout, a lack of an exact knowledge of the original, a striving after minute fidelity in one part, and an unbridled arbitrariness in another; further, a desire to tone down or to utterly eliminate anthropomorphisms or anything that appeared objectionable to the refined taste of the time.

The Septuagint was held in the very highest repute among the Alexandrine Jews, while the Palestinians looked upon it as a dangerous innovation, and even instituted the day of its completion as a day of mourning. Gradually, however, it also found its way into Palestine, and at the time of the composition of the New Testament it seems almost to have superseded the original, considering that its quotations from the Old Testament are almost invariably given from the LXX. It was read and interpreted in the synagogues for some centuries after Christ, until the increasing knowledge of the original, fostered by the many academies and schools and the frequent disputations with the early Christians, brought other and more faithful and literal translations, such as that of Aquila, Theodotion, etc., into use, and gradually the LXX. was altogether discarded

in the synagogue. The church, however, for a long time, and the Greek church up to this day, considered it as of equal authority and inspiration with the Hebrew text itself; and many translations were made from it into the vernaculars of different Christian communities (the Itala, the Syriac, the Ethiopic, Egyptian, Armenian, Georgian, Slavonian, etc.). The large diffusion of the LXX. among the Hellenists and the churches, and the want of anything like a critically fixed text, together with the pious desire bodily to insert the peculiar explanation given to obscure passages by single authorities, the ignorance of the copyists, and a number of other causes, contributed not a little to render the MSS. corrupt, in some instances past mending. Nor were the endeavors of Origen (q.v.) in his *Hexapla*, or of Lucianus and Hesychius for a restoration of the proper text of any avail. The principal MSS. that have, as far as we know, survived are the Codex Alexandrinus in the British museum, the Codex Vaticanus in Rome, and the Sinaitic Codex (imperfect) in St. Petersburg, all of which belong to the time between the 4th and 6th centuries A.D. The principal editions are the Complutensian (1514-17), reprinted in the Antwerp and Paris Polygot; the Aldine of Venice (1518); the Sixtine of Rome (1587), partly reprinted in Walton's Polygot (1657), by Lamb Bros. (Franker, 1709); Renecceius (Leip. 1730); Parsons & Holmes (Oxford, 1798-1827); Tischendorf (1850, etc.). Following more closely the Codex Alexandrinus is the edition of Grabe (Oxford, 1707-20, completed by F. Lee), reprinted by Breitinger (Zürich, 1730-32) and others. The Alexandrine Codex has been reproduced in fac-simile by H. H. Baber; the Sinaitic in the same manner by Tischendorf. Some other MS. recensions are mentioned by the early fathers, such as the "Hebrew," the "Syrian," the "Samaritan," the "Hellenian," etc. The literature of the LXX. is very large, and special grammars and dictionaries have been compiled for its peculiarly corrupt idiom.

SEPULCHREAL MOUND. The practice of rearing mounds of earth and stone over the resting place of the dead may be traced to remote antiquity. It had doubtless its origin in the heap of earth displaced by interment which, in the case of the illustrious warrior or chief, it became the practice to raise into the size and form of the barrow or tumulus which is found all over northern Europe, from Great Britain and Ireland to Upsala in Sweden and the steppes of Ukraine. Sepulchreal mounds of some sort seem, indeed, to have been erected among all the nations of Asia as well as of Europe, and they are found in numbers in Central America. Some of the larger tumuli or moathills are but partially artificial, natural mounds having been added to or shaped into the form which it was wished that they should take. There is considerable diversity in the form of the tumuli, the different forms corresponding to different periods considerably remote from each other. The oldest are long-shaped, and in the form of gigantic graves, often depressed in the center and elevated toward one end. Inside the tumulus the body was laid at full length, often along with spear and arrow heads of flint and bone. The bell and bowl-shaped tumuli seem to have succeeded this early form. Within them is often found a short cist and primitive cinerary urn, showing that the body had been burned; but there appears also to be evidence that the processes of inhumation and cremation had been in use contemporaneously, or sometimes the body was placed within the cist in a sitting posture. Skeletons of dogs and horses are occasionally found beside the ashes of the deceased. The sepulchreal mounds which seem to be of latest date are broad and low, surrounded sometimes by an earthen vallum, and sometimes, particularly in Scotland and Scandinavia, by a circle of standing stones. In both the inclosed and encircled tumuli, weapons have been found belonging to the period when the metallurgic arts were practiced, and in some instances Roman as well as native relics. A remarkable form of tumulus frequent in Sweden, and occasionally seen in Scotland, consists of an oblong mound larger than the primitive barrow, and terminated at both ends in a point, whence it has been called the *skibbs alunger*, or ship-barrow. Scandinavian antiquaries have come to the conclusion that the bodies of the warriors of the deep were sometimes burned in their ships, whose form was repeated in the earthwork reared above their ashes.

The most numerous class of sepulchreal mounds in Scotland are the *cairns* (q.v.) or tumuli of stone, which abound in every district of the country, and were often of much larger dimensions than the earthen tumuli. Another species of monument is the *cromlech* (q.v.).

SEPULVELA, JUAN GINES DE, a Spanish historian, surnamed the Livy of Spain, was b. at Pozo-blanco, in the neighborhood of Cordova, about 1490; studied first at Cordova and Alcala, and went to Bologna in 1515, where he obtained the acquaintance and esteem of the most celebrated savans of Italy and Spain. There he wrote the life of cardinal Albornoz, which was published in 1521. He assisted cardinal Cajetan at Naples in revising the Greek text of the New Testament, and in 1536 returned to Spain as chaplain and historiographer to Charles V., and preceptor to his son, afterwards Philip II. Died in 1573 or 1574. Erasmus speaks of Sepulveda in the *Ciceronianus* in terms of high encomium, and there is indeed little doubt that he was one of the most learned men and best writers of his time. His works comprise Latin translations of part of Aristotle (1531), and of the commentary of Alexander Aphrodisiensis (1527); miscellaneous dissertations, among which were treatises on fate and free-will, in opposition to Luther (1526), in favor of a war with the Turks (1529), in defense of Alberto Pio Cardi-

nal Carpi (1531), on marriage (1531), and in support of the congruency of the military profession with Christianity (1541), on monarchy and the duty of kings (1571). His histories of the reign of Charles V., of that of Philip II., and of the conquests of the Spaniards in Mexico, all of them written in Latin, are still inedited. His other works were collected and published by the royal academy of history at Madrid in 1780 (4 vols. fol.), accompanied with a portrait of Sepulveda, and an account of his life and writings.

SEQUATCHIE, a co. in e. Tennessee, drained by the Sequatchie river, a branch of the Tennessee, flowing through it centrally; 250 sq.m.; pop. '80, 2,565—2,557 of American birth, 56 colored. Its surface is mountainous in the n. and s. where part of the elevated country belongs to the Cumberland, and part to Walden's ridge. The hills are largely covered with forests of oak and hickory. On the river bottoms are groves of beech, maple, and cottonwood. Its soil is moderately fertile, producing grain and tobacco in the arable portions, and is well adapted to stock raising. Wool is exported. Its mineral products comprise limestone, iron, and coal. Co. seat, Dunlap.

SEQUESTRATION, the Scotch legal term for bankruptcy (q.v.).—In English law sequestration is the appropriate term denoting the process by which the creditor of a clergyman of the church of England in possession of a living sues out execution on his judgment, and obtains payment of the debt. In ordinary cases of lay debtors, the sheriff takes possession of the real estate of judgment debtors; but when the debtor is a clergyman, the bishop puts in force the law, and appoints sequestrators to take possession of the benefice, and draw the emoluments, and pay them over to the creditor, first making due provision for the proper celebration of divine worship.

SE QUIN (Ital. *zecchino*, from *zucca*, the name of the Venetian mint), a gold coin, first struck at Venice about the end of the 13th c., was about the size of a ducat (q.v.), and equivalent to about 9s. 4d. sterling. Coins of the same name, but varying in value, were issued by other states.

SEQUOIA, a genus of coniferous trees of the cypress family, comprising two species, the *sequoia sempervirens*, or redwood, of the Coast ranges of California, and the *S. gigantea*, the big tree, or big redwood, growing upon the western side of the Sierra Nevada. See REDWOOD and CALIFORNIA.

SEQUOYAH, a co. in s.w. Kansas, intersected by the Atchison, Topeka and Santa Fé railroad; 64 sq.m.; pop. '80, 568—521 of American birth. It is drained by the Arkansas river, flowing through it centrally, its course being followed by the railroad. Its surface is a fertile rolling prairie.

SERAGLIO (properly, **SERAI**) is the palace of the sultan at Constantinople. It stands in a beautiful situation on a head of land projecting into the sea, known as the Golden Horn, and is inclosed by walls $7\frac{1}{2}$ m. in circuit. Within the walls are a variety of mosques, gardens, and large edifices, capable of containing 20,000 persons, though the whole number of the inhabitants scarcely ever reaches the half of this. The principal entrance (*Babi humayun*, or Sublime gate) is a kind of pavilion, which is constantly guarded by *capicjis*, or officers of the seraglio; and the chief of the large edifices within is the *harem* (Arab. sacred spot), which is distinctly separated from the rest of the seraglio, and consists of a group of houses and gardens, one of each being possessed by each of the sultan's wives, and of the habitations of the concubines and slaves. The harem is ruled by the *kiaja-khatun*, or inspector of the women, who is under the sultan's authority alone, and is supplied with what they require by the *kislar-aga*, or chief of the black eunuchs who form the principal or inner guard of the harem. The second and outer guard is given to the white eunuchs, under their chief the *kapu-agassu*, or *kapu-oghlar*. Other classes of household officers are the *mutes* (Turkish, *bisclân* or *dilssis*), who, till recently, were the executors of the sultan's orders, especially those in which the utmost secrecy was required; the *bostanjis*, or gardeners; the *ballajis*, or cleavers of wood; and the *itsh-oghlanis*, or attendants of the sultan. The sultan's mother always resides within the seraglio, but his sisters do not. Access may easily be had to the seraglio, with the exception of the harem, which is scrupulously guarded from even the eyes of strangers. The English have improperly confounded the two terms "seraglio" and "harem."
